580.11	Removal of Concrete Pylons	Each
580.21	Removal of Concrete from Structural Steel Members	Foot

SECTION 581 - REMOVAL OF BRIDGE OVERLAYS

581-1 DESCRIPTION. The work shall consist of the removal and disposal of bridge overlays, reinforcement, if present, and any miscellaneous materials encountered, as shown on the contract plans.

581-2 MATERIALS. Not specified.

581-3 CONSTRUCTION DETAILS. Not specified.

581-4 METHOD OF MEASUREMENT. The work shall be measured by the area of bridge overlay, removed and disposed of. The quantities will be determined from field measurements.

581-5 BASIS OF PAYMENT. The unit price bid per square foot shall include the cost of furnishing all labor and equipment to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
581.01	Removal of Bituminous Concrete Overlay (Bridge)	Square Foot
581.02	Removal of Cement Concrete Overlay (Bridge)	Square Foot

SECTION 582 - REMOVAL AND REPLACEMENT OF STRUCTURAL CONCRETE

582-1 DESCRIPTION. The work shall consist of the removal and disposal of unsound structural concrete from an existing structure and its replacement with new structural concrete, or an approved patching material, as indicated on the contract plans, or as ordered by the Engineer. All work shall be done at the locations indicated on the contract plans, or where ordered by the Engineer.

All miscellaneous materials, not including bar reinforcement, encountered during the removal of unsound structural concrete, shall be removed and disposed of unless otherwise indicated on the contract plans, or ordered by the Engineer.

582-2 MATERIALS. Materials used in this work shall conform to the following requirements:

Vertical and Overhead Patching Material	701-08
Water	712-01
Quilted Covers (for curing)	711-02
Plastic Coated Fiber Blankets (for curing)	711-03
Membrane Curing Compound	711-05
Admixtures	711-08

582-2.01 Replacement Concrete. Concrete shall be Class A or Class D concrete for structures. It shall conform to the requirements of Section 501 - Portland Cement Concrete - General.

582-2.02 Vertical and Overhead Patching Material. The patching material used shall be a brand that appears on the Department's Approved List.

582-3 CONSTRUCTION DETAILS

556

582-3.01 Repair Determinations. The choice of replacement material will be indicated on the plans, determined by the Engineer, or determined by the contractor. The Contractor's determinations shall be made in accordance with the criteria of this subsection, and only in the absence of directions from the plans, or the Engineer. The Contractor's determinations shall be approved by the Engineer prior to the actual performance of the work.

A. Horizontal or Essentially Horizontal Locations. Class A or Class D concrete shall be used. Class A concrete shall be placed only at locations where removal depths average greater than 5 inches. Class D concrete shall be placed only at locations where removal depths average between 1 1/2 and 5 inches. Average depths shall be determined by a measurement procedure acceptable to the Engineer.

B. Vertical or Essentially Vertical Locations. Class A concrete, Class D concrete, or approved patching material shall be used. Concrete classes shall be restricted to the depth limitations noted for horizontal locations. Patching material shall be placed at locations where removal depths average between 1/2 and 1 1/2 inches. Average depths shall be determined by a measurement procedure acceptable to the Engineer.

C. Overhead. Approved patching material shall be used. Lift thicknesses shall not exceed 1 inch, unless formwork or anchoring devices are employed.

D. Pockets. Locations, within locations of 1 1/2 inches in average depth or less, which exceed this average depth, shall be filled with Class A, or Class D, concrete in accordance with the limitations outlined under horizontal locations.

582-3.02 Removal of Unsound Concrete. All unsound concrete shall be removed to a sound surface as determined by the Engineer. If called for on the plans, the existing concrete shall be saw-cut to obtain a straight joint between the existing concrete and the new material. Care shall be exercised while removing the unsound concrete so as not to damage materials which are to remain in place. Exposed reinforcement remaining in place shall be cleaned in accordance with the requirements of §584-3.02A. Chipping hammers shall meet the requirements of §580-3.02.

A. Removal for Concrete Replacement. The minimum depth of removal shall be the greater of the following:

- A depth no less than 1 1/2 inches from the rear most point of reinforcement to sound concrete.
- The depth necessary to reach sound concrete.

Should the removal depth exceed 6 inches, the Engineer may order supplementary anchoring as part of the replacement procedure. The sides of the cavity shall be made at a slight angle, so that the width of the base of the cavity is greater than the opening at the surface, thereby providing a key.

B. Removal for Patching material Replacement. Feather edges shall not be permitted. The minimum patch depth shall be 1/2 inch as measured from the theoretical plane of the original concrete surface.

582-3.03 Preparation of Surface

- A. All surfaces receiving new material shall be blast cleaned in accordance with the requirements of §584-3.02.
- B. Bar reinforcement shall be placed at the location indicated on the plans, and at all additional locations determined by the Engineer.
- C. Existing reinforcement, which, in the Engineer's opinion, has lost significant section, shall be repaired in a manner satisfactory to the Engineer.
- D. Bar placement, and bar repair work directed by the Engineer will be paid for separately.

582-3.04 Placement. Air clean the surface with oil-free compressed air. After the surface preparation has been accepted, every effort should be made to thoroughly wet the concrete surface, and all porous surfaces to be in contact with new concrete, for 12 hours. This may be accomplished by continuous wetting with soaker hoses or the use of burlap/burlene/etc. where moisture can be maintained. If, in the opinion of the Engineer, conditions or the situation prohibits this, then the surfaces should be wetted for as long as possible. Surfaces must be wetted by a means acceptable to the Engineer using potable water.

The Contractor shall remove any puddles of free standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated surface dry condition until placement of the new concrete. No material shall be placed if the ambient air, or concrete surface temperature is at, or below 45°F.

A. Concrete Placement. All concrete placements shall be in accordance with the applicable requirements of the following subsections:

555-3.02, 555-3.03A, 555-3.04, 555-3.06, 555-3.07, 555-3.08.

If formwork configuration, or clearances between formwork, steel and existing concrete are such that Class A, or D, concrete cannot be placed without voids, or honeycombing, the Contractor may, with the Engineer's permission, use an approved high range water reducer to increase the concrete's workability. Approved high range water reducers appear on the Department's Approved List.

The high range water reducer shall be added at the work site only and shall be dispersed uniformly throughout the plastic concrete. The Engineer shall approve the Contractor's dispersal methods and devices prior to their actual use.

The high range water reducer shall be added only after the concrete has reached the proper slump and contains the required quantity of air. No more than two additions of the admixture shall be made, and the manufacturer's maximum dosage rate shall not be exceeded. After the admixture has been added, the concrete shall be mixed an additional 30 revolutions. The second admixture addition shall be made only after the 30 revolutions required for the first addition have been completed. It is the responsibility of the Contractor to ensure that concrete slump does not exceed 9 inches, and air content remains within specification requirements. Plastic concrete mixes failing to meet the foregoing requirements will be subject to rejection. Replacement will be done at the Contractor's expense.

The Engineer may allow high range water reducer to be added at the concrete batching facilities. Consideration for this procedure will be undertaken only after the Contractor has clearly demonstrated the capability of providing concrete which meets the requirements of this subsection.

B. Vertical and Overhead Patching Material Placement. Patching material shall be prepared in accordance with the directions provided by the manufacturer. The Engineer shall be given two copies of the manufacturer's printed instruction at least two weeks prior to the start of all patching work. This shall include the mixing proportions and the mixing method. The manufacturer's literature shall be consulted for surface preparation and priming instructions. The material shall be troweled on in layers, the thickness of which depends on the material consistency and the location and profile of the surface to which it is applied. However, lift thickness in excess of 1 inch will not be permitted without the use of anchoring devices or formwork at overhead locations. Special curing procedures are generally not required, except under conditions of high heat, low humidity, or strong winds, as defined by the manufacturer. The manufacturer should be consulted for specific curing procedures under these adverse conditions.

582-3.05 Form Removal. Form removal shall be in accordance with §555-3.09 with the following exception:

Forms shall be removed from thin concrete placements 24 curing hours after placement has been completed unless the Engineer determines the concrete is not strong enough to withstand damage. For purposes of this subsection, a thin concrete placement begins at the outermost surface of the new concrete and generally terminates at, or before, the midpoint of the main reinforcing steel. Concrete may be removed and replaced completely around one or two main reinforcing steel members to a depth no greater than 1 inch from the innermost surface of those members and still be considered a thin concrete

placement. Main reinforcing steel members include reinforcing bars, but not spiral reinforcement or stirrups. Curing procedures shall be implemented immediately upon form removal.

582-3.06 Curing. Curing shall be performed according to the following:

A. Concrete. This shall be done in accordance with §555-3.08.

B. Vertical and Overhead Patching Material Curing. Manufacturer's recommendations for curing shall be followed for the patching material applications.

582-4 METHOD OF MEASUREMENT

582-4.01 Removal of Structural Concrete - Replacement with Class A Concrete.

Measurement shall be made as the number of cubic yards of concrete placed where indicated on the contract plans, or where ordered or approved by the Engineer.

582-4.02 Removal of Structural Concrete - Replacement with Class D Concrete.

Measurement shall be made as the number of square feet repaired as indicated on the contract plans, or where ordered or approved by the Engineer.

582-4.03 Removal of Structural Concrete - Replacement with Vertical and Overhead Patching Material.

Measurement shall be made as the number of square feet of the plane projection of the repaired area as indicated on the contract plans, or where ordered or approved by the Engineer. Measurement shall be made prior to the placement of patching material.

582-5 BASIS OF PAYMENT

582-5.01 Removal of Structural Concrete - Replacement with Class A Concrete. The unit price bid per cubic yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except that bar reinforcement removal and replacement shall be paid for separately. Progress payments will be made in accordance with §582-5.04.

582-5.02 Removal of Structural Concrete - Replacement with Class D Concrete. The unit price bid per square foot shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except that bar reinforcement removal and replacement shall be paid for separately. Progress payments will be made in accordance with §582-5.04.

582-5.03 Removal of Structural Concrete - Replacement with Vertical and Overhead Patching Material. The unit price bid per square foot shall include all labor, materials and equipment necessary to complete the work. Progress payments will be made in accordance with §582-5.04.

582-5.04 Progress Payments. Progress payments will be made when the concrete removal is completed. Payment will be made at the unit price bid for 50% of the quantity removed. The balance of the quantity will be paid upon completion of the work.

Payment will be made under:

Item No.	Item	Pay Unit
582.05	Removal of Structural Concrete - Replacement with Class A Concrete	Cubic Yard
582.06	Removal of Structural Concrete -Replacement with Class D Concrete	Square Foot
582.07	Removal of Structural Concrete -Replacement with Vertical and Overhead Patching Material	Square Foot

SECTION 583 - SHOTCRETE

583-1 DESCRIPTION

583-1.01 Work. The work shall consist of removal and disposal of unsound structural concrete and replacement with shotcrete where indicated in the contract documents and where ordered by the Engineer. The Contractor has the option of using either the Dry Mix Process or the Wet Mix Process.

583-1.02 Definitions

A Shotcrete. This is mortar conveyed through a hose and pneumatically projected at high velocity onto a surface.

B. Dry Mix Process. This is a process in which the dry cement-sand mixture is carried by compressed air to the nozzle where water is injected and the resulting mixture is jetted from the nozzle at high velocity onto the surface to be shotcreted.

C. Wet Mix Process. This is a process in which all the ingredients including water are thoroughly mixed and then jetted from the nozzle at high velocity onto the surface to be shotcreted.

D. Delivery System. This consists of the nozzle, water ring or air ring, and any necessary valves, connected to the delivery hose.

583-2 MATERIALS. Materials used in this work shall conform to the following requirements:

Portland Cement, Types 1 or 2	701-01	Quilted Covers (for curing)	711-02
Concrete Sand	703-07	Plastic Coated Fiber Blankets	711-03
Water	712-01	Membrane Curing Compound	711-05
Wire Fabric For Concrete Reinforcing1	709-02		
Expansion Bolt Anchors	GSA FF-S-325,Group III,Type 1 or Group VIII,Type 1		
Hook Bolts Inserted in Expansion Bolt Anchors	ASTM A307 Grade A		

NOTE. The wire fabric shall be galvanized in accordance with ASTM A641M regular coatings. The wire fabric shall be fabricated from No. 12 wire spaced 2 inches (nominal) in each direction or No. 10 wire spaced 3 inches (nominal) in each direction. Wire used shall have a minimum yield strength of 35 ksi.

583-2.01 Equipment

A. Batching and Mixing Equipment. The mixing equipment shall be capable of thoroughly mixing the materials in sufficient quantity to maintain placing continuity.

B. Air Supply. The compressor shall be of adequate capacity to maintain a sufficient, constant nozzle velocity for all parts of the work while simultaneously operating a blow pipe for cleaning away rebound. The air hose shall be equipped with a filter to prevent any oil or grease from contaminating the shotcrete.

C. Delivery Equipment

1. Dry Mix Process. The delivery equipment shall be capable of delivering a continuous, smooth, uniformly mixed material to the nozzle. The nozzle shall be equipped with a water ring and valve to permit adjustment of the water. The water added to the dry mix material at the nozzle shall be maintained at a pressure at least 16 psi greater than the air pressure. The nozzle shall be capable of delivering a conical discharge stream.

2. Wet Mix Process. Only pneumatic-feed type of delivery equipment will be allowed. Positive displacement type of equipment will be allowed pending a qualification test prior to the beginning of the work, which will also be the qualification test for the operator. The nozzle shall be equipped with an air ring for injecting compressed air into the material flow.

583-2.02 Qualification Test. If encasement of reinforcing bars is required, this test shall be performed to qualify the shotcrete operator and the equipment, prior to beginning work. Each shotcrete operator shall be qualified by constructing a 2 x 2 foot test panel fabricated to duplicate the project shotcreting. Reinforcement shall be placed in the panel to provide a minimum 1 inch (front and rear) embedment and be of the same size and spacing encountered in the structure. Panels shall be shot in the vertical, horizontal, and overhead positions as expected to be encountered. After setting, the test panel shall be broken open in a manner approved by and in the presence of the Engineer, to verify the reinforcement embedment. If voids are discovered, the work shall not proceed; additional panels shall be constructed until results acceptable to the Engineer are achieved. Small non-interconnected voids, as determined by the Engineer, shall not constitute failure.

Additional qualification panels will be required whenever, in the opinion of the Engineer, the shotcrete operation significantly changes.

583-3 CONSTRUCTION DETAILS

583-3.01 Preparation of Surfaces. All unsound concrete shall be removed until there are no offsets in the cavity which would cause an abrupt change in thickness, except for a transition from above to below reinforcement. Minimum 1/2 inch square shoulders shall be left at the perimeter of the cavity. The final cut surface shall be sound and properly shaped. The sound surface shall be blast cleaned. Abrasive material used for blastcleaning shall contain no more than one percent free silica by weight. Air clean the surface with oil-free compressed air. After the surface preparation has been accepted, every effort should be made to thoroughly wet the concrete surface and all porous surfaces to be in contact with new concrete for 12 hours. This may be accomplished by continuous wetting with soaker hoses or the use of burlap/burlene/etc. where moisture can be maintained. If in the opinion of the Engineer conditions or the situation prohibits this then the surfaces should be wetted for as long as possible. Surfaces must be wetted by a means acceptable to the Engineer using potable water. The Contractor shall remove any puddles of free standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated surface dry condition until placement of the new concrete.

Thickness of Placement	Underside & Vertical Surfaces Nominal Size and Spacing¹	Topside Nominal Size and Spacing¹
2	1/4 dia. @ 18 ctrs.	1/4 dia. @ ctrs. 24
4	3/8 dia. @ 24 ctrs.	3/8 dia. @ ctrs. 36
5	3/8 dia. @ 21 ctrs.	3/8 dia. @ ctrs. 36
6	3/8 dia. @ 20 ctrs.	3/8 dia. @ ctrs. 36
7	3/8 dia. @ 18 ctrs.	3/8 dia. @ ctrs. 36
8	1/2 dia. @ 23 ctrs.	1/2 dia. @ ctrs. 36
9	1/2 dia. @ 22 ctrs.	1/2 dia. @ ctrs. 36
10	1/2 dia. @ 21 ctrs.	3/4 dia. @ ctrs. 24
11	1/2 dia. @ 20 ctrs.	3/4 dia. @ ctrs. 24
12	1/2 dia. @ 18 ctrs.	3/4 dia. @ ctrs. 24

NOTE: 1. Bolt diameters may be increased but not decreased. Spacing may be decreased but not increased.

No material shall be placed if the ambient air, or concrete surface temperature is at, or below 45°F.

Reinforcement may consist of either existing reinforcing bars or welded galvanized wire fabric, depending on the conditions and shall be clean and free from loose mill scale, loose rust, oil or other coatings that interfere with bonding.

Chipping hammers shall meet the requirements of §580-3.02.

Sufficient clearance shall be provided around the reinforcement to permit complete encasement with sound shotcrete. The minimum clearance between the reinforcement and the form or other backup material shall be 1 inch.

Where the chipped area is equal to or less than 2 inches in depth, the use of wire fabric or mechanical concrete anchors will not be required except for overhead surfaces. Where the chipped areas are overhead, and are 1 inch in depth or greater, galvanized wire fabric and mechanical concrete anchors shall be used. Mechanical concrete anchors shall be placed as required by Table 583-1.

Where the chipped area is over 2 inches in depth and existing bar reinforcement is available, galvanized wire fabric shall be attached to the bars with tie wires. If existing bar reinforcement is not available, wire fabric shall be installed by means of mechanical concrete anchors in accordance with the requirements of Table 583-1.

Wire fabric shall be cut in sheets of the proper size and shall be carefully bent in such a manner as to follow closely the contours of the areas to be repaired. The wire fabric shall be securely tied to the hook-type bolts or the reinforcing bars.

Where sheets meet, they shall be lapped a minimum of 4 inches and shall be securely fastened together.

Expansion bolt anchors shall be placed in holes drilled in the existing concrete surface to the diameter and depth recommended by the manufacturer of the expansion bolt anchors. Hook-type bolts of the proper length shall be inserted and securely attached to the expansion bolt anchors so as to provide a positive connection to sound concrete.

Where the chipped area is 6 inches or greater in depth, the Contractor shall place galvanized wire fabric in layers 4 inches apart.

Where it is necessary to place more than one layer of galvanized wire fabric in an area to be repaired, the innermost layer shall be covered by a shotcreting prior to the installation of the next outermost layer.

Existing reinforcement which has lost significant section shall be repaired in a manner satisfactory to the Engineer as extra work.

583-3.02 Preparation of Materials

A. General. The sand shall be measured either by volume or weight, by means of batch boxes approved by the Engineer, or in a proportioning plant approved in accordance with section 501, Portland Cement Concrete - General. Wheelbarrows or shovels will not be permitted for measuring. The same source of sand shall be used throughout each structure.

B. Dry Mix Process. Dry mix shotcrete shall be composed of one part of cement to three to four and one-half parts of sand.

Prior to mixing, the moisture content of the sand shall be between 3 and 6%. The sand shall be dampened or dried as required to bring the moisture within these limits.

A wetting agent approved by the Engineer may be used at the Contractor's option in the dry mix process.

Sand-cement mixtures shall be applied within 75 minutes of the time the sand initially contacts the cement. Sand-cement mixtures which exceed the 75 minute limit shall not be incorporated in the work. They shall be disposed of in a manner acceptable to the engineer.

C. Wet Mix Process. Wet mix shotcrete shall be composed of one part of cement to three parts of sand. The cement, sand and water shall be premixed to a desired consistency and in accordance with §501-3.03, Handling, Measuring and Batching Materials, and §501-3.04, Concrete Mixing, Transporting and Discharges - General Requirements.

583-3.03 Placement

A. Weather. Shotcrete shall not be applied during any precipitation which is of sufficient intensity to cause the placed shotcrete to run. Shotcrete shall not be placed during a wind that disrupts the nozzle spray.

Shotcrete shall not be applied when the ambient air temperature is below 45°F unless it is placed in accordance with §555-3.08C.2., Provision of External Heat. Receiving surfaces shall be heated to, and maintained at, approximately 45°F by a method approved by the Engineer before shotcreting

operations begin. Under no conditions shall shotcrete be applied against surfaces upon which any frost adheres.

B. Application. Before starting to shoot, precautions shall be taken to protect property in the area. Adjacent construction, openings, shrubbery, and all areas that might be discolored or damaged by rebound, cement, water or dust must be covered with tarpaulins or plastic sheets to protect them from damage.

When projecting the shotcrete, the stream of flowing materials shall be directed from the nozzle as nearly at a right angle as possible to the surface being treated, and shall be held uniformly at the same distance, less than 5 feet away from the surface at all times. Manufacturer's recommendations shall be followed. The size of the nozzle shall be consistent with the manufacturer's recommendation for the maximum size of the sand used. The use of rebound material shall not be permitted.

Shotcrete on vertical and overhead surfaces shall be built up in 3/4 inch maximum layers to prevent sloughing in heavy applications. Succeeding layers shall be applied just prior to the initial set to maintain a good bond.

When encasing reinforcing steel, the stream from the nozzle shall be directed at an angle so as to fill the space behind the bars. An air jet shall be used to blow out any rebound ahead of the application of shotcrete. Should any such deposit of sand rebound be covered with shotcrete, it shall be cut out and removed by the Contractor without compensation.

Ground wires may be installed to establish the thickness and surface planes of the shotcrete build up. Both horizontal and vertical ground wires may be installed at corners and offsets not clearly established by exterior corners of walls, column or beam corners, and other locations. They may also be used as screed guides. Eighteen or 20 gage hard steel piano wire is recommended for this purpose. Ground wires shall be tight and true to line, and placed in such a manner that they may be further tightened.

C. Quality Control

1. Test Panels. This test shall be used to determine the physical quality of the shotcrete and shall be performed immediately before shotcreting operations begin, after each additional 100 sf, and immediately after operations are ended.

The test panels shall be 12 inches square, 3/4 inch thick plywood boards with galvanized mesh (1/2 inch square openings) strips projecting 4 inches attached around the perimeter of the board. The boards shall be erected horizontally, vertically, or overhead, depending on the anticipated shooting positions. The shotcrete operator shall completely fill the test panel, after which it shall be screeded or cut with a trowel such that it contains a 4 inches uniform depth of shotcrete. The test panels shall then be covered with wet quilted covers or wet polyethylene-coated blankets; put in a shaded, protected place; kept wet and cured for a minimum of seven days. The test panels shall be sent to the Department of Transportation's Materials Bureau for testing at fourteen days. Cores will be drilled from the panels and compressive strengths at fourteen days will be reported to the Engineer. Additional information on the conditions of the shotcrete such as sand pockets, voids, and laminations will also be reported with the strength results.

2. Coring. The Contractor shall take a core, at a location determined by the Engineer, from each structural element, such as pier, abutment, arch, etc., to verify acceptability of reinforcement encasement. Cores which do not contain reinforcing bars will not be used to determine encasement acceptability. If interconnected voids are found, the structural element represented by that core shall be rejected. All rejected shotcrete shall be repaired or replaced at the Contractor's expense. Repair methods shall be proposed by the Contractor for approval by the Engineer. The Contractor may take additional cores at locations approved by the Engineer to establish the limits of rejected work. The additional coring shall not jeopardize the design integrity of the structural element. If additional cores are not taken, all work on that structural element shall remain rejected. Core holes shall be patched with an applicable concrete repair material from the Approved List.

D. Finishing. The natural gun finish will be sufficient unless the plans call for one of the following finishes:

1. Screed Finish. After the surface has taken its initial set, excess material outside the forms and ground wires shall be sliced off with a sharp-edged cutting screed. After screeding, the ground wires shall be removed.

2. Broom Finish. This type of finish may be applied after screeding.

3. Flash Coat Finish. This is a thin surface coating containing finer sand than normal, and the application nozzle is held well back from the work. This finish shall be applied to the surface as soon as possible after screeding.

Any of the remaining three types of finish may be applied following flash coat:

a. Wood Float Finish. This gives a granular finish.

b. Rubber Float Finish. This gives a coarse finish.

c. Steel Trowel Finish. This gives a very smooth finish.

E. Curing. Curing shall be in accordance with §555-3.08, Curing, and the following modifications:

- All curing covers shall be pre-wet and kept wet during the entire curing period in a manner satisfactory to the Engineer.
- Curing compounds shall be applied twice. The second application shall be done when the first application has become tacky. The second application shall be done at a right angle to the first application. The rate of each application shall be that given in §555-3.08A.

583-4 METHOD OF MEASUREMENT. The quantity to be paid for under this item will be the number of square feet of finished shotcrete installed. Measurement will be taken as the plane projection of the finished surface. Measurement shall be made prior to the placement of shotcrete.

583-5 BASIS OF PAYMENT. The unit price bid per square foot shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

583-5.01 Removal of Structural Concrete - Replacement with Shotcrete. No Reinforcement Bar Encasement. The unit price bid per square foot shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

583-5.02 Removal of Structural Concrete - Replacement with Shotcrete, Reinforcement Bar Encasement. The unit price bid per square foot shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except that replacement of deteriorated reinforcement shall be paid for separately. Payment shall not be made until cores verify acceptability.

Payment will be made under:

Item No.	Item	Pay Unit
583.02	Removal of Structural Concrete - Replacement with Shotcrete, No Reinforcement Bar Encasement	Square Foot
583.03	Removal of Structural Concrete - Replacement with Shotcrete, with Reinforcement Bar Encasement	Square Foot

SECTION 584 - SPECIALIZED OVERLAYS FOR STRUCTURAL SLABS

584-1 DESCRIPTION. Prepare the surfaces that will be in contact with slab reconstruction concrete and place slab reconstruction concrete. Prepare the structural slab surface and place a specialized concrete overlay.

584-1.01 Scope. Concrete removal work will be paid for under the appropriate item(s). Minimum thickness of overlay concrete is 1 1/2 inches. Include the cost of any grade changes necessitated by this requirement in the unit bid price for overlay concrete. Use only one type of overlay concrete on any one structure.

584-1.02 Definitions

A. Class DP Concrete. A homogeneous mixture of portland cement, fly ash, microsilica admixture, fine and coarse aggregates, air entraining agent, set retarding water reducing admixture and water.

B. Microsilica Concrete. A homogeneous mixture of portland cement, microsilica admixture, fine and coarse aggregates, air entraining agent, high range water reducing admixture and water.

C. Overlay Concrete. Concrete placed over existing and slab reconstruction concrete. Overlay concrete will be Microsilica concrete for Method 1 and Method 2, and Class DP concrete for Method 3, as described in 584-1.03 Placement Methods.

D. Slab Reconstruction Concrete. Concrete placed completely around the exposed top mat of bar reinforcement. Slab reconstruction concrete will be Class D or Class DP concrete for Method 1, Microsilica concrete for Method 2, and Class DP concrete for Method 3, as described in 584-1.03 Placement Methods.

E. Positive-tie-downs. Anchors drilled into the structural slab and connected to reinforcing steel.

584-1.03 Placement Methods.

A. Method 1 - Separate Placement. Place Class D or Class DP slab reconstruction concrete and Microsilica overlay concrete separately. Use only one type of slab reconstruction concrete on each placement.

B. Method 2 - Integral Placement of Microsilica Concrete (Optional). When all of the following conditions are satisfied, Microsilica overlay concrete and Microsilica slab reconstruction concrete may be placed in a single lift:

- The area of the exposed top mat of bar reinforcement is 5% or less of the placement area, per span.
- No individual area of the exposed top mat of bar reinforcement exceeds 25 sf.
- No dimension of any area of the exposed top mat of bar reinforcement exceeds 6 feet.

C. Method 3 - Integral Placement of Class DP Concrete (Optional). When 100% of the top mat of bar reinforcement is exposed, Class DP overlay concrete and Class DP slab reconstruction concrete may be placed in a single lift.

584-2 MATERIALS

584-2.01 General. All materials listed in §557-2 with the following:

A. Air Entraining Admixture. §711-08 with the following: For Microsilica concrete, use only a vinsol resin-based air entraining agent.

B. Microsilica Admixture

1. Follow the requirements of §501-2 and §501-3.01.
2. Samples will be taken in accordance with Materials Method 9.1M and Materials Procedure 90.1.
3. Blended Portland Cement, §701-03 (Type SF) may also be used for the Portland cement/microsilica portion of the Class DP and the Microsilica Concrete designed mix.

C. (Vacant)

584-2.02 Manufacture of Class DP Concrete

A. Proportioning. The initial ingredient proportions, except for admixtures, are given in TABLE 584-1.

B. Handling, Measuring and Batching. Follow the requirements of §501-3.02 and §501-3.03, except that water reduction must be accomplished using only a water-reducing and retarding admixture (§711-08, ASTM Type D). If a microsilica slurry is used, include the slurry water as mix water.

TABLE 584-1 MIX CRITERIA - CLASS DP CONCRETE	
Cement Content (lb/cy)	536
Fly Ash Content (lb/cy)	145
Microsilica Content (lb/cy)	44
Sand Percent Total Aggregate (solid volume)	45.8
Designed Water/Total Cementitious Content	0.4
Desired Air Content (%)	7.5
Allowable Air Content (%)	6.0 - 9.0
Desired Slump (inches)	4
Allowable Slump (inches)	2 - 5
Type of Coarse Aggregate Gradation	CA 1

NOTE: The criteria are given for design information and the data is based on a fine aggregate modulus of 2.80 and a CA1 coarse aggregate gradation. Adjust the mixture proportions using actual fineness modulus and bulk specific gravities (saturated surface dry for aggregates). Compute the adjustments according to Department instructions.

584-2.03 Manufacture of Microsilica Concrete

A. Proportioning. The initial ingredient proportions except for admixtures are in TABLE 584-2.

TABLE 584-2 MIX CRITERIA - MICROSILICA CONCRETE	
Cement Content (lb/cy)	657
Microsilica Content (lb/cy)	61
Sand Percent Total Aggregate (solid volume)	53
Designed Water/Total Cementitious Content	0.37
Desired Air Content (%)	6.5
Allowable Air Content (%)	5.0 - 8.0
Desired Slump (inches)	4
Allowable Slump (inches)	2 - 6
Type of Coarse Aggregate Gradation	CA 1

NOTE: The criteria are given for design information and the data is based on a fine aggregate modulus of 2.80 and a CA1 coarse aggregate gradation. Adjust the mixture proportions using actual fineness modulus and bulk specific gravities (saturated surface dry for aggregates). Compute the adjustments according to Department instructions.

B. Handling, Measuring and Batching. Follow the requirements of Subsection 501-3.02 and - 3.03, except that water reduction must be accomplished using only a High-Range Water-Reducing Admixture (§711-08, ASTM Type F). Add the High-Range Water Reducer at the batching facility.

The Regional Materials Engineer may allow a maximum of two additions of water and/or admixture at the work site. Provide an additional 30 mixing revolutions for each addition of water and/or admixture. However, once the concrete has reached the desired slump, only the High-Range Water Reducer may be used to adjust the concrete slump. The maximum total mixing revolutions is 200. Observe the Manufacturer's maximum dosage rate for the admixture, regardless of where the admixture is added. If a microsilica slurry is used, include the slurry water as mix water.

584-2.04 Equipment

A. Microsilica Admixture. Follow Subsection 584-2.01B.

B. Finishing Machine. A finishing machine capable of self propulsion in forward and reverse, raising the screeds above the screeded surface when traveling in reverse, and meeting one of the two sets of requirements below.

1. Roller Screed. Must be equipped with a power driven strike-off auger, power driven finishing roller, vibrating pan or roller producing 3000 to 7000 vpm, and pan float.

2. Dual Oscillating Screed. Must be equipped with at least 2 oscillating screeds producing between 3000 and 7000 vpm, strike-off auger, and control of each screed's vertical position and tilt angle.

The specific method and equipment used for finishing will be approved by the Regional Construction Engineer before use. Provide access to the machine at the work site for one working day, for inspection by the Engineer. Have a qualified Finishing Machine Operator present at the time of inspection. Two weeks prior to the inspection date, provide the Engineer with a copy of the operating manual for their exclusive use.

Use supporting rails with no bends or kinks. Support the rails with fully adjustable supports (no shims), spaced a maximum of 12 inches on center. When placing concrete adjacent to a completed placement, set the supporting rails for one side of the finishing machine on the completed placement.

C. Recording Thermometer. A continuous recording thermometer capable of measuring temperatures in the range of 30°F to 100°F for a minimum of 24 hours. Include the cost of calibration in the unit price bid.

D. (Vacant)

584-3 CONSTRUCTION DETAILS

584-3.01 Limitation of Operations

- A. No structural concrete removal work is permitted in areas adjoining new concrete during the new concrete's specified curing period.
- B. No loads, other than construction loads which are less than 2 tons and approved by the Engineer, are permitted on areas of the structural slab where concrete has been removed.
- C. No loads are permitted on concrete until completion of the specified curing period.

584-3.02 Blast Cleaning

- A. Blast clean all surfaces to be in contact with new concrete. Remove all grease and dirt. Remove all rust and mortar which is not firmly bonded to the surface being cleaned. Rust and concrete deposits which are firmly bonded and cannot be removed by blast cleaning may remain. A light coating of orange rust, that forms on steel surfaces after blast cleaning, is not considered detrimental to bond and may remain. Remove all debris created by blast cleaning.
- B. Place reinforcing steel supports and positive-tie-downs at a maximum spacing of 4 feet.
- C. Repeat blast cleaning if more than 48 hours pass before concrete placement begins.

584-3.03 Preplacement Wetting. After blast cleaning has been accepted, thoroughly wet the structural slab surface and all porous surfaces to be in contact with new concrete for at least 12 hours immediately prior to placement. Remove all standing water with oil-free compressed air, and protect the deck from drying, so the concrete remains in a saturated surface dry condition.

584-3.04 (Vacant)

584-3.05 Handling and Placing Concrete. §557-3.05 and §557-3.12 with the following:

- A. Place concrete only when the ambient air temperature and deck surface temperature (after wetting) will be below 85°F during the entire placement.
- B. Place overlay concrete only if preplacement wetting has been completed on an area large enough to require one working day for placement, at least one span length.
- C. When using concrete transporting devices on a prepared surface, protect exposed reinforcing steel from deformation and prevent contamination of the surface.
- D. If operations are delayed for more than 30 minutes, install a construction dam or bulkhead. If placement operations are delayed for more than 60 minutes or if the concrete attains initial set, discontinue placement for at least 48 hours. This restriction does not prohibit continuation of the placement provided a gap is left in the placement. This gap is to be sufficient in length to allow the finishing machine to clear the previously placed concrete. Prepare the gap area for concrete placement in accordance with this specification, after the previously placed concrete, on both sides of the gap, has cured for 48 hours.

584-3.06 Finishing and Curing

A. Slab Reconstruction Concrete - Separate Placement. §557-3.09 and §557-3.11 with the following:

1. For areas less than 25 sf, hand finishing of slab reconstruction concrete is acceptable. For areas greater than 25 sf, use either a manually driven vibrator equipped power screed from the Department's Approved List or the same machine to be used to finish the overlay.
2. Screed to the level of the surrounding concrete. When 100% of the reinforcing steel is exposed, screed to a minimum 3/8 inch above the reinforcing steel. Roughen the screeded surface with a tining rake or similar device.
3. Cure concrete with wet burlap for 3 days. Provide uniform continuous wetting until concrete curing is complete. The wet burlap and curing cover option is not allowed.
4. Blastclean the surface, according to §584-3.02, after the curing period is over, but prior to wetting. Expose approximately 50% of the surface coarse aggregate, and leave an irregular texture.

B. Overlay Concrete. §557-3.08, §557-3.11, and §557-3.12 with the following:

1. Finish overlay concrete to a minimum depth of 1 1/2 inches and a minimum total cover over top mat of bar reinforcement of 2 3/8 inches. Use a finishing machine meeting the requirements of this specification.
2. Machine finish the concrete within 10 minutes of its deposition onto the deck. If the machine cannot finish the concrete within the 10 minute time limit, stop all further placement, immediately

cover the fresh concrete with plastic curing covers, and keep the unfinished concrete covered until it is machine finished. Once concrete being placed can be machine finished within the 10 minute time limit, resume placing concrete.

3. Apply curing within 10 minutes after machine finishing. Provide uniform continuous wetting until concrete curing is complete. Cure Microsilica concrete with wet burlap for 4 days. Cure Class DP concrete with wet burlap for 7 days. The wet burlap and curing cover option is not allowed.

584-3.07 Construction Joints. For the purpose of this specification, construction joints provide for interruptions in overlay concrete placement.

At transverse and longitudinal construction joints, place the overlay concrete a distance at least equal to the depth of the overlay, beyond the intended joint location. After the overlay concrete has cured for 48 hours, sawcut along the joint to a depth of 3/4 ± 1/8 inch. Chip the extra overlay concrete to the level of the original prepared surface at a 45° angle. Do not undercut existing concrete.

584-3.08 Defective or Damaged Concrete. §557-3.16 with the following:

A. Defects and damage, for the purposes of this specification, are imperfections caused by the Contractor's operations, including, but not limited to: cracking, tearing, and open areas. Repair all defective or damaged concrete at no cost to the Department, using the same class of concrete originally placed.

B. Make all repairs rectangular in plan shape and as close to square as possible. Sawcut the perimeter of the repair to a depth of 3/4 ± 1/8 inch. Chip out the damaged or defective concrete to the level of the original prepared surface. Angle the walls of the repair cavity at 45° toward the center of the repair. Do not undercut existing concrete. Prepare the surfaces of the repair cavity and place new concrete in accordance with this specification.

584-4 METHOD OF MEASUREMENT. For placements with 100% exposure of the top mat of bar reinforcement, the number of square yards of slab reconstruction concrete will be equal to the number of square yards of overlay concrete.

For placements with less than 100% exposure of the top mat of bar reinforcement, measure slab reconstruction concrete prior to overlay concrete placement.

A. Method 1 - Separate Placement. Measure slab reconstruction concrete as the number of square yards of Class D or Class DP slab reconstruction concrete placed. Measure overlay concrete as the number of square yards of plan area of Microsilica overlay concrete placed.

B. Method 2 - Integral Placement of Microsilica Concrete (Optional). Measure slab reconstruction concrete as the number of square yards of Microsilica slab reconstruction concrete placed. Measure overlay concrete as the number of square yards of plan area of Microsilica overlay concrete placed.

C. Method 3 - Integral Placement of Class DP Concrete (Optional). Measure slab reconstruction concrete as the number of square yards of Class DP slab reconstruction concrete placed. Measure overlay concrete as the number of square yards of plan area of Class DP overlay concrete placed.

584-5 BASIS OF PAYMENT. Include the cost of all labor, materials and equipment necessary to complete the work in the unit bid price.

Payment will be made under:

Item No.	Item	Pay Unit
584.3001nn	Overlay Concrete, Microsilica Concrete – Type 1 Friction	Square Yard
584.3002nn	Overlay Concrete, Microsilica Concrete – Type 2 Friction	Square Yard
584.3003nn	Overlay Concrete, Microsilica Concrete – Type 3 Friction	Square Yard
584.3009nn	Overlay Concrete, Microsilica Concrete – Type 9 Friction	Square Yard

§584

584.3101nn	Overlay Concrete, Class DP – Type 1 Friction	Square Yard
584.3102nn	Overlay Concrete, Class DP – Type 2 Friction	Square Yard
584.3103nn	Overlay Concrete, Class DP – Type 3 Friction	Square Yard
584.3109nn	Overlay Concrete, Class DP – Type 9 Friction	Square Yard
584.3200nn	Slab Reconstruction Concrete, Class D, DP or Microsilica Concrete	Square Yard

NOTE: nn denotes a serialized pay item.

SECTION 585 - STRUCTURAL LIFTING OPERATIONS

585-1 DESCRIPTION. The work shall consist of raising, supporting and lowering each bearing point designated on the plans in order to perform the work to be done under other items.

585-1.01 Bearing Point. For purposes of this specification the term bearing point is defined as a point on the structure, designated on the plans, to be raised in order to perform other work.

585-1.02 Lift Point. For purposes of this specification, the term lift point is defined as a point on the structure where the lifting force is applied.

585-1.03 Type. Some bearing point locations may require different methods of accomplishing the work. Such situations will be noted on the contract plans. They will be defined by a type designation. The type designation will be reflected in the pay item title (e.g., 585.01 Structural Lifting Operations - Type A, etc.).

585-2 MATERIALS

585-2.01 Used Materials. Used materials will be allowed, except that materials that are permanently attached to the structure shall be in conformance with the current New York State Department of Transportation Standard Specifications.

585-2.02 Lifting Equipment. Unless otherwise specified on the plans, the choice of lifting equipment shall be at the Contractor's option, subject to the following provisions:

If jacks are used for the lifting operations, each jack shall have the rated capacity clearly shown on the manufacturer's name plate attached to each jack. Jacks or other lifting equipment shall have a rated capacity of at least one and a half times the calculated lifting force. The Engineer may require that any lifting equipment deemed to be inadequate or faulty be removed from the project site.

Jacks or other lifting equipment shall be equipped with pressure gages or other load measuring devices that will enable the applied lifting force to be monitored at all times.

585-3.01 General. The plans designate, by type, the bearing points that must be raised in order to perform the work. The loads at each bearing point are shown on the plans.

The Contractor shall select the location of the lift points, subject to the approval of the Deputy Chief Engineer (Structures), and calculate the required lifting force.

Unless a specific distance is shown on the plans, each designated bearing point shall be raised the minimum distance that will allow the work to be completed.

The Contractor shall engage the services of a New York State Licensed Professional Engineer (PE) to design and detail the structural lifting system. The PE shall be available for consultation in interpreting his plans and in the resolution of problems which may arise during the performance of the work.

All design and details shall be in conformance with the current New York State Department of Transportation Standard Specifications for Highway Bridge and the current New York State Steel Construction Manual.

585-3.02 Working Drawings. The Contractor shall furnish working drawings, prepared, stamped and signed by a New York State Licensed Professional Engineer, for the system proposed to raise, support and lower each designated bearing point. The working drawings shall not alter the number or location of designated bearing points.

The drawings shall include, but need not be limited to the following:

- Lift point locations.
- Calculated lifting forces.
- Details for all lifting equipment and support systems.
- Type and grade of all materials.
- Distance that each bearing point is to be raised.
- Schematic hydraulic layout.
- All disconnections, reconnections or adjustments that are necessary to properly complete the lifting operations. This includes but is not limited to railings, joints, power lines, gas lines, water lines, etc.

Three legible, standard sized (22 x 34 inches nominal, 20 1/2 x 33 inches working area) prints of each drawing, together with three copies of all design computations shall be submitted to the Deputy Chief Engineer (Structures) for approval. Failure to submit drawings of the required size will be cause for their return without examination.

The Deputy Chief Engineer (Structures) shall be allowed the longest of the following time durations to examine design computations and working drawings:

- Fifteen working days.
- Two working days for each drawing of a set of working drawings.
- One working day for every four (4) design computation sheets. Any design computation sheet written on both sides will be considered as two design computation sheets.

All time for examination shall begin upon receipt of all pertinent information by the Deputy Chief Engineer (Structures).

The Deputy Chief Engineer (Structures) comments shall be indicated on the returned copies. Should the proposed system not be approved, the reasons shall be indicated with the return of the material. The Contractor shall then submit revised drawings for approval, subject to the same terms as the first submission. Resubmission shall not be considered a legitimate reason to request an extension of time.

All work shall be done in accordance with the approved working drawings. The Contractor must have approved working drawings prior to the start of any structural lifting operations.

The Contractor shall bear all costs and/or damages which may result from the ordering of any materials, or equipment; or the use of any preparatory labor prior to the approval of the working drawings.

585-3.03 Lifting Operations. The Contractor shall raise each designated bearing point by applying the necessary lifting force at each lift point. At no time will the Contractor be allowed to apply a lifting force in excess of one and a half times the calculated lifting force.

During all phases of the operation, the differential lift between any two adjacent bearings on a common centerline of bearing shall not exceed 5/8 inch unless otherwise noted on the Plans.

The Contractor shall, at the earliest possible moment during or after each lift, safely secure the structure with shims, cribbings, bolsters or other suitable supports. Details to be used shall be shown on the working drawings.

Unless otherwise indicated on the plans, vehicular traffic or construction equipment shall not be permitted on the lifted span until shims, cribbing, bolsters or other suitable supports are in their required position.

The lifting operation shall be conducted such that the distance between the structure and the shims, cribbing, bolsters or other suitable supports do not exceed 3/8 inch at any time.

Any replacement, repair, or adjustments to the superstructure steel shall be performed in conformance with the current New York State Steel Construction Manual.

All welding shall comply with the requirements specified in the current New York State Steel Construction Manual.

All materials required for temporary support of the structure shall remain the property of the Contractor and shall be removed from the site after the work is completed, unless otherwise agreed to.

585-4 METHOD OF MEASUREMENT. The quantity to be paid for under this item shall be the number of bearing points designated on the plans, actually raised, supported and lowered. Payment will be made only once at each bearing point regardless of the number of times the bearing point is raised, supported and lowered during the course of the planned work.

585-5 BASIS OF PAYMENT. Payment will be made at the unit price bid for each bearing point actually raised, supported and lowered. The unit price bid per bearing point shall include the cost of all labor, materials and equipment necessary to complete this work.

For payment purposes each bearing point will be considered a separate unit. After all lifting has been performed and all temporary supports have been installed for any one bearing point, payment will be made for seventy percent of that particular unit. The remainder of the unit will be paid for after the bearing point has been lowered to its final permanent position and the lifting equipment and temporary supports have been removed.

Payment will be made under:

Item No.	Item	Pay Unit
585.XX	Structural Lifting Operations - (Types A - K)	Each
	<i>XX (01 through 11) = Type Designation (A through K)</i>	

~~**SECTION 586 – MISCELLANEOUS STRUCTURAL RECONSTRUCTION**~~

~~**586-1 DESCRIPTION.** The work of this section shall consist of the following:~~

- ~~•Drilling and Grouting Bolts, or Reinforcing Bars.~~
- ~~•Removal of Rivets Replacement with High Strength Bolts.~~
- ~~•Field Drill Holes in Existing Structural Steel.~~

~~**586-1.01 Drilling and Grouting Bolts, or Reinforcing Bars.** For the purposes of this section the terms bolts and reinforcing bars are identical.~~

~~**586-1.02 Field Drill Holes in Existing Structural Steel.** Existing structural steel is that structural steel in service prior to the beginning of construction.~~

~~**586-2 MATERIALS**~~

~~**586-2.01 Drilling and Grouting Bolts.** Grout material shall conform to §701-07; Anchoring Materials Chemically Curing.~~

~~**586-2.02 Removal of Rivets Replacement with High Strength Bolts.** High strength bolts, nuts and washers shall meet the requirements of §715-14.
—If paint color is not specified, the color selected shall match the existing paint. Paint shall be selected from the Department’s Approved List for Structural Steel Paint Class 2.~~

~~**586-3 CONSTRUCTION DETAILS**~~

~~**586-3.01 Equipment – General.** All equipment proposed for use shall be approved by the Engineer prior to actually performing the work.~~

~~**586-3.02 Drilling and Grouting Bolts**~~

~~A. All holes shall be drilled by means of a rotary impact drill. If reinforcing steel is encountered, the reinforcing steel shall be cut and removed by means of a core drill. The remainder of the drilling shall be done with the rotary impact drill.~~

~~B. Drilling with a lubricant will not be permitted. Water is not considered a lubricant. Drilling methods shall not cause spalling, or other damage to concrete. Concrete spalled, or otherwise damaged by the Contractor's operations shall be repaired in a manner satisfactory to the Engineer. Such repair shall be done at the expense of the Contractor.~~

~~C. Holes shall be surface dry and shall have had all foreign and loose material removed immediately prior to grout placement.~~

~~D. Grout shall be mixed and placed in strict accordance with the manufacturer's instructions, unless modified here, or elsewhere, in the contract documents. No grout shall be placed at a temperature below that recommended by the grout manufacturer.~~

~~E. Prior to bolt placement in the grouted hole, all material which might interfere with bond between the bolt and the grout shall have been removed. This includes, but is not limited to: moisture, grease, dirt, mill scale and rust. Rust which cannot be removed even by vigorous scrubbing with a wire brush is considered firmly bonded and may remain. The hole diameter shall be in accordance with the grout manufacturer's recommendation. The bolts shall be inserted full depth into the hole and shall be manipulated to ensure complete coverage by the grout. After insertion of the bolt, all excess grout shall be struck off flush with the concrete face. Should the grout fail to fill the hole after bolt insertion, additional grout shall be added to the hole to allow a flush strike off.~~

~~F. If the bolt is inserted in a hole with an axis predominantly horizontal to the ground surface, care shall be taken to prevent grout from running down the face of the concrete. These precautions shall be done in a manner satisfactory to the Engineer.~~

586-3.03 Removal of Rivets- Replacement with High Strength Bolts

~~**A. Paint Removal.** If the steel is painted, then prior to the beginning of any other work operations, the paint shall be removed for a minimum distance of 4 inches on each side of the centerline of work location. The paint removal work shall be done in accordance with the requirements of Section 574 *Structural Steel Painting: Localized*. In cases where the contractor can clearly demonstrate through exposure monitoring that other work practices and engineering controls, under the oversight of a certified industrial hygienist, can effectively maintain actual worker exposure below the permissible exposure level, exceptions to this requirement may be granted by the Engineer.~~

~~**B.** Unless otherwise noted in the contract documents, all bolts shall be the same diameter as the rivets they replace.~~

~~**C.** Rivets shall be removed by one of the following methods:~~

- ~~1. Shear rivet head using a pneumatic rivet breaker (helldog), and drive out rivet shank with a pneumatic punch.~~
- ~~2. Flame cut rivet head 1/16 inch above the base metal using a rivet scarfing tip, and drive out shank using a pneumatic punch.~~

~~— If, in the Engineer's opinion, punching will damage the base metal, the shank shall be removed by drilling.~~

~~**D.** High strength bolts shall be installed after the nicks, burrs and foreign substances that might interfere with seating of the bolt head and nut washers are removed. Light grinding may be ordered by the Engineer.~~

~~**E.** Installation and inspection of high strength bolts shall be done in accordance with the New York State Steel Construction Manual requirements.~~

~~**F.** If it becomes necessary to disconnect, or adjust, steel remaining as part of the structure to complete the work the Contractor shall obtain the Engineer's approval prior to performing disconnections or adjustments.~~

~~G. If the bolt will not fit the rivet hole, the hole may be reamed sufficiently to accommodate the bolt.~~

~~H. If the contract does not include an item(s) for cleaning, priming and painting of structural steel, cleaning and painting of the bolt and immediate surrounding area shall be done as part of this work. — Cleaning and painting shall be done in accordance with the requirements of Section 574 Structural Steel Painting: Localized. All steel exposed by the cleaning operations shall be painted. However, at least 2 inches in every direction, measured from the washer's edge, shall be painted.~~

586-3.04 Field Drill Holes in Existing Structural Steel

- ~~A. The requirements of §586-3.03A shall apply.~~
- ~~B. The required hole diameter will be indicated on the plans.~~
- ~~C. No flame cutting, or flame drilling will be permitted.~~
- ~~D. All damage to existing steel, as determined by the Engineer, shall be repaired by the Contractor, at no cost to the State. All repair shall be done in a manner satisfactory to the Engineer.~~

586-4 METHOD OF MEASUREMENT

~~586-4.01 Drilling and Grouting Bolts. Measurement will be taken as the number of inches of holes into which grout and bolts have been inserted. Measurement will be taken to the nearest inch.~~

~~586-4.02 Removal of Rivets—Replacement with High Strength Bolts. Measurement will be taken as the number of high strength bolts installed.~~

~~586-4.03 Field Drill Holes in Existing Structural Steel. Measurement will be taken as each hole drilled. No allowances will be made for holes drilled through different thicknesses of steel, or different numbers of plates.~~

586-5 BASIS OF PAYMENT

586-5.01 Drilling and Grouting Bolts

- ~~A. The unit price bid per inch shall include the cost of all labor, materials, and equipment necessary to complete the work.~~
- ~~B. Payment will not be made for holes which do not contain both grout and bolts.~~
- ~~C. The cost of the bolts will be paid for under a separate, appropriate item.~~

586-5.02 Removal of Rivets—Replacement with High Strength Bolts

- ~~A. The unit price bid for each installed bolt shall include the cost of all labor, material and equipment necessary to complete the work including paint removal and when appropriate painting.~~
- ~~B. Payment will be made for each installed bolt regardless of whether or not, a rivet had been removed from the location in question.~~

586-5.03 Field Drill Holes in Existing Steel

- ~~A. The unit price bid for each hole drilled shall include the cost of all labor, equipment and materials necessary to complete the work, including paint removal when required.~~
- ~~B. No extra compensation will be paid for holes drilled through different thicknesses, or through different numbers of plates.~~

~~Payment will be made under:~~

Item No.	Item	Pay Unit
586.01	Drilling and Grouting Bolts, or Reinforcing Bars	Inch
586.05	Removal of Rivets- Replacement with High Strength Bolts	Each
586.10	Field Drill Holes in Existing Structural Steel	Each

SECTION 586 - MISCELLANEOUS STRUCTURAL RECONSTRUCTION

586-1 DESCRIPTION. The work of this section shall consist of the following:

- Drilling and Grouting Bolts, or Reinforcing Bars.
- Removal of Rivets- Replacement with High Strength Bolts.
- Field Drill Holes in Existing Structural Steel.

586-1.01 Drilling and Grouting Bolts, or Reinforcing Bars. For the purposes of this section the terms bolts and reinforcing bars are identical.

586-1.02 Field Drill Holes in Existing Structural Steel. Existing structural steel is that structural steel in service prior to the beginning of construction.

586-2 MATERIALS

586-2.01 Drilling and Grouting Bolts. Grout material used in overhead applications, or where a sustained tensile load will exist, shall conform to §701-05 *Concrete Grouting Material*. Grout used in other applications shall conform to §701-07 *Anchoring Materials - Chemically Curing*.

586-2.02 Removal of Rivets - Replacement with High Strength Bolts. High strength bolts, nuts and washers shall meet the requirements of §715-14 *High Strength Bolts, Nuts and Washers*. If paint color is not specified, the color selected shall match the existing paint. Paint shall be selected from the Department's Approved List for Structural Steel Paint - Class 2.

586-3 CONSTRUCTION DETAILS

586-3.01 Drilling and Grouting Bolts

A. All holes shall be drilled by means of a rotary impact drill. If reinforcing steel is encountered, the reinforcing steel shall be cut and removed by means of a core drill. The remainder of the drilling shall be done with the rotary impact drill.

B. Drilling with a lubricant will not be permitted. Water is not considered a lubricant. Drilling methods shall not cause spalling, or other damage to concrete. Concrete spalled, or otherwise damaged by the Contractor's operations shall be repaired at no additional cost to the State.

C. Holes shall be surface dry and shall have had all foreign and loose material removed immediately prior to grout placement.

D. Grout shall be stored, mixed, and placed in strict accordance with the manufacturer's instructions, unless modified here, or elsewhere, in the contract documents. No grout shall be placed at a temperature below that recommended by the grout manufacturer.

E. Prior to bolt placement in the grouted hole, all material which might interfere with bond between the bolt and the grout shall have been removed. This includes, but is not limited to: moisture, grease, dirt, mill scale and rust. Rust which cannot be removed even by vigorous scrubbing with a wire brush is considered firmly bonded and may remain. The hole diameter shall be in accordance with the grout manufacturer's recommendation. The length of any plastic sleeve used as an aid to grout placement shall not be included in the length of the bolt hole. The bolts shall be inserted full depth into the hole and shall be manipulated and rotated to ensure complete coverage by the grout. After insertion of the bolt, all excess grout shall be struck off flush with the concrete face. Care shall be taken to prevent

grout from running out of the drilled hole. Should the grout fail to fill the hole after bolt insertion, additional grout shall be added to the hole to allow a flush strike-off.

F. If the bolt is inserted in a hole with an axis that is predominantly horizontal, care shall be taken to prevent grout from running down the face of the concrete.

G. If approved by the Engineer, hole locations may be moved to avoid encountering reinforcing steel.

H. The Contractor may increase the embedment length beyond that required by the contract documents if approved by the Engineer, at no additional cost to the State. The bottom of the hole shall be at least 1 5/8 inches from the nearest free surface of a structural element, unless otherwise shown in the contract documents.

586-3.02 Pull-Out Testing

A. Testing. Table 1 gives the number of anchors (N1) to be tested for any lot size. The Engineer will randomly choose the anchors to be tested. Testing of anchors in a lot shall not begin until all the anchors in the lot are installed. If any (N1) anchors fail, N2 indicates the number of additional anchors that must be tested. If only one anchor fails, the lot will be accepted. If a second anchor fails, all remaining anchors must be tested.

A lot size is determined by the Contractor, but must meet the following criteria:

1. A lot size shall not exceed 600 anchors.
2. All anchors in a lot must be installed within a two-month period.
3. Any anchors installed beyond the two-month period set forth in 2 above shall be part of another lot.
4. A lot shall only include anchors grouted with a single product
5. A lot shall only include anchors of the same type, diameter and embedment depth.

Table 586-1 NUMBER OF ANCHORS TO BE TESTED		
LOT SIZE	N1	N2
1-30	All the anchors in the lot	-
31-50	30	All remaining anchors
51-75	38	All remaining anchors
76-100	44	21
101-200	49	26
201-300	50	30
301-600	55	30

B. Equipment. The equipment shall consist of a load cell, jacking system, a frame to distribute the jack load, couplers to connect the jack to the anchors, and appropriate safety devices. A calibrated pressure gauge with hydraulic ram is equivalent to a load cell. Prior to starting the testing, the Contractor shall supply the Engineer with a certificate of calibration for the load cell performed within the previous six months by an independent testing agency. Supports for the frame used to distribute the jack load shall be located outside a circle centered at the anchor. The circle shall have a diameter equal to 2 inches plus twice the anchor embedment length, but need not exceed 24 inches. The frame and jack shall be positioned so that the load is applied along the axis of the anchor. Chains or cables shall be used to connect the various pieces of the tensioning system so that free flying projectiles will not be created by the failure of an anchor coupling or other portion of the testing system.

C. Test Load. The test load for anchor bolts shall be 90% of the ASTM proof load, unless otherwise specified in the contract documents. When no proof load is given in the ASTM specifications for anchor bolt steel, use the yield strength. The test load for reinforcement shall be 90% of the yield strength unless otherwise specified in the contract documents. Listed below are the test loads for the most commonly used anchor bolts and rebar steels, and anchor types.

ASTM A325 or ASTM A449 Anchor Bolts (Coarse-Threaded Full Length)		ASTM A615 GR 60 Reinforcement Bars	
Diameter (inches)	Test Load (kips)	Size	Test Load (kips)
1/2	11	4	11
5/8	17	5	17
3/4	26	6	24
7/8	35	7	32
1	46	8	43
1 1/8	51	9	54
1 1/4	65	10	69
		11	84
		14	122

Anchors shall be deemed to pass if the specified test load is attained without permanently displacing the anchors. Concrete spalled or otherwise damaged by the load testing shall be repaired. Such repair shall be done at no additional cost to the State. All anchors which fail a load test, or are otherwise damaged, shall be replaced at no additional cost to the State. All such replaced anchors shall be load tested.

NOTE: THIS LOAD TESTING IS DESIGNED TO BE NON-DESTRUCTIVE. LOADING SHALL BE STOPPED AS SOON AS THE TEST LOAD IS REACHED.

586-3.03 Removal of Rivets-Replacement with High Strength Bolts

A. Paint Removal. If the steel is painted, then prior to the beginning of any other work operations, the paint shall be removed for a minimum distance of 4 inches on each side of the centerline of work location. The paint removal work shall be done in accordance with the requirements of Section 574, *Structural Steel Painting: Localized*.

B. Unless otherwise noted in the contract documents, all bolts shall be the same diameter as the rivets they replace.

C. Rivets shall be removed by one of the following methods:

1. Shear rivet head using a pneumatic rivet breaker (hell-dog), and drive out rivet shank with a pneumatic punch.
2. Flame cut rivet head 0.079 inches above the base metal using a rivet scarfing tip, and drive out shank using a pneumatic punch. If punching will damage the base metal, the shank shall be removed by drilling.

D. High strength bolts shall be installed after the nicks, burrs and foreign substances that might interfere with seating of the bolt head and nut washers are removed. Light grinding may be required.

E. Installation and inspection of high strength bolts shall be done in accordance with the New York State Steel Construction Manual requirements.

F. If it becomes necessary to disconnect, or adjust, steel remaining as part of the structure to complete the work the Contractor shall obtain the Engineer's approval prior to performing disconnections or adjustments.

G. If the bolt will not fit the rivet hole, the hole may be reamed sufficiently to accommodate the bolt.

H. If the contract does not include an item(s) for cleaning, priming and painting of structural steel, cleaning and painting of the bolt and immediate surrounding area shall be done as part of this work. Cleaning and painting shall be done in accordance with the requirements of Section 574, *Structural Steel Painting: Localized*. All steel exposed by the cleaning operations shall be painted. However, at least 2 inches in every direction, measured from the washer's edge, shall be painted.

586-3.04 Field Drill Holes in Existing Structural Steel

A. The requirements of §586-3.03A *Paint Removal* shall apply.

B. The required hole diameter will be indicated on the contract documents.

C. No flame cutting, or flame drilling will be permitted.

D. All damage to existing steel shall be repaired by the Contractor, at no additional cost to the State.

586-4 METHOD OF MEASUREMENT

586-4.01 Drilling and Grouting Bolts. The quantity to be measured for payment will be the number of holes into which grout and bolts have been inserted.

586-4.02 Removal of Rivets - Replacement with High Strength Bolts. The quantity to be measured for payment will be the number of high strength bolts installed.

586-4.03 Field Drill Holes in Existing Structural Steel. The quantity to be measured for payment will be each hole drilled.

586-5 BASIS OF PAYMENT

586-5.01 Drilling and Grouting Bolts

A. The unit price bid per hole shall include the cost of all labor, materials, and equipment necessary to complete the work.

B. Payment will not be made for holes which do not contain both grout and bolts.

C. The cost of the bolts will be paid for under a separate, appropriate item.

586-5.02 Removal of Rivets - Replacement with High Strength Bolts

A. The unit price bid for each installed bolt shall include the cost of all labor, material and equipment necessary to complete the work including paint removal and when appropriate painting.

B. Payment will be made for each installed bolt regardless of whether or not a rivet had been removed from the location in question.

586-5.03 Field Drill Holes in Existing Steel

A. The unit price bid for each hole drilled shall include the cost of all labor, equipment and materials necessary to complete the work, including paint removal when required.

B. No extra compensation will be paid for holes drilled through different thicknesses, or through different numbers of plates.

Payment will be made under:

Item No.	Item	Pay Unit
586.02	Drilling and Grouting Bolts or Reinforcing Bars	Each
586.03	Drilling and Grouting Bolts or Reinforcing Bars with Pullout Test	Each
586.04	Drilling and Grouting Bolts, Overhead or Sustained Tension, with Pullout Test	Each
586.05	Removal of Rivets-Replacement with High Strength Bolts	Each
586.10	Field Drill Holes in Existing Structural <u>Steel</u>	Each

Comment [cjt77]:
EI 08-012

SECTION 587 - BRIDGE RAILING RECONSTRUCTION

587-1 DESCRIPTION. The work shall consist of the following:

- The removal and disposal of bridge railing.
- The Removal and storage of bridge railing.
- The installation of stored bridge railing.
- The furnishing and installing of box beam bridge railing.
- The furnishing and installing of thrie beam bridge railing.

587-1.01 Bridge Railing Removed and Disposed; and Stored Bridge Railing Installed.

Material removed for disposal and material not used for installation shall become the property of the Contractor and shall be removed from the work site.

587-1.02 Bridge Railing Removed and Stored. All bridge railing removed shall remain the property of the State and shall be transported to a location within the project site designated by the Engineer.

587-2 MATERIALS

587-2.01 New Material. Materials shall meet the requirements of §710-23, Steel Bridge Railing and the following:

Component	ASTM Designation or Standard Specification
S3 x 5.7 Post	A36
Post Plate	A36
Spacer Brackets	A36
Rail Connection Angles	A36
Rail Plates	A36
“U” Bolts, Nuts and Washers	A307
Anchor Bolts, Nuts and Washers	A325
Thrie Beam	710-201
W6 x 25 Post	A36
Anchor Bolts (Thrie Beam)	A449
Carriage Bolts (Thrie Beam)	A307
Nuts and Washers for Carriage Bolts	A563 and F436
Attachment Plate	A36
Concrete Grouting Material	701-05

NOTE: 1. Thrie Beam Bridge Railing shall be fabricated from 10 gage material.

587-2.02 Stored Material. The Contractor shall choose the best available material for installation, subject to the approval of the Engineer.

587-3 CONSTRUCTION DETAILS

587-3.01 Bridge Railing Removal. If so indicated on the plans, the existing anchorages shall be reused for anchoring new or stored railing. Should this be the case, the Contractor shall exercise care removing the railing so as not to damage the existing anchorages. The provisions of §589-3.01 shall apply for the removal of any painted bridge railing.

587-3.02 Bridge Railing Storage. The Contractor shall remove, transport, unload and store bridge railing. Care shall be taken not to damage the railing during the various operations. In the event railing is damaged it shall be repaired or replaced in kind as directed by the Engineer. Such repair or replacement shall be done at no expense to the State.

587-3.03 Stored Bridge Railing Installation. Installation of the railing shall be done in accordance with the following subsections of section 568, Bridge Railing:

Inspection of Railing	568-3.01A1	Base Plates	568-3.01H
Field Welding	568-3.01D	Non-Metallic Pads	568-3.01I
Positioning Railing	568-3.01F	Anchor Studs	568-3.01L
Positioning Posts	568-3.01G	Inspection	568-3.01N

NOTE: 1. Bends or kinks in the railing which were present at the place of storage will not be cause for rejection.

587-3.04 Box Beam Bridge Railing Installation. Erection shall be in accordance with requirements of 568-3.01, Erection of Bridge Railing.

The installation procedure shall be coordinated to provide the least disturbance of pedestrian and vehicular traffic, if such traffic is maintained during the course of the work.

587-3.05 Thrie Beam Installation

A. Direct Attachment to Existing Railing. The railing shall be installed in accordance with the following:

Inspection of Railing	568-3.01A
Field Galvanizing for Repair	568-3.01C
Inspection of Galvanizing	568-3.01B
Inspection	568-3.01N

The railing shall be installed such that the bottom edge is parallel to the roadway profile.

B. Separate Post Installation - Concrete Support Surface. The posts and railing shall be installed in accordance with the following:

Inspection of Railing	568.3.01A
Positioning Posts	568-3.01G
Inspection of Galvanizing	568-3.01B
Base Plates	568-3.01H
Field Galvanizing for Repair	568-3.01C
Anchor Studs	568-3.01L
Field Welding	568-3.01D
Inspection	568-3.01N
Erection	568-3.01E

Mortar leveling courses shall be made from Concrete Grouting Material (§701-05).
 Manufacturer's instruction shall be strictly followed.

Railing shall be installed such that the bottom edge is parallel to the roadway profile.

C. Separate Post Installation - Steel Support Surface. The posts and railing shall be installed in accordance with the following:

Inspection of Railing	568-3.01A
Positioning Posts	568-3.01G
Inspection of Galvanizing	568-3.01B
Base Plates	568-3.01H
Field Galvanizing for Repair	568-3.01C
Anchor Studs	568-3.01L
Field Welding	568-3.01D
Inspection	568-3.01N
Erection	568-3.01E

Railing shall be installed such that the bottom edge is parallel to the roadway profile.

587-4 METHOD OF MEASUREMENT

A. All Railing Removal and Installation Except Thrie Beam Railing Installation.

Measurement will be taken as the number of feet of railing removed, or installed. Measurement will be taken along the centerline of the top rail, end-to-end of railing between the limits indicated on the contract plans. No deduction will be made for open joints. If there is only one rail it will be considered the top rail.

B. Thrie Beam Railing Installation. Measurement will be taken as the number of feet of railing installed. Measurement will be taken along the top of the thrie beam, end-to-end of railing between the limits indicated on the contract plans. No additional measurement will be taken for overlapping sections of railing. If transition sections are installed, measurement will be taken to the end of the transition section indicated on the contract plans.

587-5 BASIS OF PAYMENT. The unit price bid shall include the cost of all labor, materials and equipment necessary to complete the work. When required, mortar leveling courses, anchor bolts, nuts and washers shall be included in the unit price bid. The drilling and grouting of anchor bolts, when required will be paid for under a separate item.

Painting of the railing, if required, shall be paid under a separate item.

Payment will be made under:

Item No.	Item	Pay Unit
587.01	Bridge Railing Removal and Disposal	Foot
587.02	Bridge Railing Removal and Storage	Foot
587.03	Installation of Stored Bridge Railing	Foot
587.1001	Box Beam Bridge Rail, One Rail	Foot
587.1002	Box Beam Bridge Rail, Two Rail	Foot
587.20	Thrie Beam Bridge Rail - Attachment to Existing Bridge Rail	Foot
587.21	Thrie Beam Bridge Rail - New Post Installation Mounted on Concrete Surfaces	Foot
587.22	Thrie Beam Bridge Rail - New Post Installation Mounted on Steel Surfaces	Foot

SECTION 588 (VACANT)

SECTION 589 - REMOVAL OF EXISTING STEEL

589-1 DESCRIPTION. The work shall consist of removal and disposal of existing steel where indicated on the contract plans, or where ordered by the Engineer. Unless otherwise noted, all materials removed as part of this work shall become the property of the Contractor, and shall be removed from the work site.

589-2 MATERIALS. Not applicable.

589-3 CONSTRUCTION DETAILS. The removal of existing steel requires the submittal of a written work plan. This plan shall meet the requirements of §202-3.01; General and Safety Requirements. The work plan shall set forth all expected supports, disconnections and adjustments to steel which is to remain. If, during the course of the work it becomes necessary to support, disconnect, or adjust steel, not previously noted in the work plan, the contractor shall submit a revised work plan to the Engineer for approval. All such proposals shall be approved prior to implementation.

In addition, the requirements of §202-3.05; Demolition of Structures shall also apply.

All work performed on steel which is to remain as part of the structure shall be in accordance with the applicable requirements of the SCM.

Actual removal procedures shall conform to the following requirements:

589-3.01 Paint. If the steel is painted, then prior to the beginning of any steel removal operations, the paint shall be removed for a minimum distance of 4 inches on each side of the centerline of cut, bolt row, rivet row, or weld as applicable. The paint removal work shall be done in accordance with the requirements of Section 574 *Structural Steel Painting: Localized*. In cases where the contractor can clearly demonstrate through exposure monitoring that other work practices and engineering controls, under the oversight of a certified industrial hygienist, can effectively maintain actual worker exposure below the permissible exposure level, exceptions to this requirement may be granted by the Engineer.

589-3.02 Cutting. All cutting work shall be done in accordance with the requirements of the SCM, part 601, and when applicable, part 602.

589-3.03 Fastener Removals

A. Bolts. Nuts shall be removed with wrenches, wherever possible, and the bolts driven out with a hand held punch. Alternate removal procedures shall be set forth in the work plan.

B. Rivets. Rivets shall be removed by either of the following methods:

- Shear rivet head, using a pneumatic rivet breaker (helldog), and drive out rivet shank with a pneumatic punch, OR
- Flame-cut rivet head 1/16 inch above the base metal, using a rivet scarfing tip, and drive out shank using a pneumatic punch.

If, in the opinion of the Engineer, rivet shanks, or bolts, cannot be removed by punching, without damaging the base metal, the rivet shank, or bolt, shall be removed by drilling.

589-3.04 Welded Connections. Welded connections shall be disassembled in accordance with the following:

A. The affected weld shall be removed by means of air carbon arc gouging equipment. To ensure that base metal remaining in place is not damaged, at least 1/8 inch of weld material shall be left in place. If it is necessary to gouge into base metal to remove the weld fusion, the least critical member, as determined by the Engineer, shall be damaged. If the damaged member is permitted to remain, it shall be repaired by procedures approved by the DCES.

B. The weld material left in place shall be ground flush with the base metal surface. No base metal shall be removed by grinding.

C. The Engineer shall perform a careful visual inspection of all weld removal locations. If damage is suspected the Engineer will direct the Contractor to perform a dye penetrant inspection in accordance with the requirements of the SCM.

If the Contractor's operations damage existing steel which is to remain in place, the damaged steel shall be repaired, or replaced, as determined by the DCES. The Contractor shall be required to repair damage, or replace damaged material, caused by the Contractor's operations, at no additional expense to the State.

589-4 METHOD OF MEASUREMENT

589-4.01 Removal of Existing Steel (lb.) Measurement will be taken as the number of pounds of existing steel removed and disposed of.

The weight of existing steel removed shall be computed from the nominal sizes indicated on the contract plans. If the nominal size is not indicated on the contract plans, field measurements shall be used to determine the mass, using 490 pcf as the density of steel. The weight of bolts, rivets and welds shall be neglected, and no deductions in mass shall be made for any rivet, or bolt holes, in the existing steel, or for any loss of steel section due to corrosion.

589-4.02 Removal of Existing Steel (Each). Measurement will be taken as each unit of existing steel removed, and disposed of.

589-5 BASIS OF PAYMENT. The unit price bid per pound, or per each unit, shall include the cost of all labor, materials and equipment necessary to complete the work, including the removal of fasteners, and disconnecting, supporting, or adjusting steel as necessary.

No payment will be made for repair of, or replacement of, damaged material, which was made necessary due to the Contractor's operations.

No separate payment will be made for the removal of paint.

The treatment, handling and disposal of the paint removal waste will be paid under a separate item.

Payment will be made under:

Item No.	Item	Pay Unit
589.01nnnn	Removal of Existing Steel	Pound
589.52nnnn	Removal of Existing Steel	Each

NOTE: nnnn denotes a serialized pay item.

SECTION 590 - ADJUSTMENT OF BRIDGE APPURTENANCES

590-1 DESCRIPTION. This work shall consist of adjusting the elevation of bridge joints and drainage devices to meet the proposed finished elevations in the manner indicated on the Contract Plans.

In order to perform the work, it may be necessary to remove structural concrete. Structural concrete removal, if performed, shall be done under its respective item.

590-2 MATERIALS. Materials shall meet the following requirements:

Structural Steel	ASTM A36, A242 or A588
Nuts, Bolts, and Washers	ASTM A307 Grade A
Galvanized Coatings and Repair Methods	719-01
Preformed Elastic Joint Sealer	705-09

590-3 CONSTRUCTION DETAILS. All steel materials, including nuts, bolts, and washers, used as a part of this work, shall be galvanized in accordance with §719-01. Any galvanized surface, either existing or installed as a part of this work, which is damaged by welding or abrasion, shall be repaired in accordance with §719-01.

All welding shall be done in accordance with the applicable requirements of the New York State Steel Construction Manual.

The Contractor shall take suitable precautions to prevent damage to materials designated to remain-in-place. Damage to such material, due to the Contractor's operations, shall be repaired or the damaged material replaced, as determined by the Engineer.

§590

Dimensions shown on the plans shall be verified by the Contractor and any necessary changes approved by the Engineer prior to construction of any needed fabrications.

Preformed elastic joint sealer, where required, shall be installed in accordance with the Contract Plans.

590-4 METHOD OF MEASUREMENT

590-4.01 Bridge Drainage Devices. The work will be measured as each bridge drainage device as defined by the Contract Plans which has had its elevation adjusted in accordance with the Contract Plans.

590-4.02 Bridge Joints. The work will be measured as the number of feet of joint system which has had its elevations adjusted in the manner indicated on the Contract Plans.

Measurement will be taken only between curb lines. No measurements will be taken across sidewalks, or raised medians. In the event that curbs are not present, measurement will be taken only to those points where the elevations have actually been adjusted.

590-5 BASIS OF PAYMENT

590-5.01 Bridge Drainage Devices. The unit price bid for each bridge drainage device adjusted shall include the cost of all labor, materials, and equipment necessary to complete the work.

No payment will be made for work done to repair damage due to the Contractor's operations, nor for any material supplied as replaced material made necessary due to damage attributable to the Contractor's operations.

590-5.02 Bridge Joints. The unit price bid per foot shall include the cost of all labor, materials and equipment necessary to complete the work.

No payment will be made for work done to repair damage due to the Contractor's operations, nor for any material supplied as replacement material made necessary due to damage attributable to the Contractor's operations.

Any concrete removal or replacement will be paid for under the appropriate items.

Payment will be made under:

Item No.	Item	Pay Unit
590.01	Vertical Adjustment of Bridge Drainage Devices - 1	Each
590.02	Vertical Adjustment of Bridge Drainage Devices - 2	Each
590.03	Vertical Adjustment of Bridge Drainage Devices - 3	Each
590.04	Vertical Adjustment of Bridge Drainage Devices - 4	Each
590.05	Vertical Adjustment of Bridge Drainage Devices - 5	Each
590.21	Vertical Adjustment of Joint System - 1	Foot
590.22	Vertical Adjustment of Joint System - 2	Foot
590.23	Vertical Adjustment of Joint System - 3	Foot
590.24	Vertical Adjustment of Joint System - 4	Foot
590.25	Vertical Adjustment of Joint System - 5	Foot

SECTIONS 591 THRU 593 (VACANT)

SECTION 594 - TIMBER AND LUMBER

594-1 DESCRIPTION. Under this work the Contractor shall furnish and place timber and lumber of various sizes and types as may be specified for sills or platforms beneath the road, for culverts, bridges reinforcing existing structures, and for other similar purposes as shown on the plans or specified by the Engineer.

594-2 MATERIALS. Materials shall meet the following requirements:

Wood Preservative - Creosote Oil, Type I	708-30
Wood Preservative - Water Borne	708-31
Wood Preservative - Oil Borne	708-32
Timber and Lumber	712-13
Stress Graded Timber and Lumber	712-14
Steel Plates as Specified	715-01

594-2.01 Fasteners. Fasteners such as: spikes, nails, screws, timber connectors, bolts, nuts and washers shall meet the standard industrial fastener specifications for the intended application.

594-2.02 Approval of Order. Prior to ordering timber and lumber, the Contractor shall submit to the Engineer for approval, a detailed statement of his proposed order. No material shall be ordered until the statement is approved.

594-2.03 Preservative Treatment. The preservative treatment shall be applied to stress graded lumber and timber and shall conform to the requirements of the AWPA C2, C3, and C18.

594-2.04 Sampling and Inspection. Sampling and inspection will be done by an accredited representative of the Department. The Inspector shall have the power to take samples of the material for analysis and to reject those materials which do not fulfill the requirements of these specifications as to either quality or workmanship. The acceptance of any materials by the Inspector shall not be a bar to their subsequent rejection if found defective. The Contractor shall furnish all facilities and equipment for the inspection and testing of materials and workmanship and the Inspector shall be allowed free access to all premises where inspections can be made.

The Contractor shall give the Department and Department's Inspection Agents ample notice relative to the location of, and time when, treating operations will take place. Inspection of all timber and lumber will be made by the Department's Inspection Agents before, during, and after pressure treatment at the treating plant. No treated timber and lumber shall be shipped which does not bear, in legible form, the Inspector's stamp of approval.

594-3 CONSTRUCTION DETAILS

594-3.01 General. Timber and lumber shall be placed or erected as shown on the plans or specified by the Engineer.

Any surface breaks resulting from storage and handling which do not warrant rejection shall be treated in accordance with AWPA M4 with the addition that at least three coats of preservative shall be applied.

Paint, where specified, shall be applied as required by the Contract Documents.

594-3.02 Treatment after Fabrication. All cutting, framing and boring of timber and lumber shall be done before treatment whenever practicable. Cutting and boring below high water shall be particularly avoided in material which is to be used in waters infested with marine borers.

All cut surfaces and all bolt holes bored subsequent to treatment shall be treated in accordance with AWPA M4 with the addition that at least three coats of preservative shall be applied. Any unfilled holes, after being treated with preservative shall be plugged with preservative treated plugs.

All cut surfaces and bolt holes below the high water line shall, in addition to the AWPA M4 preservative treatment, be coated with a thick application of a mixture of 30% creosote and 70% pitch.

The Contractor shall obtain all necessary permits pertaining to the purchase and field application of wood preservatives from the U.S. Environmental Protection Agency (EPA) and the New York State Department of Environmental Conservation.

594-4 METHOD OF MEASUREMENT. The quantity to be paid for timber and lumber will be the number of cubic feet placed in the completed work. In measuring dressed timber and lumber, the cross-section of any piece will be taken as the minimum nominal commercial size of undressed material from which the piece could have been cut. When round timber is used, it shall be estimated as square timber of the smallest undressed commercial size from which the timber can be manufactured. The length of any piece will be taken as the actual length in the finished work, making no deductions for bevels, notches or splices. If the measured quantity is first computed in board feet, the conversion factor shall be 0.083334 cubic feet per board feet.

594-5 BASIS OF PAYMENT. The unit price bid per cubic foot shall include the cost of furnishing all spikes, nails, screws, timber connectors, bolts, nuts, washers, hardware, preservative treatment and other required materials together with labor and equipment necessary to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
594.01	Timber and Lumber	Cubic Foot
594.02	Stress Graded Timber and Lumber	Cubic Foot
594.03	Treated Timber and Lumber	Cubic Foot

SECTION 595 (VACANT)

SECTION 596 - OPEN STEEL FLOOR

596-1 DESCRIPTION. The work shall consist of furnishing and placing open steel floor in structural slabs, at the locations indicated on the contract plans.

596-2 MATERIALS

596-2.01 Steel. All steel for the component parts shall conform to the requirements of ASTM A36 or A588. If steel conforming to ASTM A36 is used, it shall be furnished with a minimum copper content of 0.20 percent.

The Contractor shall furnish the Department with two certified copies of the record of physical tests and chemical analysis of the steel used.

596-2.02 Fabrication. All the requirements and provisions of the SCM shall apply.

596-2.03 Shop Painting. The open steel floor shall be painted in accordance with the contract documents. Surfaces which are to be welded shall not be painted until all welding is completed.

596-3 CONSTRUCTION DETAILS

596-3.01 Placement. Open steel floor shall be placed true to line and grade and shall make full and even bearing on the underlying surface.

596-3.02 Field Welding. All the requirements and provisions of the SCM shall apply.

596-3.03 Field Painting. The requirements of §596-2.03 shop painting, shall apply.

596-4 METHOD OF MEASUREMENT. The quantity to be measured will be the actual area, in square feet, of open steel floor furnished and installed, including any portions that are filled with concrete.

596-5 BASIS OF PAYMENT. The unit price bid per square foot shall include the costs of all labor, material (including fabrication) and equipment necessary to complete the work.

586 *Payment will be made under:*

Item No. 596.01	Item Open Steel Floor	Pay Unit Square Foot
---------------------------	---------------------------------	--------------------------------

SECTION 597 - TIMBER BRIDGE RAILING AND TRANSITIONS

597-1 DESCRIPTION. The work shall consist of furnishing and erecting timber bridge railing and transitions as shown on the contract plans and in accordance with the specifications. As soon as the Contract is awarded, the Contractor shall notify the DCES of the name and address of the fabricator of all timber bridge railing. This notification shall list the specific shop or shops in which the railing will be fabricated.

597-2 MATERIALS. Materials for this work shall meet the following requirements:

Component	ASTM or SAE Designation
Internal Steel Plates	A36 (A709, Grade 36)
Rail Splice Plate	A36 (A709, Grade 36)
Tension Rods and Connection Bolts	A325 or A449 Type 1
Round Head Square Neck Threaded Bolt	A307 Grade A
Nuts	A563 Class 10S, Type HH
Washers	F436, Type 1
Thrie Beam	A588 or A572 (A709, Grade 36 or 36W)
Thrie Beam to W-Beam Transition Piece	A588 or A572 (A709, Grade 36 or 36W)
Dome Head Drive Spike	Industry Standard
Split Rings	SAE 1010 Hot Rolled Carbon Steel
Shear Plates	ASTM A47/A47M, Grade 32510

The provisions of §708-31 Wood Preservative - Water Borne, §708-32 Wood Preservative - Oil Borne, §712-14 Stress Graded Timber and Lumber, and §715-01 Structural Steel, shall apply.

Glued laminated timber shall comply with the requirements of the American Institute of Timber Construction (AITC). All wood products shall be pressure treated with wood preservative in accordance with §708-31 or §708-32 except that laminations for glue laminated timbers shall be treated prior to gluing with wood preservative designated as light pentain oil as in AWPA C28 and glued with wet-use adhesives conforming to Sections 4.5.1.2 of ANSI/AITC A190.1-1983.

The bridge rail shall be horizontally laminated glued laminated timber, visually graded Western species combination No. 2 or visually graded Southern Pine Combination No. 48. Other species and grades of glued laminated timber may be substituted provided that the minimum values tabulated in the latest edition of the National Design Specification for Wood Construction (ANSI/NFoPA NDS) are not less than the following:

$$F_{b \ y-y} = 1800 \text{ psi}$$

$$E = 1800 \text{ ksi}$$

Posts, curbs, scuppers, and spacing blocks may be sawn lumber or glued laminated timber. When sawn lumber is used, material shall be visually graded No. 1 Southern Pine or visually graded No. 1 Douglas Fir-Larch. Other species and grades of lumber may be substituted provided that the minimum values tabulated in the latest edition of the National Design Specification for Wood Construction (ANSI/NFoPA NDS) or obtained through a Machine Stress Rated (MSR) procedure approved by the American Lumber Service (ALS) are not less than the following:

$$F_b = 1350 \text{ psi}$$

$$E = 1500 \text{ ksi}$$

597-3 CONSTRUCTION DETAILS

597-3.01 Fabrication. Timber bridge railing shall be fabricated to the dimensions shown on the Contract plans and in compliance with the specifications.

A. Shop Drawings. Shop drawings shall be provided in accordance with the Steel Construction Manual (S.C.M.) except as follows:

- The drawings shall be submitted to the Engineer for review and approval; and
- The computed weights need not be shown.

B. Galvanizing. Galvanizing shall conform to the requirements of §719-01, Galvanized Coatings and Repair Methods, Type I. All steel components of the railing, including the round head square necked threaded bolts, shall be galvanized. Galvanizing of high-strength steel tension rods shall follow the recommendations of the tension rod manufacturer so as not to adversely affect the mechanical properties of the steel. All steel components shall be galvanized after welding and other fabrication.

Shop galvanizing repair of uncoated areas will be permitted on localized areas. Repair of localized areas is limited to a total of 2 square inches on any one component. Any component requiring more than 2 square inches of galvanizing repair shall be stripped and regalvanized.

Shop repair shall be in accordance with the methods given in §719-01.

The following areas shall not require galvanizing repair: One 1/8 inch maximum dimension spot of tight flux remaining in the fusion line of any 7 inch length of weld after blast cleaning, pickling and galvanizing.

C. Shop Wood Repair. All cutting, framing and boring of timber shall be done before treatment whenever practicable.

All cut surfaces shall be treated in accordance with AWP A M4 with the addition that at least three coats of preservative shall be applied.

All bolt holes bored subsequent to treatment shall be treated with preservative by means of an approved pressure bolt hole treater. Any unfilled holes, after being treated with preservative shall be plugged with preservative treated plugs.

597-3.02 Erection of Timber Bridge Railing and Transitions

A. Inspection of Railing. Prior to installation, all timber and lumber shall be examined for shakes, holes, knots, checks, splits, and decay. The Materials Requirements under "Defects" of §712-17 shall apply. Any piece of timber or lumber exhibiting any one of the aforementioned defects shall be subject to rejection as determined by the Engineer.

B. Inspection of Galvanizing. Immediately prior to erection, the railing shall be inspected for damage. Damage to the galvanizing of steel railing components shall constitute sufficient cause for rejection except for the following conditions:

1. If a damaged area is not required to be repaired under the provisions of §710-23, Steel Bridge Railing.
2. If the total damaged area of a single piece is 6 square inches or less. Total damaged area is exclusive of the damaged area described under §597-3.02B1.

C. Field Wood Repair. All cut surfaces shall be treated in accordance with AWP A M4 with the addition that at least three coats of preservative shall be applied.

All bolt holes bored subsequent to treatment shall be treated with preservative by means of an approved pressure bolt hole treater. Any unfilled holes, after being treated with preservative shall be plugged with preservative treated plugs.

The Contractor shall obtain all necessary permits pertaining to the purchase and field application of wood preservatives from the U.S. Environmental Protection Agency (EPA) and the New York State Department of Environmental Conservation.

D. Field Galvanizing Repair. Field galvanizing repair shall be allowed to be performed upon damaged areas meeting the requirements of §597-3.02B2.

Field galvanizing repair shall be made by painting zinc repair material onto the damaged area in accordance with the requirements of §719-01, Galvanized Coatings and Repair Methods.

All finished surfaces of welds and adjacent surfaces where galvanizing has been removed, due to any field welding operation, shall be field galvanized.

E. Holes in Metal Plates. Prior to galvanizing, any necessary holes in the metal plates shall be made in the shop in accordance with the requirements of the S.C.M.

F. Installation. The installation work shall be done by bolting methods alone. The requirements of the S.C.M. shall apply.

G. Posts. Bridge railing posts shall be installed as truly vertical as possible within the following tolerance limit: 5/16 inch in any direction as measured from the top of the deck to the top of the post.

Bridge railing transition posts shall be installed at the location and in the manner indicated on the Contract plans. The Contractor shall carefully excavate for all post holes. Post holes and post foundation structures shall be backfilled and compacted in accordance with [Section 203, Select Structural Fill, §203-3.15, "Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables"](#). Prior to acceptance, all posts shall be plumb to a tolerance of +/- 5/16 inch.

Comment [c78]:
E109024

Posts, in their final position, shall satisfy the Material Requirements for "Defects" of §712-17.

The tops of all posts and the top of the rail splice plate kerf shall be sealed with roofing cement or otherwise protected from direct exposure to weather.

H. Rails. The rails of timber railings shall span a minimum of four (4) posts. Bolts on traffic face of rail shall be round head square neck threaded bolt. Railing splices shall be installed in the manner indicated on the Contract plans.

I. Washers. Unless otherwise noted, malleable iron washers shall be provided under bolt heads and under nuts that are in contact with wood. Washers may be omitted under heads of dome-head timber bolts when the size and strength of the head is sufficient to develop connection strength without wood crushing.

J. Erection Inspection. All erection shall be subject to the inspection of the Engineer who shall be given all facilities required for a visual inspection of workmanship and materials.

597-4 METHOD OF MEASUREMENT

597-4.01 Timber Bridge Railing. The quantity to be paid for timber bridge railing shall be the number of feet measured along the centerline of railing between the extreme outer limits indicated on the Contract plans.

597-4.02 Timber Bridge Railing Transition. The quantity to be paid for timber bridge railing transition shall be the number of transitions required.

597-5 BASIS OF PAYMENT. The unit price bid per linear foot of the timber railing shall include the cost of all labor, material and equipment necessary to do the work.

The price bid per timber bridge railing transition shall include the cost of all labor, material and equipment necessary to do the work.

All drilling and grouting work, if permitted, will be done at the contractor's expense.

Payment will be made under:

Item No.	Item	Pay Unit
597.10	Timber Railing	Foot
597.20	Timber Railing Transition	Each

SECTIONS 598 AND 599 (VACANT)

Section 600

INCIDENTAL CONSTRUCTION

SECTION 601 - ARCHITECTURAL PAVEMENTS AND TREATMENTS

601-1 DESCRIPTION. The work in this section shall include work required for architectural pavements and treatments.

601-2 MATERIALS. Materials shall be as specified in the special specifications.

601-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

601-4 METHOD OF MEASUREMENT. As specified in the special specifications.

601-5 BASIS OF PAYMENT. As specified in the special specifications.

~~SECTION 601 (VACANT)~~

Comment [c79]:
EI09-014

SECTION 602 - REHABILITATION OF CULVERT AND STORM DRAIN PIPE

602-1 DESCRIPTION. Rehabilitate culvert and storm drain pipe in accordance with these specifications, the contract documents, and as directed by the Engineer.

602-2 MATERIAL REQUIREMENTS.

602-2.01 General. Materials requirements are specified in the following subsections:

Portland Cement Concrete	501	Tunnel Liner Plate (relining)	707-05
Shotcrete	583	(Steel)	
Concrete Repair Material	701-04	(Aluminum)	
Vertical Overhead Patching Material	701-08	Corrugated Aluminum Pipe	707-13
Grout Sand	703-04	Corrugated Aluminum Structural	
Polyester Formed In Place Pipe Liner	706-06	Plate for Pipe and Pipe Arches	707-14
PVC Pipe (relining)	706-10	Anchor Bolts for Corrugated	707-20
(Profile Wall)		Culverts	
(Corrugated)		Zinc Chromate Primer	708-04
High Density Polyethylene Pipe (relining)	706-11	Membrane Curing Compound	711-05
(Profile Wall)		Coal Tar Epoxy Paint	SSPC-16
(Smooth Wall)			
Corrugated Steel Pipe	707-02		
(Concrete Lined)			
(Aluminum Coated (Type 2))			
(Polymer Coated)			

Materials referencing SSPC will be accepted on the basis of Manufacturer's certification.

602-2.02 Fill Material for Annular Space. Design the fill material for the annular space between the existing and new liner pipe in accordance with the pipe Manufacturer's recommendations. Calculate

the required fill material based on the existing culvert/storm drain internal diameter (minus deformations) and the external diameter of liner pipe.

602-3 CONSTRUCTION DETAILS. Provide the Engineer with written details of how the work is to be progressed a minimum of 10 days prior to starting. Include pipe manufacturer's instructions, dewatering, assembly drawings, necessary insertion and bracing methods, and proposed shotcreting, concrete, and void filling methods.

602-3.01 Existing Pipe Preparation. Dewater, clean and inspect the existing pipe. Determine the location of and remove obstructions that may prevent proper installation of the paving or the relining material. Locate holes and perforations and hammer sound the interior walls of the existing pipe to identify all voids around the pipe's periphery. For small inaccessible pipes, generally less than 48 inches in diameter, sounding is not required; use a closed circuit television and camera to provide a visual inspection. Fill all voids within 12 inches of the existing pipe's circumference. Provide strutting and bracing as required to insure stability of the pipe. For small inaccessible pipes, less than 48 inches in diameter, preliminary filling of voids in the existing pipe's periphery is not required.

602-3.02 Handling & Installing Relining Materials

A. General. Install each run of pipe with the same material for the entire run unless otherwise identified in the contract documents or approved by the Engineer. Do not allow water to flow along the invert during concrete or fill material placement.

B. Paving Inverts with Concrete. Apply §603-3.07 Concrete Paving for Corrugated Structural Plate Pipe.

C. Lining with Shotcrete. Apply the requirements of Section 583, Shotcrete with the exception of the following:

- The application is not limited to repair of concrete surfaces. Corrugated metal pipe is another material that can be shotcreted.
- Apply 2 inches minimum over the crests of the corrugations.

D. Lining with Polyester Formed-in-Place Pipe Liner. Provide the Engineer with written design details and calculations for determining the thickness of the cured-in-place-pipe (CIPP), the minimum pressure required to hold the tube tight against the existing conduit, and the maximum allowable pressure so as not to damage the tube.

Use a liner with the following criteria:

- One or more layers of flexible needled felt or an equivalent material as approved by the Materials Bureau.
- Be flexible enough to fit irregular pipe sections and be able to negotiate pipe bends.
- Use a plastic coated outside layer that is compatible with the resin system.
- Must use either a styrene based, thermoset resin and catalyst system or an epoxy resin and hardener that is compatible to the inversion system being used.
- Vacuum impregnate the tube with the resin and use a volume of resin that fills all voids in the tube material at nominal thickness and diameter. Adjust the volume by adding a minimum of 5% excess resin for the change in resin volume due to polymerization and to allow for any migration of resin into the cracks and joints in the original pipe.

1. Installation. A cured-in-place-pipe (CIPP) may be installed by either a hydrostatic head or air pressure inversion system. Maintain the pressure between the minimum and maximum during the inversion process and a continuous record of the pressure during the cure period. If the

pressure deviates such that it is outside the range of the minimum and maximum pressure, remove the installed tube from the conduit.

a. Hydrostatic Head. Insert the tube into the vertical inversion standpipe with the impermeable plastic membrane side out. At the lower end of the inversion standpipe, turn the tube inside out and attach it to the standpipe thereby creating a leakproof seal. Apply a hydrostatic head to fully extend the liner to the next designated manhole or termination point. Insert the tube into the vertical standpipe. Do not over-stress the felt fiber during the inversion process. Alternative methods using a hydrostatic head will be subject to approval of the Engineer.

b. Air Pressure. Connect the tube to the upper end of the guide chute to create a leak proof seal with the impermeable plastic membrane side out. Turn the tube inside out as it enters the guide chute. Adjust the inversion air pressure to cause the impregnated resin tube to invert from point to point and to hold the tube tight against the pipe wall to produce dimples at the side connections.

2. Curing. Cure the liner with heated water circulated throughout the section so as to uniformly raise the temperature above that required to cure the resin. Monitor the temperature of the incoming and outgoing water supply from the heat source to the circulating equipment. Initial cure occurs during temperature heat-up and is considered complete when the remote temperature sensor indicates the temperature has reached the Manufacturer's recommendation for the initial resin cure. After reaching the initial cure temperature, raise and hold the temperature to the post-cure temperature as recommended by the Manufacturer.

Cool the liner to a temperature of 100°F before relieving the static head in the inversion standpipe. Cool-down may be accomplished by adding cool water to the inversion standpipe to replace warm water being drained from a small hole made in the downstream end. Alternative methods of curing will be subject to approval of the Engineer.

3. Workmanship. The finished pipe liner should be continuous over the entire length of an inversion run and be free of dry spots, lifts and delaminations. If any dry spots, lifts and delaminations exist, remove the liner in those areas. Mark a line 40 inches from both ends of the distressed area, cut the distressed area out, and replace it to the satisfaction of the Engineer. If the Cured-In Place-Pipe (CIPP) does not fit against its termination point, seal the space between the pipe and liner with a resin mixture compatible with the CIPP.

4. Storm Drain Lateral Connections. Reconnect the existing storm drain lateral connections after the liner has cured in place. Use robotic cutting devices to reestablish tie-ins in non-man entry pipes.

E. Lining with a new Liner Pipe. Liner pipe sections may be pushed or pulled into place. Prior to relining, install skids or place a concrete or grout bed in the invert. Finish the bed to the specified line and grade depicted in the contract plans, and taper the edges to allow the annular fill material to flow freely in the space between the liner pipe and the bed. If installing skids, use 80 inch lengths staggered to allow the annular fill material to flow beneath and around the liner pipe. Secure the skids to the invert of the existing pipe such that the bottom of the liner pipe does not drag along the invert during relining, or the skids may be welded or banded to the liner pipe's exterior in a manner approved by the Engineer. Before relining, pull or push a single piece of liner through the pipe to verify liner clearance.

Follow the Manufacturer's instructions for handling and assembling the pipe, except as modified in the Contract Documents or as directed by the Engineer. Brace the liner against the existing pipe such that it maintains line and grade during filling of the annular space. Place the bracing so as to allow unimpeded flow of fill material into the entire annular space. Secure the liner before filling the annular space.

When required, reconnect existing storm drain lateral connections by utilizing an open cut excavation, internal connection or remote installation using robotics. Prior to filling the annular space connect and seal all laterals between the new liner pipe and the existing lateral.

Fill the entire annular space. Provide a minimum annular space of 1 inch for fill material between the new and existing pipes, and details on how to hold the liner pipe to line and grade until the fill material has set.

If the actual fill material used is less than the anticipated (calculated) fill or an inspection of the relined culvert indicates that there are voids in the annular space, the Contractor must provide the EIC with a plan to correct voids found. Depending on the location and size of the voids, additional grouting may be required in these areas. This may be accomplished by re-grouting in those areas within the culvert. The voids must be filled to the satisfaction of the Engineer at no additional cost to the state.

1. Lining with Polyethylene Pipe. Prior to relining, install skids or place a concrete or grout bed as per §602-3.02 E. Lining with a new Liner Pipe.

Reline with Smooth Wall Polyethylene Pipe or Profile Wall Polyethylene Pipe. Insert one end of the liner into the existing pipe leaving approximately 60 inches outside. Place the opposing end of the second section against the exposed end of the first section. Assure that the two sections are in alignment and have the same slope.

Install a gasket on the male end of the liner pipe. Pull the couplings together until the female and male ends are locked together. Install joined liners into the culvert and repeat until completely lined.

Install all pipe, fittings, adapters and appurtenances according to the Manufacturer's recommendations. Limit joint separations to less than 1/2 inch between adjoining sections. Field cuts will be permitted only at the terminal ends. No pipe length less than 40 inches will be allowed.

Perform all butt fusion, welding and extrusion welding of HDPE pipe in accordance with the Manufacturer's recommendation. Have a Manufacturer's representative present during any fusion or welding operations.

2. Lining with Corrugated Metal Pipe. Use Corrugated Aluminum Pipe, Aluminum-Coated (Type 2) Corrugated Steel Pipe, Concrete Lined Corrugated Steel Pipe, or Polymer Coated Corrugated Steel Pipe. Apply zinc-chromate primer, or an equivalent as approved by the Materials Bureau, to all aluminum surfaces that will come in contact with concrete or grout.

Prior to relining, install skids or place a grout bed as per §602-3.02 E. Lining with a new Liner Pipe.

Insert and brace the liner pipe to the specified line and grade, and align adjacent pipe sections such that port holes, if used, are placed as detailed in the contract plans (Alignment bolts are not adequate bracing by themselves). Sever all alignment bolts not fully turned out and grind them flush to the new pipe interior. If port holes are used, provide fittings and plugs compatible with the delivery equipment. Insert the plugs into the fittings as the operation is completed. Limit joint separations to 1/2 inch between adjoining sections. To insure that fill material remains in the annular space, place internal expanding joint bands with annular corrugations and foam gaskets at each joint. Before filling the annular space brace, strut the bands. Remove the bracing and struts upon completion of this work.

3. Lining with Polyvinyl Chloride Pipe. Prior to relining, install skids or place a concrete or grout bed as per §602-3.02 E. Lining with a new Liner Pipe.

Reline with a Profile Wall PVC Pipe or Corrugated Wall PVC Pipe with integral bell and spigot joints.

Place a nose cone over the leading pipe spigot to protect the edge as it is pulled or pushed through the culvert. Use a pushing or pulling ring/plate to install the liner. Monitor the jacking and pushing loads in accordance with the Manufacturer's specifications and guidelines.

4. Lining with Corrugated Aluminum Structural Plate Pipe. Prior to relining, install skids or place a concrete or grout bed as per §602-3.02 E. Lining with a new Liner Pipe. Apply zinc-chromate primer, or an equivalent as approved by the Materials Bureau, to the entire exterior surface of the pipe.

Submit fabrication details, including assembly drawings, pipe insertion methods, and bracing details, to the Engineer.

Align adjacent pipe sections such that port holes, if used, are placed as detailed in the contract plans. If port holes are used, provide port hole fittings and plugs compatible with the delivery equipment. Insert the plugs into the fittings as the grouting operation is completed. Alignment bolts are not adequate bracing by themselves. Sever all alignment bolts not fully turned out and grind them flush to the new pipe interior. Do not impede the flow of fill material into the annular space with bracing material.

5. Lining with Steel or Aluminum Tunnel Liner Plate. Install two flange liner plates. Use a lap type longitudinal seam. Fabricate the lap to allow a continuous cross section of the plates through the seam. Use an offset depth equal to the metal thickness for the full width of plate, including flanges. Drilling, punching or drifting to correct defects in manufacturing will not be permitted. Plates with improperly punched holes will be rejected.

Use 5 bolts per 18 inches width of plate in each lapped longitudinal joint and stagger the bolts in the ridges and valleys. Follow the Manufacturer’s recommendation for circumferential and longitudinal bolt spacings.

602-3.03 Damaged Pipe and Repair. Repair any damage to the existing pipe caused by the relining operation consistent with Section 603 Culverts and Storm Drains.

602-4 METHOD OF MEASUREMENT

602-4.01 Relining with new pipe. This work will be measured as the number of feet along the bottom centerline, measured to the nearest foot.

602-4.02 Paving inverts. This work will be measured as the number of square feet, determined by the paved width measured along the pipes circumference and the length along the centerline of the pipe measured to the nearest square foot.

602-4.03 Shotcreting. This work will be measured as the number of square feet, determined by the shotcreted width measured along the pipes circumference and the length along the centerline of the pipe measured to the nearest square foot.

602-5 BASIS OF PAYMENT. Include the cost of furnishing all labor, materials, and equipment necessary to complete the work in the unit price bid. Include the cost of all fill material needed to fill the annular space between the existing pipe and the liner pipe, and the removal of any obstructions, intrusions or damaged pipe prior to relining. The quantity of fill material required to fill voids beyond 12 inch outside of the existing pipe’s circumference will be paid under a separate item.

For Paving Inverts and Shotcreting, include the cost of furnishing all labor, materials and equipment necessary to complete the work for the unit price bid and include all necessary preparations to the existing pipe.

Payment will be made under:

Item No.	Item	Pay Unit
602.2001	Paving Inverts with Portland Cement Concrete	Square Foot
602.2101	Lining Culvert with Shotcrete	Square Foot
602.25xx	Lining with High Density Polyethylene Pipe	Foot
602.30xx	Lining with Polyvinyl Chloride Pipe	Foot
602.35xx	Lining with Polyester Formed in Place Pipe Liner	Foot
602.40xx	Lining with Corrugated Aluminum Pipe Type IR	Foot

602.45xx	Lining with Aluminum Coated (Type 2) CSP Type IR, 12 gauge	Foot
602.47xxxx	Lining with Aluminum Coated (Type 2) CSP Type IIR, 10 gauge	Foot
602.50xxxx	Lining with Aluminum Structural Plate Pipe (9 x 2 1/2)	Feet
602.52xxxx	Lining with Aluminum Structural Plate Pipe Arch (9 x 2 1/2)	Foot
602.550101	Lining with Steel Tunnel Liner Plate 0.135 inch thick	Square Foot
602.550102	Lining with Steel Tunnel Liner Plate 0.165 inch thick	Square Foot
602.550103	Lining with Steel Tunnel Liner Plate 0.18 inch thick	Square Foot
602.550104	Lining with Steel Tunnel Liner Plate 0.21 inch thick	Square Foot
602.550105	Lining with Steel Tunnel Liner Plate 0.24 inch thick	Square Foot
602.600101	Lining with Aluminum Tunnel Liner Plate 0.125 inch thick	Square Foot
602.600102	Lining with Aluminum Tunnel Liner Plate 0.15 inch thick	Square Foot
602.600201	Lining with Aluminum Tunnel Liner Plate 0.175 inch thick	Square Foot
602.600202	Lining with Aluminum Tunnel Liner Plate 0.20 inch thick	Square Foot
602.600301	Lining with Aluminum Tunnel Liner Plate 0.225 inch thick	Square Foot
602.65xx	Lining with Concrete-Lined CSP (2 2/3 x 1/2)	Foot
602.70xx	Lining with Concrete-Lined CSP (5 x 1)	Foot
602.75xx	Lining with Polymer Coated CSP 12ga, (2 2/3 x 1/2)	Foot
602.80xx	Lining with Polymer Coated CSP 12ga, (3 x 1) or (5 x 1)	Foot

Refer to Contract Proposal for full Item Number and full description.

SECTION 603 - CULVERTS AND STORM DRAINS

603-1 DESCRIPTION. Construct culverts and storm drains in accordance with these specifications, the contract plans, and the appropriate standard sheets.

603-2 MATERIALS

603-2.01 General. Materials requirements are specified in the following subsections:

Geotextile	207	Corrugated Structural Steel Plate for Pipe,	
Portland Cement Concrete	501	Pipe-Arches and Underpasses	707-09
Portland Cement	701-01	Galvanized Steel End Sections	707-10
Masonry Cement	701-02	Aluminum End Sections	707-11
Concrete Repair Material	701-04	Corrugated Aluminum Pipe	707-13
Mortar Sand	703-03	Corrugated Aluminum Structural	
Non-Reinforced Concrete Pipe	706-01	Plate for Pipe and Pipe-Arches	707-14
Reinforced Concrete Pipe	706-02	Anchor Bolts for Corrugated Culverts	707-20
Reinforced Concrete Elliptical Pipe	706-03	Zinc Chromate Primer	708-04
Reinforced Concrete End Sections	706-07	Bar Reinforcement, Grade 60	709-01
Smooth Interior Corrugated		Wire Fabric for Concrete Reinforcement	709-02
Polyethylene Pipe	706-12	Plastic Coated Fiber Blankets (For Curing)	711-03
Corrugated Steel Pipe	707-02	Membrane Curing Compound	711-05
Ductile Iron Pipe (Non-Pressure)	707-03	Water	712-01
		Galvanized Coatings and Repair Methods	719-01

603-3 CONSTRUCTION DETAILS

603-3.01 Excavation. Apply the requirements specified in Section 206, Trench, Culvert and Structure Excavation, except as modified by the Contract Documents or as directed by the Engineer.

603-3.02 Laying Pipe

A. General. Lay all pipe in close conformity to line and grade having a full, firm and even bearing at each joint and along the entire length of pipe. Lay all pipe beginning at the downstream end and progress upstream. Use the same material in each run of pipe unless otherwise directed by the Engineer.

B. Handling and Assembly of Pipe. Follow the Manufacturer's instructions or approved Materials Details except as modified on the Contract Plans or as directed by the Engineer.

C. Bell and Spigot Type Pipe. Lay all pipe with the bells upstream. Where the spigot end of an existing pipe does not fit the bell end of a new pipe, construct a concrete collar as shown on the Standard Sheets. Fill the bottom half of the space on the inside of the pipe between the existing spigot and the new bell with an approved concrete repair material (§701-04). Alternate designs may be submitted to the Director, Materials Bureau, for approval.

Where the spigot end fits into the bell end and the clearance is so great as to render the elastomeric gasket or preformed sealer ineffective, join the pipe by caulking a gasket of jute or oakum into the joint space and then fill with mortar of equal parts of Portland Cement and Mortar Sand or a preformed or poured caulking compound of a type approved by the Engineer.

D. Round Corrugated Metal Pipe and Pipe-Arches. Place steel or aluminum pipe with longitudinal seams located at the sides. Place circumferential seams with laps in the downstream direction so flow of water is directed over instead of under each succeeding downstream section.

E. Corrugated Structural Plate Pipe and Pipe-Arches. Assemble the plates for corrugated steel or aluminum structural plate pipe and pipe-arches to form the circular pipe or pipe-arch cross section as defined by the pipe manufacturer.

For metal pipe arches, install the bolts nearest the visible edge of the lapped joint in the valley at the top of the corner plate of the corrugations. Cover the joint with the top of the corner plate on the outside of the structure with a geotextile conforming to Geotextile Underdrain from the Department's Materials Bureau Approved List. Extend the covering a minimum of 12 inches beyond each side of the joint for its entire length. A minimum of 12 inches is required for any longitudinal lap.

F. Polyethylene Pipe. Handle, store and assemble all pipe in accordance with the Approved Materials Details except as modified in the Contract Documents or by the Engineer. Joint misalignment resulting in offsets greater than 1/4 inch or joint separations greater than 1/2 between adjoining sections of pipe will not be allowed. Field cuts are permitted only at the terminal ends and with a minimum pipe length of 40 inches.

G. Corrugated Metal End Sections. Assemble all pipe end sections in accordance with the Contract Documents or as approved by the Engineer.

H. Thickness Measuring Equipment. Prior to laying any pipe, provide the Engineer with equipment to measure gauge and steel coating thickness. Gauge shall be measured with a micrometer caliper. Measure steel coating thickness with a Type II Fixed Probe Magnetic Gauge meeting the requirements of Steel Structures Painting Council Specification SSPC-PA2. When the Engineer verifies the required gauge and coating thickness the pipe may be laid. Micrometer calipers and Type II probes shall remain the property of the Contractor.

603-3.03 Bedding and Backfilling Pipe. Apply the standards of [Section 203, Select Granular Fill](#) ~~203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits, and Direct Burial Cables~~ and the appropriate NYSDOT Standard Sheets. Select Granular Fill used to backfill around aluminum or aluminum coated pipes will be free of portland cement unless the pipe sections are thoroughly coated with Zinc Chromate Primer, §708-04 or an equivalent alternative as approved by the Materials Bureau. 100% of the Select Granular Fill used around Type IR and IIR corrugated aluminum pipe must pass a 2 inch sieve.

Comment [c80]:
E109024

603-3.04 Damaged Pipe and Repair

A. General. Repair, realign or replace pipe that is damaged or disturbed through any cause occurring prior to acceptance of the contract. Pipe which is defective, and determined by the Engineer as unrepairable, will be unacceptable for installation and shall be replaced as directed by the Engineer at no cost to the State.

B. Concrete Pipe. Repair concrete pipe in accordance with the requirements set forth in §706-02 Reinforced Concrete Pipe. The repairs will be acceptable if they are sound, properly finished and cured, as determined by the Engineer, and the repaired pipe conforms to the requirements of the Contract Documents.

C. Damaged Bituminous Coating and Paving. Damage to bituminous coating shall be repaired with asphalt repair material. The repair material shall appear on the Department's Approved List. Damage to bituminous paving shall be repaired by an application of the original hot material for areas 2 square feet or less in each pipe section. Damage to bituminous paving in areas greater than 2 square feet in a pipe section will be cause for rejection of that section.

D. Polyethylene Pipe. Polyethylene pipe with damaged ends may be incorporated into the work at terminal locations provided the damaged portion is totally removed by the field cut. Repair or replacement of pipe that is disturbed, damaged or misaligned must provide the same product as a new pipe installation, as determined by the Engineer. After backfilling operations are complete, inspect the pipe for deflection. No more than 5% deflection of the internal diameter will be allowed. If this is exceeded, the pipe will be rejected and removed at the Contractors expense.

603-3.05 Field Strutting of Corrugated and Structural Plate Pipe. Field strutting of corrugated metal pipe and structural plate pipe may be done at the Contractor's option and expense to provide added protection from construction equipment and other loads during installation, backfilling and filling above the pipe. The method and scheduling of installation and removal of strutting, must be approved by the Engineer. Field strutting shall constitute installation of structurally sound timber sills, compression caps and struts.

603-3.06 Joints

A. Corrugated Metal Pipe. Use corrugated band field connections for corrugated metal pipe and pipe arch connections. Lap the band on equal portions of each culvert section to be connected. All connections shall be an approved type, fabricated and installed so that a secure and firm pipe connection may be readily made in the field. Thoroughly coat all aluminum or aluminum coated field connections in contact with concrete with Zinc Chromate Primer §708-04 or an equivalent alternative as approved by the Materials Bureau and permit to dry prior to concrete placement.

B. Structural Plate Pipe. Assemble plates for structural plate pipe and pipe arches with joints staggered such that not more than three (3) plates come together at any one point. Tighten all nuts for field or shop assembled plates to at least 150 but not more than 300 ft-lbs of torque, before filling and backfilling are commenced. Supply the Engineer-in-Charge with an approved torque wrench.

C. Concrete Pipe. For round concrete pipe, use flexible water-tight elastomeric gaskets. For elliptical pipe and cattle pass use concrete pipe joint sealing compound meeting the requirements of §705-16. Install all sealants at the time the pipe is being laid to line and grade.

To detect leakage in the finished installation, internal pressure tests will be required in concrete pipe only when specified in the Contract Documents. If a leakage test is required, use an exfiltration test between consecutive manholes. Perform the test by filling the pipe with water to a height 24 inches above the top of the pipe at the upstream manhole and allowing the pipe to remain saturated for a period of 72 hours prior to checking for leakage. No more than 250 gallons per inch of pipe diameter per mile in a 24 hour period will be allowed.

Where a culvert or a storm drain system is open at either one or both ends, with or without end sections, use a minimum of 90 inches. Round pipe less than 24 inches in diameter, elliptical pipe, and larger diameter round pipe beginning with 66 inch diameter where the weight of the pipe section requires a shorter length shall have a minimum length of 72 inch.

Shorter sections will be permitted where they are required to obtain an exact length of culvert. Use of shorter sections requires approval by the Engineer. For closed storm drain systems, drains having structures such as drop inlets on each end, the length of sections is unspecified.

Connect the first three full sections at the open end(s) of a culvert or storm drain system together to restrain movement of the sections. A full section is defined as a section with a minimum laying length of 90 or 72 inches as defined in the preceding paragraph. An end section is considered as the first section. If a short section is used at the end or within the first three full sections of a culvert, connect it together with the first three full sections.

Use a device at the springline on each side of the pipe to restrain the sections from movement. Use a device at least 12 feet in length when using 90 inch minimum length pipe sections and at least 120 inches in length when used with 72 inch minimum length sections. Securely anchor the devices to the pipe, with minimum slack in the device and the joints. Locate anchoring points a minimum of 18 inches from the end of the pipe sections and the flared end sections. Anchor each end of the device with a 1 inch diameter bolt with a nut and washer, or its equivalent, through the section wall. Apply ANSI B 18.2.1, ANSI B 18.2.2 and ANSI B 27.2, Grade A or B respectively for all nuts, bolts, and washers. For all round pipe 48 inches in diameter and smaller, and/or equivalent diameter elliptical pipe use a steel strap for the restraining device conforming to ASTM A36 with a minimum width of 2 1/4 inches, 1/4 inch minimum thickness with 1 1/4 inch maximum diameter holes centered 1 1/2 inch from each end. For pipe larger than 48 inches in diameter and for cattle pass, the requirements for the restraining devices will be shown on the contract plans. Apply the requirements of §719-01, Galvanized Coatings and Repair Methods: Type I for straps and Type II for nuts, bolts, and washers for the steel strap and anchoring hardware.

Alternative designs of the restraining device and anchoring hardware will be considered for approval by the Director of the Materials Bureau if they provide equivalent restraining properties and durability.

Restraining devices may be placed on either the inside or outside of the pipe. If placed on the inside, the device shall not protrude from the wall to the degree where flow would be obstructed. Only cold bending of the restraining device is allowed. Holes in the pipe and end sections required for the anchor bolts may be drilled in the field.

D. Ductile Iron Pipes. Form joints by caulking a gasket of jute or oakum into the hubs and then filling with mortar consisting of equal parts of Portland Cement Type I or Type II, Mortar Sand, or at the Contractor's option, a preformed or poured caulking compound of a type approved by the Engineer. For sanitary sewer systems, apply the joint requirements of ASTM C425.

E. Polyethylene Pipe Connections. Manufactured ends shall be used for joint assemblies; no field cuts are permitted unless approved by the Engineer. No separations greater than 1/2 inch are permitted between adjoining sections of pipe. Use only appropriate fittings for lateral connections supplied by the pipe manufacturer and shown on the standard sheet, except that the pipe shall protrude 2 inches into the basin to provide a 45° battered grout seal. Apply the battered grout seal to both the interior and exterior faces of the basin.

F. Dissimilar Metal Pipe Connections. Use a sleeve gasket when joining corrugated pipe or end sections to pipes or end sections fabricated of dissimilar metals between the pipe(s) and the coupling band. Keep the ends apart, to prevent electrical contact between the dissimilar metals. Apply the requirements of ASTM A36/A36M for all gaskets.

G. Breaking into Existing Drainage Structures. When breaking into existing drainage structures to make a pipe connection, remove only the minimum amount of material from the wall of the structure. After inserting the pipe, fill the cavity between the pipe exterior and the wall of the

drainage structure in accordance with the drainage structure Standard Sheets. Large spaces may be chinked with 704-13 Precast Concrete Driveway and Sidewalk Pavers.

H. Tolerance. A 1/2 inch difference in diameter is allowed when joining round pipes or the spans or rises of pipe-arches. A 1 1/2 inch difference is allowed in the perimeters. These tolerances may be attained by proper production control or by match-marking pipe ends.

603-3.07 Concrete Paving for Corrugated Structural Plate Pipe. Place reinforced Portland Cement Concrete over the inverts of corrugated structural plate pipe where specified and indicated on the Contract Documents, so as to form a smooth interior. Do not place pavement until the embankment has been completed over the pipe and settlement has been completed to the satisfaction of the Engineer.

Pave the bottom 25 percent of the inside circumference for round pipe, the bottom 30 percent of the inside periphery for arch spans of 10 feet 3 inches and shorter and the bottom 35 percent of the inside periphery for arch spans longer than 10 feet 3 inches unless otherwise specified by the Engineer. A minimum cover of 4 inches is required over all corrugations. Schedule and conduct the diversion of water operations prior to and during the placement of pavement in a manner satisfactory to the Engineer. Prior to placing pavement clean and dry the surfaces to be in contact with concrete to the satisfaction of the Engineer.

Place the steel fabric reinforcement on the crests of corrugations and securely fasten to the pipe or pipe-arch by welding or by other methods acceptable to the Engineer. Place the reinforcement to provide a 4 inch minimum clearance from the edges of concrete and lap 6 inch minimum. Unless otherwise shown on the plans, the steel fabric reinforcement shall consist of No. 6 gauge wire at 6 inch centers transversely and longitudinally.

Finish the pavement to a smooth surface acceptable to the Engineer. Within 18 hours after completion of finishing, protect the surface by either an approved curing cover or an approved membrane curing compound applied at a minimum rate of 1 gallon per 150 square feet. However, any concrete in the invert that would be exposed to sunlight must be cured immediately after the finishing operations have been completed and the surface water has evaporated.

Cure the concrete for a minimum period of 48 hours before water is permitted to flow on the invert. If the atmospheric temperature is below 45°F, the requirements of 555-3.08C, Provisions for Concreting in Cold Weather, shall apply.

603-3.08 Relaying Pipe. Carefully remove, clean, preserve, haul and relay pipe as directed by the Engineer or as called for in the Contract Documents. The relaid pipe shall be true to line and grade, and have a full, firm, even bearing and be comparable to newly laid pipe. Construct joints of relayed pipe as specified in §603-3.06. When existing pipe is damaged during removal or relaying, rendering it unfunctional, replace it with new pipe at no additional cost to the State. Existing pipe which is determined by the Engineer to be unfit for relaying may be destroyed before removal.

Apply the requirements of §603-3.03 for backfill and placement.

603-3.09 Anchor Bolts. Unless instructed otherwise, use anchor bolts, as specified in §707-20 to anchor the ends of corrugated metal pipes, and sectional plate arches to either reinforced or plain concrete headwalls.

603-3.10 Culvert-End Safety Grates. Culvert-end safety grates shall be fabricated in accordance with the Standard Sheets.

The grate shall lay flat on the embankment slope, overlap the opening equally on each side, and at the top as indicated in the contract documents. The Contractor shall perform any necessary excavation, backfill, and final slope shaping and grading to ensure proper grate support and smooth uniform slopes in the area surrounding the grate. All disturbed areas will be reestablished to the satisfaction of the Engineer.

603-4 METHOD OF MEASUREMENT

§603

603-4.01 Pipe. The Engineer will measure the pipe, in feet along the bottom centerline, furnished and incorporated into the work in accordance with the Contract Documents.

603-4.02 End Sections. The Engineer will count the number of units of each size or diameter furnished and incorporated into the work in accordance with the Contract Documents.

603-4.03 Relaying Pipe. The Engineer will measure the existing pipe relayed and any new pipe laid and furnished to replace existing pipe, in feet along the bottom centerline, incorporated into the work in accordance with the Contract Documents.

603-4.04 Concrete Collars. The Engineer will count the number of concrete collars furnished and incorporated into the work in accordance with the Contract Documents.

603-4.05 Culvert-End Safety Grates. Culvert-end safety grates will be measured in square feet to the nearest 0.1 square foot of safety-grate installed, using payment areas shown on the Standard Sheet. For sizes that are not shown on the Standard Sheet, the area will be computed as the product of the overall length and width.

603-5 BASIS OF PAYMENT

603-5.01 General. The accepted quantities of all pipe construction and reconstruction will be paid for at the contract price bid which will include the cost of furnishing all labor, materials and equipment necessary to complete the work including those joints made with oakum, portland cement and mortar or poured caulking compounds.

For concrete end sections include the cost of the restraining devices and their installation. If no end sections are specified and restraining devices are required, include the cost of the restraining devices in the unit price bid for the pipe. Include the cost of bituminous coating or concrete paving including steel wire fabric reinforcement, when specified in the unit price bid for the respective pipe items. Include the cost of breaking into existing drainage structures to connect new pipe in the unit bid price for the respective pipe items. Include the cost of anchor bolts, when required, in the unit bid price for pipe items.

Progress payment may be made to the extent of 80% of the price bid for pipe items requiring concrete invert paving when the installation is substantially completed and backfilled to a minimum of 24 inch over the top of the pipe plus whatever additional cover is necessary to protect the installation from construction traffic. The remaining 20% will be paid upon completion of the invert paving.

Excavation, granular fill and backfill will be paid for separately under their appropriate items in Sections 203 and 206, as applicable except include the additional costs necessary for the special gradation for Backfill Material for Corrugated Aluminum Pipe-Type IR and the additional cost necessary to assure the backfill material be free of portland cement in the unit bid price for these pipes.

Include the cost of adding water for compaction in the price bid, unless items for furnishing water equipment and applying water are included in the proposal.

Payment for the geotextile material and its installation is included under the structural pipe arch item.

603-5.02 End Sections. Include the cost of all labor, materials and equipment necessary to complete the work as specified in the contract documents. The cost of the restraining devices and their installation, required for concrete pipe, shall be included in the unit price bid for the end sections.

603-5.03 Concrete Collars. Include the cost of all labor, materials (including concrete repair material) and equipment necessary to complete the work as specified in the contract documents.

603-5.04 Culvert-End Safety Grates. The unit price bid shall include the cost of all labor, materials, and equipment necessary to complete the work, including excavation, topsoil, seeding and mulching.

Payment will be made under:

Item No.	Item	Pay Unit
603.0101	Culvert-End Safety Grate	Square Foot

603.0102	Culvert-End Safety Grate (Heavy-Duty)	Square Foot
603.02xx	Non-Reinforced Concrete Pipe	Foot
603.05xxxx	Corrugated Steel Pipe (2 2/3 x 1/2)	Foot

603.99	Relaying Pipe	Foot

Refer to Standard Contract Pay Item Catalog for full Item Number and full Description. Numbers in parentheses (without denotation) are spacing and depth of corrugations in inches.

SECTION 604 - DRAINAGE STRUCTURES

604-1 DESCRIPTION

604-1.01 General. This work shall consist of the construction or alteration of drainage structures, manholes, leaching basins and transverse drainage interceptors in accordance with these specifications, the contract plans and the standard sheets.

604-1.02 Adjustment Rings and Frames for Drainage Structures and Manholes. The Contractor shall furnish and install prefabricated adjustment rings and frames for drainage structures and manholes. The extensions shall elevate and support drainage structure grates or manhole covers without the necessity of removing the original drainage structure frame or manhole casting, when the roadway is resurfaced.

604-2 MATERIALS

604-2.01 Drainage Structures and Manholes. Materials used for the construction of drainage structures and manholes shall be as indicated on the plans, and/or Standard Sheets, and shall conform to the requirements of the following:

Cast-in-Place Concrete - Class A	501
Frames and Grates	655
Concrete Repair Material	701-04
Concrete Grouting Material	701-05
Precast Concrete Driveway and Sidewalk Pavers.	704-13

602

Premolded Resilient Joint Filler	705-07
Masonry Mortar	705-21
Reinforced Concrete Pipe	706-02
Precast Concrete Drainage Units	706-04
Bar Reinforcement, Grade 60	709-01
Wire Fabric for Concrete Reinforcement	709-02
Cold Drawn Wire for Concrete Reinforcement	709-09
Steps for Manholes	725-02

604-2.02 Transverse Drainage Interceptors. Materials used for the construction of transverse drainage interceptors shall meet the requirements of §604-2.01, except that bar reinforcement shall meet the requirements of §709-04, Epoxy Coated Bar Reinforcement, Grade 60.

Transverse drainage interceptors, if precast, shall meet the requirements of §706-04, Precast Concrete Drainage Units.

Dowels shall be fabricated from epoxy coated bar reinforcement conforming to §709-04.

604-2.03 Leaching Basins. Materials used for the construction of leaching basins shall conform to the requirements of §604-2.01 and shall be as indicated on the plans. Concrete for precast units shall conform to the requirements of §706-04, Precast Concrete Drainage Units.

604-2.04 Adjustment Rings and Frames for Drainage Structures and Manholes. Materials for prefabricated adjustment rings and frames for drainage structures and manholes shall conform to the following:

Prefabricated Adjustment Rings & Frames for Drainage Units & Manholes	715-13
---	--------

604-2.05 Altering Drainage Structures, Leaching Basins and Manholes. Materials for the repair and alteration of existing structures shall meet the requirements of §604-2.01 and shall be as indicated on the contract plans. Structures originally constructed with concrete block, common brick or concrete brick shall be altered with Precast Concrete Driveway and Sidewalk Pavers, §704-13, unless indicated otherwise on the contract plans.

604-3 CONSTRUCTION DETAILS

604-3.01 Excavation. Excavation shall be in conformance with the Construction Details of §206-3 Trench, Culvert and Structure Excavation.

604-3.02 Concrete Drainage Structures and Manholes. Concrete drainage structures and manholes shall be constructed in accordance with the requirements of these specifications, the Standard Sheets and plans. The Contractor shall have the option of erecting either cast-in-place or precast drainage structures unless specified otherwise. Cast-in-place drainage structures shall be constructed of Class A concrete and to the requirements of Section 555 Structural Concrete.

The Contractor shall have the option of constructing either a rectangular or circular drainage structure when such option is specified and allowed in the contract documents. When the circular structure is selected, it shall conform to the requirements of §706-04 and will require submission of complete working drawings to the Engineer for review and approval.

Contractor proposed changes to drainage structures shown on the Standard Sheets or on the plans, other than minor changes approved by the Engineer, shall require submission of complete working drawings to the Engineer for review and approval.

Unless prohibited in the contract documents, the Contractor shall have the option of reducing the size of the drainage structure riser above the uppermost pipe entry in accordance with the requirements of the Standard Sheets. Flat slab reducer designs proposed by the Contractor shall be subject to the review and approval of the Engineer and shall be accompanied by the following:

1. Working drawings prepared by a Professional Engineer licensed to practice in New York State.

2. The design calculations used in the preparation of the working drawings.

Acceptance of flat slab tops or platforms for flat slab reducer designs will be on the Basis of Proof-of-Design Test or on the Basis of Rational Design as required by ASTM C478.

604-3.03 Masonry Construction. Masonry construction, when indicated on the plans or standard sheets, shall consist of concrete pavers laid in full mortar beds. All joints shall be full mortar joints not greater than 1/2 inch wide. When specified, the outside of the masonry construction shall be plastered with 1/2 inch thick mortar coat.

604-3.04 Leaching Basins. Leaching basins shall be constructed in accordance with these specifications and the contract plans.

604-3.05 Pipe Entries. All pipe(s) built into the wall(s) of a drainage structure shall be flush with the inside face of the drainage structure wall and shall project outside a sufficient distance to allow connection with the adjoining section. The wall knockouts and sealing the space around the pipe shall be in accordance with the Standard Sheets. The bell of concrete pipe shall be cut off at every pipe entry where the bell enters the drainage structure.

604-3.06 Steps. Drainage structures steps may be cast or bolted in place during construction, mortared with a concrete grouting material after the structure is completed or attached by friction locking into preformed or drilled holes. The steps shall clear all pipes. Steps in risers and conical top sections shall be aligned to form a continuous ladder with rungs equally spaced vertically in the completed structure at a maximum distance of 16 inches. Steps shall be embedded into the walls of the riser or conical top section a minimum of 3 inches. The rung shall project a minimum clear distance of 4 inches from the walls of the riser or conical sections measured from the point of embedment.

604-3.07 Frames and Grates. Frames and grates shall be as specified in the contract documents. Frames located in the top slab or top of the uppermost riser shall be secured and held in place by a minimum of 4 stirrups or studs per frame, welded to the frame near the corners. Parallel bar frames shall contain shear stud anchors, for the purpose of transferring loads, as required and detailed on the standard sheet for parallel bar grates and frames. Shear stud anchors, when required, shall replace the frame securing stirrups or studs.

604-3.08 Altering Drainage Structures, Leaching Basins and Manholes. Reconstruction and adjustment of existing drainage structures shall be as detailed and specified on the contract plans. Construction with cast-in-place concrete shall conform to the requirements of Section 555, Structural Concrete.

Frames, grates and covers to be reused shall be removed, cleaned and reset at the required elevations. New frames, grates and manhole covers shall be installed when specified. Upon completion, each structure shall be cleaned of any accumulation of silt, debris or foreign matter of any kind and shall be kept clear of such accumulation until final acceptance of the work.

604-3.09 Adjustment Rings and Frames for Drainage Structures and Manholes. Prior to the placement of the surface course and after the placement of the binder course, when required, the Contractor shall install adjustment rings and frames for manholes and drainage units. The adjustment ring or frame shall be placed so the manhole cover or drainage unit grate will not protrude above the finished surface of the pavement.

To assure a firm and secure fit with the adjustment ring or frame, the seat of the existing manhole casting or drainage unit frame shall be free of all foreign material at the time of installation. The entire assembly shall be set on the seat of the existing manhole casting or drainage unit frame and the locking devices shall be tightened evenly. The manhole cover or drainage unit grate shall then be set upon the seat of the adjustment ring or frame.

The Contractor shall be responsible for insuring that the adjustment rings and frames are compatible with the existing manhole castings and covers or drainage frames and grates.

All rings or frames shall be protected from displacement caused by traffic maintained on the roadway or equipment used in the paving operation.

The Contractor shall have the option of removing and resetting the existing manhole casting or drainage unit frames to the required grade where shown on the plans or approved by the Engineer.

604-3.10 Transverse Drainage Interceptors. This work shall consist of the construction of reinforced concrete transverse drainage interceptors with frames and grates, and dowels as shown on the plans or Standard Sheets. Unless specifically designated on the plans and/or in the proposal, the Contractor shall have the option of constructing cast-in-place or precast transverse drainage interceptors.

A. Cast-in-Place. Cast-in-place transverse drainage interceptors shall conform to the requirements of Section 555 Structural Concrete. The cast-in-place interceptors shall be constructed so that they have construction joints at a maximum spacing of 24 feet, unless the Engineer gives written directions otherwise or a longer length is specified on the plans.

B. Precast Interceptors. Precast interceptors shall be laid in reasonably close conformity to line and grade and shall have a full, firm and even bearing at each joint and along their entire length.

They shall be handled and assembled in accordance with the manufacturer's instructions, except as modified on the plans or by the Engineer's written directions. Six (6) 1/4 inch thick Premoulded Resilient Joint Filler shall be placed in the joint between the units, and the lifting hole and dowels shall be grouted with material conforming to §701-04 or §701-05.

Underdrain and Underdrain Filter shall be installed when shown on the plans or directed by the Engineer.

The underdrain pipe shall be installed in accordance with §605-3.01, and the underdrain filter shall be placed in accordance with §605-3.02 except when the details of either or both are modified on the plans or by the Engineer's written order.

604-3.11 Backfill. No structure shall be backfilled until all the mortar has completely set. The requirements of Section 203, *Select Granular Fill* §203-3.15, *Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cable*, shall apply.

Comment [c81]:
E109024

604-4 METHOD OF MEASUREMENT

604-4.01 Drainage Structures, Leaching Basins and Manholes. Drainage structures, leaching basins and manholes will be measured for payment by the number of linear feet of height measured to the nearest tenth of a foot from the bottom of the base to the top of the masonry, including the top slab.

604-4.02 Transverse Drainage Interceptors

A. Cast-In-Place. Cast-in-place transverse drainage interceptors will be measured by the actual length of interceptor placed.

B. Precast. Precast transverse drainage interceptors will be measured by multiplying the number of whole units by the nominal length of each unit and adding thereto the length of any fractional units incorporated in the work. The nominal length of the units shall be indicated on the Standard Sheet.

604-4.03 Altering Drainage Structures, Leaching Basins and Manholes. Altering drainage structures, leaching basins and manholes will be measured by the number of structures altered.

604-4.04 Adjustment Rings and Frames for Drainage Structures and Manholes. This work will be measured by the number of prefabricated adjustment rings or frames furnished and installed.

604-5 BASIS OF PAYMENT

§604

604-5.01 Drainage Structures, Leaching Basins and Manholes. The unit price bid per linear foot shall include the cost of all labor, equipment and materials, including bar reinforcement and welded wire fabric, necessary to complete the work, except the following:

A. Excavation. Excavation will be paid for under Trench and Culvert Excavation.

B. Backfill. Backfill of drainage structures and leaching basins will be paid for under the item(s) shown in the contract documents.

C. Frames, Covers and Grates. Frames, covers and grates will be paid for under the appropriate payment items for Frames and Grates in Section 655.

604-5.02 Contractor Options. When the specifications allow the Contractor to substitute a precast circular drainage unit in lieu of a rectangular drainage unit or the Contractor constructs a flat slab reducer design under the provisions of §604-3.02, the following basis of payment provisions will apply.

1. §604-5.01 will apply.
2. Payment for excavation and backfill will be for those quantities determined for the original structure.
3. No adjustments will be made to the unit price bid for the original structure.

604-5.03 Altering Drainage Structures, Leaching Basins and Manholes. The unit price bid for each shall include the cost of all materials, labor and equipment necessary to satisfactorily complete the work including all necessary cleaning, excavation, backfill, and replacement of any pavement, shoulder and sidewalk courses, subcourses, curbs, drives, lawns and any other surface. Frames, covers or grates to be reused that are broken by the Contractor's operations shall be replaced at the Contractor's expense. New frames, covers and grates will be paid for under the appropriate payment items for Frames and Grates in Section 655.

604-5.04 Adjustment Rings and Frames for Drainage Structures and Manholes. The unit price bid for each adjustment ring or frame shall include the cost of all material, labor and equipment necessary to satisfactorily install the adjustment rings and frames. If the Contractor elects to reset the existing casting or frames, the costs of the work involved in the removal and replacement of existing disturbed pavement shall be included in the price bid for the adjustment rings and frames.

604-5.05 Transverse Drainage Interceptors. The price per linear foot bid for this work shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except the excavation will be paid for under Trench and Culvert Excavation, and the Underdrain and Underdrain Filter will be paid for under their respective items.

Payment will be made under:

Item No.	Item	Pay Unit
604.01	Leaching Basin	Foot
604.06	Transverse Drainage Interceptors	Foot
604.07XXYY	Altering Drainage Structures, Leaching Basins and Manholes XX = Region (01 through 11) YY = Serialized 01 to 99 *	Each
604.10	Prefabricated Adjustment Rings for Manholes	Each
604.11	Prefabricated Adjustment Frames for Drainage Structures	Each
604.30XXYY	Rectangular Drainage Structure XX = Structure Type ** YY = Frame No. **	Foot
604.31XXYY	Rectangular Drainage Structure with Round Option XX = Structure Type ** YY = Frame No. **	Foot
604.32XXYY	Rectangular Drainage Structure with Concrete Cap	Foot

	XX = Structure Type **	
	YY = Frame No. **	
604.40XX	Round Precast Manhole	Foot
	XX = Type **	
604.50XXYY	Special Drainage Structure	Foot
	XX = Region (01 through 11)	
	YY = Serialized 01 to 99 *	

* Serialized number identified structure detailed on the plans.

** Structure type and frame number are as defined on the Drainage Structure Details Standard Sheets and the Grate and Frame Standard Sheets.

SECTION 605 - UNDERDRAINS

605-1 DESCRIPTION. The work shall consist of constructing underdrain installations in accordance with these specifications and in conformity with the lines, grades, and cross-sections shown on the plans or established by the Engineer.

605-2 MATERIALS

605-2.01 Underdrain Pipe. Underdrain pipe shall meet the requirements specified in the following subsections of Section 700- Materials and Manufacturing for the type of pipe specified in the contract documents:

Corrugated Steel Pipe - Type III	707-02
Porous Concrete Pipe Underdrain	706-05
Extra Strength Porous Concrete Pipe Underdrain	706-05
Perforated Corrugated Polyethylene Underdrain Tubing	706-13
Corrugated Aluminum Pipe - Type III	707-13
Perforated Polyvinyl Chloride Underdrain Pipe	706-18

Optional underdrain pipe shall meet the requirements of any of the above listed subsections of Section 700- Materials and Manufacturing at the Contractors option except that porous concrete and vitrified clay pipe shall not be permitted in an edge of pavement underdrain installation. Aluminum and steel shall be 16 gage.

605-2.02 Granular Filter Materials. Underdrain Filter Material shall consist of crushed stone, sand, gravel or screened gravel. Material tests and quality control methods pertaining to the item requirements and work of this Section will be performed in conformance with the procedures contained in the appropriate Departmental publication in effect on the date of advertisement of the project. These publications are available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau.

The procedure for acceptance or rejection of these materials shall be as described in the appropriate [Geotechnical Control Procedure \(GCP\)](#) ~~Soil Control Procedure (SCP)~~ manual.

Underdrain Filter Type I and Type II shall be stockpiled.

A. Underdrain Filter Type I

1. Soundness:

The soundness of material meeting the requirements of §703-02, Coarse Aggregates or §703-10, Lightweight Aggregates, is acceptable for Underdrain Filter Type I. When the Contractor elects to use material from sources not approved under §703-02 or §703-10, the soundness of the material shall be tested and shall have a loss not exceeding 20 percent by weight after four cycles of the Magnesium Sulphate Soundness Test.

2. Gradation:

Sieve Size Designation	Percent Passing by Weight
1 inch	100
1/2 inch	30 - 100
1/4 inch	0 - 30
No. 10	0 - 10
No. 20	0 - 5

B. Underdrain Filter Type II

1. Soundness:

The soundness of material meeting the requirements of §703-02, Coarse Aggregates or §703-10, Lightweight Aggregates, is acceptable for Underdrain Filter Type II. When The Contractor elects to use material from sources not approved under §703-02 or §703-10, the soundness of the material shall be tested and shall have a loss not exceeding 20 percent by weight after four cycles of the Magnesium Sulphate Soundness Test.

2. Gradation:

Sieve Size Designation	Percent Passing by Weight
1/2 inch	100
1/4 inch	20 - 100
No. 10	0 - 15
No. 20	0 - 5

C. Underdrain Filter Type III. Material for Underdrain Filter Type III shall meet the gradation and quality requirements of §703-07 Concrete Sand.

605-3 CONSTRUCTION DETAILS

605-3.01 Underdrain Pipe. The construction details of Section 603 shall apply. The type of filter material to be used at any location will be as shown on the plans unless otherwise directed by the Engineer. A carefully leveled and compacted bed of this material shall be prepared just prior to the placement of the underdrain pipe. The upgrade end of corrugated polyethylene underdrain pipe shall be closed with a solid plastic cap; the upgrade end of all other types of underdrain pipe shall be closed with a suitable plug. Unless otherwise shown on the plans or specified by the Engineer, the underdrain pipe shall be placed with the perforations down. In the event that the semi-circular option of the Steel Pipe underdrain is utilized, the pipe shall be placed such that the flat surface is on the top.

A. Perforated Corrugated Polyethylene Underdrain Tubing and Perforated Polyvinyl Chloride Underdrain Pipe. When these underdrains are daylighted through the side slope they shall be protected from sunlight by using a minimum 3 feet long section of corrugated steel or aluminum pipe at the outlet. The metal pipe, shielding the underdrain, shall extend a minimum of 6 inches into the ground and overlap the underdrain by a like distance for 4 and 6 inch underdrains. For underdrains from 8 inches through 12 inches the shielding pipe shall extend at least 12 inches into the ground and overlap the underdrain by a like distance. In no case shall the outlet end of the underdrain be exposed or extend beyond the end of the metal pipe shielding it. The metal pipe for shielding the underdrain shall be of such internal diameter to easily slip over the underdrain. To prevent intrusion of the filter material into the joint between the metal and underdrains, one of the following methods shall be used: A reducer fitting placed over the joint, roofing felt wrapped around the joint, or another method approved by the Engineer.

Perforated corrugated polyethylene underdrain tubing and perforated polyvinyl chloride underdrain pipe will melt and burn when exposed to flame. Flame damage or damage by deterioration, crushing or stretching will be cause for rejection.

B. Optional Underdrain Pipe. The Contractor shall not intermix types of underdrain in the same run of pipe.

605-3.02 Underdrain Filter. After the pipe installation has been inspected and approved, Underdrain Filter shall be loosely placed around and over the pipe to such a depth that, after compaction, Underdrain Filter will extend to a level 6 inches above the underdrain pipe or to the next course, whichever is less. Subsequent lifts of Underdrain Filter shall be no more than 6 inches thick prior to compaction and shall be compacted by two passes of an approved vibrating pad or drum type compactor. The remainder of the installation shall be in accordance with the applicable standard sheet or as indicated on the plans.

For corrugated polyethylene underdrain tubing the filter material shall be placed around and over the tubing to such a depth that, after compaction, the underdrain filter material shall extend to a level 12 inches above the underdrain tubing or to the next course, whichever is less above the tubing. At this stage the surface of the filter material shall be compacted by three passes of a vibrating pad or drum type compactor. The remainder of the backfill shall be placed in maximum 2 foot loose lift thicknesses and compacted by three passes of a vibrating pad or drum type compactor after the placement of each lift.

In the event that a pipe is not included in this installation, the filter shall be placed in horizontal layers not exceeding 6 inches in thickness prior to compacting. Each lift shall be compacted by two passes of an approved vibrating pad or drum type compactor.

No compaction control tests will be required.

605-3.03 Underdrain Filter at Structures. Underdrain Filter, Type I material, shall be placed adjacent to structures as specified on the contract plans. The lift thickness for the loose Type I material shall not exceed 6 inches and shall precede the placement of each lift of the adjacent backfill material. A physical barrier may be used to facilitate placement of the Underdrain Filter and adjacent backfill. This barrier shall not be left in place and shall be removed prior to compaction of the material. Each lift of filter material and backfill material located within a minimum distance of 3 feet from the backwall plus the footing heel projection shall be compacted simultaneously. Compactive effort for this material shall be provided by two passes of a vibratory compactor approved by the Engineer. Placement and compaction operations shall be conducted in a manner so as to insure that the top surface of each lift of Type I filter material shall not be contaminated by the adjacent backfill materials. No compaction control tests will be required for the Type I filter material.

605-4 METHOD OF MEASUREMENT

605-4.01 Underdrain Pipe. The quantity of underdrain pipe to be paid for will be the number of linear feet of pipe incorporated in the completed work in accordance with the plans and specifications and as directed by the Engineer.

605-4.02 Underdrain Filter. The quantity of underdrain filter material to be paid for under this item will be the number of cubic yards of material computed between the payment lines as shown on the plans, or where changes have been ordered, as established by the Engineer. A deduction shall be made for pipes (based on nominal diameters) and other payment items, when the combined cross-sectional area exceeds 1.0 square foot, unless otherwise shown on the plans. No deduction will be made for the cross-sectional area of an existing facility.

If the excavation for the underdrain extends outside these payment lines, it shall be backfilled with Underdrain Filter material meeting the requirements of this specification, furnished and installed at the Contractor's expense.

605-4.03 Underdrain Filter at Structures. The quantity of Underdrain Filter Type I material shall be computed for payment as the number of cubic yards within the payment lines shown on the contract

§605

plans or as modified by the Engineer. No deduction will be made for the volume occupied by the underdrain pipe.

605-5 BASIS OF PAYMENT

605-5.01 Underdrain Pipe. The unit price bid per linear foot for this work shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

Excavation, granular fill and backfill will be paid for separately under their appropriate items in Sections 203 and 206, as applicable.

605-5.02 Underdrain Filter. The unit price bid per cubic yard shall include the cost of furnishing all labor materials and equipment necessary to complete the work. No direct payment will be made for any losses of material which may result from compaction, foundation settlement, erosion, or any other causes; the cost of such losses shall be included in the price bid for this item. Any contaminated underdrain filter material shall be replaced by the Contractor as directed by the Engineer at no cost to the State.

Excavation, granular fill and backfill will be paid for separately under their appropriate items in Sections 203 and 206, as applicable.

Payment will be made under:

Item No.	Item	Pay Unit
605.04xx	Porous Concrete Pipe Underdrain	Foot
605.05xx	Extra Strength Porous Concrete Pipe Underdrain	Foot
605.07xx	Corrugated Steel Pipe - Type III	Foot
605.08xx	Corrugated Aluminum Pipe - Type III	Foot
605.0901	Underdrain Filter, Type I	Cubic Yard
605.1001	Underdrain Filter, Type II	Cubic Yard
605.1101	Underdrain Filter, Type III	Cubic Yard
605.15xx	Perforated Corrugated Polyethylene Underdrain Tubing	Foot
605.16xx	Perforated Polyvinyl Chloride Underdrain Pipe	Foot
605.17xx	Optional Underdrain Pipe	Foot

Refer to the Standard Contract Pay Item Catalog for full Item Number and full Description.

SECTION 606 - GUIDE RAILING

606-1 DESCRIPTION. This work shall consist of the construction, reconstruction, removal, disposal, storage, and resetting of highway barrier systems and component parts in accordance with the specifications, standard sheets, manufacturer's drawings, manufacturer's directions and contract documents to the lines and grades shown on the plans or established by the Engineer.

The types of barrier systems are designated as follows:

Cable Guide Railing and Median Barrier.
Corrugated Beam Guide Railing and Median Barrier
Heavy Post Blocked-Out Corrugated Beam Guide Railing and Median Barrier
Box Beam Guide Railing and Median Barrier
Concrete Barrier
Pier Protection

606-1.01 I-Beam Posts for Existing Highway Barrier. Under this work the Contractor shall furnish and install I-beam posts and necessary hardware for existing highway barriers in accordance with the plans, specifications, and as directed by the Engineer.

606-1.02 Guide Railing with Extra Long Posts. Under this work the Contractor shall furnish and install guide railing of the type specified with extra long (7 foot) posts in accordance with the contract documents, and as directed by the Engineer.

606-1.03 Retensioning Existing Cable Guide Railing And Median Barrier. Under this work the Contractor shall retension existing guide rail and median barrier cables in accordance with the Contract Documents.

606-2 MATERIALS. Materials shall meet the requirements specified in the following subsections of Section 700-- Materials and Manufacturing and ASTM Specifications:

Concrete Grouting Material	701-05
Precast Concrete Median Barrier	704-05
Premoulded Resilient Joint Filler	705-07
Joint Filler	ASTM D1056
Wire Fabric For Concrete Reinforcement	709-02
Epoxy Coated Bar Reinforcement, Grade 60	709-04
Wood and Timber Posts and Timber Blockouts	710-13
Galvanized Steel Barrier Posts	710-14
Corrugated Beam Guide Railing and Median Barrier	710-20
Box Beam Guide Railing and Median Barrier	710-21
Cable Guide Railing and Median Barrier.	710-22
Box Beam End Assembly Type III and Box Beam Median Barrier End Assembly, Type C	710-24
Guide Rail and Median Barrier Systems (Rustic)	710-25
Plastic and Synthetic Block-Outs for Heavy Post Guiderail Systems	710-26
Galvanized Coatings And Repair Methods	719-01
Epoxy Polysulfide Grout	721-03
Anchor Bolts	723-60
Reflective Sheeting	730-05 (Materials Designation 730-05.02)
Paint for Galvanized Surfaces	708-06
Rolled Steel Channels for Continuity Connections	ASTM A36
Steel Plates for Continuity Connections	ASTM A36

606-2.01 Steel Hardware. Steel posts, plates, channels, stiffeners, block-outs, angles, brackets, slipbases and other miscellaneous steel hardware not referenced to or specified by §710-14, §710-20, §710-21, §710-22, §710-24 or other sections of this specification shall be fabricated as shown in the contract plans and documents from steel meeting the requirements of ASTM A36 unless specified otherwise. All components shall be galvanized in accordance with §719-01, Type I or II. Components shall be fabricated prior to galvanizing. Similar hardware associated with Rustic barrier systems shall meet the requirements of §710-25.

606-2.02 Anchor Bolts and Studs. Anchor bolts and studs embedded or grouted in concrete for securing post and railing base plates shall meet the requirements of §723-60. Nuts and washers shall meet the requirements of ASTM A325.

Anchor studs, bolts or rods embedded in concrete anchorage units for terminating guide rail and median barrier systems shall have minimum yield and tensile strength meeting the requirements of ASTM A307 Grade A.

§606

Anchor studs, bolts, rods, nuts and washers shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type II unless indicated otherwise on the plans or standard sheets.

Grout for anchor studs and bolts shall conform to the requirements of §721-03, §701-07 or §701-05.

606-2.03 Fasteners. Bolts, nuts and washers shall conform to the following unless specified otherwise on the plans, standard sheets, manufacturer's drawings, or in the contract documents.

Bolts	ASTM A307 Grade A
Nuts	ASTM A563 Grade A or Better
Washers	ASTM F436

Bolts, nuts and washers shall be galvanized in accordance with the provisions of §719-01 Galvanized Coatings and Repair Methods, Type II. Fasteners associated with Rustic barrier shall meet the requirements of §710-25 Guide Rail And Median Barrier Systems (Rustic).

606-2.04 I-Beam Posts for Existing Highway Barrier. I-beam posts for existing highway barrier shall conform to the requirements of §710-14 Galvanized Steel Barrier Posts or §710-25 Guide Rail And Median Barrier Systems (Rustic) as specified or required in the contract documents. Posts shall conform to the details shown on the plans or the latest edition of the standard sheet for the guide railing or median barrier affected. Hardware (nuts, bolts, "J" bolts, offset beams or block-outs, back up plates, washers, and shelf angles) necessary shall conform to the requirements of the current specifications and standard sheets for the highway barrier affected.

606-2.05 Extra Long Guide Rail Posts. Extra long Guide Rail Posts shall conform to the requirements of §710-14 Galvanized Steel Barrier Posts or §710-25 Guide Rail And Median Barrier Systems (Rustic) as specified or required in the contract documents. The posts shall conform to the details for extra long posts shown on the standard sheets or plans.

606-2.06 Concrete for End Assembly Anchorage Units. Cast-in-place concrete shall meet the requirements of Class A Concrete in Section 501 Portland Cement Concrete-General. The Contractor may submit, for approval by the Director of the Materials Bureau, a mix at least equivalent to the specified Class A Concrete, with a minimum cement content of 575 lb/cu yd.

Precast concrete anchorage units, when selected as an alternate to cast-in-place units by the Contractor, shall meet the requirements of Section 704-03 Precast Concrete-General.

606-2.07 Concrete Barrier

A. Precast Concrete Barrier. The requirements of §704-05 shall apply

B. Cast-in-Place Concrete Barrier. Concrete shall meet the requirements specified for Class A Concrete in §501, Portland Cement Concrete--General. Reinforcement shall meet the material requirements §606-2 and be of the type and sizes as indicated on the standard sheets and plans.

C. Machine Formed Concrete Barrier. The concrete shall meet the requirements specified for Class I Concrete in §501, Portland Cement Concrete--General. Reinforcement shall meet the material requirements of §606-2 and shall be of the type and sizes as indicated on the standard sheets and plans.

606-2.08 Resetting Guide Railing, Median Barrier, Anchorage Unit Assemblies and End Assemblies. The materials comprising the existing system shall be used if they conform to the materials requirements specified for new guide rail systems and are found to be in satisfactory condition as determined by the Engineer. The Contractor shall supply all new hardware (splice tongues, plates, nuts, bolts, washer, etc.) Replacement materials shall meet the material requirements specified for new guide

rail systems. Galvanizing of railing and posts may be repaired in accordance with §719-01, Galvanized Coatings and Repair Methods.

606-2.09 Heavy Post Blocked-Out Corrugated Beam Guide Railing and Median Barrier.

The material requirements for §710-20 Corrugated Beam Guide Railing and Median Barrier shall apply except that posts, timber, plastic or synthetic block-outs, soil plates, expansion anchors, hardware and fasteners shall be as detailed on the standard sheets for Heavy Post Blocked-Out Corrugated Beam Guide Railing and Median Barrier. The Wood and Timber Posts and Timber Block-Outs shall conform to §710-13. The Plastic and Synthetic Block-Outs for Heavy Post Guiderail Systems shall conform to §710-26.

606-2.10 Corrugated Beam Guide Rail Transition To Bridge Rail, Concrete Barrier and Concrete Parapets. Corrugated beam rail sections shall conform to the requirements of §710-20. All remaining material shall conform to the requirements of §710-23 except that:

A. Posts for rustic barrier shall conform to the requirements of §710-25.
 B. Block-outs and stiffening channels shall conform to ASTM A36.
 C. All components shall be galvanized in accordance with §719-01 *Galvanized Coating and Repair Methods*, Type I or Type II. If required by the plans, the components shall be painted to match the existing railing. Painting shall be done in accordance with Section 657 except that:

1. Painting with rollers will not be permitted.
2. Spray painting will be allowed only if the components are painted at a location away from the work site, acceptable to the Engineer.

D. Shop drawings will not be required. Approval of the system will be made by the Engineer.

606-2.11 Rustic Barriers. Materials for rustic box beam and corrugated beam guide rail and median barrier systems respectively shall meet the requirements of §710-25. When rustic posts are specified for cable barriers the posts shall meet the requirements for posts of §710-25.

606-2.12 Pier Protection. Half section concrete barrier units shall be precast and conform to the requirements of §704-05 Precast Concrete Median Barrier. The box beam guide rail shall conform to the requirements of §710-21 Box Beam Guide Railing and Median Barrier.

606-2.13 (Vacant)

606-2.14 Transitions Constructed of, or with, Concrete. Concrete transition between concrete barriers of different shapes and the concrete elements of transitions between metal barriers and concrete barriers shall conform to §606-2.07 Concrete Barrier, A. Precast Concrete Barrier or, with the permission of the Engineer, B. Cast-in-Place Concrete Barrier.

606-3 CONSTRUCTION DETAILS

606-3.01 General. All barrier systems and transitions described by these specifications shall be subject to the following requirements.

A. Inspection of Rail Elements. Immediately prior to erection, the rail elements shall be inspected for damage. Bends or kinks in the railing, not specifically required by the contract documents, shall constitute sufficient cause for rejection. Straightening of such bends or kinks will not be allowed.

Erection of all guide rail, median barrier, transitions and connections shall be subject to the inspection of the Engineer who shall be given all facilities required for a visual inspection of workmanship and materials.

B. Field Galvanizing For Repair. Field galvanizing repair shall be allowed only when the total damaged area on each piece or component is less than 2 percent of the coated surface, or 16 square inches, whichever is less. Any single piece or component with total damaged area greater than the amount specified above shall be rejected and replaced by the Contractor. Field galvanizing repair shall be done in accordance with the requirements of the Repair section of §719-01 Galvanized Coating And Repair Methods.

C. Field Welding. Field welding shall not be permitted unless noted in the contract documents. When specified, welding shall comply with the requirements of the SCM.

D. Erection. Posts, railing, barrier systems, rail transitions, end assemblies, anchorage units, and pier protection shall be erected in the position and manner indicated on the standard sheets, manufacturer’s drawings’, manufacturer's directions and contract plans and in a manner approved by the Engineer. Rail mounting height shall be within ± 1/4 inch of that indicated on the standard sheets and plans.

Prior to installing guide rail, median barrier, transitions, or end terminals, the Contractor shall determine the locations of all structures, including underground structures, that may be affected by the installation. If the determinations disclose that there are conflicts between the proposed installation of guide rail, median barrier, transition, or end terminal and other structures, including underground structures, the Contractor shall discuss with and recommend to the Engineer alternative locations or types of guide rail, median barrier, transition, or end terminal, subject to the approval of the Engineer, that will not be in conflict with the structure, including underground structure.

Posts and foundation tube(s) shall be driven unless otherwise specified by the Engineer. The driving shall be accomplished with approved equipment and methods that will leave the posts and foundation tube(s) in their final position, free of any distortion, burring or other damage. When posts and foundation tube(s) are driven through asphalt concrete or a bituminous treated material, the Contractor shall take care to prevent damage to the paved or treated areas. Large holes and voids caused by driving the posts and foundation tube(s) shall be filled and compacted with a bituminous treated material or asphalt concrete similar to that damaged. The small area adjacent to the post and foundation tube(s) disturbed during installation or where gaps exist at the post and foundation tube(s) after pavement repairs shall be sealed with a bituminous material approved by the Engineer.

As an alternate to driving posts and foundation tube(s) on unpaved medians and where site conditions are such that driving is not possible, the Contractor shall carefully excavate for all post and foundation tube(s) holes. Post and foundation tube(s) holes and post and foundation tube(s) foundation structures shall be backfilled and backfilled material compacted in accordance with [Section 203, Select Granular Fill](#) ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.~~

Comment [c82]:
EI09024

On structures, concrete anchors and paved medians, base plates for posts shall be anchored as shown in the Contract Documents and as specified by the Engineer. Where drilling and grouting is required, the Contractor shall take care to prevent damage to the concrete, asphalt or other paved surfaces. The proposed construction method and equipment for drilling and grouting of holes shall be submitted to the Engineer for approval before drilling and grouting operations begin. Anchoring devices shall be grouted with §701-05 Concrete Grouting Material, §701-07 Anchoring Materials-Chemically Curing or §721-03 Epoxy Polysulfide Grout.

The work of installing the guide railing system when it abuts stabilized shoulder courses shall be coordinated and progressed to provide the least disturbance between the two phases of the work.

All posts shall be aligned to a tolerance of 1/4 inch for plumb and grade line.

Curved box beam and corrugated beam guide railing and median barrier rail elements shall require shop curving in accordance with Table 606-1.

TABLE 606-1 SHOP CURVED GUIDE RAILING AND MEDIAN BARRIER	
Barrier Type	Radius Requiring Shop Curving
Box Beam Guide Railing	Equal to or less than 720 ft
Box Beam Median Barrier	Equal to or less than 1525 ft

Corrugated Beam Guide Railing	Equal to or less than 150 ft
Corrugated Beam Median Barrier	Equal to or less than 150 ft

When shop curving is required, the rail element shall be shop-worked to the radius that the barrier will be installed on.

E. Concrete Anchorage Units. Concrete anchors shall be constructed as detailed on the standard sheets. Excavation shall meet the requirements of §206-3 of the Standard Specifications. The bottom of the anchor shall have a full and even bearing on the surface under it. After the concrete anchor is in place, the excavation shall be backfilled in accordance with [Section 203, *Select Granular Fill*](#), ~~§203-3.15 of the Standard Specifications.~~

Comment [c83]:
EI09024

F. End Terminals and Assemblies. The following shall apply to end terminals or assemblies to be installed under this section.

1. Drawings. For end terminals and end assemblies not shown on standard sheets or detailed in the plans, the Contractor shall submit two copies of the manufacturer’s drawings, modified as necessary to reflect site conditions, to the Engineer for approval prior to ordering any materials required under this section. Drawings of parts not detailed on the plans, but which are necessary to develop the full performance of the end assemblies or terminals shall also be provided. The Contractor shall commence work of installation of end assemblies or terminals only after approval of the above mentioned drawings and authorization from the Engineer to do so.

2. Manuals. In addition to the drawings mentioned above, the Contractor shall deliver to the Engineer two (2) copies of design manuals, installation manuals, parts lists, and maintenance manuals prepared for each type end terminal or assembly being installed but not shown on the standard sheet.

3. Coordination with Other Work. The work of furnishing and installing all types of end assemblies shall be coordinated with the removal of existing impact attenuators or end assemblies, the installation of guide railing or median barrier, or the installation of the object to be shielded, so as to minimize the time that motorists are exposed to the possibility of collision with the shielded object, unprotected ends of barriers, or incomplete end terminals or assemblies. Also, the contractor shall minimize exposure of approaching vehicular traffic to the possibility of impact on the back of the end assembly. Unless modified in the Contract Documents, minimization shall mean seven (7) or fewer calendar days.

4. Traffic Protection. Traffic protection devices, such as cones, drums, lights, signs, barricades, or other articles directed by the Engineer, shall be provided and maintained under their respective pay items. These devices shall not be removed until the end assembly, including required transition pieces, is fully operational. If the end assembly is to be installed in lighted areas, or in areas to be lighted, the mentioned traffic protection articles shall also be maintained until the lighting system is operational.

606-3.02 Cable Guide Railing and Median Barrier. Beginning with the first post where the rail is parallel to the edge of pavement, every sixth post in the line of guide rail shall be reflectorized (96 foot spacing for reflectors) except those posts in the approach terminal and intermediate anchorage area, which curve away from the shoulder, or used in a median barrier. The reflector and method of attachment shall be as indicated on the standard sheet.

A. Anchorage Unit Assemblies. After the posts are driven to the specified line and grade, anchor angles and anchor posts shall be adjusted in the field to provide a full and even bearing on the underlying surface.

B. Cable Tensioning. The Contractor shall install and tension the cable of guide railing and median barrier as follows: Properly seat the spring compensation device and then permanently mark the unloaded position. Complete the assembly of the guide railing and set the compensating devices to a spring compression of 3 1/2 inches. Leave the springs at this setting for at least 2 weeks, then set them to the proper setting according to temperature from the data in the table on the standard sheets.

C. Cable Splicing. The Contractor shall install cable splices in the following manner: Place a splice end over the cable. Twist the cable to separate the three strands. Insert the wedge into the center of the strands, leaving at least one inch of excess cable, and pull the cable back until the wedge is snug to the splice. Pound the wedge into the splice. Crimp at least one wire of the cable over the wedge. Repeat the procedure for the other cable. Connect the two splice ends together.

606-3.03 Box Beam Guide Railing and Median Barrier. Rail sections for tangent runs shall be at least 18 feet long. Rail splices shall be a minimum of 18 inches from the centerline of any post.

During non-working hours, exposed approach ends (free ends) of the box beam guide railing or median barrier shall be temporarily terminated with box beam guide railing end assemblies utilizing two splice plates and eight bolts per temporary termination connection. No posts for anchorages will be required. Special temporary splice plates will be needed to adapt box beam guide railing end assemblies to box beam median barrier.

606-3.04 Corrugated Beam Guide Railing and Median Barrier, and Heavy Post Blocked-Out Corrugated Beam Guide Railing and Median Barrier. In the erection procedures, the free end of the rail element shall not be allowed to swing free and cantilever around the mounting bolt. The free end shall be supported in a manner approved by the Engineer while the splice bolts and mounting bolts are fastened.

During non-working hours, exposed approach ends (free ends) of the guide railing or median barrier shall be dropped to the ground and pinned in a manner approved by the Engineer.

A. Corrugated Beam Guide Railing and Median Barrier. The rail elements shall be installed so the weight of the beam rests on the double nutted support bolt before the 5/16 inch mounting bolts are torqued. Before the final torquing, six of the 5/16 inch mounting bolts in the installation shall be selected at random and with a suitable torque wrench tightened to failure. The six readings shall be averaged, the six failed bolts replaced and all the mounting bolts in the installation torqued to 50% of the average value.

Support bolts shall be installed on all the guide rail posts except the three posts adjacent to the anchors.

B. Heavy Post Blocked-Out Corrugated Beam Guide Railing and Median Barrier. The heavy post blocked-out corrugated beam guide railing shall be erected from the approach end anchorage unit and down stream along the flow of traffic.

The heavy post blocked-out median barrier shall be erected from one of the anchorage sections and shall be completed as the work progresses. During non-working hours no uncompleted anchorage units or heavy posts without rail will be permitted on either heavy post blocked-out guide railing or median barrier.

For heavy post blocked-out corrugated beam guide railing connections to walls (trailing ends), the holes for the expansion anchors shall be drilled to the minimum depths and diameters shown on the plans or standard sheets or to larger values if specified by the manufacturer. The holes shall be drilled with care to avoid damage to the wall. Any damage caused by the drilling operation shall be repaired by the Contractor and to the satisfaction of the Engineer.

606-3.05 Concrete Barrier. Unless specified otherwise in the contract documents the Contractor shall have the option of providing precast concrete barrier, cast-in-place concrete barrier, or machine formed barrier. No intermixing in any run of barrier will be permitted unless shown otherwise in the contract

documents except that precast transition sections and ends may be used with cast-in-place or machine formed concrete barriers.

Half section concrete barrier shall be erected with the appropriate back-up posts and continuity plates or earth back-up as shown on the standard sheets and plans.

A. Precast Concrete Barrier

1. Placement. Immediately prior to installation, the Engineer shall inspect the sections for manufacturing defects or shipment damage. Damaged or defective sections shall be rejected or repaired in accordance with §704-05. Precast Concrete Barrier, Repair. The sections shall be placed in accordance with the contract plans and proposals.

2. Vertical Expansion Joint. Sections shall be separated by 1/2 inch nominal joint openings. The joint opening, at any point in the plane of the joint, shall not vary by more than 1/4 inch. Premoulded Resilient Joint Filler conforming to the requirements of §705-07 or Joint Filler conforming to the requirements of ASTM D1056 class 2B1 or 2B2 shall be placed in the joint as shown on the plans, standard sheet or as directed by the Engineer.

3. Dimensional Tolerance.

- a. Cross-sectional dimensions shall not vary from the dimensions shown by more than 1/4 inch.
- b. The barrier shall not be out of plumb by more than 1/4 inch.
- c. Longitudinal dimensions shall not vary from the dimensions shown by more than 1/4 inch per 10 foot of the barrier.
- d. When checked with a 10 foot straight edge, irregularities shall not exceed 1/4 inch.

B. Cast-in-Place Concrete Barrier

1. Placing. The Contractor shall have the option of placing the cast-in-place concrete barrier in monolithic form or with a horizontal construction joint between the stem and the rectangular footing.

a. Horizontal Construction Joint Option. When the Contractor elects to use a horizontal construction joint between the stem and the rectangular footing, joint details must be prepared and submitted to the Regional Director for approval. The footing shall be placed in lengths not exceeding 60 feet except when the barrier system abuts a reinforced Portland Cement concrete pavement, then it shall match the length of the pavement slab. Every third vertical joint of the barrier stem shall exactly match the joint formed in the footing.

When the barrier abuts an unreinforced pavement slab, the vertical joint in the footing and stem shall match the pavement joint at every third pavement slab.

b. Monolithic Barrier. When the Contractor elects to use a monolithic barrier the lengths of the sections shall not exceed 20 feet except when the barrier abuts a Portland Cement concrete pavement. Then the sections shall be cast in uniform lengths so that every third joint will exactly match the transverse joint in the pavement when reinforced concrete is used and every joint when unreinforced concrete is used.

2. Joints. The sections of barrier, in monolithic barrier, and of stem in horizontal construction joint barrier shall be separated by vertical expansion joints with provisions for expansion of 1/2 inch at each joint. Premoulded Resilient Joint Filler conforming to the requirements of §705-07 shall be placed in the joint as shown on the plans, standard sheet, or as directed by the Engineer.

3. Forms. Forms shall be metal and of such construction that there will be minimum interference to inspection for grade and alignment. Forms shall be braced and secured adequately so that no discernible displacement from alignment or grade will occur during placement of concrete.

4. Concrete Placing and Vibrating. Concrete shall be placed in the barrier forms in accordance with the requirements of §555-3.04 Handling and Placing Concrete. Concrete shall be compacted by means of immersion type mechanical vibrators approved by the Engineer. The vibrator shall be inserted into the concrete at one foot intervals. The vibrators shall be of size and weight sufficient to thoroughly vibrate the entire concrete mass without damaging or misaligning the forms or reinforcement.

5. Removal of Forms and Finishing Surfaces. Forms shall be left in place for 24 hours or until, in the judgment of the Engineer, the concrete has sufficiently set so that the forms may be removed without injury to the barrier. Immediately after the forms have been removed, surfaces exposed to view shall have all projections and irregularities carefully removed and all cavities neatly filled with mortar of the proportion used in the concrete. The same brand of cement and the same kind of fine aggregate shall be used for filling cavities as was used in the original concrete mix. Surfaces repaired by plastering will not be allowed.

6. Concrete Curing. Curing of concrete median barriers shall conform to the requirements given in 555-3.08 Curing. Other methods of curing may be used only when so indicated on the plans or in the itemized proposal.

7. Reinforcement. The Contractor shall incorporate reinforcement as indicated on the standard sheets and plans. All reinforcing steel shall be epoxy coated meeting the requirements of §709-04.

8. Placement Adjacent to Cement Concrete Pavement or Shoulders. The barrier shall be separated from the cement concrete pavement or shoulder by a 1/2 inch wide vertical joint extending down to the bottom of the pavement or shoulder. The joint shall be formed with and contain Premoulded Resilient Joint Filler conforming to the requirements of §705-07. A recess of approximately one inch shall be provided at the top of the joint for installation of a backer rod and joint sealant. The joint sealant shall be a silicone sealant appearing on the Department's Approved List and shall be applied in accordance with the manufacturer's instructions.

9. Dimensional Tolerance

- a. Cross-sectional dimensions shall not vary from the dimensions shown by more than 1/4 inch.
- b. The barrier shall not be out of plumb by more than 1/4 inch.
- c. Longitudinal dimensions shall not vary from the dimensions shown by more than 1/4 inch per 10 foot of the barrier.
- d. When checked with a 10 foot straight edge, irregularities shall not exceed 1/4 inch.

C. Machine Formed Concrete Barrier

1. Weather Limitations. The requirements of §502-3.01 shall apply.

2. Equipment. The slipforming equipment shall be self-propelled and shall be capable of placing, consolidating and finishing concrete to the proper line and grade. The Engineer may require the Contractor to demonstrate that the specific equipment proposed for use is capable of satisfactorily placing the concrete mix. The Contractor shall furnish the manufacturer's data regarding machine operation to the Engineer.

3. Preparation of the Subbase Course. Before any concrete may be placed, the subbase course shall be compacted and fine graded to a tolerance of $\pm 1/2$ inch of the true grade at any location under the barrier. Whenever possible, as determined by the Engineer, concrete placing operations shall not begin until the subbase course has been fine graded ahead at least 1000 feet.

4. Reinforcement. The Contractor shall incorporate reinforcement as indicated on the standard sheets and plans. All reinforcing steel shall be epoxy coated meeting the requirements of §709-04.

5. Placing Operations

a. Central and Transit Mixed Concrete. The provisions of §501-3.03 C and D shall apply for Central Mixed and Transit Mixed Concrete respectively, except that water may be added at the point of deposition to maintain the desired slump. The water addition may be made at any time after the beginning of the discharge until approximately two-thirds (2/3) of the load, as determined by the Engineer, has been discharged. After the water addition the concrete shall be mixed at least 30 revolutions in the mixing range. When the water additions made after discharge the total number of revolutions shall not be more than 190.

b. Truck Mixed Concrete. The provisions of §501-3.03 E shall apply except that after the initial slump has been achieved, water may be added to the mixture one additional time to maintain the desired slump. The water addition may be made anytime after the beginning of discharge until approximately two-thirds (2/3) of the load, as determined by the Engineer, has been discharged. After the water addition, the concrete shall be mixed at least 30 revolutions in the mixing range.

The slipforming equipment shall have as nearly a continuous forward movement as possible to provide uniform progress with stopping and starting of the equipment held to a minimum. Any edge slump resulting from slipforming operations in excess of 1/4 inch, as measured from the top surface of the median barrier, exclusive of edge rounding, shall be corrected before the concrete has hardened.

Concrete supply shall be sufficient to produce a continuous, completely shaped barrier. If concrete placement is interrupted for a period of time where the delay will affect the quality and structural integrity of the barrier, the contractor shall terminate his operations by one of the following procedures. The Engineer shall determine when the slipform operation is to be terminated.

Method A. Construct a cast in place expansion joint system as detailed on the standard sheets.

Method B. Remove existing unset concrete to a vertical score line with hand tools. The vertical surface resulting from the removed concrete shall remain reasonably rough and unfinished to facilitate interlock and increased bond area when concrete operations are to be resumed. The vertical surface shall be touched up with hand tools, as directed by the Engineer, to correct unacceptable voids, tears and lack of consolidation resulting from the concrete removal. The surface shall be covered with several layers of wet burlap to prevent drying. All reinforcing steel shall extend beyond the face to provide adequate lapping.

Concreting operations may resume at the terminated face when the terminated portion has achieved enough rigidity to withstand the sequence of operations it will be subjected to without sustaining damage. All loose or unacceptable concrete and material shall be removed from the terminated face as directed by the Engineer. Concrete barrier damaged as a result of the contractor's operations shall be repaired to the satisfaction of the Engineer.

Termination of slipform operations at the end of the day for an uncompleted run shall be by method A or B above.

6. Curing. The median barrier shall be cured using a clear curing compound meeting the requirements of §711-05. The compound shall be sprayed on the concrete surface immediately following the placing operation at a rate of 1 gal/ 150 sf.

7. Placement Adjacent to Cement Concrete Pavement or Shoulders. The barrier shall be separated from the cement concrete pavement or shoulder by a 1/2 inch wide vertical joint

extending down to the bottom of the pavement or shoulder. The joint shall be formed with and contain Premoulded Resilient Joint Filler conforming to the requirements of §705-07. A recess of approximately one inch shall be provided at the top of the joint for installation of a backer rod and joint sealant. The joint sealant shall be a silicone sealant appearing on the Department's Approved List and shall be applied in accordance with the manufacturer's instructions.

8. Contraction Joints. Contraction joints shall be formed or saw cut normal to the pavement. The spacing shall be every 20 feet, as shown on the plans or as ordered by the Engineer. The joints shall conform to the dimensions as shown on the plans or standard sheets. If the joints are saw cut, they shall be saw cut as soon as no damage to the concrete will result, with a maximum time of 8 hours. The clear curing compound shall be reapplied at the saw cut.

9. Expansion Joints. Expansion joints shall be formed normal to the pavement with Premoulded Resilient Joint Filler meeting the requirements of §705-07 and shall provide for expansion of 1/2 inch. The filler material shall be cut to conform to the cross section of the barrier.

The expansion joints shall be located at all immovable objects (bridge substructures, etc.), where shown on the plans, and/or as directed by the Engineer. Expansion joints shall not be required at regular intervals unless shown on the plans.

10. Tolerances. All concrete barrier produced by this method shall conform to the following tolerances:

a. Placing Tolerances

- (1) Bar Reinforcement Cover 0 to + 1/2 inch.
- (2) Width (top) 0 to + 1/4 inch.
- (3) Width (base) 0 to + 1/2 inch.

b. Dimensional Tolerance

- (1) Cross-sectional dimensions shall not vary from the dimensions shown by more than 1/4 inch.
- (2) The barrier shall not be out of plumb by more than 1/4 inch.
- (3) Longitudinal dimensions shall not vary from the dimensions shown by more than 1/4 inch per 10 foot of the barrier.
- (4) When checked with a 10 foot straight edge, irregularities shall not exceed 1/4 inch.

11. Defects. Defects are divided into two categories Minor defects and major defects. Minor defects in the barrier may be repaired in the field. Major defects shall be cause for rejection of the section, or the section shall be repaired in the manner directed by the Engineer.

a. Minor Defects. Minor defects are defined as holes, honeycombing or spalls which are 6 inches or less, in diameter, and which do not expose the outermost surface of the steel reinforcement. Surface voids 5/8 inch, or less, in diameter and 1/4 inch, or less, in depth are not considered defects and they do not require repair.

b. Major Defects. Major defects are defined as:

- (1) Any defect which does not meet the definition of a minor defect.
- (2) Minor defects which, in aggregate, comprise more than five percent (5%) of the surface area of the barrier section.

12. Repair. Repair of hardened concrete shall be as follows:

a. Minor Defect Repair. Repair shall be made with a material meeting the requirements of §701-04. Methods of repair shall be acceptable to the Engineer. The color of the repaired portion shall match as nearly as practicable, the color of the surrounding concrete. Repaired

portions shall exactly match shape requirements. The repaired portion shall withstand a moderate blow from a 16 ounce hammer.

b. Major Defect Repair. Major defect repair shall be preapproved by the Engineer.

13. Hand Finishing. The Contractor shall make provisions to allow hand finishing, when directed by the Engineer, on all surfaces. Hand finishing, if done shall be done immediately after the passage of the slipforming equipment. Curing compound shall be applied only after hand finishing has been completed at any particular location.

14. Transitions and Tapered End Sections. Transitions and tapered end sections shall be either cast-in-place or precast, at the Contractor's option."

606-3.06 Resetting Guide Railing, Median Barrier and Precast Concrete Barrier. The Contractor shall remove, store, clean and reset railing, posts, and precast concrete barrier as shown on the plans or as directed by the Engineer. The reset guide railing and/or median barrier shall be placed in accordance with the requirements of §606-3.01 General. Reset concrete barrier shall be placed in accordance with the requirements of §606-3.05 Concrete Barrier. During non-working hours, exposed approach ends (free ends) of the reset guide railing and/or median barrier shall be temporarily terminated as follows: Box beam guide railing and/or median barrier shall be temporarily terminated with box beam guide railing end assemblies utilizing two (2) splice plates per temporary termination connection. No posts for anchorages shall be required. Special temporary splice plates will be needed to adopt box beam guide rail end assemblies to box beam median barriers. Corrugated guide railing and/or median barrier, and heavy post blocked-out corrugated guide railing and/or median barrier shall be temporarily terminated by dropping the exposed approach ends (free ends) of the rail element to the ground and pinning it in a manner approved by the engineer. Any rail element or component of the barrier damaged shall be replaced by the Contractor.

606-3.07 Resetting Guide Railing and Median Barrier (New Posts). The construction details of §606-3.06 shall apply, except that the Contractor shall furnish and install new posts.

606-3.08 Removing and Storing Guide Railing, Median Barrier, and Precast Concrete Barrier. The Contractor shall remove designated existing guide railing, median barrier and precast concrete barrier and neatly store the component parts in separate piles at locations designated for future pick up by Department forces, or its designee. The work shall be done in a workmanlike manner so as to salvage all usable parts. Unusable material shall be disposed of by the Contractor.

606-3.09 Removing and Disposing of Guide Railing, Median Barrier, Concrete Barrier, Guide Posts, Guide Rail Posts, and Median Barrier Posts. The Contractor shall remove designated existing guide railing, median barrier, concrete barrier, guide posts, guide rail posts, and median barrier posts and remove them from the site of work. Holes shall be backfilled with a suitable material and compacted in a manner approved by the Engineer.

606-3.10 I-Beam Posts for Existing Highway Barrier. I-beam posts for existing highway barrier shall be installed at the locations indicated in the contract documents or where directed by the Engineer. The driving shall be in accordance with the requirements of §606-3.01 and the applicable standard sheet(s). All hardware necessary for mounting the rail elements or cable to the post shall be supplied by the Contractor. New heavy post steel block-outs shall be supplied to replace damaged or unusable block-outs. S3x5.7 posts installed as intermediate posts to reduce post spacing on corrugated beam guide railing, corrugated beam median barrier, and box beam guide railing shall not be attached to the rail element.

All reflectors, delineators, reference markers, or other items, which are to remain in place, that are damaged by the Contractor's operations shall be replaced by the Contractor.

§606

606-3.11 Retensioning Existing Cable Guide Railing and Median Barrier. Cable guide rail and median barrier shall be retensioned in accordance with the cable tensioning requirements of §606-3.02.

606-3.12 Resetting Anchorage Unit Assemblies and End Assemblies for Guide Rail and Median Barrier. The Contractor shall remove, store, clean and reset existing anchorage units and end assemblies for Guide Railing and Median Barrier as shown on the plans or as directed by the Engineer. The anchorage units and end assemblies shall be reset and placed in accordance with the requirements of §606-3.01 General.

Existing concrete anchors and deadman may be left in place and replaced with new ones if the top of the existing anchor or deadman is at least 6 inches below final grade and the anchor or deadman will not be an obstruction to other construction.

The Contractor shall take care so reusable parts are not damaged by his operations. Any parts damaged in handling and placing shall be replaced by the Contractor. Unusable material shall be disposed of by the Contractor.

Surface areas disturbed during the removal operations shall be reestablished, as nearly as possible, to match the adjacent surfaces to remain.

606-3.13 Removing and Storing Anchorage Unit Assemblies and End Assemblies for Guide Railing and Median Barriers. The construction details of §606-3.08 shall apply. Excavation and backfill shall be in conformance with the requirements outlined in §606-3.01E.

Existing concrete anchors and deadman may be left in place if the top of the existing anchor or deadman is at least 6 inches below final grade and the anchor or deadman will not be an obstruction to other construction.

606-3.14 Removing and Disposing Anchorage Unit Assemblies and End Assemblies for Guide Railing and Median Barriers. The construction details of §606-3.13 shall apply except the Contractor shall dispose of the Anchorage Unit Assemblies and End Assemblies in a manner approved by the Engineer.

606-3.15 Box Beam Guide Rail Transition to Concrete Barrier. The contractor shall construct a guide rail transition from concrete barrier to box beam guide rail at the locations indicated and as detailed on the contract plans. The work shall conform to the requirements of §606-3.01.

606-3.16 Corrugated Beam Guide Rail Transition to Bridge Rail, Concrete Barrier and Concrete Parapets. The contractor shall construct corrugated beam guide transitions to bridge rail, concrete barrier and/or concrete parapets at the locations and as detailed on the contract plans. The requirements of §606-3.01 shall apply together with the following:

Railing shall be erected so that the rails are parallel to the roadway, except in those sections where it is necessary to vertically transition the highway barrier to the bridge railing, or barrier. Bending or curving of rail elements in order to fit alignment requirements in the field shall not be permitted. The Engineer may order some bending or curving to allow for necessary minor adjustments. The Contractor shall exercise care in attaching the guide rail to the bridge rail so as not to damage the rails, posts, or joints, or splices. Any damage to the material attributable to the Contractor's operation shall require that the material be repaired, or replaced. The decision to repair, or replace, shall rest solely with the Engineer.

606-3.17 Rustic Barrier. In order to develop the aesthetic property of rustic barrier to its maximum the Contractor shall remove all mill scale from the surfaces of all weathering steel that will be exposed to view from the roadway. All surfaces are to be free of mud, grease, oil and paint. When either materials or finished products are in storage or transit, all necessary precautions shall be taken to prevent water stains and other surface adulteration that will deter from ultimately achieving the uniform and sound weathering characteristics of the base metal.

Care shall be taken during the field erection of the barrier system to avoid surface scratches and gouges. The Contractor is put on notice that cleanliness is most important in obtaining the early and

uniform weathered surface. Where soilage is too severe to be removed by hand cleaning, the soiled areas shall be cleaned by other methods such as power brush cleaning in a manner approved by the Engineer.

606-3.18 Pier Protection. Pier protection shall be installed in accordance with the standard sheets, contract documents and directions of the Engineer. The half section precast concrete barrier units shall be backed up with either fully compacted excavated material or steel backup posts except when only one method is specified or indicated in the contract documents. Steel continuity connections shall be required on the half section barrier units when back up posts are utilized.

606-3.19 Transitions Constructed of, or with, Concrete. Transitions constructed of concrete and the concrete elements of transitions constructed of metal components and concrete elements shall be constructed at the locations indicated in the contract documents, or those indicated by the Engineer, in accordance with these specifications, the contract documents, and the directions of the Engineer. The shapes indicated on the Standard Sheets are standard. The Deputy Chief Engineer (Design) will consider other shapes for approval.

§606-3.05 Concrete Barrier, A. Precast Concrete Barrier and B. Cast-in-Place Concrete Barrier shall apply.

606-4 METHOD OF MEASUREMENT

606-4.01 Cable, Corrugated Beam or Box Beam Guide Railing and Median Barrier. The quantity of guide railing or median barrier measured for payment will be the number of feet measured along the axis of the railing and between its extreme outer limits as shown on the plans and/or standard sheets or as directed by the Engineer. The quantity of shop curved guide railing or median barrier shall be the number of feet measured along the axis of the curved railing. Shop curved guide railing or median barrier is defined as that which will require shop working in accordance with the requirements of these specifications and not that curvature which may be attained by springing or bending in the field. If the railing is anchored to a structure instead of an anchorage unit or end assembly, the railing will be measured up to the structure.

Where curved corrugated beam guide railing or median barrier is specifically called for on the contract plans or ordered in writing by the Engineer and no provision for such curved beam railing is included in the contract proposal, the quantity of railing measured for payment will be as described above plus an additional allowance of 33 1/3% of the curved lengths at a factor of 1.0 measured along the horizontal center line of the beam.

606-4.02 Anchorage Units, End Assemblies and Transitions for Guide Railing or Median Barrier. Anchorage units, end assembly units and transitions between various highway guide railing and median barrier systems will be measured by the actual number of units installed in accordance with the plans, standard sheets, manufacturer's drawings', manufacturer's directions and/or as directed by the Engineer.

The payment limits for the Box Beam Guide Rail End Assembly Type III and Box Beam Median Barrier End Assembly, Type C will be separated by a distance of 50 feet extending along the end assembly from the front of the Nose Assembly to a point 50 feet removed. These payment limits apply regardless of whether the Type III End Assembly or Type C End Assembly employs crushable fiberglass elements or beam bursting type mandrels to absorb the energy of the impacting vehicle.

606-4.03 Concrete Barrier and Terminal Sections. The quantity of concrete barrier and terminal sections measured for payment will be the number of feet placed in accordance with the plans and specifications, measured along the axis of the barrier and between its extreme outer limits, unless otherwise indicated on the plans or in the proposal.

606-4.04 Resetting Guide Railing, Median Barrier and Precast Concrete Barrier. The quantity of reset guide railing or median barrier measured for payment will be the number of feet reset in accordance with the specifications, plans and as directed by the Engineer, exclusive of anchorage units and end assemblies. If the guide railing is anchored to a structure instead of an anchorage unit or end

§606

assembly, measurement will be made up to the structure. The quantity of reset precast concrete barrier measured for payment will be the number of feet placed in accordance with the plans and specifications measured along the axis of the barrier between its extreme outer limits.

606-4.05 Resetting Guide Railing and Median Barrier (New Posts). The Method of Measurement of §606-4.04 will apply.

606-4.06 Removing and Storing Guide Railing, Median Barrier and Precast Concrete Barrier. The quantity of removed and stored guide rail and median barrier measured for payment will be the number of feet removed in accordance with the specifications, plans, and as directed by the Engineer, exclusive of anchorage units and end assemblies. If the guide rail or median barrier is anchored to a structure, measurement will be made up to the structure. The quantity of removed and stored precast concrete barrier measured for payment will be the number of feet removed in accordance with the specifications and plans, measured along the axis of the barrier between its extreme outer limits.

606-4.07 Removing and Disposing of Guide Railing, Median Barrier and Concrete Barrier. The quantity of guide rail and median barrier measured for payment will be the number of feet removed and disposed of in accordance with the specifications, plans, and as directed by the Engineer, exclusive of anchorage units and end assemblies. The quantity of concrete barrier measured for payment will be the number of feet removed and disposed of in accordance with the specifications and plans measured along the axis of the barrier between its extreme outer limits.

606-4.08 Removing and Disposing of Guide Posts, Guide Rail Posts, and Median Barrier Posts. The quantity to be measured for payment will be the number of posts removed and disposed of in accordance with the specifications and plans and as directed by the Engineer.

606-4.09 Resetting Anchorage Unit Assemblies and End Assemblies for Guide Railing and Median Barrier. This work shall be measured by the number of anchorage units and/or end assemblies reset in accordance with the requirements of the contract documents and in a manner approved by the Engineer.

606-4.10 Removing and Storing or Disposing of Anchorage Unit Assemblies and End Assemblies for Guide Railing and Median Barrier. This work shall be measured by the number of Anchorage Units or End Assemblies properly removed and stored for pick up by others or removed and disposed of in accordance with the contract documents and to the satisfaction of the Engineer.

606-4.11 Retensioning Existing Cable Guide Railing and Median Barrier. Quantity measured for payment will be the number of sections retensioned. A section shall consist of the length of cable guide rail or median barrier running between two concrete anchorage units.

606-4.12 Heavy Post Blocked-Out Corrugated Beam Guide Railing Connections to Walls (Trailing Ends). Guide railing connections to walls will be measured by the number furnished and installed in accordance with the plans, specifications, standard sheets, and as directed by the Engineer.

606-4.13 Corrugated Beam Guide Rail Transition to Bridge Rail, Concrete Barrier and Concrete Parapets. Measurement will be taken as the actual number of transition units installed in accordance with the plans and specifications.

606-4.14 Box Beam Guide Rail Transition to Concrete Barrier. Measurement will be taken as the actual number of transition units installed in accordance with the specifications, plans and standard sheets.

606-4.15 Pier Protection. Pier protection shall be measured by the number of feet measured along the top centerline of the steel box beam and between the pay limits as shown on the plans and/or standard sheets.

606-4.16 I-Beam Posts for Existing Highway Barrier. I-beam posts for existing highway barrier will be measured by the actual number of posts installed in accordance with the contract documents and as directed by the Engineer.

606-4.17 Transition between Concrete Sections. Transitions will be measured by the actual number of units installed in accordance with the plans, standard sheets and/or as directed by the Engineer.

Payment Factor	1.0	1.1	1.3	1.4	1.6	1.8	1.9
Rail Type	Post Spacing Center to Center in Feet & Inches						
Cable*	16'	12'	---	8'	---	---	4'
Box Beam	6'	---	3'	---	---	---	---
Corrugated Beam	12'6"	---	---	6'3"	4'2"	---	3' 1 1/2"
Heavy Post Blocked Out Corrugated Beam	6'3"	---	---	---	---	3'1"	---
* For cable guide rail, the post spacing in the typical approach, terminal sections and typical intermediate anchorage sections as indicated on the standard sheets, shall have payment factors of 1.0.							

606-5 BASIS OF PAYMENT

606-5.01 Guide Railing, Median Barrier, Concrete Barrier and Terminal Sections; Various Types. The unit price bid per foot for the above work shall include the cost of all labor, equipment and material necessary to complete the work, including the cost of any repairs required, and the costs of bending any rail element to the required curvature.

Payment for guide rail and median barrier shall include the unit price bid and the measured quantity multiplied by the payment factor for the various typical post spacings listed in Table 606-2.

Payment for box beam guide rail terminating and buried in a backslope with the posts embedded in rock shall have a payment factor of 2 for the last 20 feet.

When posts are driven through asphalt concrete or bituminous treated material, any repairs to damage paved or treated areas shall be at the Contractor's expense. Progress payments will be made when the metal railing and/or metal barrier is erected in the position and manner indicated on the standard sheets and in a manner approved by the Engineer, exclusive of bituminous repair and final alignment. Payment will be made, at the unit price bid, for 90% of the measured quantity erected. The balance of the quantity erected will be paid for upon proper repair to the bituminous surfaces and alignment of the metal railing and/or metal barrier to the specified tolerances.

606-5.02 End Assembly, End Anchorage Units and Transitions for Guide Railing and Median Barrier. The unit price bid for each end assembly, end anchorage unit or transition shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, including the necessary concrete, excavation, backfill, reflectorization, object markers when required at driveways and vehicle openings, and spring cable assembly (compensating device) and/or steel turnbuckle cable end assembly required for cable guide rail.

606-5.03 Resetting; Removing and Storing; Removing and Disposing; of Guide Railing, Median Barrier and Concrete Barrier. The unit price bid per foot for the above work items shall include the cost of furnishing all labor, equipment and materials necessary to complete the work.

Any materials damaged due to Contractor's operation shall be replaced by him and the cost shall be included in the price bid for this item.

Payment for resetting guide rail and median barrier shall include the unit price bid multiplied by the measured quantity multiplied by the payment factor for the various typical post spacings listed in Table 606-2, except that posts required to reduce the post spacing from the original post spacing shall be paid for under the appropriate I-beam post for existing highway barrier item.

§606

A. Progress payments for resetting guide rail, median barrier and precast concrete barrier will be made as follows:

1. 25% of the unit price bid for the quantity of guide rail, median barrier or precast concrete barrier removed and stored in accordance with the provisions of §606.3-06 Resetting Guide Railing, Median Barrier and Precast Concrete Barrier.
2. 65% of the unit price bid for the measured quantity of guide railing, median barrier or precast concrete barrier cleaned and reset in accordance with the provisions of §606-3.06.
3. The balance of the unit price bid for the quantity of the guide railing, median barrier or concrete barrier will be paid upon repair to the bituminous surfaces damaged by the resetting operations.

B. Progress payments for removing and disposing or storing of guide railing, median barrier or concrete barrier will be made as follows:

1. 75% of the unit price bid for the measured quantity of guide railing, median barrier or concrete barrier removed and stored or disposed of as specified.
2. The balance of the unit price bid for the measured quantity of guide railing and/or median barrier removed and stored or disposed of as specified will be paid when any voids have been backfilled and disturbed areas are reestablished to the satisfaction of the Engineer.

606-5.04 Removing and Disposing of Guide Posts, Guide Rail Posts and Median Barrier Posts. The unit price bid per post for the above work items shall include the cost of furnishing all labor, equipment and material necessary to complete the work.

606-5.05 Resetting; Removing and Storing; Removing and Disposing; of Anchorage Unit Assemblies and End Assemblies for Guide Railing and Median Barrier. The unit price bid for each of these items shall include the cost of furnishing all labor, equipment and material necessary to complete the work including excavation and backfill.

If the Contractor elects to install new concrete anchors, in lieu of removing and resetting the existing ones, the cost of furnishing and installing the new anchor as well as the cost for necessary adjustments to the existing one shall be included in the price bid for these items.

A. Progress payments for resetting anchorage unit assemblies and end assemblies for guide railing and median barrier will be made as follows:

1. 25% of the unit price bid for the quantity of anchorage unit assemblies and/or end assemblies removed and stored in accordance with the provisions of §606-3.12 Resetting Anchorage Unit Assemblies and End Section Assemblies for Guide Railing and Median Barrier.
2. 65% of the unit price bid for the quantity of anchorage unit assemblies and/or end assemblies cleaned and reset in accordance with the provisions of §606-3.12 Resetting Anchorage Unit Assemblies and End Section Assemblies for Guide Railing and Median Barrier.
3. The balance of the unit bid price for the quantity of anchorage units assemblies reset upon the reestablishment of surface areas disturbed.

B. Progress payments for removing and storing or removing and disposing of anchorage unit assemblies and/or end assemblies for guide railing and/or median barriers will be made as follows:

1. 75% of the unit price bid for the quantity of anchorage unit assemblies and/or end assemblies removed and stored or disposed of as specified.
2. The balance of the unit price bid for the quantity of anchorage unit assemblies and/or end assemblies removed and stored or disposed of as specified will be paid upon the establishment of surface areas disturbed.

606-5.06 Heavy Post Blocked-Out Corrugated Beam Guide Railing Connections to Walls (Trailing Ends). The price bid for each guide railing connection shall include the cost of all labor, material, equipment and the repair of any damage caused by the Contractor's operations.

606-5.07 Corrugated Beam Guide Rail Transition to Bridge Rail, Concrete Barrier and Concrete Parapets. The unit price bid per guide rail transition shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work, including back-up posts, connections and hardware.

606-5.08 Box Beam Guide Rail Transition to Concrete Barrier. The unit price bid per guide rail transition shall include the cost of all labor, equipment, and material necessary to satisfactorily complete the work, including back-up posts, necessary rail curvature, splices, connections and hardware.

606-5.09 Pier Protection. The price bid per foot of pier protection shall include the cost of all labor, materials and equipment necessary to complete the work. The curved box beam guide rail at each end of the assembly designed for two way traffic and on the approach end of the assembly designed for one way traffic, and the terminal sections shall be paid for under their own items.

606-5.10 I-Beam Posts for Existing Highway Barrier. The unit price bid for I-beam posts for existing highway barrier shall include the cost of furnishing all labor equipment and material necessary to complete the work. Removal of damaged posts and hardware is included in other items of work.

When posts are driven through asphalt concrete or bituminous treated material, any repairs to damaged paved or treated areas shall be at the Contractor's expense.

606-5.11 Retensioning Existing Gable Guide Railing and Median Barrier. The unit price bid for retensioning a section of cable guide railing or median barrier shall include the cost of all labor, materials and equipment necessary to complete the work.

606-5.12 Transition between Concrete Sections. The unit price bid per concrete transition shall include the cost of all labor, equipment, and material necessary to satisfactorily complete the work, including back-up posts, connections and hardware.

Payment will be made under:

Item No.	Item	Pay Unit
606.01	Cable Guide Railing	Foot

SECTION 607 - FENCES

607-1 DESCRIPTION. This work shall consist of furnishing and erecting fencing and metal fence gates of the type and size, and at the locations shown on the plans or as directed by the Engineer. Construction of fencing and gates shall be done in accordance with the specifications, the standard sheets, and the plans, and in reasonable close conformity with the lines and grades shown on the plans or established by the Engineer.

607-1.01 Fence Types. The fence shall be designated as follows:

- Optional Chain Link Fence Type I
- Optional Chain Link Fence Type II
- Vinyl Coated Chain Link Fence on Plastic Coated Frame
- Right-of-Way Fencing

The options for Type I and Type II chain link fences shall be as follows:

TYPE I

Fabric Options

- Coated Steel Fence Fabric
(95% Zinc 5% Aluminum- Mischmetal Alloy)
- Galvanized Steel
- Aluminum
- Aluminum Coated Steel

Frame Options

- Mischmetal Alloy Coating
(95% Zinc 5% Aluminum)
- Galvanized Steel
- Combined Coating on Steel
- Aluminum
- Aluminum Coated Steel

TYPE II

Fabric Options

- Coated Steel Fence Fabric
(95% Zinc 5% Aluminum- Mischmetal Alloy)
- Galvanized Steel
- Vinyl Coated Steel
- Aluminum
- Aluminum Coated Steel

Frame Options

- Mischmetal Alloy Coating
(95% Zinc 5% Aluminum)
- Galvanized Steel
- Combined Coating on Steel
- Plastic on Steel
- Aluminum
- Aluminum Coated Steel

§607

Fence gates for Type I and Type II optional fences shall be consistent with the fabric and frame option selected for the contract. Fence frame and fabric selected shall be consistent throughout the contract except where intermixing is permitted by the Engineer.

607-2 MATERIALS. Materials shall conform to the requirements specified in the following subsections of Section 700 - Materials and Manufacturing:

Zinc Chromate Primer	708-04
Aluminum Fence Fabric	710-01
Galvanized Steel Fence Fabric	710-02
Vinyl Coated Steel Fence Fabric	710-03
Aluminum Coated Steel Fence Fabric	710-04
Coated Steel Fence Fabric (95% Zinc 5% Aluminum-Mischmetal Alloy)	710-05
Steel and Iron Posts, Rails, Braces and Fittings for Chain-Link Fence	710-10.03
Aluminum Posts, Rails, Braces and Fittings for Chain-Link Fence	710-11
Plastic Coated Posts, Rails, Braces and Fittings for Chain-Link Fence	710-12
Right-of-Way Fencing	710-30

607-2.01 Portland Cement Concrete for Bases. Portland Cement concrete used for bases shall be Class A or C conforming to the requirements of Section 501 Portland Cement Concrete--General except that requirements for automated batching shall not apply.

607-2.02 Right-of-Way Fencing. The Contractor has the option of using posts and braces fabricated from either high carbon shapes of steel or pressure treated wood meeting the requirements of §710-30 Right-of-Way Fencing.

607-2.03 Fence Gates. Fence gates for Right-of-Way Fencing shall Conform to the requirements for Right-of-Way Fence Gates of §710-30. Fence gates for Chain-Link Fence shall conform to the following:

A. Gate Frames. Frames shall be constructed of tubular members welded at all corners or assembled with corner fittings. Where corner fittings are used gates shall have 3/8 inch nominal diameter truss rods to prevent sag or twist. Gate leaves shall have vertical intermediate bracing so that no vertical members are more than 8 feet apart. Gate leaves over 10 feet long shall have a horizontal brace or a 3/8 inch nominal diameter diagonal truss rod. Gate leaves over 16 feet shall have both a horizontal brace and a 3/8 inch nominal diameter truss rod.

B. Gate Fabric. Gate fabric shall conform to the requirements of the fabric used in the fence construction.

C. Gate Hinges. Hinges shall be weldable steel, cast steel or malleable iron 180° offset industrial type. The hinges shall not twist or turn under the action of the gate. The gates shall be capable of being opened and closed easily by one person. Hinges shall be galvanized in accordance with §719-01 Type I.

D. Gate Latches. Latches, stops and keepers shall be provided for all gates. Latches shall have a plungerbar arranged to engage the center stop, except that single left gate openings with an opening of less than 10 feet may use a forked latch. Latches shall be arranged for locking and the Contractor shall provide a lock with triplicate keys for each gate. Center stops shall consist of a device arranged to be set in concrete and to engage a plunger-bar of the latch of double leaf gates. No stop is required for single leaf gates. Keepers shall consist of a mechanical device for securing the free end of the gate when in the full open position.

607-3 CONSTRUCTION DETAILS

607-3.01 General. The Contractor shall perform such clearing and grubbing as may be necessary to construct the fence to the required grade and alignment.

At locations where breaks in a run of fencing are required, or at intersections with existing fences, appropriate adjustment in post spacing shall be made to conform to the requirements for the type of closure indicated.

When the plans require that the posts, braces, or anchors be embedded in concrete, the Contractor shall install temporary guys or braces as may be required to hold the posts in proper position until such time as the concrete has set sufficiently to hold the posts. Unless otherwise permitted, no materials shall be installed on posts or strain placed on guys and bracing set in concrete until seven days have elapsed from the time of placing the concrete.

All posts shall be set vertically and to the required grade and alignment. Cutting of the tops of the posts will be allowed only with the approval of the Engineer and under the Engineer's specified conditions.

Wire or fencing of the size and type required shall be firmly attached to the posts and braces in the manner indicated. All wire shall be stretched taut and be installed to the required elevations.

At each location where an electric transmission, distribution or secondary line crosses any of the types of fences covered by these specifications, the Contractor shall furnish and install a ground conforming to the requirements of Subsection 9 of the National Electric Safety Code.

Fence shall generally follow the contour of the ground, with the bottom of fence fabric no less than 1 inch nor more than 6 inch from the ground surface. Grading shall be performed where necessary to provide a neat appearance.

Line posts shall be spaced equidistant in the fence line at the spacing shown on the plans, standard sheets or as directed by the Engineer. End, corner, and intermediate posts shall be placed at the locations indicated on the plans, standard sheets or as directed by the Engineer, and shall be braced as shown on the plans or standard sheets. When chain link fence is on a long curve intermediate posts shall be evenly spaced so that the strain of the fence will not bend the line posts.

All end, corner, and intermediate posts shall be set plumb in concrete bases of the depth and diameter shown on the plans or standard sheets. The Contractor shall have the option of setting the line posts in concrete bases or using methods of driving and anchoring specified by the fence manufacturer and approved by the Engineer.

The concrete bases shall be rough cast in the ground around the posts. The top surfaces shall be domed to shed water and provide a neat workmanlike appearance when completed. Extensions of up 45 minutes for the allowed time for pouring the concrete will be permitted.

607-3.02 Chain-Link Fencing with Top Rail. Posts shall be set so they are equidistant with a maximum of 10 foot centers.

All top rails shall pass through the base of the post caps and shall form a continuous brace from end to end of each stretch of fence. Top rail lengths shall be joined with sleeve couplings with expansion sleeves provided at 100 foot intervals. Top rails shall be securely fastened to end posts by means of approved rail end connectors. Horizontal braces shall be provided at all intermediate posts, midway between the top rail and ground as shown on the plans or standard sheets.

Diagonal truss rods shall be installed with the horizontal braces as indicated on the plans or standard sheets.

Fence fabric shall be installed approximately 2 inch above the ground level and securely fastened along the bottom, and to all braces, top rails, line and pull posts, at the intervals indicated on the standard sheets by approved methods. The fabric shall be secured to all end, corner and gate posts with stretcher bars fastened to the posts, with stretcher bands spaced at a maximum of 14 inches and in a manner permitting adjustment of the fabric tension.

If the Contractor elects the option of using one piece roll-formed sections, the fence fabric shall be integrally woven into the fabric loops on the end, corner, pull and gate posts. The fabric shall be attached to the top braces and line posts as shown on the standard sheets.

§607

607-3.03 Chain-Link Fencing with Top Tension Wire. The construction details specified in §607-3.02 Chain Link Fencing with Top Rail shall apply with the following modifications:

- A. Top tension wire shall be installed as shown on the plans, standard sheets, or as directed by the Engineer.
- B. All posts shall be spaced equidistant in the fence line on a maximum of 8 foot centers.
- C. Additional pull posts shall be placed at locations indicated on the plans or standard sheets. Brace assemblies shall be installed at each intermediate post as indicated on the plans or standard sheets.

607-3.04 Vinyl Coated Chain-Link Fencing on Plastic Coated Frame. The construction details specified in §607-3.02 Chain-Link Fencing with Top Rail or §607-3.03 Chain-Link Fencing with Top Tension Wire shall apply with the following addition:

If any of the resin clad material specified under this item has the protective resin coating damaged so its effectiveness to prevent corrosion of the base material is impaired, the Contractor shall repair such parts by applying one coat of an approved compound of a color to match original material.

607-3.05 Aluminum Posts. Aluminum posts shall be set in accordance with requirements pertaining to fence posts of §607-3.01 General, and §607-3.02 Chain-Link Fencing with Top Rail or §607-3.03 Chain-Link Fencing with Top Tension Wire and with the following additional requirement: The portions of aluminum posts that will be in contact with the concrete bases shall be coated with Zinc Chromate Primer conforming to the requirements of §708-04. The primer shall be thoroughly dry before setting of the post in the concrete.

607-3.06 Right-of-Way. Fencing posts shall be set plumb and firm to the satisfaction of the Engineer in properly prepared post holes, as indicated on the plans or standard sheet. The concrete for post holes where required shall be placed in accordance with the requirements of §607-3.01 General.

All line posts of the type and size shown on the plans or standard sheets shall be placed equidistant in the fence line. Wood line posts shall be placed on a maximum of 15 foot centers and metal line posts shall be placed on a maximum of 10 foot centers.

Intermediate posts and post assemblies, end posts, corner posts, approach spans, and bracing shall be as shown on the plans or standard sheets.

The woven wire fencing shall be fastened to all steel line posts with at least 5 galvanized wire fasteners or clamps and to all steel end, intermediate and corner posts with aluminum wire not less than 5/32 inch diameter.

The woven wire fencing shall be fastened to all wood posts with either 1 1/2 inch galvanized or aluminum staples. The top and bottom wires and every other in-between wires shall be stapled, alternating the stapling of the in-between wires on successive posts.

607-3.07 Fence Gates. The Contractor shall construct metal fence gates of the type and size as indicated on the plans or standard sheets, and in the location shown or ordered by the Engineer.

607-4 METHOD OF MEASUREMENT

607-4.01 General. The quantity to be paid for all fencing exclusive of fence gates and fencing of the types listed in subsequent subsections, will be the number of linear feet of chain-link fencing measured along the top of fencing, center to center of end posts, properly furnished and installed in accordance with the plans, specifications, standard sheets and directions of the Engineer. An allowance of 10 feet will be added for each end post, corner post and pull post installed in accordance with the plans, specifications, standard sheets and directions of the Engineer.

607-4.02 Right-of-Way Fencing. Right-of-Way Fencing shall be measured as the number of feet along the top of the fencing from center to center of the end posts, properly furnished and installed in accordance with the plans, specifications, standard sheets and directions of the Engineer. An allowance of 20 feet will be added for each end post, corner post, intermediate post, and approach post installed in accordance with the plans, specifications, standard sheets and directions of the Engineer.

607-4.03 Fence Gates. Fence gates shall be measured as the number of complete gates furnished and erected in accordance with the specifications, plans, standard sheets and directions of the Engineer.

607-5 BASIS OF PAYMENT

607-5.01 General. The unit price bid per linear foot of fencing shall include the cost of furnishing all labor, materials, tools and equipment necessary to satisfactorily complete the work.

607-5.02 Fence Gates. The unit price bid for each size gate shall cover the cost of furnishing all labor, materials, tools and equipment necessary to satisfactorily complete the work and shall include all necessary clearing, grubbing, excavation and disposal, fill, concrete, gates, gate posts, lock, bracing and all other necessary materials.

Payment will be made under:

Item No.	Item	Pay Unit
607.051X	Vinyl Coated Steel Chain-Link Fencing on Plastic Coated Frame with Top Rail	Foot
607.052X	Vinyl Coated Steel Chain-Link Fencing on Plastic Coated Frame with Top Tension Wire	Foot
607.16xx	Fence Gate with Vinyl Coated Steel Chain-Link Fencing on Plastic Coated Frame	Each
607.19	Right-of Way Fencing	Foot
607.20xx	Right-of Way Fence Gates	Each
607.30xx	Optional Chain-Link Fence, Type I, with Top Rail	Foot
607.31xx	Optional Chain-Link Fence, Type I, with Top Tension Wire	Foot
607.32xx	Optional Chain-Link Fence, Type II, with Top Rail	Foot
607.33xx	Optional Chain-Link Fence, Type II with Top Tension Wire	Foot
607.40xx	Optional Fence Gates	Each

Refer to the Standard Contract Pay Item Catalog for full Item Number and full Description.

SECTION 608 - SIDEWALKS, DRIVEWAYS AND BICYCLE PATHS

608-1 DESCRIPTION. This work shall consist of the construction of either a Portland Cement concrete sidewalk, an asphalt concrete sidewalk, an asphalt concrete driveway, bicycle paths, or furnishing and placing precast concrete paving, brick paving or grouted stone block paving. Furnish and install detectable warnings on sidewalk curb ramps and other locations as detailed in the contract documents or as directed by the Engineer. All work shall be in accordance with these specifications and in reasonably close conformity with the lines and grades shown on the plans or established by the Engineer.

608-2 MATERIALS. Materials shall meet the requirements specified in the following subsections of Section 700 - Materials and Manufacturing:

Portland Cement	701-01
Bituminous Materials (As specified)	702-00
Asphalt Cement for Paving	702-02 or 702-03
Fine Aggregates	703-01
Coarse Aggregates	703-02
Mortar Sand	703-03
Cushion Sand	703-06
Concrete Sand	703-07
Mineral Filler	703-08
Brick Pavers	704-08
Stone Blocks	704-09
Precast Concrete Driveway and Sidewalk Pavers	704-13

§608

Premoulded Resilient Joint Filler	705-07
Masonry Mortar	705-21
Wire Fabric For Concrete Reinforcement	709-02
Fibers for Concrete Reinforcement	711-01
Form Insulating Materials for Winter Concrete (Blankets)	711-07
Water	712-01
Surface-applied Detectable Warning Units	726-01
Embedded Detectable Warning Units	726-02

608-2.01 Portland Cement Concrete Sidewalk and Driveways.

A. Reinforcement. Welded wire fabric reinforcement shall be made of W2.9 or W3 wire at 6 inch centers transversely and longitudinally.

B. Conventionally Formed Concrete. Conventionally formed concrete shall meet the requirements for Class D in accordance with Section 501 "Portland Cement Concrete--General." All concrete shall contain a water-reducing admixture meeting the requirements of §711-08 in such a quantity as to provide a minimum 10% reduction of the design water content by using a normal range water-reducer.

C. Machine Formed Concrete Sidewalks. Machine formed concrete shall meet the requirements for Class J in accordance with Section 501 "Portland Cement Concrete--General" with the exception that fibers shall be incorporated in the mix.

D. Accelerated Cure Sidewalks and Driveways. When specified in the plans that an accelerated cure sidewalk and/or driveway is required at a commercial driveway, a mix design must be submitted to the Materials Bureau by the Contractor for approval a minimum of 14 days prior to anticipated sidewalk or driveway construction. Supply data the mix achieves a compressive strength of 2,000 psi in less than 24 hours. Also supply data the mix will have a scaling rating of one or less when tested in accordance with ASTM C672.

608-2.02 Asphalt Concrete Sidewalks, Driveways, and Bicycle Paths. The mixture requirements for these items shall either be 9.5 or 19.0 mixtures. These mixtures shall be designed for <0.3 million ESALs and produced in accordance to Section 401 using coarse aggregate Type F9. The number of courses and course thicknesses shall be as given in Table 608 - 1, Hot Mix Asphalt Composition.

TABLE 608-1 HOT MIX ASPHALT COMPOSITION			
Total Paved Thickness	9.5 Mix	19.0 Mix	Number of Courses
1 1/2 inch	1 1/2 inch		1
2 inch	2 inch		1
3 + inch	1 1/2 inch	1 1/2 + inch	2+

NOTES:

1. For the 19.0 mixture, the maximum thickness that can be placed in one pass is 3 inch.
2. A course shall consist of one or more separate lifts of hot mix asphalt, as directed by the Engineer, to attain the indicated thickness.

608-2.03 Brick Paved Sidewalks and Driveways. Brick pavers shall meet the requirements of §704-08 and shall be the size(s), shape(s) and color(s) as specified in the contract documents.

A. Neoprene-Modified Asphalt Adhesive. Neoprene-modified asphalt adhesive shall consist of 2% neoprene, grade WM1, oxidized asphalt with a R & B softening point of 155°F minimum and a penetration of 80, and 10% asbestos-free fibers.

B. Mortar for Brick Paving. Mortar for brick paving shall meet the requirements outlined in §705-21 Masonry Mortar.

C. Sand-Cement Setting Bed. Sand-Cement Setting Bed shall consist of 1 part Portland Cement Type 2, §701-01 and 6 parts of Fine Aggregate, §703-01 by volume.

608-2.04 Grouted Stone Block Paved Sidewalks and Driveways. Stone blocks shall meet the requirements of §704-09 and shall be the size(s), shape(s) and color(s) as specified in the contract documents.

A. Sand-Cement Setting Bed. Sand-cement setting bed shall consist of 1 part Portland Cement Type 2, §701-01. and 6 parts of Fine Aggregate, §703-01 by volume.

B. Mortar For Stone Block Paving. Mortar for stone block paving shall meet the requirements outlined in §705-21 Masonry Mortar.

608-2.05 Precast Concrete Block Paved Sidewalks and Driveways. Precast Concrete Driveway and Sidewalk Pavers shall meet the requirements of §704-13 and shall be the size(s), shape(s) and color(s) as specified in the contract documents. Unless otherwise specified in the contract documents the setting bed material shall consist of hard, durable; uncoated particles of soil or rock, free from lumps of clay and all deleterious substances.

Setting Bed Material shall meet the following gradation requirements:

Sieve Size	Percent Passing by Weight
1/4 inch	100
# 10	50-85
# 40	20-45
# 200	3-10

608-2.06 Surface-Applied Detectable Warning Units. Surface-applied detectable warning units shall meet the requirements of Section §726-01 and shall be the color as specified in the Contract Documents to provide the required contrast, light-on-dark or dark-on-light, with the adjacent surface. If no color is specified, the color shall be dark gray Federal Standard 595B #36081 or darker. Setting bed material and/or surface preparation materials for installation of detectable warning units shall be in accordance with the manufacturer’s recommendations.

608-2.07 Embedded Detectable Warning Units. Embedded detectable warning units shall meet the requirements of Section §726-02 and shall be the color as specified in the Contract Documents to provide the required contrast, light-on-dark or dark-on-light, with the adjacent surface. If no color is specified, the color shall be dark gray Federal Standard 595B #36081, or darker. Setting bed material and/or surface preparation materials for installation of detectable warning units shall be in accordance with the manufacturer’s recommendations.

608-2.08 Stamped Concrete Detectable Warnings. Imprinted or stamped concrete detectable warning units shall comply with the specifications for Class D concrete as outlined in Section 501 Portland Cement Concrete - General. The color of the constructed detectable warning shall be uniform over the entire surface. The color shall be an approximate visual match to the color specified in the contract documents. If no color is specified, the color shall be dark gray Federal Standard 595B #36081 or darker. The color shall be incorporated into the concrete surface immediately prior to stamping the detectable warnings, or integrally incorporated throughout the mix. Color admixtures for integrally colored concrete shall meet the requirements of ASTM C979.

Imprinting tools shall be capable of imprinting the surface of the concrete with a uniform and aligned pattern meeting the required dimensions.

608-3 CONSTRUCTION DETAILS

608-3.01 Concrete Sidewalk and Driveways. When the contract includes 65 cubic yards or more of sidewalk and driveway concrete, provide an American Concrete Institute (ACI) certified concrete flatwork finisher to supervise all finishing. Provide proof of ACI flatwork certification to the Engineer prior to concrete placement. The general construction details for manufacturing and transporting concrete shall meet the requirements of Section 501, Portland Cement Concrete- General. Concrete placement operations may be started when the ambient air temperature is 39°F or higher when measured in the shade within an accuracy of $\pm 2^\circ\text{F}$. Discontinue placement when the air temperature falls below 39°F. The temperature of the base material must be 39°F or higher. The base material shall not have any snow, ice, frost, or standing water on its surface. The use of insulating materials and heating equipment may be required before concreting begins. Do not place concrete in the rain.

Install a premoulded resilient joint filler, §705-07, at all joints between sidewalk and curb, pavement, building, etc.

Sidewalks and driveways may be conventionally formed or machine formed. Concrete reinforcement shall be welded wire fabric or fiber reinforcement except, at all commercial driveways both the sidewalk and the driveway must be reinforced with welded wire fabric. They may be additionally reinforced with fiber reinforcement.

~~When using fiber reinforcement it shall be added to the concrete at a rate of 2 pounds of fibers per cubic yard of concrete.~~ When using fiber reinforcement it shall be added to the concrete at a rate of 1.5 pounds of fibers per cubic yard of concrete. Fibers shall be added to the concrete during batching under supervision of the Regional Materials Engineer, or using a method approved by the Director, Materials Bureau. Batch an appropriate volume of concrete such that whole standard size bags or packages of fibers are used. It is the responsibility of the producer to indicate on each delivery ticket the amount of fibers added to the concrete.

Comment [cjt84]:
Errata 1/10/09

A. Conventionally Formed Sidewalks and Driveways. Forms shall be free from warp, extend to the full depth of the sidewalk or driveway, and be secured so no displacement will occur during the placement of concrete. Reinforcement may be either fiber or wire fabric. When using wire fabric for concrete reinforcement, embed it at mid-depth in the slab.

Place the concrete in one course to the full depth shown in the contract documents. Immediately after placement of the concrete thoroughly compact the concrete with internal mechanical vibrating equipment. Internal mechanical vibrators shall be adequately powered, capable of transmitting vibration to the concrete in frequencies of not less than 5,000 vibrations per minute while inserted in concrete and shall produce a vibration of sufficient intensity to consolidate the concrete into place without separation of the ingredients. The vibrating element shall be vertically inserted in the concrete mass at a depth sufficient to vibrate the entire depth. It shall be withdrawn completely from the concrete before being advanced to the next point of application. Vibrate at evenly spaced intervals not farther apart than the radius over which the vibration is visibly effective and at a distance close enough to the forms to effectively vibrate the surface concrete. The time of vibration shall be of sufficient duration to accomplish thorough consolidation, produce dense, smooth surfaces free from aggregate pockets, honeycombing, and air bubbles; and to work the concrete into all angles and corners of the forms, however, over-vibration shall be avoided. Vibration shall be continued in one place until the concrete has become uniformly plastic, but not to the extent that pools of grout are formed. Vibration shall be supplemented by working or spading by hand in the corners and angles of forms and along form surfaces while the concrete is plastic. Vibrators shall not be used to push or distribute the concrete laterally.

The use of mechanical screeding or finishing equipment (such as a jitterbug) shall not be allowed. Only hand screeding and finishing shall be allowed.

B. Machine formed Sidewalk. Machine formed paving consists of a single paver capable of placing, spreading, consolidating, screeding, and finishing the concrete such that hand finishing is kept to a minimum. Use equipment guided by a reference system that ensures the pavement is placed to the specified line, grade, and cross section. Use a self-propelled machine formed paver equipped

with rigid side forms that laterally support the concrete and minimize edge slumping, a full-width finishing pan, and attached internal vibrators capable of consolidating the entire concrete placement. The equipment proposed for use by the Contractor shall demonstrate the capability of placing the concrete in accordance with these specifications.

The reinforcement must be fibers.

C. Finishing. Only magnesium floats and trowels are allowed. The use of aluminum or steel finishing trowels and tools is prohibited. The concrete shall be finished to produce a smooth surface and then lightly broomed to a uniform texture. The edges and scored joints of all sidewalk slabs shall be tooled with an edging tool having a 1/4 inch radius.

Unless otherwise specified in the contract documents, the concrete surface shall be scored and tooled at intervals of 5 feet. Score the concrete a minimum 1/8 inch to a maximum 1/4 inch in width and to a minimum depth of one-third the total thickness.

D. Curing. Immediately after finishing, and not more than 30 minutes after concrete placement, apply a clear with fugitive dye membrane curing compound at a rate of 1 gallon per 150 square feet. Do not apply curing compound in the rain. If rain damages the curing compound before it sets, reapply curing compound immediately after the concrete surface dries. Alternative curing methods shall be approved by the Director, Materials Bureau.

Concrete must be cured for a minimum of six days in colder weather. Colder weather and the methods of curing during colder weather are described as follows: If the ambient air temperature falls, or is expected to fall below 39°F anytime during the curing period of the concrete placement, a supply of blankets meeting §711-07 Form Insulating Materials for Winter Concreting must be provided at the work site that is sufficient to cover all concrete placed. Use material capable of maintaining a surface temperature of 55°F. Apply the insulating material to prevent the newly placed concrete from being exposed to ambient air temperatures at the surface below 36°F during the curing period. Secure and overlap the insulation tight to the concrete surface to prevent air intrusion beneath the insulation. Extend these materials a minimum of 12 inch beyond the edge of the concrete. Place recording surface thermometers between the concrete surface and the insulating material and 12 inch from the outside edge of concrete wherever insulation is used. Use four equally spaced thermometers for each day's placement. When insulation is needed it must remain in place for the curing period. Do not subject the concrete to a temperature drop in excess of 50°F during the first 24 hours after removing the insulation. If the concrete temperature falls below 32°F or the concrete is damaged by cold weather as determined by the Engineer it shall be removed and replaced at the Contractor's expense.

Cure all driveways and sidewalks at driveways for a minimum of three days prior to opening to vehicle traffic. In colder weather, as defined above, extend the curing period to six days unless other provisions to determine strength are provided and approved by the Director, Materials Bureau.

If saw cutting is necessary use diamond blade saws capable of making straight cuts to the dimensions required. Saws must be equipped with cutting guides, blade guards, water cooling systems, dust controls, and cut depth control.

E. Accelerated Cure Sidewalks and Driveways. When specified in the plans that an accelerated cure sidewalk and/or driveway is required at a commercial driveway all the provisions for constructing sidewalks and driveways outlined above shall apply with the following exceptions: Only conventional forming with wire fabric reinforcing is allowed. Apply curing compound as outlined in "D" above. To reduce the time needed to reach the required opening compressive strength the concrete must be covered with blankets meeting §711-07, Form Insulating Materials for Winter Concreting such that the concrete curing temperature reaches a minimum 59°F above ambient air temperature. Secure the insulation tight to the concrete surface to prevent air intrusion beneath the insulation. Extend these materials a minimum of 12 inches beyond the edge of the concrete. Place recording surface thermometers between the concrete surface and the insulating material and 12 inches from the edge of concrete wherever insulation is used. Use four thermometers for each day's placement. These thermometers may be equally spaced at one location or placed at separate locations depending on the nature of the placements. Also, use one recording thermometer for ambient air

temperature. At the request of the Contractor external heat meeting the requirements of 555-3.08, C.,2. Provision of External Heat may be applied to the concrete.

Compressive strength cylinders for determining strength gain must be cast at the time of placement. These cylinders must be kept insulated with the placement. Cylinders shall be broken at times requested by the Contractor until the minimum compressive strength of 2,000 psi is reached. Alternate means to determine concrete maturity may be considered with approval of the Director, Materials Bureau by coordinating cylinder compressive strengths to concrete curing temperature.

608-3.02 Asphalt Concrete Sidewalks, Driveways, and Bicycle Paths. The provisions under §402-3 Construction Details for Hot Mix Asphalt (HMA) Pavements, shall apply.

The sidewalks, driveways, and bicycle paths shall be constructed as indicated in the contract documents (including the Standard Sheets).

608-3.03 Brick Paved Sidewalks and Driveways. All brick pavers shall be laid in the pattern shown in the contract documents or as directed by the Engineer to provide a uniformly even surface. Joints shall be hand tight unless otherwise specified. No brick pavers shall be laid or grouted in freezing weather.

A dry mixture of mortar for brick paving shall be swept over the brick pavers until the joints are completely filled. The joints shall be lightly wetted with water. Brick pavers shall be cleaned of excess mortar, and joints shall be finished prior to the mortar setting up. All brick paving shall be kept moist for 4 days after filling the joints with mortar. After the 4 day curing period, removal of remaining mortar film may be accomplished by the use of a light acid wash (10% solution of hydrochloric or muriatic acid) followed by flushing clean with water or as approved by the Engineer. Care shall be taken to avoid the use of acid in areas where runoff could damage trees or other vegetation.

All brick pavers used over tree pits shall be laid in a 3 inch bed of cushion sand with sand filled joints.

A. Brick Paved Sidewalks and Driveways (Sand Setting Bed). Brick pavers shall be laid in a properly compacted 2 inch bed of cushion sand over the specified subbase or subgrade.

B. Brick Paved Sidewalks and Driveways (Mortar Setting Bed). Brick pavers shall be laid in a bed of mortar with a minimum thickness of 1 inch over the specified concrete or bituminous subbase.

C. Brick Paved Sidewalks and Driveways (Bituminous Setting Bed). Brick pavers shall be laid in a 3/4 inch thick bituminous setting bed over the specified concrete or bituminous subbase. The setting bed shall consist of asphalt cement meeting the requirements outlined in either §702-02 or §702-03 mixed with fine aggregate meeting the requirements of §703-01. The asphalt cement shall be 7.0% of the total batch weight. The mix shall be heated to approximately 325°F. A coating of neoprene-modified asphalt adhesive shall be applied by mopping, squeegeeing or troweling over the top surface of the setting bed to provide bond under the bricks.

D. Brick Paved Sidewalks and Driveways (Sand-Cement Setting Bed). Brick pavers shall be laid on a 2 inch setting bed of sand-cement over the specified subbase. The sand-cement setting bed shall not be placed more than 4 hours prior to installing the brick paving.

E. Brick Paved Sidewalks and Driveways (Optional Concrete Setting Bed). The Contractor shall have the option of installing Brick Paved Sidewalks and Driveways by one of the following methods:

1. Bricks shall be laid on a bed of cement concrete as specified in the contract documents. The bricks shall be laid in the cement concrete while it is still fresh as approved by the Engineer and they shall be firmly positioned to provide a uniformly even surface, and a solid bedding under each brick.

2. Bricks shall be laid as provided for under “Brick Paved Sidewalks and Driveways (Mortar Setting Bed)” provided the finished surface shall conform to the lines and grades shown in the contract documents.

608-3.04 Grouted Stone Block Paved Sidewalks and Driveways. All grouted stone block pavers shall be laid in the pattern shown in the contract documents or as directed by the Engineer to provide a uniformly even surface. Joints between blocks shall be a maximum of 1 1/4 inch or as specified. No blocks shall be laid or grouted in freezing weather.

Unless otherwise approved by the Engineer, a dry mixture of mortar as specified for Brick Paved Sidewalks and Driveways, §608-2.03, shall be swept over the stone blocks until the joints are completely filled and the joints lightly wetted with water prior to the mortar setting up. All grouted stone block paving shall be kept moist for four days after filling the joints with mortar. After the four day curing period, removal of remaining mortar film may be accomplished by the use of a light acid wash (10% ± solution of hydrochloric acid) followed by flushing clean with water, or as approved by the Engineer. Care shall be taken to avoid the use of acid in areas where runoff could damage trees or other vegetation.

All blocks used over tree pits shall be laid in a 1 inch bed of cushion sand with sand filled joints.

A. Grouted Stone Block Paved Sidewalks and Driveways (Sand Setting Bed). Blocks shall be laid in a 3 inch bed of cushion sand over the specified subbase or subgrade.

B. Grouted Stone Block Paved Sidewalks and Driveways (Mortar Setting Bed). Blocks shall be laid in a bed of mortar with a minimum thickness of 1 inch over the specified concrete or bituminous subbase.

C. Grouted Stone Block Paved Sidewalks and Driveways (Sand-Cement Setting Bed). Blocks shall be laid on a 2 inch setting bed of sand-cement over the specified subbase. The sand-cement setting bed shall not be placed more than 4 hours prior to installing the block paving.

D. Grouted Stone Block Paved Sidewalks and Driveways (Optional Concrete Setting Bed). The Contractor shall have the option of installing Grouted Stone Block Paved Sidewalks and Driveways by one of the following methods:

1. Blocks shall be laid on a bed of cement concrete as specified in the contract documents. The blocks shall be laid in the cement concrete while it is still fresh as approved by the Engineer and they shall be firmly positioned to provide a uniformly even surface, and a solid bedding under each stone block.
2. Blocks shall be laid as provided for under “Grouted Stone Block Paved Sidewalks and Driveways (Mortar Setting Bed)” provided the finished surface shall conform to the lines and grades shown in the contract documents.

608-3.05 Precast Concrete Block Paved Sidewalks and Driveways. Precast Concrete Driveway and Sidewalk Pavers shall be laid in the pattern shown in the contract documents or as directed by the Engineer to provide a uniformly even surface. Joints shall be hand tight unless otherwise specified. No pavers shall be laid in freezing weather.

After the pavers are in place, an approved sand joint filler shall be swept over the pavers until the joints are completely filled.

Unless otherwise specified in the contract documents, or directed by the Engineer, the Contractor shall install the pavers in accordance with the manufacturer's recommended procedures.

Precast Concrete Block Paved Sidewalks and Driveways (Granular Material Setting Bed). Unless otherwise specified in the contract documents, Precast Concrete Driveway and Sidewalk Pavers shall be laid on a setting bed not to exceed 2 inches of uniformly compacted material placed over the specified subbase.

608-3.06 Surface-Applied Detectable Warning Units. Surface-applied detectable warning units may be applied to existing curb ramps, formed and bonded to existing curb ramps, or as otherwise directed by the manufacturer or specified in the Contract Documents.

§608

Follow all applicable manufacturer's requirements for environmental conditions, surface preparation, installation procedures, curing procedures, and materials compatibility.

608-3.07 Embedded Detectable Warning Units. Embedded detectable warning units may be installed in plastic concrete, installed directly on existing subbase prior to placing concrete, inlaid on prepared concrete surfaces or as otherwise directed by the manufacturer or specified in the Contract Documents.

Follow all applicable manufacturer's requirements for environmental conditions, surface preparation, installation procedures, curing procedures, and materials compatibility.

608-3.08 Stamped Concrete Detectable Warnings. Apply Section 608-3.01 with the following modifications:

Prior to the start of work, the Contractor shall provide a contract-site sample that meets the dimensional requirements of the current Standard Sheet for Detectable Warnings. The sample may be constructed as part of the contract.

Color hardening powder, if used to color the surface of the concrete, shall be applied to the finished concrete in accordance with the manufacturer's recommendations.

If required, construct as many test panels as are necessary to achieve a sample panel that meets the satisfaction of the Engineer. All completed surfaces shall conform to the appearance of the approved sample.

608-4 METHOD OF MEASUREMENT

608-4.01 Concrete Sidewalks and Driveways. Portland Cement concrete sidewalks and driveways will be measured by the number of cubic yards of cement concrete necessary to construct sidewalks and driveways shown in the contract documents or as ordered by the Engineer.

608-4.02 Asphalt Concrete Sidewalks, Driveways and Bicycle Paths. Asphalt concrete sidewalks, driveways and bicycle paths will be measured by the number of tons of asphalt concrete furnished and incorporated in the work. Quality payment adjustments will be measured as outlined in §402-4, Method of Measurement.

608-4.03 Brick Paved Sidewalks and Driveways. Brick paving shall be measured as the number of square yards placed as shown in the contract documents or as ordered by the Engineer.

608-4.04 Grouted Stone Block Paved Sidewalks and Driveways. Grouted stone block paving shall be measured as the number of square yards placed as shown in the contract documents or as ordered by the Engineer.

608-4.05 Precast Concrete Block Paved Sidewalks and Driveways. Precast concrete paving will be measured by the number of square yards placed as shown in the contract documents, or as ordered by the Engineer.

608-4.06 Surface-Applied Detectable Warning Units. Surface-applied detectable warning units will be measured as the number of square yards, measured to the nearest tenth (0.1) square yard, computed from the payment lines as shown on the Contract Documents.

608-4.07 Embedded Detectable Warning Units. Embedded Detectable Warning Units will be measured as the number of square yards, measured to the nearest tenth (0.1) square yard, computed from the payment lines as shown on the Contract Documents.

608-4.08 Stamped Concrete Detectable Warnings. Stamped concrete detectable warnings will be measured as the number of square yards, measured to the nearest tenth (0.1) square yard, computed from the payment lines as shown on the Contract Documents.

608-5 BASIS OF PAYMENT

608-5.01 Concrete Sidewalks and Driveways. The unit price bid per cubic yard shall include the cost of preparing the subgrade, all materials, equipment and labor necessary to complete the work “(including saw cutting and wire fabric reinforcement) as specified except that any necessary excavation and subbase course will be paid for under their appropriate items.

Payment at the unit bid price will be made after the concrete sidewalk or driveway, and curing application have been properly placed.

608-5.02 Asphalt Concrete Sidewalks, Driveways, and Bicycle Paths. The unit price bid per ton shall include the cost of preparing the subgrade and all materials, equipment and labor (including milling, cleaning surfaces, tack coat, saw cut, trueing and leveling courses, etc.) necessary to complete the work as specified except that any necessary excavation and subbase course will be paid for under their appropriate items. Payment of Quality Units will be made based on the Index Price listed in the contract documents. The index price shown in the itemized proposal for each Quality Unit shall be considered the price bid. The unit (index) price is NOT to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded and the original price will be used to determine the total amount bid for the Contract.

608-5.03 Brick Paved Sidewalks and Driveways. The price bid per square yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, including setting bed material, as specified except that any necessary excavation and subbase course will be paid for under their appropriate items;

608-5.04 Grouted Stone Block Paved Sidewalks and Driveways. The unit bid per square yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, including setting bed material, as specified except that any necessary excavation and subbase course will be paid for under their appropriate items.

608-5.05 Precast Concrete Block Paved Sidewalks and Driveways. The unit price bid per square yard shall include the cost of all labor, materials and equipment necessary to complete the work, including setting bed material, except that any necessary excavation and subbase course will be paid for under their appropriate items.

608-5.06 Surface-Applied Detectable Warning Units. The unit bid price per square yard shall include all labor, material, and equipment necessary to satisfactorily complete the work, including surface preparation.

608-5.07 Embedded Detectable Warning Units. The unit bid price per square yard shall include all labor, material, and equipment necessary to satisfactorily complete the work, including bedding material. No adjustment shall be made for concrete removed to accommodate embedded units.

608-5.08 Stamped Concrete Detectable Warnings. The unit bid price per square yard shall include all labor, material, and equipment necessary to satisfactorily complete the work, including construction of contract site sample(s).

Payment will be made under:

Item No.	Item	Pay Unit
608.0101	Concrete Sidewalks and Driveways	Cubic Yard
608.0102	Accelerated Cure Sidewalks and Driveways	Cubic Yard
608.020101	Asphalt Concrete Sidewalks, Driveways and Bicycle Paths	Ton
608.020110	Plant Production Quality Adjustment to 608.020101	Quality Unit
608.03	Brick Paved Sidewalks and Driveways (Sand Setting Bed)	Square Yard
608.04	Brick Paved Sidewalks and Driveways (Mortar Setting Bed)	Square Yard
608.05	Brick Paved Sidewalks and Driveways (Bituminous Setting Bed)	Square Yard

§608

608.06	Brick Paved Sidewalks and Driveways (Sand-Cement Setting Bed)	Square Yard
608.07	Brick Paved Sidewalks and Driveways (Optional Concrete Setting Bed)	Square Yard
608.08	Grouted Stone Block Paved Sidewalks and Driveways (Sand Setting Bed)	Square Yard
608.09	Grouted Stone Block Paved Sidewalks and Driveways (Mortar Setting Bed)	Square Yard
608.10	Grouted Stone Block Paved Sidewalks and Driveways (Sand-Cement Setting Bed)	Square Yard
608.11	Grouted Stone Block Paved Sidewalks and Driveways (Optional Concrete Setting Bed)	Square Yard
608.12	Precast Concrete Block Paved Sidewalks and Driveways (Granular Material Setting Bed)	Square Yard
608.20	Surface-Applied Detectable Warning Units	Square Yard
608.21	Embedded Detectable Warning Units	Square Yard
608.22	Stamped Concrete Detectable Warning Units	Square Yard

SECTION 609 - CURB AND CURB & GUTTER

609-1 DESCRIPTION. Construct and place curb, and curb & gutter, and/or reset curb as specified in the Contract Documents or established by the Engineer.

609-2 MATERIALS. The materials shall meet the requirements of the following subsections of Section 700 - Materials and Manufacturing.

Portland Cement, Type II	701-01
Concrete Repair Material	701-04
Concrete Grouting Material	701-05
Anchoring Material - Chemically Curing	701-07
Coarse Aggregate	703-02
Concrete Sand	703-07
Premoulded Resilient Joint Filler	705-07
Masonry Mortar	705-21
Stone Curb Anchor Bars	709-07
Quilted Covers (for Curing)	711-02
Plastic Coated Fiber Blankets (for Curing)	711-03
Polyethylene Curing Covers (White Opaque)	711-04
Membrane Curing Compound	711-05
Stone Curb	714-01
Precast Concrete Curb	714-04
Asphalt Concrete or Hot Mix Asphalt Curb	714-06

White and Yellow Pavement Marking Paints shall meet the requirements of Section 640 - Reflectorized Pavement Marking Paints.

609-2.01 (Vacant)

609-2.02 Concrete for Cast-in-Place Concrete Curb and Curb & Gutter.

A. Conventionally Formed Curb and Curb & Gutter. The material requirements, mix preparation and manufacturing of the concrete shall conform to the requirements for Class A Concrete as specified in Section 501, Portland Cement Concrete - General.

B. Machine Formed Concrete Curb and Curb & Gutter. Use Class J Concrete as specified in Section 501, Portland Cement Concrete - General.

609-2.03 Stone Curb and Granite Curb. Stone curb shall conform to §714-01 and shall be either sandstone or bluestone. Granite curb shall conform to the requirements for granite under Stone Curb §714-01.

609-2.04 Curb Anchors. Curb anchors for cast-in-place concrete curb, and curb & gutter shall be fabricated from material conforming to the requirements for Longitudinal Joint Ties §705-14 and to the details shown on the standard sheet for concrete curb or as indicated in the contract documents.

609-2.05 Concrete for Backing and Bedding Precast Concrete Curb, Stone Curb, and Granite Curb. The Contractor shall use any Class Concrete or a concrete mix proportioned as follows:

POUNDS OF AGGREGATE PER BAG OF CEMENT				
Specific Gravity of Aggregate	2.60	2.70	2.80	2.90
Concrete Sand	326	337	350	364
Coarse Aggregate, CA 2 Gradation	536	556	558	597

609-3 CONSTRUCTION DETAILS

609-3.01 General. Curb, or curb & gutter found to be dirty, damaged or out of alignment shall be cleaned, repaired, or replaced as necessary by the Contractor to the satisfaction of the Engineer prior to final acceptance of the work. When the Contract Documents have no reference to placing curb across driveway entrances, no curb shall be placed across driveway entrances.

609-3.02 Precast Concrete Curb, Stone Curb, and Granite Curb. All precast concrete curb, stone curb, and granite curb shall be set on a 3 inch thick continuous bed of dry concrete mix, or on a 3 inch thick dry concrete mix bed at the joints as shown on the Standard Sheets and plastic concrete between the joints, or on a 3 inch minimum thick continuous bed of compacted granular material, at the Contractor's option.

Precast concrete curb, stone curb, and granite curb shall be backed up with concrete using one of the following methods depending on the type of pavement:

A. Portland Cement Concrete (Rigid) Pavement. The Contractor shall place concrete backing behind the curb at each joint. The backing shall extend a minimum of 12 inch on both sides of the joint. The minimum height of the concrete backing shall be one half of the concrete pavement thickness and shall be measured from the bottom of the curb.

B. Hot Mix Asphalt (Flexible) Pavement. The Contractor shall place a continuous concrete backing behind the curb. The minimum height of the concrete backing shall be 10 inches or to the top of the hot mix asphalt pavement, whichever is greater, measured from the bottom of the curb.

Precast curb and stone curb with and without sawed ends, not on structure, shall be butted together with no mortar between the joints.

When the curb is set next to a concrete (rigid) pavement, grout conforming to §701-04 Concrete Repair Material or §705-21 Masonry Mortar shall be placed in the joint formed between the curb and the pavement. The grout shall extend from the bottom to the top of the pavement slab.

Before proceeding with any further work adjacent to the curb, the curb shall be backfilled with material approved by the Engineer and the backfill material shall be thoroughly tamped.

609-3.03 Stone Curb and Granite Curb - Bridge Type. The requirements of §609-3.02 shall apply with the following modifications:

§609

- A. Unless special construction details are called for in the contract documents, Type A and Type T2 curbs, when not on structures, shall be set true to line and grade on a concrete bedding.
- B. Types F1, G1, M, R1, R2, S and T1 curbs shall be set in full mortar beds on structures. Excess mortar which extrudes around the curb shall be struck off flush with the front face of the curb and the top surface of the roadway.
- C. Anchor bars for stone and granite bridge curb shall be installed where and as indicated in the contract documents.

All curb on structures shall be fitted together allowing 1/4 inch full mortared joints finished flush with exposed curb surfaces. Curb surfaces shall be cleaned of excess mortar to the satisfaction of the Engineer.

Mortar used for bedding and filling of joints shall conform to §705-21 Masonry Mortar or §701-04 Concrete Repair Material.

609-3.04 Cast-In-Place Concrete Curb and Curb & Gutter. Cast-in-place concrete curb and curb & gutter shall either be conventionally formed or machine formed to the size and shape shown on the standard sheets or as indicated in the contract documents.

Curb anchors, as required on the standard sheets or the contract documents, shall not be coated with materials which impair bonding. Curb anchors shall be installed a minimum of 12 inches from the ends of a pavement slab. Curb anchors for new concrete pavement, when placed simultaneously with pavement concrete, shall be placed by equipment which can demonstrate to the satisfaction of the Engineer placement of the anchors in accordance with these specifications. Curb anchors, when not placed simultaneously with pavement concrete, shall be placed rigidly secured by chairs or other supports to prevent displacement of the anchors when pavement concrete is placed. Curb anchors for existing concrete pavement shall be inserted into holes drilled in the side of the existing concrete pavement. The holes shall be thoroughly cleaned and filled with Concrete Grouting Material §701-05 or Anchoring Materials - Chemically Curing §701-07 immediately before placing the curb anchor. The curb anchor shall be securely supported in position until the grout has hardened.

Curing of the curb and curb & gutter shall comply with the requirements of §502-3.11 Curing, except that a clear membrane curing compound with fugitive dye conforming to the requirements of Membrane Curing Compound §711-05 may be used in lieu of the white pigmented membrane.

A. Conventionally Formed Curb and Curb & Gutter

1. Forms. Forms shall be free from warp and of such construction that there will be no interference to inspection for grade and alignment. All forms shall extend to the full curb depth and be secured so no displacement will occur during the placement of concrete.

2. Casting Segments. Curb and curb & gutter shall be cast in segments having a uniform length of approximately 10 feet. The joints between segments shall not exceed 1/4 inch in width. When curb and curb & gutter is constructed next to concrete pavement, the curb and curb & gutter joints shall line up with the pavement joints or additional joints shall be provided in the curb and curb & gutter which line up with the pavement joints.

3. Expansion Joints. Expansion joints shall be 11/16 inches wide and contain Premoulded Resilient Joint Filler §705-07. The filler shall be cut to conform to the cross section of the curb and curb & gutter.

Expansion joints shall be located at all immovable objects (bridge structures, etc.), adjacent to expansion joints in the pavement, and where shown in the contract documents or directed by the Engineer. Expansion joints will not be required at regular intervals unless otherwise shown in the contract documents.

4. Concrete Placing and Vibrating. Concrete shall be placed in the forms in accordance with the applicable requirements of §555-3.04 and shall be compacted with an immersion type mechanical vibrator. The vibrator shall be of a size and weight capable of thoroughly vibrating

the concrete without damaging or misaligning the forms. The forms shall be left in place until the concrete has hardened sufficiently to permit removal without damage to the curb and curb & gutter. The front form may be removed before the other forms to facilitate finishing the curb and removal of the joint dividers. After removal of the forms, the exposed faces of the curb and curb & gutter shall be immediately rubbed to a uniform surface. No plastering will be permitted.

B. Machine Formed Concrete Curb and Curb & Gutter. The equipment proposed for use by the Contractor shall demonstrate, to the satisfaction of the Engineer, the capability of placing the concrete in accordance with these specifications.

When machine forming, the Contractor may provide additional width of curb without any other change in shape or dimension, if provided by the Contractor at no additional cost to the State. If the Contract Documents or the Engineer require no curb be placed across driveway entrances or the Contract Documents have no reference to placing curb across driveway entrances, the Contractor may continue placing curb across driveway entrances but the curb placed across driveway entrances, excluding transitions, must be cut out and the concrete disposed in a manner approved by the Engineer.

Any curb and curb & gutter placed outside the tolerance of 1/2 inch of the established line or 1/4 inch of the established grade shall be removed and replaced by the Contractor.

1. Crack Control Joints. Crack control joints shall be formed or saw cut to a width of 1/8 inch minimum, 1/4 inch maximum and to a depth of 1 1/2 inch. The cut or formed joints shall extend slightly below the surface of the adjacent pavement and shall be spaced at 1/8 inch intervals. When the curb, and curb & gutter is constructed next to concrete pavement, the curb and curb & gutter joints shall line up with the pavement joints or additional joints shall be provided in the curb and curb & gutter which line up with the pavement joints. The saw cut or formed joints shall be left unfilled.

2. Expansion Joints. Expansion joints shall be 11/16 inches wide and contain Premoulded Resilient Joint Filler §705-07. The filler shall be cut to conform to the cross section of the curb and curb & gutter.

The expansion joints shall be located at all immovable objects (bridge structures, etc.), adjacent to expansion joints in the pavement, where shown in the contract documents, or directed by the Engineer. Expansion joints shall not be required at regular intervals unless otherwise shown in the contract documents.

609-3.05 (Vacant)

609-3.06 Optional Curb. Under optional curb, the Contractor shall have the option of placing precast concrete curb, or cast-in-place concrete curb, or granite curb. Precast concrete curb or granite curb shall be placed in accordance with the requirements of §609-3.02. Cast-in-place curb shall be placed in accordance with the requirements of §609-3.04. No intermixing of curb will be allowed without the Engineer's written permission.

609-3.07 Hot Mix Asphalt Curb. Hot mix asphalt curb shall conform to the construction requirements of §402-3, except as follows:

A. Preparation of Mixture. The hot mix asphalt for curb shall be mixed in a batch type bituminous concrete mixing plant. The additive as specified in §714-06 shall be introduced into the pugmill within an accuracy of $\pm 0.1\%$ of the total batch weight. The additive may be introduced through a mineral filler feed system only if the above delivery tolerance can be maintained. The dry mixing time shall be a minimum of 15 seconds after the complete introduction of aggregates and additive into the pugmill. The wet mix time shall be a minimum of 45 seconds.

B. Preparation of Surface. When hot mix asphalt curb is constructed on a freshly laid hot mix asphalt surface, the curb shall be laid only on a clean dry surface. When curb is to be laid on a cured

§609

or aged concrete base, hot mix asphalt pavement, or performance grade binder treated base, the surface shall be thoroughly swept and cleaned by compressed air. The surface shall be thoroughly dried and, immediately prior to placing of the hot mix asphalt mixture, shall receive a tack coat of asphalt emulsion, Material Designation 702-3001 as specified in Table 702-5. The tack coat shall be applied at a rate of 0.05 to 0.15 gallons per square yard. The tack coat shall be prevented from spreading to areas outside of the area to be occupied by the curb.

C. Placing. Hot mix asphalt curb shall be constructed by machine to the size and shape shown on the standard sheets.

The machine shall be capable of placing the hot mix asphalt in accordance with these specifications to the satisfaction of the Engineer. Prior to placement, the Contractor shall demonstrate to the satisfaction of the Engineer the machine meets the following requirements:

1. The machine shall be self propelled and capable of forming curb which is uniform in texture, shape, and density.
2. The weight and the material extrusion rate of the machine shall be such that the required compaction is obtained without the machine riding above the bed on which curbing is constructed.

When short sections of hot mix asphalt curb or sections with short radii are required, the Engineer may permit construction by other means, as long as the resulting curb conforms to the curb produced by machine.

D. Painted Hot Mix Asphalt Curb. When painted hot mix asphalt curb is specified, it shall be painted yellow or white in accordance with the MUTCD. The paint shall be placed in accordance with the following:

1. After a curing period of not less than 72 hours, exposed surfaces of the curbing shall be sprayed or hand brushed with two coats of pavement marking paint, yellow or white as required. Each coat of paint shall be applied at the rate of 1 gallon per 200 linear feet of curb.
2. The curb shall be clean and free of all foreign matter before painting. Paint shall be applied only when the air temperature is above 50°F and rising. Paint shall not be applied when there is reasonable expectation of rain. In the event the first or final coat of paint is rain damaged, as determined by the Engineer, the Contractor shall clean and repaint the curb at no additional cost to the State.

609-3.08 Resetting Curb. Care shall be taken in removing the curb to be reset so that there will be no unnecessary breakage. All curb damaged in removing, hauling, storing, or resetting shall be replaced by the Contractor.

The curb shall be reset, in accordance with the requirements of §609-3.02 or §609-3.03 for resetting bridge type curbs, to the lines and grades specified in the contract documents.

609-4 METHOD OF MEASUREMENT. All curb and curb & gutter placed and curb reset under these specifications will be measured by the number of linear feet, rounded to the nearest foot. The measurement will be taken along the top front arris line of full height, transition and terminal sections. The measurement will be taken along the top front arris line of curb reveals across driveway entrances only when placed and not removed.

609-5 BASIS OF PAYMENT

609-5.01 Concrete Curb, Curb & Gutter, Stone Curb, Granite Curb, Optional Curb. The unit price bid per foot shall include the cost of all labor, materials, curb anchors, equipment, and excavation to, in accordance with these specifications, place, backfill, grout and caulk the curb, curb & gutter. When select backfill is specified, the select backfill shall be paid under its respective items. No additional payment will be made to the Contractor when more than the minimum width of curb is placed.

No additional payment will be made to the Contractor when curb is placed across driveway entrance, to facilitate concrete machine forming operations, and removed.

609-5.02 Stone Curb and Granite Curb - Bridge Type. The unit price bid per foot shall include the cost of furnishing all labor, equipment, and materials including concrete bedding, mortar for stone and granite curbs, chemically curing anchoring materials, and stone and granite curb anchors required to bed and place stone and granite bridge curb, in accordance with these specifications.

609-5.03 Hot Mix Asphalt Curb. The unit price bid per foot shall include the cost of furnishing all labor, materials, and equipment to prepare the surface for curb placement, and place the curb. If painted hot mix asphalt curb is specified, the Contractor shall also include the cost of preparing the curb for painting, furnishing the paint, and applying the paint.

Progress payments will be made after the curb has been constructed to the shape and size shown on the standard sheet and/or plans. Payment will be made, at the unit price bid, for 90% of the quantity properly constructed exclusive of painting. The balance of the quantity will be paid for upon completion of the work.

609-5.04 (Vacant)

609-5.05 Resetting Curb. The unit price bid per foot shall include the cost of furnishing all labor, equipment, and materials to remove, haul, store and reset curb, in accordance with these specifications. In addition, the unit price shall also include any re-dressing of tops and joints of bridge type curb, as directed by the Engineer, and replacement of curb damaged by the Contractor's operations.

Payment will be made under:

Item No.	Item	Pay Unit
609.01XX	Stone Curb* (Various Types as indicated)	Foot
609.02XX	Granite Curb* (Various Types as indicated)	Foot
609.03XX	Granite Bridge Curb* (Various Types as indicated)	Foot
609.035X	Stone Bridge Curb* (Various Types as indicated)	Foot
609.04XX	Cast-in-Place Concrete Curb* (Various Types as indicated)	Foot
609.05XX	Cast-in-Place Concrete Curb & Gutter* (Various Types as indicated)	Foot
609.08XX	Precast Concrete Curb* (Various Types as indicated)	Foot
609.0901	Optional Curb (Precast Concrete Type PVF150 or Cast-In-Place Concrete Type VF150 or Granite Type C)	Foot
609.0902	Optional Curb (Precast Concrete Type PM100 or Cast-In-Place Concrete Type M100 or Granite Type E100)	Foot
609.0903	Optional Curb (Precast Concrete Type PT100 or Cast-In-Place Concrete Type T100)	Foot
609.15	Resetting Existing Curb	Foot
609.21XX	Painted Hot Mix Asphalt Curb* (Various Types as indicated)	Foot
609.22XX	Unpainted Hot Mix Asphalt Curb* (Various Types as indicated)	Foot

* Refer to Standard Pay Item Catalog for full Item Number and Description.

~~SECTION 610 – TURF AND WILDFLOWER ESTABLISHMENT~~

~~**610-1 DESCRIPTION.** The work covered by this section includes work necessary to establish and care for turf and wildflowers.~~

~~**610-1.01 Applying Soil Amendments.** The work consists of furnishing and placing soil amendments as specified at the locations indicated in the contract documents or where directed by the Engineer.~~

~~**610-1.02 Establishing Turf.** The work consists of preparing ground surfaces for seeding; furnishing and installing fertilizer, seed, mulch, and mulch anchorage on areas indicated in the contract documents or~~

where directed by the Engineer. The work also consists of producing a satisfactorily established turf and caring for the turf as specified. The work may also include furnishing and applying limestone as specified in the contract documents.

610-1.03 Establishing Wildflowers. The work consists of preparing ground surfaces for seeding; furnishing and installing seed, mulch and mulch anchorage on areas indicated in the contract documents or where directed by the Engineer; and caring for and establishing the work specified.

610-2 MATERIALS

610-2.01 Applying Soil Amendments. The materials shall meet the requirements of the following subsections of Section 700 Materials and Manufacturing and/or as further specified in the contract documents:

Limestone 713-02 Fertilizer 713-03

610-2.02 Establishing Turf. The materials shall meet the requirements of the following subsections of Section 700 Materials and Manufacturing and/or as further specified in the contract documents:

Limestone 713-02 Mulch anchorage 713-12, Type A
 Fertilizer 713-03 Straw 713-19
 Seeds 713-04
 Wood fiber 713-11

Turf establishment materials not otherwise specified in the contract documents shall be as follows:

Fertilizer 713-03 Type No. 3-10-6-4 (50% N-UF)
 Straw 713-19
 Mulch anchorage 713-12, Type A
 Seeds 713-04 and as follows:

Name	Variety	Wt. of Pure Live Seed Per Acre
Red Fescue (Festuca rubra)	Commercial	50 lbs
Perennial Ryegrass (Lolium perenne)	Commercial	30 lbs
White Clover (Trifolium repens)	Commercial	
	Max. 25% hard seed	5 lbs
Total		85 lbs

610-2.03 Establishing Wildflowers. The materials shall meet the requirements of the following subsections of Section 700 Materials and Manufacturing and/or as further specified in the contract documents:

Seeds 713-04 Mulch anchorage 713-12, Type A
 Straw 713-19

610-2.04 Compost. The material shall meet the requirements of the following subsection of Section 700 Materials and Manufacturing and/or as further specified in the contract documents:

Organic Material 713-15.

610-3 CONSTRUCTION DETAILS

610-3.01 Applying Soil Amendments. Fertilizer and/or limestone shall be evenly spread over the surface of the soil in the areas described in the contract documents or where directed by the Engineer.

The rates of application shall be as specified in the contract documents. Any method of application that will insure an even distribution will be acceptable. When hydraulic application is used the minimum rate of water shall be 500 gal/acre unless otherwise specified in the contract documents.

610-3.02 Establishing Turf

A. Rates. Application rates for turf establishment materials shall be specified in the contract documents. When no rates for establishing turf are specified in the contract documents, the following shall apply:

Fertilizer	800 lbs/acre
Seed	85 lbs pure live seed/acre
Mulch	2 tons/acre
Mulch Anchorage	Manufacturer's recommended rate

B. Limitations. The contractor shall notify the Engineer at least 2 working days before the start of any seeding operation and shall not begin the work until the Engineer has given permission. When sodding and turf establishment are to be done in the same general areas, the sodding shall be done first, and equipment used during turf establishment shall not damage the sodded areas.

C. Inoculation of Leguminous Seeds. All seeds of leguminous plants requiring inoculation shall be inoculated prior to mixing or sowing unless otherwise specified or approved or unless accompanied by a certificate of preinoculation. When seeds requiring inoculation are to be sown dry, the inoculant shall be applied in accordance with its accompanying instructions and the seeds allowed to dry sufficiently for proper handling. Seeds shall be sown within thirty hours after this treatment. When seeds requiring inoculation are to be sown by water pressure, the inoculant may be added to the water and seed mixture, together with limestone and/or fertilizer as specified, providing the pH of the solution does not exceed 8.

D. Ground Preparation and Seeding. All turf establishment areas shall be approved by the Engineer prior to seeding. Areas to be seeded with turf seeds shall be maintained at approved grades and irregularities that will hold water shall be eliminated. Weed growth that, in the Engineer's judgment, may adversely affect germination or growth shall be removed or controlled as approved or as directed by the Engineer prior to seeding. Limestone, fertilizer and seeds in the amounts specified shall be evenly distributed on the areas to be seeded. All mechanical equipment used for soil preparation for seeding shall be as approved. Equipment shall pass parallel to the contours unless otherwise approved except that crawler tractors shall pass at right angles to the contours. Establishing turf shall be done using Method No. 1, unless Method No. 2 is specified. Regardless of the method used, the finished surface of any area that is seeded shall not be rougher, more uneven or have more or larger stones, clods, roots, or other foreign materials than the area it adjoins. In built up and residential areas handraking will usually be necessary to produce the required smoothness and uniformity, particularly where grading and turf establishment is to be adjacent to lawns.

Method No. 1. Areas to be seeded shall be scarified sufficiently to break up the surface crust immediately before seeding except where, in the judgment of the Engineer, the ground is already loose and friable as immediately following grading. Where topsoil is not specified, all loose stones and other objects over 2 inches in greatest dimension, or other sizes as specified, shall be removed and disposed of as approved. All embedded stones and other objects protruding more than 2 inches above the surface, or other heights specified, shall also be removed and disposed of as approved. Where topsoil is specified the maximum loose stone size shall be 2 inches or as otherwise specified under §613-2. Unless otherwise specified in the contract documents, only limestone and/or fertilizers may be mixed together with the seeds (including legume inoculants when required) immediately before sowing. Any method of sowing that does not injure the seeds in the process of spreading will be acceptable.

~~**Method No. 2.** Areas to be seeded shall be harrowed, disked, or otherwise completely pulverized to a state of tillage acceptable to the Engineer. All stones and other undesirable material over 1 inch in greatest dimension or other sizes as specified shall be removed and disposed of as approved. Fertilizer and/or limestone as specified shall be uniformly distributed on the area to be seeded. Seeds shall be distributed uniformly by any approved method that does not injure the seeds in the process of spreading. Following distribution, seeds shall be incorporated into the soil to a depth not exceeding 1/4 inch by raking, rolling brush or chain harrowing, or any other approved method.~~

~~**E. Mulching.** Mulch shall be spread uniformly in a continuous blanket of sufficient thickness to hide the soil from view, taking care not to over apply. Mulch may be spread by hand or by machinery. Mulch shall not be spread before seeding turf unless otherwise approved or directed. Anchorage for straw mulch is required unless otherwise specified in the Contract Documents. Mulch and mulch anchorage shall be applied separately from seeds unless otherwise specified in the Contract Documents. When use of wood fiber mulch is specified, it shall be spread in accordance with the manufacturer's instructions and/or recommendations.~~

~~**F. Liability.** When the Engineer determines that any seeded area has failed for any reason to produce a satisfactorily established turf after a suitable period of time has elapsed, the Contractor shall repeat all the work required by the Section until a satisfactory growth of turf has been established. Any work to be corrected shall be at the Contractor's expense. The contract will not be accepted until a satisfactory turf has been established.~~

~~**G. Care During Construction.** The Contractor shall care for seeded turf areas until final acceptance of the contract. Care shall consist of providing protection against traffic by providing approved warning signs or barricades; and shall consist of repairs to any seeded turf areas damaged by wind, water, fire, traffic or other causes. Damaged areas shall be repaired to re-establish the condition and grade of the area prior to seeding and shall then be refertilized, reseeded and remulched as specified herein.~~

~~**Method No. 1.** The Contractor shall mow all turf establishment areas seeded on 1 on 3 or flatter slopes unless otherwise specified or directed by the Engineer. Such turf areas shall be mowed to a height of 4 inches when growth reaches 8 inches and thereafter as directed by the Engineer.~~

~~**Method No. 2.** The Contractor shall mow all turf establishment areas seeded under Method No. 2 to a height of 3 inches after initial growth reaches 5 inches, and then once a week thereafter unless otherwise approved. Clippings from the first mowing shall be removed.~~

~~610-3.03 Establishing Wildflowers~~

~~**A. Rates.** Application rates for wildflower establishment materials shall be as specified in the contract documents.~~

~~**B. Limitations.** The contractor shall notify the Engineer at least 2 working days before the start of any seeding operation and shall not begin the work until the Engineer has given permission.~~

~~**C. Inoculation of Leguminous Seeds.** Shall be as required under §610-3.02 C. Inoculation of Leguminous Seeds.~~

~~**D. Ground Preparation and Seeding.** All wildflower establishment areas shall be approved by the Engineer prior to seeding. Areas to be seeded with wildflower seeds shall be maintained at approved grade and irregularities that will hold water shall be eliminated. Weed growth that, in the Engineer's judgment, may adversely affect germination or growth shall be removed or controlled as approved or as directed by the Engineer prior to seeding. Seeds in the quantities specified shall be evenly distributed on the areas to be seeded. All mechanical equipment used for soil preparation or~~

seeding shall be as approved and shall pass parallel to the contours unless otherwise approved except that crawler tractors shall pass at right angles to the contours. Areas to be seeded shall be scarified sufficiently to break up the surface crust immediately before seeding except where the ground is already loose and friable as immediately following grading. All stones and other objects over 2 inches in greatest dimension or other sizes as specified shall be removed and disposed of as approved. Any method of sowing that does not injure the seeds in the process of spreading will be acceptable. The finished surface of any area that is seeded shall not be rougher, more uneven or have more or larger stones, clods, roots, or other foreign materials than the area it adjoins.

E. Mulching. Mulch shall be spread uniformly in a continuous blanket of sufficient thickness to hide the soil from view, taking care not to over apply. Mulch may be spread by hand or by machinery. Mulch shall not be spread before seeding turf unless otherwise approved or directed. Anchorage for straw mulch is required unless otherwise specified in the Contract Documents. Mulch and mulch anchorage shall be applied separately from seeds unless otherwise specified in the Contract Documents. When use of wood fiber mulch is specified, it shall be spread in accordance with the manufacturer's instructions and/or recommendations.

F. Liability. When the Engineer determines that any seeded area has failed for any reason to produce a satisfactorily established growth of wildflowers after a suitable period of time, the Contractor shall reseed such areas in the same manner as specified in the contract until a satisfactorily established growth of wildflowers has been established. Any work to be corrected shall be at the Contractor's expense. The contract will not be accepted until a satisfactory growth of wildflowers has been produced.

G. Care of Wildflowers During Construction. The Contractor shall care for the seeded wildflower areas until final acceptance of the contract or as required under §610-3.04. Care of wildflowers shall consist of keeping the wildflowers in a healthy growing condition by watering, controlling weeds, and by any other necessary operations. Care shall also consist of providing protection against traffic by providing approved warning signs or barricades, and shall consist of repairs to any seeded wildflower area damaged by wind, water, fire, traffic or other cause. Damaged areas shall be repaired to re-establish the condition and grade of the area prior to seeding and shall be reseeded and remulched as specified herein. The Contractor shall mow wildflower establishment areas once a year in the autumn after the seed heads have matured, as approved by the Engineer for the duration of the contract.

610-3.04 PERIOD OF ESTABLISHMENT FOR WILDFLOWERS. The Period of Establishment for Wildflowers shall begin immediately following the satisfactory completion of all the wildflower seeding as confirmed in writing by the Engineer. The Contractor shall be required to continue the work specified under §610-3.03 G. Care of Wildflowers During Construction for a period of one year or until the contract is complete, whichever is later.

—In the event the Contractor requests acceptance of the contract and the "Period of Establishment" is not yet completed, the State, if approved by the Commissioner, may pay the Contractor monies retained under provisions of Section 38 Subdivision 7 of the Highway Law upon receipt of a certified check or securities as are listed in Subdivision 3 of Section 139 of the State Finance Law, in the amount of at least double the value of the uncompleted work under "Period of Establishment". For the purpose of determinations for contract acceptance prior to completion of the work under "Period of Establishment", the value of the work required under "Period of Establishment", including necessary reseeding, shall be considered as a sum equal to 10% of the price bid for the item of Establishing Wildflower unless otherwise specified.

—When all work in the contract excepting §610-03, Establishing Wildflowers, has been completed and accepted, the Contractor agrees to procure and maintain for the duration and purposes of any such work of establishment, and at the Contractor's expense, insurance for liability for damages imposed by law, in insurance companies authorized to do such business in the State covering all such operations, whether performed by the Contractor or subcontractors.

§610

~~— Before commencing any such work, the Contractor agrees to furnish to the Commissioner a certificate or certificates of insurance, in a form satisfactory to the Commissioner, showing that the Contractor has complied with this provision as to insurance, which certificate or certificates shall provide that the policies shall not be changed or cancelled until 30 days written notice has been given to the Commissioner.~~

~~— The kind and amounts of insurance are as specified under §611-3.06 Period of Establishment.~~

~~— At the conclusion of the Period of Establishment the Contractor shall remove any trash or debris from the wildflower planting area. Areas that, in the judgment of the Engineer, have failed to produce an established growth of wildflowers shall be noted for reseeded in accordance with the contract specifications.~~

~~— This requirement shall not prevent the release of the retained monies as herein defined at the expiration of the Period of Establishment but a certified check or securities, as previously described, equal to at least double the value of any uncompleted work will be required. No work other than re-grading to establish condition of the area, reseeded and remulching will be required after the conclusion of the Period of Establishment for Wildflowers.~~

610-4 METHOD OF MEASUREMENT

~~**610-4.01 Applying Soil Amendments.** Applying soil amendments will be measured as the number of tons of soil amendments that have been acceptably applied. The quantity of amendments applied will be computed to the nearest tenth of a ton.~~

~~**610-4.02 Establishing Turf.** Establishing turf will be measured as the number of acres of surface area that have been satisfactorily seeded.~~

~~**610-4.03 Establishing Wildflowers.** Establishing wildflowers will be measured as the number of acres of surface area that have been satisfactorily seeded.~~

~~**610-4.04 Compost.** Compost will be measured by cubic yards.~~

610-5 BASIS OF PAYMENT

~~**610-5.01 Applying Soil Amendments.** The unit price bid per ton shall include the cost of all labor, equipment, materials and incidentals, including water necessary to complete the work as specified.~~

~~**610-5.02 Establishing Turf.** The unit price bid per acre shall include the cost of all labor, equipment, materials and incidentals, including water necessary to complete the work as specified.~~

~~**610-5.03 Establishing Wildflowers.** The unit price bid per acre shall include the cost of all labor, equipment, materials and incidentals, including water and watering necessary to complete the work as specified.~~

~~**610-5.04 Compost.** The unit price per cubic yard shall include the cost of all labor, equipment, materials and incidentals.~~

Payment will be made under:

Item No.	Item	Pay Unit
610.0101	Applying Soil Amendments	Ton
610.0203	Establishing Turf	Acre
610.03	Establishing Wildflowers	Acre
610.04	Compost	Cubic Yards

SECTION 610 - TURF AND WILDFLOWER ESTABLISHMENT

610-1 DESCRIPTION. The work covered by this section includes work necessary to establish and care for turf and wildflowers.

610-1.01 Applying Soil Amendments. The work consists of furnishing and placing soil amendments as specified at the locations indicated in the contract documents or where directed by the Engineer.

610-1.02 Establishing Turf. The work consists of preparing ground surfaces for seeding; furnishing and installing fertilizer, seed, mulch, and mulch anchorage on areas indicated in the contract documents or where directed by the Engineer. The work also consists of producing a satisfactorily established turf and caring for the turf as specified.

610-1.03 Establishing Wildflowers. The work consists of preparing ground surfaces for seeding; furnishing and installing seed, mulch and mulch anchorage on areas indicated in the contract documents or where directed by the Engineer. The work shall consist of producing a satisfactory establishment of wildflowers and caring for wildflowers as specified.

610-2 MATERIALS

All materials used shall comply with the requirements specified in the following subsections of Section 700 *Materials and Manufacturing*.

Water	712-01
Topsoil	713-01
Limestone	713-02
Fertilizer	713-03
Seeds	713-04
Trees, shrubs and vines, groundcovers and special plants	713-06
Rolled Erosion Control Products and Soil Stabilizers	713-07
Materials for the Protection of Plants	713-08
Mycorrhizal Fungi	713-09
Moisture Retention Additive	713-10
Wood Fiber Mulch	713-11
Mulch Anchorage	713-12
Pesticides	713-13
Organic Material	713-15
Straw	713-19

Turf establishment materials shall be as follows:

Fertilizer	713-03 Type No. 3 10-6-4 (50% N-UF)
Seeds	713-04 and as follows:

Name	Variety	Wt. of Pure Live Seed Per Acre
Red Fescue (<i>Festuca rubra</i>)	Commercial	50 lbs
Perennial Ryegrass (<i>Lolium perenne</i>)	Commercial	30 lbs
White Clover (<i>Trifolium repens</i>)	Commercial	
	Max. 25% hard seed	<u>5 lbs</u>
Total		85 lbs

610-3 CONSTRUCTION DETAILS

610-3.01 Incorporating Soil Amendments. Soil amendments, including fertilizer, limestone, mycorrhizal fungi, and/or moisture retention additive shall be incorporated as described in the contract documents. When mycorrhizal fungi are specified, it shall be applied in accordance with the manufacturer's recommendations. Amendments shall be evenly spread over the surface of turf or wildflower areas, applied within plant saucers or applied over the plant beds as appropriate, at the rates

recommended by the manufacturer or as specified in the contract documents. The method of application shall ensure an even distribution. When hydraulic application is used, the minimum rate of water shall be 500 gal/acre unless otherwise specified in the contract documents.

610-3.02 Establishing Turf

A. Rates. Application rates for turf establishment materials shall be specified in the contract documents. When no rates for establishing turf are specified in the contract documents, the following shall apply:

- Fertilizer - 800 lbs/acre
- Seed - 85 lbs pure live seed/acre
- Mulch - 2 tons/acre
- Mulch Anchorage - Manufacturer's recommended rate

B. Limitations. The Contractor shall notify the Engineer at least 2 work days before the start of any seeding operation and shall not begin the work until the Engineer has given permission. When sodding and turf establishment are to be done in the same general areas, the sodding shall be done first, and equipment used during turf establishment shall not damage the sodded areas.

C. Inoculation of Leguminous Seeds. All seeds of leguminous plants requiring inoculation shall be inoculated prior to mixing or sowing unless otherwise specified or approved or unless accompanied by a certificate of preinoculation. When seeds requiring inoculation are to be sown dry, the inoculants shall be applied in accordance with its accompanying instructions and the seeds allowed to dry sufficiently for proper handling. Seeds shall be sown within thirty hours after this treatment. When seeds requiring inoculation are to be sown by water pressure, the inoculants may be added to the water and seed mixture, together with limestone and/or fertilizer as specified, providing the pH of the solution does not exceed 8.

D. Ground Preparation and Seeding. All turf establishment areas shall be approved by the Engineer prior to seeding. Areas to be seeded with turf seeds shall be maintained at approved grades. Irregularities that will hold water shall be eliminated as directed. Weed growth that may adversely affect germination or growth shall be removed or controlled prior to seeding. Limestone, fertilizer and seeds in the amounts specified shall be evenly distributed on the areas to be seeded. All mechanical equipment used for soil preparation for seeding shall be as approved. Equipment shall pass parallel to the contours unless otherwise approved except that crawler tractors shall pass at right angles to the contours.

Establishing turf shall be done using Method No. 1, unless Method No. 2 is specified. Regardless of the method used, the finished surface of any area that is seeded shall not be rougher, more uneven or have more or larger stones, clods, roots, or other foreign materials than the area it adjoins. In built up and residential areas hand raking will usually be necessary to produce the required smoothness and uniformity, particularly where grading and turf establishment is to be adjacent to lawns.

Method No. 1. Areas to be seeded shall be scarified sufficiently to break up the surface crust immediately before seeding except where, in the judgment of the Engineer, the ground is already loose and friable as immediately following grading. Where topsoil is not specified, all loose stones and other objects over 2 inches in greatest dimension, or other sizes as specified, shall be removed and disposed of as approved. All embedded stones and other objects protruding more than 2 inches above the surface, or other heights specified, shall also be removed and disposed of as approved. Where topsoil is specified the maximum loose stone size shall be 2 inches or as otherwise specified under §613-2. Unless otherwise specified in the contract documents, only limestone and/or fertilizers may be mixed together with the seeds (including legume inoculants when required) immediately before sowing. Any method of sowing that does not injure the seeds in the process of spreading will be acceptable.

Method No. 2. Areas to be seeded shall be harrowed, disked, or otherwise completely pulverized. All stones and other undesirable material over 1 inch in greatest dimension or other sizes as specified shall be removed and disposed of as approved. Fertilizer and/or limestone as specified shall be uniformly distributed on the area to be seeded. Seeds shall be distributed uniformly by any approved method that

does not injure the seeds in the process of spreading. Following distribution, seeds shall be incorporated into the soil to a depth not exceeding 1/4 inch by raking, rolling brush or chain harrowing, or any other approved method.

E. Mulching. Straw mulch: Straw mulch shall be spread uniformly in a continuous blanket of sufficient thickness to hide the soil from view, taking care not to over apply. Straw mulch may be spread by hand or by machinery. Straw mulch may not be spread before seeding turf nor later than 72 hours after seeding turf unless otherwise approved or directed. Anchorage is required unless otherwise specified in the contract documents. Straw mulch and mulch anchorage shall be applied separately from seeds unless otherwise specified in the Contract Documents.

Wood fiber mulch: Wood fiber mulch may only be used if seeding is performed during the periods specified or if otherwise approved. Wood fiber mulch shall be applied to the thickness recommended by the manufacturer or as approved in the field.

F. Liability. When any seeded area has failed for any reason to produce a satisfactorily established turf after a suitable period of time has elapsed, the Contractor shall repeat the work until a satisfactory growth of turf has been established at no additional expense to the State.

G. Care during Construction. The Contractor shall care for seeded turf areas until contract final acceptance. Care shall consist of providing protection against traffic and repairs to any seeded turf areas damaged by wind, water, fire, traffic or other causes. Damaged areas shall be repaired to re-establish the condition and grade of the area prior to seeding and shall then be refertilized, reseeded and remulched.

Method No. 1. The Contractor shall mow all turf establishment areas seeded under Method No. 1 that are on 1 on 3 or flatter slopes unless otherwise directed by the Engineer. Such turf areas shall be mowed to a height of 4 inches when growth reaches 6 inches and thereafter as directed by the Engineer.

Method No. 2. The Contractor shall mow all turf establishment areas seeded under Method No. 2 to a height of 3 inches after initial growth reaches 5 inches, and then once a week thereafter unless otherwise approved. Clippings from the first mowing shall be removed.

610-3.03 Establishing Wildflowers

A. Rates. Application rates for wildflower establishment materials shall be as specified in the contract documents.

B. Limitations. The Contractor shall notify the Engineer at least 2 work days before the start of any seeding operation and shall not begin the work until the Engineer has given permission.

C. Inoculation of Leguminous Seeds. The Contractor shall inoculate leguminous seeds in accordance with §610-3.02C. Inoculation of Leguminous Seeds.

D. Ground Preparation and Seeding. All wildflower establishment areas shall be approved by the Engineer prior to seeding. Areas to be seeded with wildflower seeds shall be maintained at approved grade. Irregularities that will hold water shall be eliminated. Weed growth that may adversely affect wildflower germination or growth shall be removed or controlled prior to seeding as specified. Seeds in the quantities specified shall be evenly distributed on the areas to be seeded. All mechanical equipment used for soil preparation or seeding shall pass parallel to the contours unless otherwise approved except that crawler tractors shall pass at right angles to the contours. Areas to be seeded shall be scarified sufficiently to break up the surface crust immediately before seeding except where the ground is already loose and friable as immediately following grading. All stones and other objects over 2 inches in greatest dimension or other sizes as specified shall be removed and disposed of as approved. Any method of sowing that does not injure the seeds in the process of spreading will be acceptable. The finished surface of any area that is seeded shall not be rougher, more uneven or have more or larger stones, clods, roots, or other foreign materials than the area it adjoins.

E. Mulching. When mulch is specified, it shall be spread uniformly in a continuous blanket taking care not to over apply. Mulch may be spread by hand or by machinery. Mulch shall not be spread before or later than 72 hours after seeding wildflowers. Anchorage is required unless otherwise specified in the contract documents. Seed, mulch and mulch anchorage shall be applied separately, unless otherwise specified.

F. Liability. When any seeded area has failed for any reason to produce a satisfactorily established growth of wildflowers after a suitable period of time, the Contractor shall reseed such areas until a satisfactorily established growth of wildflowers has been established at no additional expense to the State.

G. Care of Wildflowers During Construction. The Contractor shall care for the seeded wildflower areas until final acceptance of the contract or as required under §610-3.04. *Care of Wildflowers* shall consist of keeping the wildflowers in a healthy growing condition by watering, controlling weeds, and by any other necessary operations. Care shall also consist of providing protection against traffic by providing approved warning signs or barricades, and shall consist of repairs to any seeded wildflower area damaged by wind, water, fire, traffic or other cause. Damaged areas shall be repaired to re-establish the condition and grade of the area prior to seeding and shall be reseeded and remulched. The Contractor shall mow wildflower establishment areas once a year in the autumn after the seed heads have matured.

610-3.04 Period of Establishment for Wildflowers. The Period of Establishment for Wildflowers shall begin immediately following the satisfactory completion of all the wildflower seeding. The Contractor shall continue the work specified under §610-3.03 G. *Care of Wildflowers During Construction* for a period of one year or until the contract is complete, whichever is later.

The Department may issue contract final acceptance and allow the Contractor to complete the Period of Establishment in accordance with §109-10 *Uncompleted Work Agreements*. For the purpose of an Uncompleted Work Agreement, the value of the work required under “Period of Establishment”, including necessary reseeding, shall be considered as a sum equal to 10% of the price bid for the item of Establishing Wildflower unless otherwise specified.

At the conclusion of the Period of Establishment the Contractor shall remove any trash or debris from the wildflower planting area. Areas that have failed to produce an established growth of wildflowers shall be reseeded in accordance with the contract documents. No work other than re-grading to establish condition of the area, reseeding and remulching will be required after the conclusion of the Period of Establishment for Wildflowers.

610-4 METHOD OF MEASUREMENT

610-4.01 Incorporating Soil Amendments. Incorporated soil amendments will be measured in ~~tons~~ pounds of soil amendments applied, ~~measured to the nearest tenth of a ton.~~

610-4.02 Establishing Turf. Establishing turf will be measured as the number of acres ~~of surface area~~ to the nearest tenth of an acre that have been satisfactorily seeded.

610-4.03 Establishing Wildflowers. Establishing wildflowers will be measured as the number of acres ~~of surface area~~ to the nearest tenth of an acre that have been satisfactorily seeded.

Comment [c85]:

Landscape

610-5 BASIS OF PAYMENT

610-5.01 Applying Soil Amendments. The unit price bid per ton shall include the cost of all labor, equipment, materials and incidentals, including water necessary to complete the work as specified.

610-5.02 Establishing Turf. The unit price bid per acre shall include the cost of all labor, equipment, materials and incidentals, including water necessary to complete the work as specified.

610-5.03 Establishing Wildflowers. The unit price bid per acre shall include the cost of all labor, equipment, materials and incidentals, including water and watering necessary to complete the work as specified.

Payment will be made under:

Item No.	Item	Pay Unit
610.0110	Applying Fertilizer	Ton
610.0111	Applying Limestone	Ton
610.0112	Applying Mycorrhizal Fungi	Ton
610.0113	Applying Moisture Retention Additive	Ton
610.0203	Establishing Turf	Acre
610.03	Establishing Wildflowers	Acre
610.04	Compost	Cubic Yard

SECTION 611 – PLANTING

~~**611-1 DESCRIPTION.** This work consists of furnishing, planting and caring for plants as specified in the contract documents. This work shall include all care of planting operations and establishment necessary to complete the work as specified.~~

~~**611-2 MATERIALS**~~

~~**611-2.01 Plants.** Trees, shrubs and vines, groundcovers and special plants shall be as specified under §713-06 and as further specified in the contract documents. The Contractor shall be responsible for furnishing the vendor with a copy of the appropriate contract documents containing the plant material specifications.~~

~~**611-2.02 Planting Materials.** Topsoil, organic materials, fertilizer, mulch and materials for the protection of plants shall be specified under §713, Landscape Development Materials and as further specified in the contract documents.~~

~~—Water shall be specified under §712-01 Water.~~

~~**611-3 CONSTRUCTION**~~

~~**611-3.01 General**~~

~~**A. Planting Season.** The planting seasons shall be as specified in the contract documents. No planting shall be done when the soil is frozen or otherwise in an unsatisfactory condition for working as determined by the Engineer.~~

~~**B. Obstructions below Ground.** The Contractor shall verify the locations of underground tanks, utilities and other nonmovable obstructions. Where nonmovable obstructions are encountered, the plant pits shall be relocated, as directed by the Regional Landscape Architect.~~

~~**C. Delivery.** The Contractor shall notify the Engineer at least two full working days before intended delivery of plants or planting materials, to the site. The Engineer shall be furnished legible copies of the certificates of inspection of plant materials as specified in §713-06 and a copy of the invoice for each shipment showing point of origin, sizes, quantities, sizes, and kinds of materials supplied. Plants which fail to meet the specifications, as determined by the Regional Landscape Architect, will be rejected. All rejected plants shall be promptly removed from the project site.~~

~~**D. Storage.** All plants shall be properly protected from damage and drying out. Such protection shall include the time when the plants are in transit, being handled or in temporary storage. Bare root plants not planted immediately shall be puddled and heeled in. The bundles of heeled in plants shall be opened and the plants shall be spaced separately. The roots of the heeled in plants shall have their~~

earth balls protected by earth, mulch or straw, or they may be heeled in. All plants not planted immediately shall be watered as approved by the Regional Landscape Architect.

611-3.02 Ground Preparation

~~**A. Layout.** Locations for plants and outlines of areas to be planted shall be staked or marked out on the ground by the Contractor to the satisfaction of the Regional Landscape Architect before any plant pits or plant beds are dug.~~

~~**B. Undesirable Material.** When rock, construction debris or other undesirable materials is encountered while digging, the materials shall be removed to the depth and width necessary to obtain the specified plant pit diameter and depth, or the plant pit may be relocated as directed by the Regional Landscape Architect.~~

~~**C. Plant Pit Diameter.** The minimum plant pit diameter shall bear the following relationship to the diameter of the root spread or root balls of the plants to be planted in them, unless otherwise specified in the contract documents:~~

Root Spread/Root Ball Diameter	Plant Pit Diameter
under 2 feet	Twice the root spread or root ball diameter
from 2 feet to 4 feet	Equal to the root spread or root ball diam. plus 0.6 m
plus 2 feet over 4 feet	One and one half times the root spread or root ball diameter

The sides of the plant pits shall be loose and friable at the time of planting.

~~**D. Plant Pit Depth.** The depth of all plant pits shall allow the root ball to sit on undisturbed subgrade unless otherwise specified in the contract documents. Pit depth for bare root plants shall be as specified in the contract documents.~~

~~**E. Planting Beds.** Plants in planting beds shall either be planted in individual plant pits, or the entire planting bed shall be excavated and backfilled with planting soil as specified in the contract documents. Existing vegetation shall be removed from all planting beds as specified in the contract documents or as directed by the Regional Landscape Architect.~~

~~**F. Drainage.** Where an impervious layer of soil is encountered during the excavation of plant pits or beds, all such soil shall be removed to a depth as approved by the Engineer and the pits or beds shall be backfilled with acceptable planting soil.~~

~~**G. Planting Soil.** Planting soil shall be unamended existing soil excavated from the plant pit unless one of the following alternates is specified elsewhere in the contract documents:~~

~~Alternative 1. Amended existing soil excavated from the plant pit.~~

~~Alternative 2. Unamended approved topsoil.~~

~~Alternative 3. Amended approved topsoil thoroughly premixed with specified soil amendments at the specified rates.~~

~~When specified, fertilizer shall be applied within the plant saucers or over the plant beds, unless otherwise specified in the contract documents.~~

~~**H. Disposal of Excess Soil.** Excess soil shall be removed immediately and disposed of in disposal areas designated in the contract documents or at an on-site or off-site location, consistent with law, rule or regulation, and as approved by the Engineer.~~

611-3.03 Setting Plants

~~**A. General.** All plants shall be set plumb at such a level that they bear the same relation to the surface of the surrounding ground as they bore to the ground from which they were dug. Planting soil shall be carefully backfilled into plant pits in layers not to exceed 4 inches in depth, and shall be tamped to prevent voids and settling before additional planting soil is placed. Thorough watering shall accompany backfilling of planting soil unless otherwise approved. A saucer shall be formed around each plant pit as specified in the contract documents.~~

~~**B. Balled Plants.** Following placement in the plant pit, balled plants shall have all natural burlap cloth, ropes, wire baskets, twine, and nonbiodegradable woven and nonwoven fabrics completely removed from the upper one third (1/3) sides and top of the root ball to a maximum depth of 18 inches. There is no requirement to remove the fabric or basket from the bottom of the root ball.~~

~~**C. Container Grown Plants.** Container grown plants shall be removed from their containers. Roots which are matted or entangled shall be straightened or cut and removed. Encircling roots shall be cut in a vertical direction.~~

~~**D. Bare Root Plants.** Roots of bare root plants shall be properly spread out in a radial position and planting soil shall be carefully worked in among them. All dead, broken, frayed and twisted roots shall be cleanly cut off.~~

~~**E. Wrapping.** When wrapping is specified in the contract documents, the wrapping material shall be a single layer of burlap bandage or paper. The wrapping shall extend from the ground line to the height of the first branch, and be wound spirally upwards from the ground line, overlapping 1 1/2 inch. The wrapping shall be securely tied in place with biodegradable twine at 15 inch intervals, or by other means approved by the Regional Landscape Architect.~~

~~**F. Staking, Guying and Anchoring.** No tree shall be staked, guyed or anchored, unless otherwise specified in the contract documents. When staking is specified, stakes shall be placed in the plant pit prior to backfilling.~~

~~**G. Pruning.** Plants pruned before their arrival will be rejected unless such pruning is specified in the contract documents. Pruning at the time of planting shall be limited to the removal of dead, conflicting and broken branches; and to other pruning consistent with good horticultural practice unless otherwise specified in the contract documents or as directed by the Regional Landscape Architect.~~

~~**H. Mulching.** Where mulching is specified, it shall completely cover the area of the plant pit or planting bed to the depth specified in the contract documents. Mulch shall be placed at the time of planting.~~

~~**611-3.04 Restoration.** Areas disturbed by the planting operations shall be restored by disposing of excess soil, stones and rubbish such as twine, pruned limbs, tree wrap, containers, burlap and wire baskets as approved by the Engineer. Existing turf areas disturbed by planting operations shall be restored to a satisfactory condition which may include topsoil, regrading, fertilizing, seeding and mulching. All waste material generated as a result of the work shall be properly disposed of in accordance with law, rule or regulation, and in a manner approved by the Engineer.~~

611-3.05 Care of Planting.

~~**A. General.** Care of planting shall begin immediately after each plant is planted and shall continue until the final acceptance of the contract and as required under §611-3.06, Period of Establishment. Care of planting shall consist of keeping the plants in a healthy growing condition by watering;~~

~~weeding, cultivating, pruning, tightening of guys if staked, remulching, applying approved antidesiccants and pesticides, and by other operations as necessary.~~

~~**B. Care of Planting Work Schedule.** The Contractor shall prepare and submit a Care of Planting Work Schedule to the Engineer for approval. The schedule shall identify how and when all other work specified under §611-3.05 Care of Planting will be accomplished. Exceptions to the approved schedule shall be subject to advance written approval of the Engineer.~~

~~**C. Watering.** All plants shall be watered at the directed times and at the rates specified in the contract documents, or as ordered by the Engineer. Each watering shall provide not less than 5 gallons of water per plant pit. Payment for the furnishing and applying of water shall be as stated in §611-5 Basis of Payment.~~

~~**D. Weeding.** All plant pits and planting beds shall be maintained weed free by methods approved by the Regional Landscape Architect.~~

~~**E. Remulching.** All plant pits and planting beds shall be remulched as necessary to maintain the required depth specified in the contract documents.~~

~~**F. Pruning.** All dead, injured or diseased wood shall be removed in accordance with good horticulture practice and as approved by the Regional Landscape Architect.~~

~~**G. Remedial Measures.** In the event of the threat of serious damage from insect or diseases, the plants shall be treated by preventative or remedial measures according to good horticultural practice as approved or as directed by the Regional Landscape Architect.~~

~~**H. Antidesiccants.** When specified in the contract documents, plants shall be sprayed with an antidesiccant meeting the requirements of §713-08, Materials for the Protection of Plants. The antidesiccant shall be applied according to the manufacturer's recommendations to thoroughly cover all above ground parts.~~

~~**I. Removal and Replacement.** At the conclusion of the essential portion of the planting work all plants shall be in a healthy, unimpaired and undamaged condition as determined by the Regional Landscape Architect. All plants that are dead, missing, or in an unhealthy or badly impaired condition, as determined by the Regional Landscape Architect, shall be removed and replaced with new, healthy plant material as specified. All planting to be completed or replaced shall be planted not later than the next succeeding planting season as specified in the contract documents.~~

611-3.06 Period of Establishment

~~**A. General.** The Contractor shall be required to continue the work specified under §611-3.05 Care of Planting for a period of one year following the satisfactory completion of all of the planting on the contract as confirmed in writing by the Engineer, or for the duration of the contract, whichever is later. The Period of Establishment applies to all planting unless otherwise specified.~~

~~**B. Period of Establishment Work Schedule.** The Contractor shall prepare and submit a Period of Establishment Work Schedule to the Engineer. The schedule shall describe how and when all work specified under §611-3.06 A. General shall be accomplished. The schedule shall be approved by the Engineer prior to the beginning of the Period of Establishment.~~

~~**C. Contract Acceptance.** In the event the Contractor requests acceptance of the contract and the Period of Establishment is not yet complete, the State, if approved by the Commissioner, may pay the Contractor monies retained under provisions of Section 38 subdivision 7 of the Highway Law upon receipt of certified check or securities as are listed in subdivision 3 of section 139 of the State Finance~~

~~Law, in the amount of at least double the value of the uncompleted work under Period of Establishment.~~

~~— For the purpose of determinations for contract acceptance prior to completion of the work under “Period of Establishment,” the value of the work required under “Period of Establishment,” including necessary replacement, shall be considered as a sum equal to 10% of the price bid for the item of planting unless otherwise specified.~~

~~**D. Insurance.**— When all contract work excepting Section 611 Planting, has been completed and accepted, the Contractor agrees to procure and maintain insurance for the duration and purposes of any such work of establishment, at no additional expense to the State.~~

~~**E. Requirements.**— At the conclusion of the Period of Establishment the Contractor shall remove all stakes, guy wires and tree wrappings unless otherwise approved. All plants in an unhealthy or badly impaired condition, as determined by the Regional Landscape Architect, shall be removed and replaced or removed and noted for replacement at the next succeeding planting season.~~

~~**F. Conclusion of the Period of Establishment.**— These requirements shall not prevent the release of the retained monies as herein defined at the expiration of the Period of Establishment. However, a certified check or securities, as previously described, equal to at least double the value of any uncompleted work will be required. No work other than replacement will be required after the conclusion of the Period of Establishment.~~

~~**611-4 METHOD OF MEASUREMENT.**— Planting will be measured as the number of plants of each kind, size or quality as set forth in the contract documents which are counted in place as having been completed and accepted.~~

~~**611-5 BASIS OF PAYMENT.**— The unit price bid for each plant of each kind, size or quality, as set forth in the contract, which has been acceptably planted shall include the cost of all labor, equipment, materials and incidentals, including watering and planting soil to complete the work specified.~~

~~— Furnishing water and watering plants as required under §611 3.05 Care Of Planting will be paid for under the pay item for Watering Vegetation when this item is specified in the contract documents. No separate payment will be made for water used in the initial planting operation, as required in §611 3.03A. No separate payment will be made for water used during the Period of Establishment.~~

~~— Progress payments for work satisfactorily performed in the excavation and backfilling of plant pits and plant beds may be made in amounts not to exceed twenty percent (20%) of the unit price bid for the respective plants.~~

~~*Payment will be made under:*~~

Item No.	Item	Pay Unit

~~Refer to the Contract Proposal for full item number and full description.~~

SECTION 611 - PLANTING

611-1 DESCRIPTION. This work consists of furnishing, planting and caring for plants as specified in the contract documents. This work shall include all care of planting operations and establishment necessary to complete the work as specified.

611-2 MATERIALS

§612

All materials used shall comply with the requirements specified in the following subsections of Section 700 *Materials and Manufacturing*.

Water	712-01
Topsoil	713-01
Fertilizer	713-03
Wood Chips	713-05
Trees, shrubs and vines, groundcovers and special plants	713-06
Materials for the Protection of Plants	713-08
Mycorrhizal fungi	713-09
Moisture Retention Additive	713-10
Wood Fiber Mulch	713-11
Pesticides	713-13
Organic Material	713-15

611-3 CONSTRUCTION

611-3.01 General.

- A. *Planting Season.*** The planting seasons shall be as specified in the contract documents. No planting shall be done when the soil is frozen or otherwise in an unsatisfactory condition for working.
- B. *Obstructions below Ground.*** The Contractor shall verify the locations of underground utility facilities and other nonmovable obstructions. Where nonmovable obstructions are encountered, the plant pits shall be relocated, as directed by the Engineer.
- C. *Delivery.*** The Contractor shall notify the Engineer at least two full work days before intended delivery of plants or planting materials, to the site. The Engineer shall be furnished legible copies of the certificates of inspection of plant materials and a copy of the invoice for each shipment showing point of origin, sizes, quantities, sizes, and kinds of materials supplied. Plants which fail to meet the specifications will be rejected.
- D. *Storage.*** All plants shall be properly protected from damage and drying out. Such protection shall include the time when the plants are in transit, being handled or in temporary storage. Bare root plants not planted immediately shall be puddled and heeled in by protecting the roots with earth, mulch or straw. The bundles of heeled in plants shall be opened and the plants shall be spaced separately. All plants not planted immediately shall be watered.

611-3.02 Ground Preparation

- A. *Layout.*** Locations for plants and outlines of areas to be planted shall be staked or marked out on the ground by the Contractor before any plant pits or plant beds are dug.
- B. *Undesirable Material.*** Any rock, construction debris or other undesirable materials encountered while digging shall be removed to the depth and width necessary to obtain the specified plant pit diameter and depth, or the plant pit may be relocated as directed by the Engineer.
- C. *Plant Pit Diameter.*** Unless otherwise specified in the contract documents, the minimum plant pit diameter shall bear the following relationship to the diameter of the root spread or root balls of the plants to be planted in them:

TABLE 611-1 REQUIRED PLANT PIT DIAMETER	
Root Spread/Root Ball Diameter	Plant Pit Diameter
under 2 ft.	Twice the root spread or root ball diameter
from 2 to 4 ft.	Equal to the root spread or root ball diam. plus 2 ft.
over 4 ft.	One and one half times the root spread or root ball diameter

The sides of the plant pits shall be loose and friable at the time of planting.

D. Plant Pit Depth. The depth of all plant pits shall allow the root ball to sit on undisturbed subgrade at a depth that allows the upper-most root of the ball to be visible. Pit depth for bare root plants shall be as specified in the contract documents. Refer to Standard Sheet 611-1.

E. Planting Beds. Plants in planting beds shall either be planted in individual plant pits, or the entire planting bed shall be excavated and backfilled with planting soil as specified in the contract documents. Existing vegetation shall be removed from all planting beds as specified in the contract documents.

F. Drainage. Where an impervious layer of soil is encountered during the excavation of plant pits or beds, all such soil shall be removed to a depth as approved by the Engineer and the pits or beds shall be backfilled with acceptable planting soil.

G. Planting Soil. Planting soil shall be unamended existing soil excavated from the plant pit unless one of the following alternates is specified in the contract documents.

Alternative 1. Amended existing soil excavated from the plant pit.

Alternative 2. Unamended approved topsoil.

Alternative 3. Amended approved topsoil thoroughly premixed with specified soil amendments at the specified rates.

Amendments as listed in §713 and specified shall be applied to the planting soil within the plant saucers or over the plant beds, unless otherwise specified in the contract documents.

611-3.03 Setting Plants

A. General. All plants shall be set plumb at such a level that their root flair is level or slightly higher than the surrounding elevation. Planting soil shall be carefully backfilled into plant pits in layers not to exceed 4 inches in depth, not placed over the top of the root ball, and shall be tamped to prevent voids and settling before additional planting soil is placed. Thorough watering shall accompany backfilling of planting soil. A saucer shall be formed around each plant pit as specified in the contract documents. Refer to Standard Sheet 611-1.

B. Balled Plants. Following placement in the plant pit, balled plants shall have all natural burlap cloth, ropes, wire baskets, twine, and nonbiodegradable woven and nonwoven fabrics completely removed from the upper one third (a) sides and top of the root ball to a maximum depth of 18 inches. The fabric or basket on the bottom of the root ball need not be removed.

C. Container Grown Plants. Container grown plants shall be removed from their containers. Roots which are matted or entangled shall be straightened or cut and

removed. Encircling roots shall be cut in a vertical direction. Plants in liners should have the liners cut vertically every 2 inches around the ball of the plants.

D. Bare Root Plants. Roots of bare root plants shall be properly spread out in a radial position and planting soil shall be carefully worked in among them. All dead, broken, frayed and twisted roots shall be cleanly cut off.

E. Wrapping. When wrapping is specified in the contract documents, the wrapping material shall be a single layer of burlap bandage or paper. The wrapping shall extend from the ground line to the height of the first branch, and be wound spirally upwards from the ground line, overlapping 1 1/2 inches. The wrapping shall be securely tied in place with biodegradable twine at 15 inch intervals, or by other means approved by the Engineer.

F. Staking, Guying and Anchoring. Staking of plants shall be as specified. When staking is required, it shall be done according to the details on Standard Sheet 611-1, unless otherwise specified or approved in the field.

G. Pruning. Plants pruned before their arrival will be rejected unless such pruning is specified in the contract documents. Pruning at the time of planting shall be limited to the removal of dead, conflicting and broken branches; and to other pruning consistent with good arboricultural practice.

H. Mulching. Where mulching is specified, it shall completely cover the area of the plant pit or planting bed to the depth specified in the contract documents. Mulch shall be placed at the time of planting. Keep mulch away from the trunk of the plant.

611-3.04 Restoration. Areas disturbed by the planting operations shall be restored by disposing of excess soil, stones and rubbish such as twine, pruned limbs, tree wrap, containers, burlap and wire baskets. No debris shall be buried in plant pits. Existing turf areas disturbed by planting operations shall be regraded, then topsoiled and seeded as approved in the field. The Contractor shall dispose of all waste material generated as a result of the work.

611-3.05 Care of Planting.

A. General. Care of planting shall begin immediately after each plant is planted and shall continue until the final acceptance of the contract and as required under §611-3.06, Period of Establishment. Care of planting shall consist of keeping the plants in a healthy growing condition by watering, weeding, cultivating, pruning, tightening of guys if staked, remulching, applying approved antidesiccants and pesticides, and by other operations as necessary.

B. Care of Planting Work Schedule. The Contractor shall prepare and submit a Care of Planting Work Schedule to the Engineer for approval. The schedule shall identify how and when all other work specified under §611-3.05 Care of Planting will be accomplished. Exceptions to the approved schedule shall be subject to advance written approval of the Engineer.

C. Watering. All plants shall be watered at the directed times and at the rates specified in the contract documents. Each watering shall provide not less than 20 L of water per plant pit. Payment for the furnishing and applying of water shall be as stated in §611-5 Basis of Payment.

D. Weeding. All plant pits and planting beds shall be maintained weed free by methods approved by the Engineer.

E. Remulching. All plant pits and planting beds shall be remulched as necessary to maintain the required depth.

F. Pruning. All dead, injured or diseased wood shall be removed in accordance with good horticulture practice.

G. Remedial Measures. In the event of the threat of serious damage from insect or diseases, the plants shall be treated by preventative or remedial measures according to good horticultural practice.

H. Antidesiccants. When specified in the contract documents, plants shall be sprayed with an antidesiccant meeting the requirements of §713-08 *Materials for the Protection of Plants*. The antidesiccant shall be applied according to the manufacturer's recommendations to thoroughly cover all above ground parts.

I. Removal and Replacement. At the conclusion of the essential portion of the planting work all plants shall be in a healthy, unimpaired and undamaged condition. All plants that are dead, missing, or in an unhealthy or badly impaired condition shall be removed and replaced with new, healthy plant material. All planting to be completed or replaced shall be planted not later than the next succeeding planting season.

611-3.06 Period of Establishment. The Contractor shall continue the work specified under §611-3.05 Care of Planting for a period of one year following the satisfactory completion of the planting, or for the duration of the contract, whichever is later. The Period of Establishment applies to all planting unless otherwise specified.

The Contractor shall prepare and submit a Period of Establishment Work Schedule to the Engineer describing when all work conducted during the Period of Establishment will be accomplished. The schedule shall be approved by the Engineer prior to the beginning of the Period of Establishment.

The Department may issue contract final acceptance and allow the Contractor to complete the Period of Establishment in accordance with §109-10 *Uncompleted Work Agreements*.

For the purpose of an Uncompleted Work Agreement, the value of the work required under Period of Establishment, including necessary replacement, will be considered as a sum equal to 10% of the price bid for the item of planting.

At the conclusion of the Period of Establishment the Contractor shall remove all stakes, guy wires and tree wrappings unless otherwise approved. All plants in an unhealthy or badly impaired condition shall be removed and replaced or removed and noted for replacement at the next succeeding planting season. No work other than replacement will be required after the conclusion of the Period of Establishment.

611-4 METHOD OF MEASUREMENT. Planting will be measured as the number of plants of each kind, size or quality successfully planted.

611-5 BASIS OF PAYMENT. The unit price bid for each plant shall include the cost of all labor, materials and equipment including watering and planting soil to complete the work.

Furnishing water and watering plants as required under §611-3.05 Care Of Planting will be paid for under the pay item for Watering Vegetation when this item is specified in the contract documents. No separate payment will be made for water used in the initial planting operation. No separate payment will be made for water used during the Period of Establishment, unless otherwise stated in the Contract Documents.

Progress payments for work satisfactorily performed in the excavation and backfilling of plant pits and plant beds may be made in amounts not to exceed twenty percent (20%) of the unit price bid for the respective plants.

§612

Payment will be made under:

Item No.	Item	Pay Unit
611.0101XY	Planting - Major Deciduous Trees	Each
611.0201XY	Planting - Minor Deciduous Trees	Each
611.0301XY	Planting - Coniferous Trees	Each
611.0401XY	Planting - Deciduous Shrubs	Each
611.0501XY	Planting - Evergreen Shrubs	Each
611.0601XY	Planting - Vines & Groundcovers	Each
611.0701XY	Planting - Special Plant Materials	Each

Refer to the Contract Proposal for full item number and full [description](#).

Comment [cjt87]:
EI 08-013

SECTION 612 - SODDING

612-1 DESCRIPTION. This work shall consist of preparing the sod bed including topsoil, furnishing, delivering, placing, and caring for sod in the locations shown and specified in the contract documents.

612-2 MATERIALS. Materials for sodding shall meet the following requirements.

Water	712-01
Topsoil	713-01
Sod	713-14
Fertilizer	As specified in the contract documents. Where not specified, fertilizer shall be 713-03 Type No. 1 or as approved by the Engineer.

612-3 CONSTRUCTION DETAILS.

612-3.01 Limitations. The Contractor shall notify the Engineer at least two working days before beginning to place sod. The Contractor shall not begin the work until written permission from the Engineer has been received.

No frozen sod shall be placed nor shall sodding be done when the ground surface is frozen. When frost or excessive moisture exist that will prevent satisfactory results from being obtained for any stage of work, the Engineer will stop the work and it shall be resumed only when allowed by the Engineer.

612-3.02 Procuring Sod. The Contractor shall exercise maximum care to retain the soil existing on the roots of the sod during transporting, handling and transplanting operations. Dumping or dropping of sod from vehicles will not be permitted. Sod shall be planted within twenty-four hours from the time of harvesting, unless it is tightly rolled, or stored roots-to-roots. All sod in stacks shall be kept moist and protected from exposure to the sun and from freezing. The maximum period of time from harvesting to planting shall not exceed forty-eight hours. Sod that is stored on the project site prior to planting shall meet the moisture requirements of §713-14 at the time of planting.

612-3.03 Ground Preparation. There shall be a minimum of 2 inches of topsoil under all sod unless otherwise specified. The subgrade of areas to be sodded shall be excavated and firmed to a sufficient depth below the finished grade of the sod to accommodate the tamped or rolled thickness of topsoil and sod.

Fertilizer shall be applied at a rate of 50 lbs of nitrogen per acre unless otherwise specified in the contract documents.

Fertilizer applied under this work shall be uniformly mixed with the topsoil to a depth of at least 2 inches before the sod is laid, unless otherwise specified or approved.

612-3.04 Finished Grade for Sod. When laid in strips adjacent to paths, pavements, drain inlets and other structures, the finished sod surface shall be flush with surface of the adjacent soil and the adjacent structures. Sod laid in drainage ways, and areas to be continuously or solidly sodded shall meet the finished grades as shown in the contract documents. Grades shall be formed with special care at the junction of drainage ways.

612-3.05 Placing Sod. The soil on which the sod will be laid shall be moist. The soil shall be watered prior to sodding, if so directed. The sod shall be laid smoothly, edge to edge and all openings shall be plugged with sod. In drainage ways and where continuous or solid sodding is indicated and/or specified in the contract documents, the sod shall be laid with the longest dimension parallel to the contours. Sodding shall start at the base of slopes and progress upwards in continuous parallel rows.

Vertical joints between sides shall be staggered. Immediately after laying, sod shall be pressed firmly into contact with the sod bed by tamping, rolling, or by any other method that will eliminate air pockets, provide true and even surfaces, ensure knitting and protect all exposed sod edges, but without damaging or displacing the sod or deforming the finished sod surface. At the time of placing, the sodded areas shall be watered evenly and at a rate of 5 gallons per square yard, unless otherwise directed.

612-3.06 Anchoring. Sod shall be firmly anchored in all drainage ways, on slopes 1 on 2 or steeper, and wherever else specified or directed. Sod shall be anchored immediately after tamping. All anchors shall be driven flush to the ground.

612-3.07 Finishing. Excess sod or excess soil resulting from the sodding operation shall be disposed of by the Contractor. Excess soil shall not be left to form a ridge adjacent to the sodded area or sodded strips.

612-3.08 Care During Construction. The Contractor shall care for the sodded areas until all work on the entire contract has been completed and accepted. When necessary, such care shall consist of providing protection against traffic by warning signs or barricades. In locations where mowing is specified, the grass shall be mowed until the acceptance of the Contract to a height of 3 inches when the growth reaches a height of 5 inches or as directed.

All sod shall be watered at weekly intervals for a minimum of four weeks following installation and in accordance with §615-3.01, unless otherwise specified or directed. Additional watering shall be performed if specified in contract documents. When watered, sufficient water shall be applied to wet the sod at least 2 inches into the sod bed. Watering shall be done in a manner that will not cause erosion or other damage to the finished surfaces. Any surfaces that have settled, become gullied or otherwise damaged shall be repaired at the Contractor's expense to re-establish the grade and conditions of the soil prior to sodding and shall then be re-fertilized and re-sodded as specified under this work.

612-3.09 Period of Establishment. When the Engineer decides that any area that has been sodded fails for any reason to produce a satisfactory turf after a suitable period of time has elapsed, the Contractor shall re-sod such areas in the same manner as specified in the contract until a satisfactory turf has been established. Any work to be corrected shall be at the Contractor's expense. The contract will not be accepted until a satisfactory turf has been produced unless the work necessary to assure satisfactory turf will be done under the provisions of an uncompleted work agreement.

612-4 METHOD OF MEASUREMENT. Sodding including topsoil bed will be measured as the number of square yards of surface area that have been acceptably completed.

612-5 BASIS OF PAYMENT. The unit price bid per square yard shall include the cost of all labor, equipment, materials, including topsoil placed under the sod, water used during planting, and necessary excavation, equipment and incidentals necessary to acceptably complete and care for the work as specified. When the quantity of sod is equal to or less than 500 square yards, the watering necessary to establish the sod after planting shall be included in the price bid for sodding including topsoil bed. When

§612

the quantity of sod exceeds 500 square yards, the watering, except initial watering at time of planting, shall be paid for under the watering vegetation item in the Contract.

Payment will be made under:

Item No.	Item	Pay Unit
612.01	Sodding including Topsoil Bed	Square Yard

SECTION 613 - PLACING TOPSOIL

613-1 DESCRIPTION. This work shall consist of furnishing and placing topsoil Type A and/or Type B in accordance with the contract documents or as directed by the Engineer.

613-2 MATERIALS. Topsoil shall conform to the requirements §713-01 Topsoil. Unsuitable excavated material that meets the requirements of §713-01 is acceptable. Materials used to amend the organic content of topsoil shall conform to the requirements of §713-15 Organic Material.

613-3 CONSTRUCTION DETAILS

613-3.01 Preparation. The subsoil within the areas to be covered by topsoil shall be graded so that the completed work after topsoil is placed, shall conform to the specified lines and grades. Where specified or directed, the Contractor shall scarify or till the surface of the subsoil before the topsoil is placed to permit bonding the topsoil with the subsoil. Tillage by disking, harrowing, raking or other approved methods shall be accomplished in such a manner that depressions and ridges formed by tillage shall be parallel to the contours.

613-3.02 Placing and Spreading. Topsoil in an unworkable condition due to excessive moisture, frost, or other conditions shall not be placed until it is suitable for spreading. Topsoil shall be placed on the designated area and spread to a thickness of 4 inches unless otherwise specified in the contract documents. After the topsoil is spread, all large stiff clods, rocks, roots, or other foreign matter shall be cleared and disposed of by the Contractor as approved so that the finished surface will be acceptable for seeding, sodding, mulching, or planting.

613-3.03 Amendment in Place. When used for turf and wildflower establishment only, the Contractor may amend topsoil deficient in organic content and/or pH in place. Topsoil shall be amended with approved materials and by approved methods, based upon the recommendations of a laboratory certified by a nationally recognized entity that has been engaged and paid for by the Contractor. Amendments shall not contain any material that is deleterious to soil structure, plant growth or seed germination. The Contractor shall provide acceptable evidence of weights of pH amendment(s) applied via scale tickets, bag weights, etc. The Engineer will determine the volume of organic amendment(s) from truck volumes, etc. prior to placement.

613-3.04 Restoration. The sites of all stockpiles and areas adjacent thereto, which have been disturbed by the Contractor, shall be graded to a condition acceptable for seeding. Surplus topsoil shall become the property of the Contractor and shall be removed from the project site.

613-4 METHOD OF MEASUREMENT. The quantity to be measured for payment will be in cubic yards to the nearest 0.1 cubic yard of topsoil placed.

613-5 BASIS OF PAYMENT. The unit price bid shall include the cost of furnishing all labor, materials and equipment required to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
613.02	Placing Topsoil-Type A	Cubic Yard
613.03	Placing Topsoil-Type B	Cubic Yard

670

SECTION 614 - CARE, THINNING AND REMOVAL OF TREES

614-1 DESCRIPTION. This work shall consist of care of trees, selective thinning and tree removal as specified.

614-1.01 Care of Trees. The work shall be performed on existing trees shown in the contract documents or designated by the Engineer and shall include one or both of the following operations, or as specified: Pruning; Fertilizing.

614-1.02 Selective Thinning. The work shall consist of felling specifically identified trees, disposing of all wood and debris, and will usually require topping, limbing, stump removal and restoration as shown in the contract documents, in the proposal or as directed.

614-1.03 Tree Removal. The work shall consist of felling trees, disposing of all wood and debris, and may require topping, stump removal and other work as shown in the contract documents or as directed by the Engineer.

614-2 MATERIALS

614-2.01 Care of Trees. Mulch, and other special materials shall be as specified in the contract documents. Fertilizer shall be §713-03, Type 3, 10-6-4, unless otherwise specified. Water shall be as specified under §712-01. Materials for the protection of plants shall be as specified under §713-08.

614-2.02 Selective Thinning. Pesticides §713-13 for basal treatment of stumps shall be as specified.

614-2.03 Tree Removal. The materials for backfilling the stump holes and for establishing grass on the stump hole areas shall be as specified or as approved.

614-3 CONSTRUCTION DETAILS

614-3.01 Care of Trees

A. Equipment. Workers shall not be permitted to climb trees with climbing spurs but they shall employ accepted tree climbing methods. All tools used and methods employed shall be as approved except that no anvil type pruners will be permitted. The cutting surfaces of all tools, ladders, ropes, soles of workers shoes and other objects coming into contact with the tree shall be washed with an approved disinfectant at the start of any work on a tree to prevent the spread of plant diseases when ordered by the Engineer.

B. Pruning. When pruning is specified, the quantity of trees as shown in the contract documents shall be pruned of undesirable wood and the resulting crown shaped to the natural habit of the kind of the tree and as approved. Any and all branches interfering with or hindering the healthy growth of the tree shall be removed. All diseased branches and all dead branches 1 inch or more in diameter shall be removed. Any branch which may be partly dead, yet has a healthy lateral branch at least one-third the diameter of the parent branch shall be removed beyond the healthy branch. All branches less than 16 feet above any part of the roadway or interfering with sight distance or signs shall be removed as directed. All stubs or improper cuts resulting from former pruning shall be removed. All cuts shall be cleanly made with sharp tools as close to the parent trunk or limb as possible without disturbing the callus collar. All large bark wounds shall be scar traced in accordance with good horticultural practice to the satisfaction of the Engineer. All existing nails, spikes, wire or other materials found driven into

or fastened to the trunk or branches shall be removed or if approved they shall be cut flush in a manner to permit complete healing over.

C. Fertilizing. When fertilizing is specified, the quantity of trees shown in the contract documents shall be fertilized as specified for Method No. 1, No. 2 or No. 3.

Method No. 1. Holes shall be made in the earth about 18 inch deep and 18 inch apart, and located in the outer two-thirds (as measured on the radius) of the circular area lying under the limits of the tree branches. The holes shall be made with a crowbar, soil auger, pneumatic equipment or other approved tools and care shall be taken to avoid injury to the roots. Fertilizer shall be applied at the rate specified and shall be evenly distributed over the area to be fertilized by placing equal amounts of fertilizer in the lower 12 inches of each hole.

Method No. 2. Fertilizer shall be applied at the rate specified with sufficient water pressure to saturate the soil for the area and depth of the tree roots. Standard high pressure power tree spraying equipment with a valve controlled pipe used as a jet irrigator or other approved equipment may be used.

Method No. 3. Fertilizer rate and method of application shall be as specified in the contract documents.

D. Cleanup and Disposal. All trunks, branches, rubbish and debris resulting from the work shall be removed and disposed of by the Contractor as specified in §201-3.03, Disposal.

614-3.02 Selective Thinning. All trees and shrubs to be removed will be designated by the Engineer either by separate marking, marking in sample areas, or otherwise, to guide the Contractor on the scope and detail of the work. All stumps shall be cut to a height of about 6 inches above the ground unless otherwise specified or approved. An approved pesticide shall be applied to all live stumps in accordance with the manufacturer's recommendations. An approved dye shall be added to the pesticide mixture to identify treated stumps and stubble.

Care shall be taken in the felling of trees and the operation of equipment to prevent injury to trees and shrubs which are to be preserved. All injuries to the limbs, bark and roots of such plants shall be repaired as directed by the Engineer.

Selective thinning work shall be completed in any area before any planting or seeding work is begun in that area unless otherwise approved.

All wood, stumps, brush and other debris resulting from the work shall be disposed of as specified in §201-3.03, Disposal.

614-3.03 Tree Removal

A. General. No tree shown in the contract documents or listed for removal under this section shall be cut until it is approved by the Engineer. All work involving public utilities shall be coordinated with the respective utility company.

All trees shall be "topped" and "limbed" before felling unless otherwise approved.

Stumps of trees removed under this item and existing stumps listed for removal shall be grubbed, ground or cut as specified. Stumps shall include all visible wood and roots and shall be grubbed, ground or cut to the depth specified below the average grade or as directed by the Engineer. All stump holes shall be backfilled with the specified or approved materials compacted to the satisfaction of the Engineer within one week after start of work on the tree. The work of establishing grass on the stump hole areas shall be performed as specified or approved.

If, in the opinion of the Engineer, unsafe tools, equipment or methods are employed, work shall be stopped until such unsafe conditions have been corrected.

B. Disposal of Wood. The requirements of §201-3.03, Disposal, shall apply.

C. Liability. The Contractor shall protect and shall be liable for injuries to all plants, curbs, pavements, structures, utility lines and other features on the highway right-of-way and adjacent property. Replacements and restoration shall be as approved by the Engineer.

614-4 METHOD OF MEASUREMENT

614-4.01 Care of Trees. Care of trees shall be measured by the number of trees of each size group as set forth in the contract which are counted in place as having been completed and accepted.

614-4.02 Selective Thinning. Selective thinning shall be measured by the number of square acres satisfactorily completed.

614-4.03 Tree Removal. Tree removal shall be measured by the number of trees of each size group which have been satisfactorily removed. All trees shall be measured before they are cut. Measurements shall be made 4 1/2 feet (commonly referred to as D.B.H. -Diameter Breast High) above the ground. Removal of Existing stumps shall be measured by the number of stumps which have been satisfactorily removed.

614-5 BASIS OF PAYMENT

614-5.01 Care of Trees, Selective Thinning and Tree Removal. Payment for each item of work will be based on the unit price bid, which payment shall constitute full compensation for all labor, materials, equipment and incidentals necessary to complete the work as specified.

When trees and their respective stumps are specified in the contract documents for removal, payment for each tree removal shall include the work required for removal of the respective stump.

Removal of existing stumps shall be paid for separately.

Tree removal on an each basis shall be limited to those trees specifically listed for removal in the proposal or designated by the Engineer to be removed under this item.

Payment will be made under:

Item No.	Item	Pay Unit
614.01xx	Care of Trees	Each
614.02	Selective Thinning	Acre
614.03xx	Tree Removal	Each

NOTE: xx denotes serialized pay item.

SECTION 615 - LANDSCAPE MISCELLANEOUS

615-1 DESCRIPTION. This work shall include watering plants, shrubs, ground covers, vines and other plants as specified in the contract documents. This work shall also include other landscape development items as specified in the contract documents, applicable standard sheets and in accordance with the specifications.

615-2 MATERIALS

615-2.01 Watering Vegetation. The materials shall meet the requirements of the following subsection of Section 700- Materials and Manufacturing.

Water 712-01

615-3 CONSTRUCTION DETAILS

§618

615-3.01 Watering Vegetation. Water shall be applied in such a manner that the required volume of water will be provided without damage to plants, mulch, stakes, plant saucers, sod or other areas to be watered. Damage resulting from watering operations shall be repaired at the Contractor's expense.

615-4 METHOD OF MEASUREMENT

615-4.01 Watering Vegetation. This work will be measured in 1000 gallon units of water applied. The quantity applied will be determined from approved meters, or by measurement in tanks or tank trucks of predetermined capacity.

615-5 BASIS OF PAYMENT

615-5.01 Watering Vegetation. The unit price bid shall include the cost of furnishing and applying water, all labor, equipment and incidentals necessary to satisfactorily complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
615.03	Watering Vegetation	1000 Gallons

SECTION 616 – SOIL BIOENGINEERING AND STREAM RESTORATION

616-1 DESCRIPTION. The work in this section shall include work required for soil bioengineering and stream restoration.

616-2 MATERIALS. Materials shall be as specified in the special specifications.

616-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

616-4 METHOD OF MEASUREMENT. As specified in the special specifications.

616-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 617 - INVASIVE SPECIES CONTROL

617-1 DESCRIPTION. The work in this section shall include work required for invasive species control.

617-2 MATERIALS. Materials shall be as specified in the special specifications.

617-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

617-4 METHOD OF MEASUREMENT. As specified in the special specifications.

617-5 BASIS OF PAYMENT. As specified in the special specifications.

~~**SECTIONS 616 AND 617 (VACANT)**~~

Comment [c88]:
E109-014

SECTION 618 - BITUMINOUS MATERIAL

618-1 DESCRIPTION. Under this work the Contractor shall furnish and place bituminous material of the type and quantity specified on the plans or in the specifications.

618-2 MATERIALS. The bituminous materials shall meet the requirements of the following subsections of §700 - Materials and Manufacturing:

Miscellaneous Asphalt Cement (Grades 18 - 60)	702-0700
Rapid Curing Liquid Asphalts (Grade RC-70)	702-1100
Rapid Curing Liquid Asphalts (Grade RC-250)	702-1200
Rapid Curing Liquid Asphalts (Grade RC-250 with additive)	702-1300
Rapid Curing Liquid Asphalts (Grade RC-800)	702-1400
Rapid Curing Liquid Asphalts (Grade RC-800 with additive)	702-1500
Rapid Curing Liquid Asphalts (Grade RC-3000)	702-1600
Medium Curing Liquid Asphalts (Grade MC-30)	702-2000
Medium Curing Liquid Asphalts (Grade MC-70)	702-2100
Medium Curing Liquid Asphalts (Grade MC-250)	702-2200
Medium Curing Liquid Asphalts (Grade MC-250 with additive)	702-2300
Medium Curing Liquid Asphalts (Grade MC-800)	702-2400
Medium Curing Liquid Asphalts (Grade MC-3000)	702-2500
Anionic Asphalt Emulsions (Grade RS-1)	702-3001
Anionic Asphalt Emulsions (Grade RS-1h)	702-3002
Anionic Asphalt Emulsions (Grade RS-2)	702-3101
Anionic Asphalt Emulsions (Grade HFRS-2)	702-3102
Anionic Asphalt Emulsions (Grade MS-2)	702-3201
Anionic Asphalt Emulsions (Grade HFMS-2)	702-3301
Anionic Asphalt Emulsions (Grade HFMS-2h)	702-3401
Anionic Asphalt Emulsions (Grade HFMS-2s)	702-3402
Anionic Asphalt Emulsions (Grade SS-1)	702-3501
Anionic Asphalt Emulsions (Grade SS-1h)	702-3601

618-3 CONSTRUCTION DETAILS. The construction details for the application of bituminous materials specified in sections 401, 402, 403, 405, 407, and 410 shall apply.

618-4 METHOD OF MEASUREMENT. The quantity to be measured for payment will be in gallons of bituminous material incorporated in work, measured at 60°F to the nearest gallon. The following formula will be used to calculate material quantity at 60°F:

$$\text{Volume}_{60^{\circ}\text{F}} = \text{Volume}_{\text{D}} \times [1 - (\Delta\text{T} \times 0.00045)]$$

ΔT = Delivered Temperature (°F) - 60

Volume_{D} = Quantity Delivered (gallons)

§618

618-5 BASIS OF PAYMENT. The unit price bid per gallon for bituminous material used shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
618.07	Miscellaneous Asphalt Cement (Grades 18 - 60)	Gallon
618.11	Rapid Curing Liquid Asphalts (Grade RC-70)	Gallon
618.12	Rapid Curing Liquid Asphalts (Grade RC-250)	Gallon
618.13	Rapid Curing Liquid Asphalts (Grade RC-250 with additive)	Gallon
618.14	Rapid Curing Liquid Asphalts (Grade RC-800)	Gallon
618.15	Rapid Curing Liquid Asphalts (Grade RC-800 with additive)	Gallon
618.16	Rapid Curing Liquid Asphalts (Grade RC-3000)	Gallon
618.20	Medium Curing Liquid Asphalts (Grade MC-30)	Gallon
618.21	Medium Curing Liquid Asphalts (Grade MC-70)	Gallon
618.22	Medium Curing Liquid Asphalts (Grade MC-250)	Gallon
618.23	Medium Curing Liquid Asphalts (Grade MC-250 with additive)	Gallon
618.24	Medium Curing Liquid Asphalts (Grade MC-800)	Gallon
618.25	Medium Curing Liquid Asphalts (Grade MC-3000)	Gallon
618.3001	Anionic Asphalt Emulsions (Grade RS-1)	Gallon
618.3002	Anionic Asphalt Emulsions (Grade RS-1h)	Gallon
618.3101	Anionic Asphalt Emulsions (Grade RS-2)	Gallon
618.3102	Anionic Asphalt Emulsions (Grade HFRS-2)	Gallon
618.3201	Anionic Asphalt Emulsions (Grade MS-2)	Gallon
618.3301	Anionic Asphalt Emulsions (Grade HFMS-2)	Gallon
618.3401	Anionic Asphalt Emulsions (Grade HFMS-2h)	Gallon
618.3402	Anionic Asphalt Emulsions (Grade HFMS-2s)	Gallon
618.3501	Anionic Asphalt Emulsions (Grade SS-1)	Gallon
618.3601	Anionic Asphalt Emulsions (Grade SS-1h)	Gallon
618.3701	Polymer-Modified Asphalt Emulsions (Grade RS-2p)	Gallon
618.3801	Polymer-Modified Asphalt Emulsions (Grade HFRS-2p)	Gallon
618.4001	Cationic Asphalt Emulsions (Grade CRS-1)	Gallon
618.4002	Cationic Asphalt Emulsions (Grade CRS-1h)	Gallon
618.4101	Cationic Asphalt Emulsions (Grade CRS-2)	Gallon
618.4201	Cationic Asphalt Emulsions (Grade CMS-2)	Gallon
618.4301	Cationic Asphalt Emulsions (Grade CMS-2h)	Gallon
618.4401	Cationic Asphalt Emulsions (Grade CSS-1)	Gallon
618.4501	Cationic Asphalt Emulsions (Grade CSS-1h)	Gallon
618.4601	Cationic Asphalt Emulsions (Grade CQS-1h)	Gallon
618.4701	Polymer-Modified Asphalt Emulsions (Grade CRS-1p)	Gallon
618.4702	Polymer-Modified Asphalt Emulsions (Grade CRS-2p)	Gallon
618.4801	Polymer-Modified Asphalt Emulsions (Grade CQS-hp)	Gallon
618.70	Synthetic Resins (Resin Binder)	Gallon
618.71	Synthetic Resins (Rapid Curing Resin Liquid)	Gallon

SECTION 619 - WORK ZONE TRAFFIC CONTROL

619-1 DESCRIPTION

619-1.01 General. Work zone traffic control shall consist of all work to provide for the safe and efficient movement of traffic through or around work zones, and to protect workers and the public from damage to person and property which may result, directly or indirectly, from any construction operations, under the direction of a trained, responsible person, as shown in the contract documents, the MUTCD and as directed by the Engineer. The duration of this work shall be from the date any work is started on the contract site, including mobilization of equipment, signs, offices, and shops until the date of contract final

acceptance. Temporary materials and components that are furnished by the Contractor shall remain the property of the Contractor.

See Figure 619-1 Component Parts Of A Highway Work Zone for definitions of terms.

619-1.02 Basic Work Zone Traffic Control. Work shall consist of controlling traffic over a reasonably smooth traveled way which shall be marked by signs, delineators, channelizing devices, pavement markings, and other devices as shown in the contract documents or as directed by the Engineer. Work after sunset and before sunrise shall include additional requirements for nighttime operations including, but not limited to, a written plan for nighttime operations, additional worker and equipment protection, additional channelizing devices and contract site patrol.

The Contractor shall conduct its operations to ensure the safety and convenience of travelers and abutting property owners as well as the safety of all workers on the contract. Travelers include, but may not be limited to motorists, motorcyclists, bicyclists and pedestrians.

Work shall be scheduled to keep the time and distance that existing pavement is removed or substantially disturbed to a minimum and consistent with the physical requirements of the contract. Unless otherwise indicated in the contract documents, the distance over which traffic is maintained on an unpaved surface shall not exceed 1/2 mile at any one time. During seasonal shutdown periods, no part of the highway shall be closed to traffic unless provided for in the contract documents, or the Contractor has submitted and the Engineer has approved a detailed schedule of operations reflecting a proposal to close the highway to traffic.

Basic work zone traffic control shall include the following:

A. Surface Condition, Debris, Drainage and Dust Control. Work shall consist of maintaining the surface condition of the traveled way consistent with the preconstruction posted speed limit; maintaining positive drainage, including on detours; and dust control and keeping the roadway free from debris and materials spilled from or tracked by vehicles or equipment. Debris and dust shall be controlled on all operations.

B. Seasonal Operations and Snow and Ice Control. Work shall consist of maintaining the traveled way to facilitate safe, efficient travel and permit snow and ice control by others during winter months and during any period that work is suspended.

C. Maintain Public Access. Work shall consist of maintaining public access to intersecting roads, residences, business establishments, adjacent property, bus stops and transportation facilities for vehicles, pedestrians, and bicyclists.

D. Maintain Existing Roadside Signs, Delineators and Markers. Work shall consist of maintaining, in their existing condition, existing highway signs, delineators, and markers within the contract limits.

E. Maintain Existing Guide Rail, Median Barrier and Bridge Rail. Work shall consist of maintaining existing traffic barriers and other safety devices, in their existing condition, within the contract limits.

F. Construction Vehicles and Equipment. Work shall consist of equipping construction vehicles and equipment with warning lights, signs, and reflective markings and maintaining vehicles and equipment in safe operating condition.

G. Barrier/Shadow Vehicles.

1. Barrier Vehicles. Work shall consist of providing barrier vehicles to guide traffic and protect workers in stationary lane and shoulder closures and other stationary temporary traffic control zones, as shown in the contract documents or as directed by the Engineer.

2. Shadow Vehicles. Work shall consist of furnishing shadow vehicles to guide traffic and to protect workers in mobile or short duration work zones not protected by stationary lane or shoulder closures, as shown in the contract documents or as directed by the Engineer.

H. Construction Signs. Work shall consist of furnishing, installing, moving, deactivating, maintaining, and removing construction signs, including warning lights, as shown in the contract documents or as directed by the Engineer.

I. Arrow Panels. Work shall consist of furnishing, installing, maintaining, and removing arrow panels as shown in the contract documents or as directed by the Engineer. Arrow panels are used to warn and guide traffic when travel lanes are temporarily closed by construction activities.

J. Channelizing Devices. Work shall consist of furnishing and maintaining channelizing devices, with warning lights where required, including drums, vertical panels, construction barricades, cones, and temporary tubular markers. Type III construction barricades and interim tubular markers may be specified under separate pay items.

K. Pavement Edge Drop-Off Protection. Work shall consist of furnishing and maintaining protection for edge drop-offs adjacent to the pavement or shoulder.

L. Flagging and Traffic Control. Work shall consist of furnishing the necessary traffic control equipment and flaggers for adequate traffic control.

M. Maintain Existing Mailboxes. Work shall consist of maintaining postal route mailboxes serviced from vehicles, in a useable condition and location consistent with U.S. Postal Service requirements.

N. Contract Site Patrol. Work shall consist of furnishing personnel to patrol the contract area as necessary to ensure conditions on the site are adequate for public safety and convenience at all times.

O. Portable Traffic Signals. Work shall consist of furnishing, installing, energizing, operating, maintaining and removing portable traffic signal systems authorized by the Engineer, only as an alternative to flagging operations for one-lane, two-way alternating traffic. Portable signals shall be installed only on a highway designated as a Restricted Highway.

619-1.03 Basic Work Zone Traffic Control (Daily Operations). Work shall consist of controlling and protecting traffic as shown in the contract documents, or as directed by the Engineer, except the Contractor will not be required to repair or maintain the surface of the traveled way and other roadway features not part of the work, except to repair damage resulting from the Contractor's operations.

619-1.04 Temporary Business Signs. Work shall consist of furnishing, installing, moving, covering, maintaining, and removing temporary business signs as shown in the contract documents or as directed by the Engineer.

619-1.05 Covering or Removal of Pavement Markings. Work shall consist of removing or covering existing permanent pavement markings or, if shown in the contract documents, interim pavement markings, including, but not limited to: edge lines, lane lines, center lines, crosswalks and stop bars, arrows and symbols, and diagonal markings in gores and medians, as shown in the contract documents or as directed by the Engineer.

619-1.06 Temporary Pavement Markings. Work shall consist of furnishing, applying and removing temporary pavement markings as shown in the contract documents or as directed by the Engineer. Temporary pavement markings are intended for use on any new pavement or milled surface until the subsequent course is placed or interim pavement markings or final pavement markings are installed.

619-1.07 Interim Pavement Markings. Work shall consist of furnishing, applying, maintaining, and removing interim pavement markings as shown in the contract documents or as directed by the Engineer. Interim pavement markings are intended for use in diversions, temporary pavement realignments and crossovers, lane shifts and closures, and other traffic patterns associated with construction activities. Interim pavement markings are intended for use for a given phase or season, for a maximum of 1 year.

619-1.08 Temporary Rumble Strips. Work shall consist of installing, maintaining, and removing temporary rumble strips at the locations shown in the contract documents or as directed by the Engineer.

619-1.09 Interim Tubular Markers. Work shall consist of furnishing, installing, moving, and maintaining interim tubular markers attached to the pavement as shown in the contract documents or as directed by the Engineer. Interim tubular markers are typically used for 2-way, 2-lane freeway work zones and long-term closures where available width is limited.

619-1.10 Portable Variable Message Signs (PVMS). Work shall consist of furnishing, installing, operating, maintaining, relocating, and removing PVMSs as shown in the contract documents or as directed by the Engineer. The number, general locations and duration of use of PVMSs will be specified in the contract documents under the Special Note Requirements for Portable Variable Message Signs (PVMS). PVMSs are intended to supplement other traffic control devices by displaying symbolic or word messages, but are not to be used alone to replace conventional traffic control devices.

619-1.11 Type III Construction Barricades. Work shall consist of furnishing, installing, moving, maintaining, and removing Type III construction barricades, with warning lights where specified, as shown in the contract documents or as directed by the Engineer.

619-1.12 Temporary Concrete Barrier. Work shall consist of furnishing, installing, moving, maintaining, and removing temporary concrete barrier, including barrier warning lights where specified, as shown in the contract documents or as directed by the Engineer.

619-1.13 Temporary Glare Screen. Work shall consist of furnishing, installing, moving, maintaining, and removing modular glare screen mounted on a concrete barrier as shown in the contract documents or as directed by the Engineer.

619-1.14 Temporary Impact Attenuator. Work shall consist of furnishing, installing, maintaining, repairing, moving and removing temporary impact attenuators as shown in the contract documents or as directed by the Engineer.

619-1.15 Temporary Sand Barrel Arrays. Work shall consist of furnishing, installing, maintaining, relocating and removing temporary sand barrel arrays as shown in the contract documents or as directed by the Engineer.

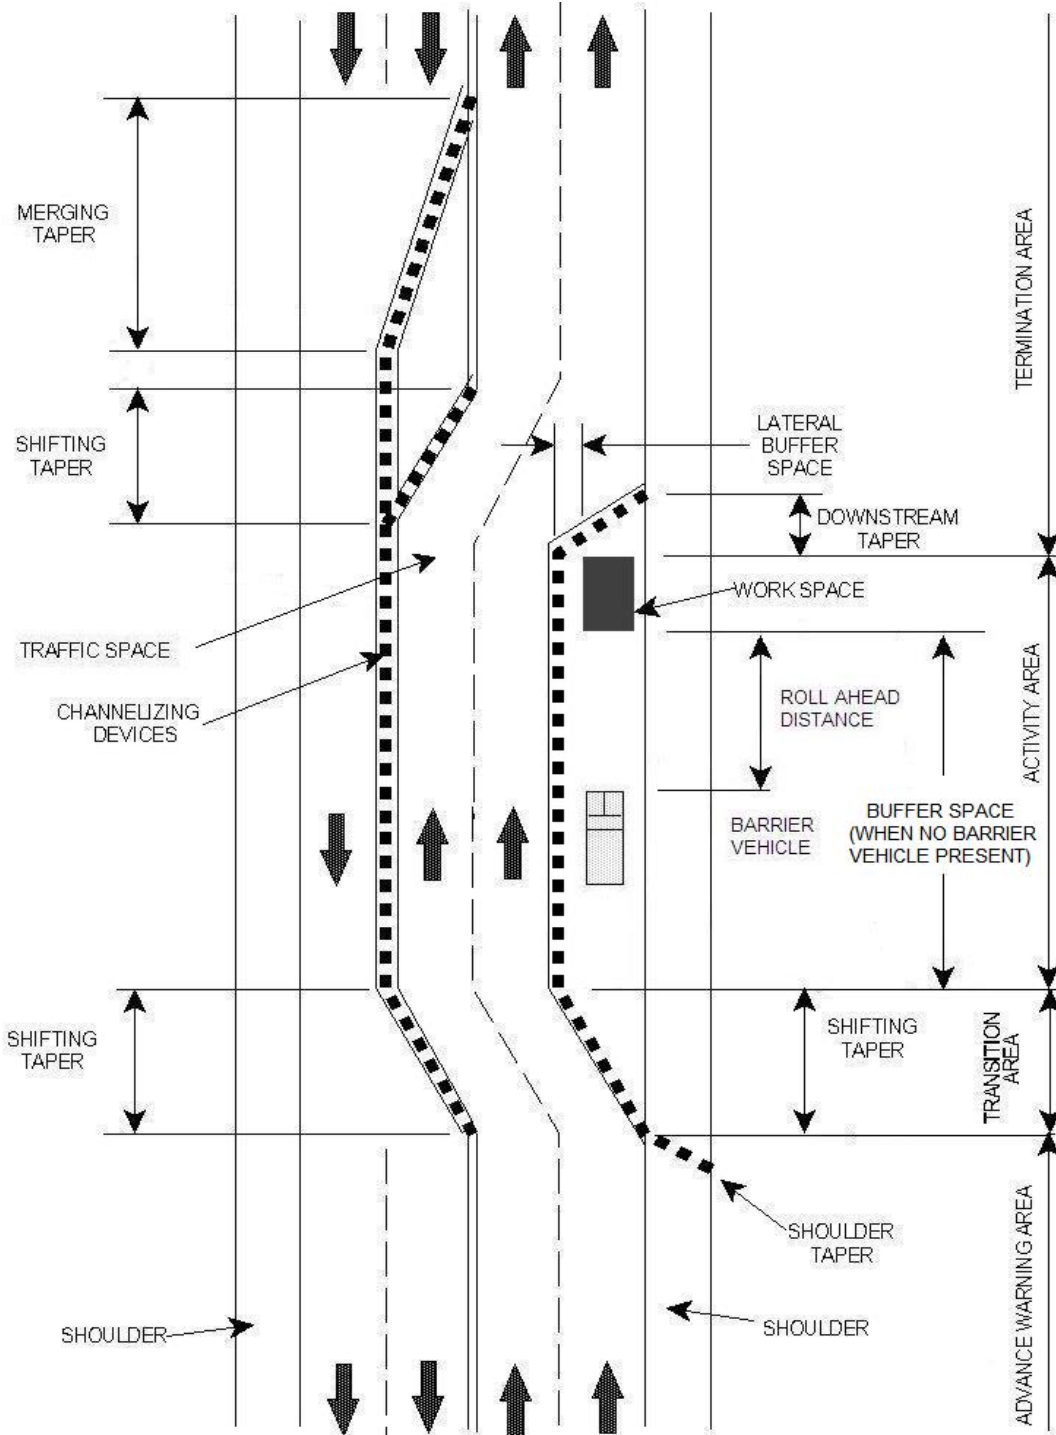

619-1.16 Vehicle Arresting Barrier. Work shall consist of providing vehicle arresting barriers (net-type) and their anchorages as shown on the Standard Sheets to prevent errant vehicles from entering a closed work area as shown in the contract documents or as directed by the Engineer.

619-1.17 Maintain or Modify Traffic Signal Equipment. Work shall consist of modifying or maintaining in proper operation, existing, relocated, modified, or newly installed traffic signals as shown in the contract documents or as directed by the Engineer.

619-1.18 Temporary Traffic Signals. Work shall consist of furnishing, installing, moving, maintaining, and removing temporary traffic signals and necessary components as shown in the contract documents or as directed by the Engineer. Temporary signals shall be installed only on a highway designated as a Restricted Highway.

619-1.19 Nighttime Operations. Work shall consist of developing a Nighttime Operations and Lighting Plan, and furnishing, installing, operating, maintaining, moving and removing lighting equipment for nighttime construction operations as shown in the contract documents or as directed by the Engineer.

FIGURE 16-1 COMPONENT PARTS OF A TYPICAL HIGHWAY WORK ZONE

619-1.20 Traffic Control Supervisor. Work shall consist of providing a full-time traffic control supervisor having adequate training, experience, and authority to implement and maintain all traffic control operations, as shown in the contract documents or as directed by the Engineer.

619-1.21 Temporary Structures and Approaches. Work shall consist of designing, constructing, moving, maintaining, and removing temporary structures, and necessary appurtenances, as shown in the contract documents or as directed by the Engineer. Temporary structures may also include temporary structural elements added to an existing structure to allow temporary use of or staged removal of the structure.

619-1.22 Pavement Patching. Work shall consist of providing and installing pavement patching materials to maintain pavements open to traffic in acceptable condition as shown in the contract documents or as directed by the Engineer.

619-1.23 Mailboxes. Work shall consist of relocating or replacing postal route mailboxes and/or mailbox supports consistent with U.S. Postal Service requirements, as shown in the contract documents or as directed by the Engineer.

619-2 MATERIALS.

619-2.01 General. All materials used shall comply with the requirements of the following subsections of Section 700 Materials and Manufacturing, or as established by this section, the applicable Standard Sheets, and the contract documents.

Concrete Grouting Material	701-05
Precast Concrete Barrier	704-05
Epoxy Polysulfide Grout	721-03
Traffic Signal Heads	724-04
Removable Raised Pavement Markers	727-02
Epoxy Paint	727-03
Permanent Tape	727-04
Glass Beads for Pavement Markings	727-05
Removable Pavement Tape	727-06
Removable Wet-Night Reflective Tape	727-07
Permanent Wet-Night Reflective Tape	727-08
Traffic Paint	727-09
Drums	729-01
Cones	729-02
Temporary Tubular Markers	729-03
Vertical Panels	729-04
Stop/Slow Paddles	729-05
Type II Construction Barricades	729-07
Type III Construction Barricades	729-08
Temporary Sign Supports	729-09
Temporary Impact Attenuators - Redirective	729-10
Temporary Impact Attenuators - Gating	729-11
Truck Mounted Impact Attenuators	729-12
Truck Mounted and Trailer Mounted Impact Attenuators	729-12
Temporary Sand Barrels	729-13
Vehicle Arresting Systems	729-14
Arrow Panels	729-15
Portable Variable-Message Signs	729-16
Temporary Glare Screens	729-17
Warning Lights	729-18
Aluminum Sign Panels	730-01

Comment [cjt89]:
EI08036

Temporary Plywood Sign Panels	730-02
Temporary Rigid Lightweight Sign Panels	730-03
Reflective Sheeting	730-05
Reflectorized Sheeting Sign Characters (Type IV)	730-12
Reflectorized Sheeting Sign Characters (Type V)	730-13
Temporary Wooden Sign Posts	730-19
Stiffeners, Overhead Brackets and Miscellaneous Hardware	730-22
Fiberglass Reinforced Plastic Sign Panels	730-23
Type A Sign Supports	730-24
Type B Sign Supports	730-25

619-2.02 Basic Work Zone Traffic Control.

A. Surface Condition, Debris, Drainage and Dust Control. Materials used to repair pavement surfaces shall be compatible with the pavement. In general, plant-mixed hot mix asphalt is suitable for all pavement surfaces to be repaired. Material other than plant-mixed hot mix asphalt may be used if approved by the Engineer.

Environmentally compatible, approved dust palliatives may be used in conformance with any conditions placed on their use.

B. Seasonal Operations and Snow and Ice Control. (None Specified)

C. Maintain Public Access. (None Specified)

D. Maintain Existing Roadside Signs, Delineators and Markers. All materials used to maintain existing roadside appurtenances shall be consistent with the features to be maintained.

E. Maintain Existing Guide Rail, Median Barrier and Bridge Rail. All materials used to maintain existing roadside appurtenances shall be consistent with the features to be maintained.

F. Construction Vehicles and Equipment. Reflective markings on construction vehicles and equipment shall be ASTM Type III, Type VII or Type IX. Sign panels on vehicles and equipment shall be plywood, fiberglass, aluminum or lightweight plastic, and shall use ASTM Type III or Type VII sheeting.

Haul trucks shall display a 24 inch by 48 inch fluorescent orange reflective sign with the legend "Construction Vehicle - Do Not Follow" in black lettering on the tailgate. The sign shall be kept clean and in good condition such that it is clearly legible from a distance of 300 feet.

~~**G. Barrier/Shadow Vehicles.** Barrier/Shadow vehicles shall weigh a minimum of 18,000 lb and shall be equipped with a Type B or Type C Arrow Panel. Ballast may be used to bring a lighter vehicle up to the indicated weight provided the ballast is securely contained within an enclosed body or otherwise securely fastened to the vehicle such that the ballast will not separate from the vehicle upon impact. Where the preconstruction posted speed limit is 55 mph or less, barrier/shadow vehicles shall be equipped with Test Level 2 Truck Mounted Impact Attenuators. Where the preconstruction posted speed limit is more than 55 mph, barrier vehicles shall be equipped with Test Level 3 Truck Mounted Impact Attenuators.~~

~~—For locations where a barrier vehicle remains stationary throughout the workday, the Contractor may elect to utilize a trailer as a barrier vehicle. A barrier trailer shall be a tandem axle unit and shall be detached from the tow vehicle.~~

G. Barrier/Shadow Vehicles. Barrier/Shadow vehicles shall weigh a minimum of 18,000 lb and shall be equipped with a Type B or Type C Arrow Panel. Ballast may be used to bring a lighter vehicle up to the indicated weight provided the ballast is securely contained within an enclosed body or otherwise securely fastened to the vehicle such that the ballast will not separate from the vehicle upon impact. Where the preconstruction posted speed limit is 55 mph or less, barrier/shadow vehicles shall be equipped with a Test Level-2 truck mounted or trailer mounted impact attenuator. Where the

preconstruction posted speed limit is more than 55 mph, barrier/shadow vehicles shall be equipped with a Test Level-3 truck mounted or trailer mounted impact attenuator. Impact attenuators meeting the requirements of NCHRP 350 Test Level 3 are also acceptable as Test Level 2 devices.

Where a barrier vehicle remains stationary for extended periods of time, the Contractor may utilize a barrier trailer in lieu of a barrier vehicle. A barrier trailer is a tandem-axle trailer that may be detached from the tow vehicle and that meets barrier vehicle weight, arrow board, attenuator and placement distance requirements.

Comment [cjt90]:
EI08036

H. Construction Signs. Fabrication of all components shall produce a finished sign panel. Holes may be punched or drilled. Edges shall be smooth and true and free from burrs or ragged breaks. Sign panels, including face shape, color, dimensions, and characters shall be fabricated using colors, character series and sizes, symbols, route shields and borders as shown in the MUTCD or in the contract documents.

1. Sign Panels. Modification of sign legends by overlaying an existing legend with a revised legend, changing a single word or distance, such as changing LEFT to RIGHT or 1000 to 1500 will be permitted if the overlay is a match to the rest of the sign in terms of legend size and type, sheeting color and reflectivity. The overlay shall be firmly adhered to the underlying panel. Any such overlays shall provide a visual match to the rest of the sign when viewed from a distance of 100 feet or greater during all periods in which the sign will be used.

a. Rigid Sign Panels. Rigid sign panels may be aluminum, fiberglass, plywood, or lightweight plastic. Orange signs on rigid panels shall be fluorescent-orange Class D or ASTM Type IX sheeting. All other colors of construction sign faces on rigid panels shall be ASTM Type III sheeting. White characters and borders shall be formed with Type IV or Type V Characters. Shields shall be either demountable or directly applied panels with Type V characters. Black sign characters and background shall be non-reflective Type V.

For nighttime operations and freeways with a preconstruction posted speed limit of 65 mph, orange signs on rigid panels shall be fluorescent-orange ASTM Type IX sheeting.

Effective with projects let beginning on January 1, 2008, for freeways and other expressways with a preconstruction posted speed limit of 55 mph, orange signs on rigid panels shall be fluorescent-orange ASTM Type IX sheeting.

Effective with projects let beginning on January 1, 2009, all orange signs on rigid panels shall be fluorescent-orange ASTM Type IX sheeting.

b. Flexible Sign Panels. Flexible sign panels shall be a solid, fluorescent-orange, durable elastomeric material. Flexible panels fabricated from mesh will not be allowed. Flexible sign panels shall be mounted on supports with adequate bracing, so as to minimize flutter and to support the intended shape of the sign.

2. Temporary Sign Supports. Temporary sign supports, except those located beyond the deflection distances of guide rail or temporary barrier as given in Table 619-5 Guide Rail & Concrete Barrier Standard Deflection Distances or otherwise protected against impact by errant vehicles, shall meet the following requirements for portable or fixed supports. If rigid diagonal bracing is used, the high end of the bracing shall face away from approaching traffic. All wood supports shall be painted white.

a. Portable Temporary Sign Supports. Ballast used to stabilize supports shall be bagged sand or other suitable material, and shall be located at ground level. Portable supports shall be a configuration which is NCHRP 350 approved, or be constructed in accordance with a Standard Sheet(s).

b. Fixed Temporary Sign Supports. The Contractor shall provide NCHRP 350 approved Type A, Type B or wooden sign posts in accordance with §730-19 Temporary Wooden Sign Posts, §730-24 Type A Sign Supports, or §730-25 Type B Sign Supports as appropriate.

3. Sign Covers. Covers used to inactivate unneeded construction signs shall match the size and shape of the sign and shall cover the entire sign panel. Covers shall be a heavy-duty, opaque material and contain no wording or images. Covers shall be a single dark color. If fabric covers are used, more than one layer of fabric may be required to prevent legibility of the sign legend to be covered. Sign covers other than fabric shall be NCHRP 350 approved. The finished sign covers shall be neat in appearance, with any fasteners secured on the back side of the panel. Hinged signs that fold at the center when not in use and completely cover the sign face may be used.

4. Enhanced Enforcement Signs. The panel sign sheeting shall be ASTM Type I.

5. Special-Use Signs. The sign sheeting for BE PREPARED TO STOP (W3-4) and WORK ZONE (NYW8-45) Signs shall be ASTM Type IX.

I. Arrow Panels. Arrow panels shall be in accordance with §729-15 Arrow Panels.

J. Channelizing Devices. Drums shall be in accordance with §729-01 Drums. Standard cones, tall cones and extra tall cones shall be in accordance with §729-02 Cones. Temporary tubular markers shall be in accordance with §729-03 Temporary Tubular Markers. Vertical panels shall be in accordance with §729-04 Vertical Panels. Type II construction barricades shall be in accordance with §729-07 Type II Construction Barricades.

K. Pavement Edge Drop-off Protection. (None Specified)

L. Flagging and Traffic Control. Hand signaling devices used to control traffic shall meet the requirements of the MUTCD. The standard signaling device shall be STOP/SLOW signal paddles in accordance with §729-05 Stop/Slow Paddles. Red signal flags shall be a minimum of 24 inch square.

M. Maintain Existing Mailboxes. (None Specified)

N. Contract Site Patrol. (None Specified)

O. Portable Traffic Signals. Portable traffic signal systems shall meet the requirements of the MUTCD and appear on the Department's Approved List. The portable traffic signal system shall consist of two self-contained, trailer-mounted signals, each with a vertical signal mast, horizontal mast arm and two signal heads. Each signal face shall have steady circular red, yellow and green indications with 12 inch diameter lenses.

The system shall have a built-in conflict monitor to prevent the display of conflicting indications, have a means to keep the signal indications synchronized, or shall be hard-wired or radio-controlled in the field. The system shall be capable of providing traffic-actuated control with commonly used types of above-ground sensors and adequate phasing to serve expected traffic movements. The controller and power supply shall be housed in a locked compartment to prevent unauthorized access.

A minimum of thirty days prior to installation, the Contractor shall submit catalog cuts, manufacturer's specifications for all hardware and software, and any other information required to evaluate the signal, to the Engineer for approval. A manufacturer's representative may be required to demonstrate the capabilities of the portable traffic signal prior to approval.

619-2.03 Basic Work Zone Traffic Control (Daily Operations). (None Specified)

619-2.04 Temporary Business Signs. Temporary business sign sizes, shapes and details shall conform to the MUTCD, (NY18-4). Sign panels shall be in accordance with §619-2.02H.1. Sign Panels, except that the panels shall be white on a blue background. Supplemental arrows, as required, shall be white on a blue background (M5-1 to M6-2). Temporary business signs shall be mounted on temporary sign supports.

619-2.05 Covering or Removal of Pavement Markings. Paint used to cover existing pavement markings shall be an exterior, non-reflective paint, substantially similar in color to the pavement surface, in accordance with §727-09 Traffic Paint. Tape used to cover existing pavement markings shall be pavement marking masking tape in accordance with §727-06 Removable Pavement Tape.

619-2.06 Temporary Pavement Markings. Temporary pavement markings shall consist of traffic paint in accordance with §727-09 Traffic Paint, removable pavement tape in accordance with §727-06 Removable Pavement Tape, removable wet-night reflective tape in accordance with §727-07 Removable Wet-Night Reflective Tape or removable raised pavement markers in accordance with §727-02 Removable Raised Pavement Markers.

619-2.07 Interim Pavement Markings. Interim pavement markings shall consist of traffic paint in accordance with §727-09 Traffic Paint, epoxy paint in accordance with §727-03 Epoxy Paint, removable pavement tape in accordance with §727-06 Removable Pavement Tape, removable wet-night reflective tape in accordance with §727-07 Removable Wet-Night Reflective Tape. Interim pavement markings shall be supplemented, where specified, with removable raised pavement markers in accordance with §727-02 Removable Raised Pavement Markers.

619-2.08 Temporary Rumble Strips.

A. Raised Asphalt Rumble Strips. Raised asphalt rumble strips shall be formed from a 6.3 or a 9.5 hot mix asphalt. Asphalt Emulsion Tack Coat shall be used to adhere the rumble strip to the existing pavement.

B. Raised, Removable-Tape Rumble Strips. Removable-tape rumble strips shall be formed from black, non-reflectorized, removable pavement-marking tape. Raised, removable-tape rumble strips shall have a minimum width measured in the direction of traffic of 6 inch, with sufficient layers of tape such that each finished rumble strip has a thickness of 3/8 inch \pm 1/8 inch.

C. Raised, Preformed Rumble Strips. Raised, preformed rumble strips shall be manufactured specifically as temporary rumble strips. Raised, preformed rumble strips shall have a minimum width measured in the direction of traffic of 4 inches, with a thickness of between 1/4 inch and 1/2 inch.

D. Saw-Cut Rumble Strips. Saw-cut rumble strips shall have a width measured in the direction of traffic of 4 inches \pm 1/2 inch. The depressions shall have a rectangular cross section with a depth of 3/8 inch \pm 1/8 inch.

E. Milled-in Rumble Strips. Milled-in rumble strips shall have a nominal width measured in the direction of traffic of 6 inches. The depressions shall have a semicircular, concave cross section with a depth of 3/8 inch \pm 1/8 inch.

F. Removing Temporary Rumble Strips. Rumble strip depressions shall be filled in with a 6.3 or a 9.5 hot mix asphalt meeting the requirements of Section 402, Hot Mix Asphalt (HMA) Pavements.

619-2.09 Interim Tubular Markers. Interim tubular markers shall be in accordance with §729-03 Temporary Tubular Markers.

619-2.10 Portable Variable-Message Signs (PVMS). Portable Variable-Message Signs shall be in accordance with §729-16 Portable Variable-Message Signs (PVMS).

§619

619-2.11 Type III Construction Barricades. Type III construction barricades shall be fabricated in accordance with §729-08 Type III Construction Barricades. All barricades used at night shall be equipped with warning lights in accordance with §729-18 Warning Lights.

619-2.12 Temporary Concrete Barrier. Temporary concrete barrier segments shall be precast concrete units in accordance with the Standard Sheets or approved Materials Details. All temporary concrete barrier supplied after January 1, 2015 shall be produced in accordance with the requirements of §704-05 Precast Concrete Barrier, and shall have a legible permanent marking. Temporary concrete barrier supplied prior to January 1, 2015 which was not produced in accordance with the requirements of §704-05 Precast Concrete Barrier, shall be material certified in accordance with specific Standard Sheets or Materials Details used for fabrication.

Warning lights for temporary concrete barrier with warning lights shall be in accordance with §729-18 Warning Lights. Where warning lights are not required, each temporary concrete barrier segment shall be delineated using reflective panels covered with ASTM Type IX sheeting, approximately 3 x 6 inches, having a minimum area of 18 square inches. Where warning lights are required, segments shall not be delineated with panels. Reflective pavement marking materials applied to the face of the barrier shall not, by themselves, be considered acceptable delineation.

619-2.13 Temporary Glare Screen. Temporary glare screen shall be in accordance with §729-17 Temporary Glare Screens.

619-2.14 Temporary Impact Attenuator. Temporary impact attenuators shall be in accordance with §729-10 Temporary Impact Attenuators - Redirective or §729-11 Temporary Impact Attenuators - Gating.

619-2.15 Temporary Sand Barrel Arrays. Temporary sand barrels shall meet the requirements of §729-13 Temporary Sand Barrels. Sand fill shall meet the material requirements of §703-06 Cushion Sand or §203-2.02I. Sand Backfill. Deicing material shall meet the requirements of §712-03 Sodium Chloride.

619-2.16 Vehicle Arresting Barrier (VAB). Vehicle arresting barriers shall meet the requirements of §729-14 Vehicle Arresting Systems. Portland Cement Concrete used for bases shall be Class A or C, except that requirements for automated batching shall not apply.

619-2.17 Maintain or Modify Traffic Signal Equipment. All traffic signal hardware, including but not limited to wire, cable, conduit, pull boxes, switch packs, modules and relays, detectors, signal heads, poles, and pedestrian push buttons used to maintain proper operation, shall meet the applicable requirements of Section 680 Traffic Signals. Materials which will be permanently incorporated into the work shall be in accordance with Section 680 Traffic Signals.

619-2.18 Temporary Traffic Signals. All equipment for temporary traffic signals shall meet the requirements of Section 680 Traffic Signals, except that used equipment in good operating condition may be furnished, and for which material certifications are not required. All span wire, inductance-loop wire, shielded lead-in cable, traffic signal cable, and other wire used for temporary traffic signals shall be new material. All other equipment for temporary traffic signals shall meet the requirements of Section 680 Traffic Signals except for the following modifications:

A. Temporary Poles. Temporary timber poles shall be ANSI O5.1, Class 2, treated with an appropriate waterborne wood preservative. Preservative retention shall be appropriate for the species when used in ground-contact application.

B. Signal Controller. The signal controller may be either solid-state or electro-mechanical.

C. Traffic Signal Heads. The materials and painting requirements of §724-04 Traffic Signal Heads shall not apply except that the signal head housing shall be dark green.

D. Conflict Monitor. Means shall be provided to prevent the signal from displaying indications which will result in two or more conflicting traffic movements being permitted simultaneously.

619-2.19 Nighttime Operations. (None Specified)

619-2.20 Traffic Control Supervisor. (None Specified)

619-2.21 Temporary Structures and Approaches. When specific details are shown in the contract documents for temporary structures, the materials specified shall be used, except that substitutions or alterations may be permitted if approved by Deputy Chief Engineer (Structures) (DCES). Fabrication inspection will not be required for structural steel furnished under this item. Certified copies of the manufacturer's test results shall be submitted to the Engineer. When specific details are not shown in the contract documents, the Contractor shall assume all liability and responsibility for determining that all materials required conform to the current AASHTO Specifications for Highway Bridges unless otherwise approved by the DCES. Used material shall not be furnished for fracture-critical members. Excluded from this provision are pedestrian and pre-engineered (fabricated) proprietary structures.

619-2.22 Pavement Patching. In general, hot mix asphalt (HMA) is suitable for all pavement surfaces. During winter months when HMA is not available, a bituminous cold-patch material shall be used.

619-2.23 Mailboxes. Materials used shall meet the requirements of the U.S. Postal Service and the Standard Sheets.

619-3 CONSTRUCTION DETAILS

619-3.01 General. The Contractor shall each designate a trained, responsible person who has the primary responsibility and sufficient authority for implementing the work zone traffic control plan and other safety and mobility aspects as necessary. The Contractor's responsible person shall be appropriately experienced and trained in accordance with the level of decisions that the individual will be required to make, reflecting current industry practices and Department requirements.

The Contractor shall generally maintain a traveled way suitable for moving traffic, in accordance with the contract documents. Construction operations shall be conducted to ensure a minimum of delay to traffic. Stopping traffic for more than 5 minutes shall not be permitted unless specifically authorized in the contract documents or in writing by the Engineer. All operations shall be carried out in a manner that provides workers with safe access to the worksite and protects workers from moving traffic. Unless otherwise noted, temporary items supplied in accordance with this section shall remain the property of the Contractor.

When pedestrians are not prohibited from the street or highway, sidewalks, walkways, or other accommodations shall be provided to allow their safe passage as shown in the contract documents. When sidewalks, walkways, or shoulders must be temporarily closed to facilitate construction operations, accommodations for safe pedestrian passage shall be maintained on at least one side of the roadway at all times, unless other temporary pedestrian accommodations are provided in the contract documents or are approved by the Engineer.

The requirements in this section refer to posted speed limits. If prevailing or operating speeds for a highway exceed the preconstruction posted limits, the contract documents may direct the Contractor to assume that the preconstruction posted speed limits are different than posted.

619-3.02 Basic Work Zone Traffic Control. The Contractor shall control traffic so that a person who has no knowledge of conditions may safely and with a minimum of discomfort and inconvenience ride, drive, or walk, day or night, over all or any portion of the highway and/or structure under construction where traffic is to be maintained.

The Contractor shall cease operations and restore the traveled way to safe operating condition during any specific periods listed in the contract documents, at such times as traffic renders conditions unsafe to continue work, and during periods of darkness (before sunrise or after sunset), fog, snow or rain, high

winds, or other inclement weather that renders conditions unsafe to continue work, for either the traveling public or the workers. The Engineer will determine when traffic or weather conditions render work operations unsafe.

A. Surface Condition, Debris, Drainage and Dust Control. The traveled way, sidewalks and pedestrian walkways shall be kept reasonably smooth and hard at all times, and shall be well drained and free of potholes, bumps, irregularities, and depressions that hold water. Except when construction operations necessitate disturbance of the normal surface, the Contractor shall maintain the pavement surface in such a condition as to permit the safe, comfortable passage of vehicles at the posted speed limit. A satisfactory riding surface shall be maintained both when work is underway, and when work is inactive. Special attention shall be given to maintenance of the traveled surface during hours of inactivity, including nights, weekends, holidays, and the winter season.

Milling operations shall be conducted to prevent pavement runoff from collecting along milled joints. Bumps and transverse irregularities shall be eliminated to the extent practical. Pavement joints and milling rebates resulting in longitudinal or transverse vertical faces exceeding 1 inch in height that would be exposed to traffic during non-work hours shall be sloped or tapered with temporary patches or shims providing a taper rate in accordance with Table 619-1 Required Taper Rate for Transverse Bumps.

Where longitudinal tapered wedge paving joints are used, temporary pavement markings shall be provided prior to reopening lanes to traffic. The joints may be left open to traffic provided traffic is not expected to frequently change lanes, and UNEVEN LANES (W8-11) signs are posted in advance of the condition, posted at each ramp and roadway intersection and repeated every 1/2 mile, supplemented with NEXT [X] MILES (W16-4) auxiliary signs.

Transverse bumps or vertical faces, unpaved surfaces, milled or grooved pavement, rough pavement, and other surface irregularities 1 inch or more in height shall be adequately sloped or tapered, or BUMP (W8-1) or other appropriate warning signs shall be posted in advance of the condition. An object marker (OM1-1) or a drum with a flashing warning light shall be installed on the right side of the roadway at the bump or other condition. On divided highways, an object marker or a drum with a flashing warning light shall be installed on both sides of the roadway.

Where traffic will be riding on a milled pavement, the Contractor shall install GROOVED PAVEMENT (NYW4-5) signs on the approaches. On multilane highways where only one lane in a direction is milled and both lanes are open to traffic, the Contractor shall supplement the GROOVED PAVEMENT sign with a LEFT LANE or RIGHT LANE panel below the sign. Where only an entrance or exit ramp is milled, the Contractor shall sign the mainline with a GROOVED PAVEMENT sign and a supplemental RAMP panel. The Contractor shall sign all side streets approaching the milled section.

Where both BUMP and GROOVED PAVEMENT signs are warranted the GROOVED PAVEMENT sign shall be installed 500 feet upstream of the BUMP sign in non-urban areas, and 300 feet upstream in urban areas.

For expressways where the posted speed limit is 45 mph or higher, the Contractor shall not leave milled or grooved pavement for more than 7 calendar days before replacement of the HMA binder course. The Contractor shall place a portable variable message sign (PVMS) in advance of pavement that has been milled or grooved and is open to traffic, warning motorcycle riders to use caution. The PVMS will be paid for separately.

The Contractor shall keep the traveled way, sidewalks, and walkways free of construction materials and foreign objects that fall from vehicles or equipment. Materials spilled by, dropped from, or tracked by traffic or by any vehicle used in the Contractor's operations along or across any public traveled way shall be removed immediately.

The Contractor shall keep all surface drainage facilities operative at all times. Positive drainage shall be provided at all times, even during grading operations and periods of accumulated plowed snow, to adequately drain the traveled way and the remainder of the right-of-way areas. Maintaining positive drainage shall include cleaning of drainage grates on roadway pavements. Cleaning of drainage structures and drainage pipes of material not deposited due to the Contractor's operations will be paid for separately. Repair of drainage structures will be paid for separately.

Dusty conditions resulting from the Contractor's operations may be corrected by the use of calcium chloride and/or water. Dust control measures shall be applied to control dust resulting from traffic on unpaved surfaces and from Contractor operations on or adjacent to the roadway. Dust control shall be adequate to prevent dust which hinders driver visibility or which creates a nuisance condition for property owners and residents adjacent to the contract. If used, water shall be distributed uniformly using a suitable spray head or spray bar.

TABLE 619-1 REQUIRED TAPER RATE FOR TRANSVERSE BUMPS			
Height of Bump (in)	Anticipated Exposure Time (Calendar Days)	Posted Speed ≤ 45 mph	Posted Speed > 45 mph
1 to 6	≤ 7	6:1	10:1
	> 7	15:1	30:1

B. Seasonal Operations and Snow and Ice Control. The Contractor shall maintain the traveled way in such a condition and conduct operations in such a manner that snow and ice may readily be controlled by others as and when necessary, and in such a manner that proper drainage is provided for the melting of snow banks resulting from normal plowing. The Contractor will not be responsible for snow and ice control on the pavement, shoulder, or sidewalks which are not restricted by construction operations and open to the public. Prior to contract final acceptance, the Contractor shall remove snow and ice from new sidewalks which are open to the public and for which maintenance jurisdiction has not been accepted.

During periods of seasonal shutdown, the traveled way shall be maintained in an acceptable manner for travel, and all traffic control devices and safety features maintained in a safe, operable condition. All construction signs and temporary traffic control devices that are not needed during shutdown periods shall be covered or removed.

C. Maintain Public Access. The Contractor shall provide and maintain at all times safe and adequate ingress and egress for intersecting roads, residences, business establishments, adjacent properties, bus stops and other transportation facilities for vehicles, pedestrians and bicycles; at existing or at new access points, consistent with the work, unless otherwise authorized by the Engineer. Whenever construction operations disrupt or interfere with normal traffic patterns, intersections, business establishment access points, and driveways shall be clearly marked using channelizing devices.

A ROAD CLOSED (R11-2) sign on a temporary sign support and Type III construction barricades with warning lights shall be used whenever an entire roadway or ramp is closed to traffic.

Where pedestrian facilities exist, or where pedestrian traffic is reasonably anticipated, the Contractor shall maintain pedestrian access on at least one side of the highway or street at all times, and ensure accessibility for persons with disabilities in accordance with the contract documents and consistent with provisions of the Americans With Disabilities Act. Pedestrian access may be provided using existing pedestrian facilities, temporary sidewalks or walkways, or alternate paths. Where a sidewalk is closed, it shall be marked with a Type II or Type III construction barricade and a SIDEWALK CLOSED (R9-9) sign. Advance warning signs and directional guidance shall be provided to direct pedestrians to alternate paths and crosswalks and to alert motorists. Potentially hazardous areas adjacent to sidewalks, walkways, or other areas used by pedestrians shall be protected to prevent pedestrian intrusion in accordance with §107-05F. Restricted Areas. Where bus service is maintained, the Contractor shall provide suitable areas or locations for the loading and unloading of passengers.

Sidewalks and walkways shall be kept smooth and free from holes, obstructions, and tripping hazards. Surfaces shall consist of pavement, firmly compacted granular material, or other surfaces noted in the contract documents or approved by the Engineer. A minimum usable width of 36 inches with a 5 feet wide and 5 feet long passing space every 200 feet shall be maintained for open existing sidewalks and walkways at all times. Construction materials, vehicles, equipment, debris, temporary sign supports or other materials shall not be placed or stored on open sidewalks or walkways unless

expressly shown in the contract documents or permitted by the Engineer, and only if such storage does not reduce the usable width to less than 36 inches.

Where bicycles are not prohibited from the highway, adequate accommodations for bicyclists shall be maintained in the travel lanes, on the shoulder, or on alternate paths or facilities.

D. Maintain Existing Roadside Signs, Delineators and Markers. Existing Department authorized signs, delineators, markers and their supports within the contract limits shall remain under the control and jurisdiction of the Engineer. Signs not authorized by the Department shall be removed from the right of way, as directed by the Engineer, in accordance with Section 647 Removing, Storing and Relocating Signs.

1. Maintenance. Existing signs, delineators, markers and their supports shall be maintained by the Contractor. Adequate visibility of route markers and directional signing shall be provided for drivers at all times. If relocation of route markers and directional signing is necessary to accommodate construction operations, the temporary or new locations shall be subject to approval of the Engineer. Existing roadside delineators shall be removed or relocated only to the minimum extent necessary to accommodate the work under the contract. Where contract operations require the temporary removal of existing delineators to facilitate work operations, temporary roadside delineation consisting of the existing delineators, temporary delineators, or channelizing devices shall be in place each night and at any time work operations at that location are suspended. Temporary devices shall be placed at the outer edge of the shoulder at a spacing similar to the existing delineator spacing.

2. Storage. Existing signs, delineators, markers, and their supports which directly interfere with the construction operations shall be removed, stored, protected, cleaned and replaced in accordance with the contract documents and the provisions of Section 647 Removing, Storing and Relocating Signs and paid for separately. Existing signs, delineators and markers removed for the Contractor's convenience shall be stored, cleaned and replaced at no additional cost to the State. Existing signs, delineators and markers lost or damaged due to negligence of the Contractor, shall be replaced at no additional cost to the State.

E. Maintain Existing Guide Rail, Median Barrier, and Bridge Rail. When construction operations require the temporary removal of existing bridge rail, guide rail or median barrier; or when existing rail will be removed and replaced with new rail, the Contractor shall schedule operations to minimize the time period that rail is not installed. Unless otherwise specified in the contract documents, guide rail or median barrier shall be replaced or the location otherwise protected within 14 calendar days.

Bridge rail shall be maintained in service at all times on any structure on which vehicle or pedestrian traffic is maintained, unless a temporary barrier is installed, or other means are used to ensure that vehicles, bicyclists and pedestrians are not exposed to the unprotected edge of a bridge.

During any overnight period when existing guide rail or median barrier is temporarily removed, the Contractor shall install and maintain channelizing devices along the edge of the shoulder or median in the location where the guide rail or median barrier was removed. The maximum spacing of the channelizing devices shall be 80 feet when shoulder widths are 4 feet or greater, and 40 feet for shoulder widths less than 4 feet, except that a minimum of three devices shall be provided for each individual run of guide rail or median barrier that has been removed. Channelizing devices consisting of drums, free-standing tubular markers, Type II construction barricades, or 36 inch traffic cones may be substituted for the post-mounted vertical panels, subject to approval by the Engineer.

During non-work hours when traffic is being maintained on the facility, all temporary ends (free ends) of guide rail, median barrier and bridge rail shall be temporarily terminated and marked with a channelizing drum or object marker equipped with a Type B flashing warning light. Corrugated beam guide rail and median barrier, and heavy-post, blocked-out, corrugated beam guide rail and median barrier shall be temporarily terminated by having the exposed ends (free ends) dropped to the ground and pinned. The approach ends of box beam guide rail, median barrier and bridge rail shall be temporarily terminated with box beam guide rail end assemblies utilizing two splice plates and the

proper number of bolts per connection. No posts for anchorages will be required. Special temporary splice plates are required to adapt box beam guide rail end assemblies to box beam median barriers.

F. Construction Vehicles and Equipment. All construction vehicles and equipment operating within the contract limits, whether in the work space, in the traffic space, in spoil areas, in storage areas, or any other areas of the contract, shall be operated at all times with due consideration for the safety of the public and workers.

All trucks with a GVWR greater than 10,000 lbs shall display a minimum 2 inch wide band of reflective sheeting on the front, rear and each side. The sheeting need not be continuous, but the sum of the length of the segments shall be at least one-half the length of the body or trailer. The centerline of the sheeting shall be between 15 inches and 60 inches above the ground. All equipment shall display a minimum 2 inch wide band of reflective sheeting on the front and rear (100 square inches per end minimum) as practicable.

All vehicles and equipment within the contract limits and on the roadway shall be equipped with, and operate, a rotating amber beacon which shall be visible from all directions for a minimum of 1,000 feet during daylight. Strobe lights will not be allowed. If visibility of the amber beacon is blocked by a portion of the vehicle or equipment, additional beacons shall be provided. Short-term delivery vehicles not equipped with rotating amber beacons shall display four-way emergency flashers when in the temporary traffic control zone. Beacons shall be mounted in a manner which does not cause glare for the driver or operator.

Any vehicle with a GVWR greater than 10,000 lbs and with restricted visibility to the rear shall be equipped with a operational audible backup alarm. Any vehicle with a non-operational backup alarm shall be taken out of service until the alarm is repaired.

Other than vehicles registered and meeting all applicable requirements of the NYS Vehicle and Traffic Law, no construction vehicle or equipment used in the performance of the work shall be permitted to operate in travel lanes or shoulders open to traffic unless proper traffic control devices and other safety measures are in place to warn drivers of the presence of the equipment.

On any expressway where the posted speed limit is 45 mph or higher, no construction vehicle or equipment shall be allowed to operate in a travel lane or shoulder open to and unimpeded by traffic at a speed less than 15 mph slower than the posted speed limit unless accompanied by a vehicle equipped with flashing warning lights and a 24 inch by 48 inch orange sign with the legend SLOW MOVING EQUIPMENT in black lettering on the rear.

The Contractor shall ensure that all construction vehicles and equipment are safely stored during non-working hours so as not to constitute a hazard to vehicles and pedestrians. Workers' personal vehicles shall be parked in legal parking areas within the roadway or beyond the shoulder on roadways with posted speed limits of 40 mph or less and beyond 30 feet from the active traveled way on other roadways, unless protected by traffic barrier.

G. ~~Barrier/Shadow Vehicles.~~

~~1. **Barrier Vehicles.** The Contractor shall provide barrier vehicles to guide traffic and protect workers within stationary shoulder closures, lane closures and other stationary work zones in accordance with the contract documents.~~

~~—When located in the taper of a lane closure and another arrow panel is not present, arrow panels on barrier vehicles shall be operated in the appropriate flashing arrow mode. For all other applications, arrow panels shall either display the four corner flashing caution mode, or shall be turned off. Barrier vehicles should normally be unoccupied, with transmission in gear, parking brakes set and wheels straight, except when being moved.~~

~~—Barrier vehicles shall be moved if necessary as the work progresses. The roll ahead distance (distance Barrier Vehicle is located in advance of the first workers or hazard) shall be based on Table 619-2 Roll Ahead Distances for Barrier/Shadow Vehicles.~~

TABLE 619-2 ROLL-AHEAD DISTANCE FOR BARRIER/SHADOW VEHICLES	
Posted Speed	Roll-Ahead-Distance (ft)

Limit (mph)	Barrier Vehicles			
	18,000 lb		24,000 lb	
	Minimum	Maximum	Minimum	Maximum
>55	100	200	100	200
45-55	100	200	75	150
<45	75	150	50	100
	Shadow Vehicles			
	18,000 lb		24,000 lb	
	Minimum	Maximum	Minimum	Maximum
>55	225	300	175	250
50-55	175	250	150	225
≤45	100	200	100	200

2. Shadow Vehicles. For posted speed limits of 30 mph or higher, the Contractor shall provide shadow vehicles to guide traffic and protect workers conducting mobile or short duration work operations except where the travel lane is closed to traffic by traffic barriers or by channelizing devices, including, but not limited to, pavement marking application, pavement marking removal and sweeping

—When located in an open travel lane of a multilane roadway, the shadow vehicle shall display the flashing arrow panel in the appropriate mode. When located in a travel lane closed by barrier or channelizing devices, on a shoulder, otherwise not in an open travel lane, or on a two-lane, two-way roadway, the arrow panel shall either display the four-corner flashing caution mode or shall be turned off.

—The shadow vehicle shall be moved as necessary to keep pace with the work operations. The roll-ahead distance (distance the shadow vehicle is in advance of the first workers or hazard) shall be as shown in Table 619-2 Roll Ahead Distance for Barrier/Shadow Vehicles.

—When slowly moving operations occupy a long distance of a travel lane not closed to traffic by barrier or channelizing devices, such that traffic may reenter the lane between work operations, the Contractor shall provide additional shadow vehicles for any gaps in the operation of 500 feet or more.

G. Barrier Vehicles/Barrier Trailers/Shadow Vehicles.

1. Barrier Vehicles. The Contractor shall provide barrier vehicles to guide traffic and protect workers within stationary shoulder closures, lane closures and other stationary work zones in accordance with the contract documents.

When located in the taper of a lane closure and another arrow panel is not present, arrow panels on barrier vehicles shall be operated in the appropriate flashing arrow mode. For all other applications, arrow panels shall either display the four-corner flashing caution mode, or shall be turned off. Barrier vehicles should normally be unoccupied, with transmission in gear, parking brakes set and wheels straight, except when being moved. Barrier trailers should have parking brakes set and arrow panels shall be operated in the appropriate flashing arrow mode.

Barrier vehicles and barrier trailers shall be moved if necessary as the work progresses. The placement distance (distance a barrier vehicle or barrier trailer is located in advance of the first workers or hazard) shall be based on Table 619-2 Placement Distance for Barrier/Shadow Vehicles.

Table 619-2 PLACEMENT DISTANCE FOR BARRIER/SHADOW VEHICLES				
Posted Speed Limit (mph)	Placement Distance (ft)			
	Barrier Vehicles			
	18,000 lb		24,000 lb	
	Minimum	Maximum	Minimum	Maximum
> 55	100	200	100	200
45- 55	100	200	80	160
<45	80	160	50	100
Shadow Vehicles				

> 55	230	325	180	280
50 - 55	180	280	150	250
≤ 45	100	200	100	200

2. Shadow Vehicles. For posted speed limits of 30 mph or higher, the Contractor shall provide shadow vehicles to guide traffic and protect workers conducting mobile or short duration work operations except where the travel lane is closed to traffic by traffic barriers or by channelizing devices., including, but not limited to, pavement marking application, pavement marking removal and sweeping

When located in an open travel lane of a multilane roadway, the shadow vehicle shall display the flashing arrow panel in the appropriate mode. When located in a travel lane closed by barrier or channelizing devices, on a shoulder, otherwise not in an open travel lane, or on a two-lane, two-way roadway, the arrow panel shall either display the four-corner flashing caution mode or be turned off.

The shadow vehicle shall be moved as necessary to keep pace with the work operations. The placement distance (distance the shadow vehicle is in advance of the first workers or hazard) shall be as shown in Table 619-2 *Placement Distance for Barrier/Shadow Vehicles*.

When slowly moving operations occupy a long distance of a travel lane not closed to traffic by barrier or channelizing devices, such that traffic may reenter the lane between work operations, the Contractor shall provide additional shadow vehicles for any gaps in the operation of 500 ft or [more](#).

Comment [cjt91]:
EI08036

H. Construction Signs. The Contractor shall install and maintain construction signs in good condition to adequately and safely inform and direct motorists, bicyclists and pedestrians. Existing and construction signs shall indicate actual conditions, and shall be covered, changed, relocated, or removed immediately to reflect current conditions. Construction signs shall be covered or removed when they no longer indicate actual conditions.

The Contractor shall provide measures to protect workers during placement and removal of construction signs adequate for the prevailing speed and volume of traffic and roadway geometry where the work is to occur. Such protection may include, but is not limited to, the use of flaggers and spotters, shadow vehicles equipped with truck-mounted attenuators. Where pedestrian access is prohibited, workers shall not cross or enter travel lanes open to traffic.

All signs shall be kept clean, mounted at the required height on acceptable supports, and installed in the proper position, alignment and orientation so as to give maximum visibility. Construction signs will be evaluated for acceptability in accordance with the American Traffic Safety Services Association (ATSSA) Quality Guidelines for Work Zone Traffic Control Devices. Unless otherwise noted in the contract documents or in the MUTCD, construction signs shall be mounted on a separate support. In cases where construction signs on an existing support will replace or supplement existing sign(s), they shall be mounted in accordance with the Standard Sheet(s). When auxiliary panels are mounted above or below a warning or regulatory sign, they shall not cover any part of the warning or regulatory sign. Signs shall be placed so that each sign is visible at night, at the desired distance, without being obscured by another sign, existing features on the highway, or foliage.

When not in service, temporary signs and portable temporary sign supports shall be stored in such a manner and location that they do not interfere with or present a hazard to vehicular, bicycle or pedestrian traffic. No signs or supports shall be stored on the traveled way or sidewalks during non-working hours. Portable temporary sign supports stored on the roadside within the roadside recovery area, or any area that may be traversable by an errant vehicle, shall be laid flat such that no part of the support is more than 4 inches above the ground. No sign supports shall be leaned against or overhang the traffic side of traffic barrier. The faces of stored signs shall not be visible to traffic in any direction, regardless of the orientation of the sign.

1. Sign Panels. Panels shall be flat and shall not be bowed or warped. Panels whose shapes have been altered, such as trimmed corners of diamond shapes, shall not be used. If insufficient clearance exists, rectangular and/or smaller signs shall be used to obtain proper clearance. Panels with any wrinkling, delamination, or lack of adhesion of the reflective sheeting or legend

evaluated for acceptability in accordance with the American Traffic Safety Services Association (ATSSA) Quality Guidelines for Work Zone Traffic Control Devices. All mounting heights are measured from the bottom of the lower sign panel to the nearest edge of pavement or to the ground directly below the sign, whichever results in a higher mounting.

a. Rigid Sign Panels. Rigid sign panels shall have a minimum mounting height of 5 feet, or a minimum mounting height of 7 feet where pedestrians or parked vehicles are present. For signs incorporating an auxiliary panel below the primary panel, the minimum mounting heights shall be 4 feet and 6 feet, respectively. For pedestrian regulation and guidance signs the minimum mounting height shall be 4 feet.

b. Flexible Sign Panels. Flexible sign panels shall only be used for short-term, daytime use, for portable signs that are deployed for use on a daily basis. All flexible sign panels shall be mounted on supports with adequate bracing, so as to minimize flutter and to support the intended shape of the sign. Fluorescent-orange colored flexible sign panels shall be approved by the Engineer prior to and for the duration of their use.

Flexible panel signs shall be mounted at the same height as rigid panel signs, except they may be mounted, when approved by the Engineer, as low as 1 foot when all the following conditions are met:

1. a. On two-lane, two-way roadways, or;
 - b. When signs are placed on the left and right sides of four-lane divided highways.
2. Where there will be no parked vehicles to obstruct the view.
3. When at least one advance work zone warning sign, mounted at a height of 5 feet or higher is located in advance of any flexible signs to alert motorists that they are entering a temporary traffic control zone.
4. When the lower mounting height does not adversely affect visibility of the sign by motorists.

2. Temporary Sign Supports. The type of temporary sign supports used shall be selected by the Contractor. Signs that are erected and removed or relocated on a daily basis, or that must be frequently relocated to adjust to the location of construction operations, may be mounted on portable temporary sign supports. If rigid diagonal bracing is used, the high end of the bracing shall face away from approaching traffic. Signs that are to remain at one location may be supported on fixed temporary sign supports.

Supports for construction signs shielded by barrier or guide rail, and located beyond the deflection distance described in Table 619-5 Guide Rail & Concrete Barrier Standard Deflection Distances are not required to be NCHRP 350 approved.

3. Sign Covers. Covers for construction signs shall be attached in such a manner that completely covers the face of the sign, including auxiliary panels above or below the main panel. The cover shall be firmly attached to the sign in a secure manner using straps or other means to prevent dislodging. Sign covers shall be maintained in good condition to present a neat appearance and minimize distraction to motorists. Damaged covers which are no longer effective shall be promptly replaced. Covers for permanent signs shall be in accordance with Section 645 Signs.

4. Enhanced Enforcement Signs. Signs advising motorists of increased fines for speeding within a work zone shall be installed in accordance with the contract documents. Enhanced enforcement signs will be the LICENSE SUSPENDED AFTER TWO WORK ZONE SPEEDING TICKETS (NYR9-11) sign and/or the FINES DOUBLED (R2-6) sign.

Signs shall be installed where a travel lane and/or shoulder is closed to vehicular traffic, or where a reduced work zone speed limit is established. Signs shall be placed upstream of the first advance warning sign, and shall not be placed between a warning sign and the condition to which it relates, or within a warning sign countdown series. To avoid the aforementioned conditions, the sign shall be installed approximately 1,000 feet upstream of the first warning sign on highways

with posted speed limits equal to or greater than 45 mph and 300-500 feet upstream where posted speed limits are under 45 mph. For contracts with multiple work zones, the sign shall be installed at the above distances upstream of the ROAD WORK NEXT XX MILES (G20-1) sign or at the contract limits and need not be installed at each work zone.

If indicated in the contract documents as an alternate to enhanced enforcement signs where a reduced work zone speed limit is posted, FINES DOUBLED (R2-6) panels shall be installed on the same post immediately below the SPEED LIMIT (R2-1) signs used to post the reduced work zone speed limit. The FINES DOUBLED panels shall be the same width as the speed limit sign they are supplementing.

If the FINES DOUBLED panel is added to a previously installed speed limit assembly, it may be necessary to install additional sign posts based on an assessment of the adequacy of the existing post to support the additional panel. It may also be necessary to adjust sign mounting heights to meet the 4 feet minimum mounting height requirement.

5. Special Use Work Zone Signs. Special use work zone signs shall be installed in accordance with the contract documents.

a. BE PREPARED TO STOP (W3-4) Signs. Where shown in the contract documents, the Contractor shall install BE PREPARED TO STOP signs to inform oncoming traffic of potential stopped, queued or very slow conditions upstream of advanced warning signs. Multiple signs may be installed and covered for later use. A PVMS may be used for the sign or as a supplement.

Each BE PREPARED TO STOP sign shall be mounted on a temporary sign support, and shall be equipped with a pair of orange warning flags. For approaches with three lanes or more, both sides of the approach shall be signed unless the median is too narrow.

The signs shall be posted approximately 1/2 mile in advance of the anticipated end of the queue. If the end of the queue is beyond the sign, the sign location shall be adjusted for the subsequent work day until the desired advance warning reflects typical conditions for that location. If the resulting adjustment places the sign in advance of the first warning sign, the Contractor shall also furnish and place a ROAD WORK (W20-1) sign approximately 1,000 feet in advance of the BE PREPARED TO STOP signs.

b. WORK ZONE (NYW8-45) Sign. When a reduced regulatory speed limit for a work zone has been legally established, the SPEED LIMIT (R2 series) signs shall be supplemented by a WORK ZONE (NYW8-45) panel. The WORK ZONE panel shall be the same width as the speed limit sign it supplements and shall be placed on the same post and immediately above the speed limit sign.

I. Arrow Panels. The Contractor shall provide, operate and maintain arrow panels on highways having two or more travel lanes in the same direction, where the posted speed limit is 40 mph or higher, whenever a lane or lanes are closed to traffic and vehicles are required to merge with traffic in adjacent lanes. One arrow panel shall be provided for each lane closed to traffic regardless of the duration. Arrow panels shall be mounted so that the base of the panel is at least 7 feet above the pavement surface and properly aligned to provide optimum viewing by approaching motorists. Arrow panels may need be relocated or reoriented on a daily basis or more frequently.

Arrow panels shall not be used where they would interfere with the operation of a traffic signal or flasher or where there is an operation controlled by a signal or flagger. Arrow panels will not be permitted for alignment changes or lane diversions where the number of through traffic lanes is not reduced, or for any application on two-lane, two-way roadways except in the caution mode.

For posted speeds less than 40 mph, arrow panels may be used as a substitute for the large arrow sign (W1-6) located nearest the beginning of the taper.

J. Channelizing Devices. Where construction operations obliterate pavement markings, or otherwise change or disrupt the normal traffic pattern, the Contractor shall use channelizing devices to clearly define the intended travel path for vehicles, bicycles, and pedestrians to physically separate

traffic from portions of the roadway not available for travel; to separate traffic from hazards adjacent to the roadway; to separate opposing or adjacent travel lanes; and to mark the location of hazards within or adjacent to the roadway. Spacing of devices shall be sufficiently close at all times to provide clear and adequate guidance to ensure that vehicles, bicycles, and pedestrians follow the intended travel path. Channelizing device spacing requirements are stated in center-to-center distances.

Channelizing devices shall be maintained upright, at proper spacing, in proper alignment and orientation, and kept clean. Channelizing devices used at night shall be reflective. The Contractor shall make frequent checks commensurate with traffic conditions to identify and reset channelizing devices dislodged by traffic. Deformed or damaged devices and devices that do not maintain appearance, color, and reflectivity will be evaluated for acceptability in accordance with the American Traffic Safety Services Association (ATSSA) Quality Guidelines for Work Zone Traffic Control Devices. Ballast and/or mailboxes shall not be placed on top of a device or at any point above ground level. Ballast rings may be added to traffic cones, or traffic cones may be doubled, with one cone on top of the other, to serve as ballast.

One Type B flashing warning light shall be installed on the first channelizing device in each series of a nightwork shoulder or travel lane closure. One Type B flashing warning light shall be installed on channelizing devices used to mark the location of hazards in or adjacent to the travel lane, including, but not limited to, pavement discontinuities, drainage structures, excavations, fixed objects, and other obstructions and potential hazards remaining at the end of the work shift. Where the placement of numerous Type B flashing warning lights may present a distraction to motorists, flashing warning lights may be eliminated at intermediate locations such as driveway entrances or intersections.

Where permitted, the Contractor may opt to substitute Type III construction barricades or interim tubular markers for other channelizing devices at no additional cost to the State.

1. Tapers. Tapers are defined as a transition area where motorists are redirected out of their normal path to a new path, including the tapered portion of lane closures, lane shifts, transitions, crossovers, ramps, intersections, or interchanges. The Contractor shall use drums, oversized vertical panels, or Type II construction barricades for channelizing and delineating tapers. At stationary work zones where workers are exposed to traffic and the posted speed limit is 40 mph or more, the spacing of channelizing devices shall not exceed 40 feet. Where the posted speed limit is less than 40 mph, the spacing of channelizing devices shall not exceed 20 feet.

2. Traveled Way (Including Lane and Shoulder Closures). At stationary work zones, where no workers are exposed to traffic or no workers are present, the spacing of channelizing devices shall not exceed 80 feet. At stationary work zones, where workers are exposed to traffic, the spacing of channelizing devices shall not exceed 40 feet. The 40 feet spacing shall be used for a minimum of 500 feet in advance of workers and may be used throughout the work zone. Where necessary to permit ingress or egress by construction vehicles, wider gaps may be provided between channelizing devices, not to exceed the deletion of every fifth device. Drums spaced at 20 feet intervals shall be used at expressway gores.

Standard cones and temporary tubular markers shall not be used in nighttime work zones for worker protection. Standard cones may be used in work zones where workers are not exposed to traffic, where the cones are placed to protect the work, and the placement does not create a hazard for traffic. Type III construction barricades shall not be substituted for other channelizing devices near driveways, intersections, ramps, and in other locations where they restrict driver vision. Tall cones may be used in the longitudinal run section of lane closures of active night work zones. Tall cones may be used to mark hazards on roadways where the posted speed limit is 40 mph or less.

In long lane or shoulder closures, when traffic will be traveling adjacent to the closures, two tall cones, two extra tall cones, two plastic drums, two vertical panels or two Type II construction barricades shall be placed transversely across each closed lane at maximum 800 feet intervals to discourage traffic from driving through the closed lane except where it would interfere with milling, paving or other ongoing work. The Contractor may opt to substitute one Type III

construction barricade at no additional cost to the State. These transverse devices may be relocated or adjusted as necessary to permit passage of construction vehicles.

3. Roadway or Pavement Edge. Where the work introduces or exposes hazards, the difference in elevation is 2 inches or less, and pavement edge markings or permanent delineators are not installed, channelizing devices consisting of drums, vertical panels, or 36 inch tall cones, shall be spaced at a maximum of 200 feet. If barrier is within 4 feet of the nearest travel lane, barrier delineation at a maximum spacing of 40 feet may be provided in place of channelizing devices.

4. Roadway Intersections and Commercial Driveway Radii. The spacing between channelizing devices used to define roadway intersections and commercial driveways shall not exceed 6 feet. Reduced spacing near driveways and at intersections may be necessary to provide clear guidance. Cones and temporary tubular markers shall be used only during daylight hours. Type III construction barricades and vertical panels shall not be used.

A non-signalized intersecting roadway shall be delineated by a new series of channelizing devices, and the series will start with one drum equipped with a Type B flashing warning light, placed along the primary roadway after the intersection.

5. Residential Driveway Radii. The spacing between channelizing devices shall not exceed 6 feet. Reduced spacing near driveways may be necessary. Standard cones and temporary tubular markers shall be used only during daylight hours. Only drums shall be used during nighttime.

6. Setting and Removing Channelizing Devices. The Contractor shall take all necessary precautions to protect the public and workers during setup and removal of channelizing devices. Warning signs shall be in place in advance of and prior to the start of channelizing device placement, and shall remain in place until after the channelizing devices have been removed. Except where traffic or roadway conditions require otherwise, and subject to approval of the Engineer, placement of devices shall begin at the upstream end of the setup and proceed downstream with traffic flow. Removal of devices shall begin at the downstream end and proceed upstream, proceeding the opposite of placement.

The Contractor shall provide measures to protect workers during placement and removal of channelizing devices adequate for the prevailing speed and volume of traffic and roadway geometry where the work is to occur. Such protection may include, but is not limited to, the use of flaggers and spotters, shadow vehicles equipped with truck-mounted attenuators, cone-setting equipment, and placement of devices from work vehicles. Where pedestrian access is limited or prohibited, workers shall not cross or enter travel lanes open to traffic. If devices are manually placed from work vehicles, positive measures shall be in place to protect workers against falling from the vehicle during the operation. Workers shall not place or remove devices while sitting or standing unrestrained in the rear of a pickup truck or other work vehicle.

K. Pavement Edge Drop-Off Protection. A drop-off is an abrupt difference in surface elevation of more than 2 inches at approximately 1V:3H or steeper. In the absence of adequate Traffic Control Plans in the contract documents, the Contractor shall submit alternate Traffic Control Plans to the Engineer for approval at least 30 calendar days prior to proposed work which will create a drop-off of over 24 inches within 10 feet from the edge of the traveled way for durations longer than one shift. A drop-off of greater than 24 inches within 10 feet from the edge of the traveled way to remain at the end of the work shift shall be separated from traffic with temporary or permanent barrier. For posted speed limit of 45 mph and less, a drop-off of greater than 24 inches within 10 feet from the edge of the traveled way that is 100 feet or less in length will be allowed with channelizing devices at a maximum spacing of 20 feet for short durations not to exceed one work shift.

Unless otherwise noted in the contract documents, the Contractor shall begin work to eliminate drop-offs created by contract work within 14 days of the completion of the work creating the drop-off. Work shall continue in a timely manner until such time as the drop-off condition is eliminated.

The Contractor shall provide pavement edge drop-off protection in accordance with Table 619-3 Pavement Edge Drop-Off Protection. Channelizing devices used to mark drop-offs should be placed to not reduce the available travel lane width, at the elevation of the open travel lane in order to provide maximum target value and visibility for motorists.

1. Drop-off Within Shoulder. Channelizing devices shall be preceded by SHOULDER DROP-OFF (W8-9a) or NO SHOULDER (NYW4-13) signs, repeated at all ramps and roadway intersections. Signing shall be repeated every 1/2 mile and supplemented with NEXT [X] MILES (W16-4) auxiliary signs.

2. Drop-off at Outside Shoulder Edge. Where pavement edge lines are provided, channelizing devices shall be preceded by LOW SHOULDER (NYW4-13) or SHOULDER DROP-OFF (W8-9a) signs, repeated at all ramps and roadway intersections. Signing shall be repeated every 1/2 mile and supplemented with NEXT [X] MILES (W16-4) auxiliary signs.

Where pavement edge lines are not provided, channelizing devices shall be preceded by NO SHOULDER (NYW4-13) or SHOULDER DROP-OFF (W8-9a) signs, repeated at all ramps and roadway intersections. Signing shall be repeated every 1/2 mile and supplemented with NEXT [X] MILES (W16-4) auxiliary signs.

TABLE 619-3 PAVEMENT EDGE DROP-OFF PROTECTION							
Drop-Off Height	Edge Line Pavement Markings	Shoulder Closure	Drums	Vertical Panels	Tubular Markers	Tall Cones	Signs
DROP-OFF AT OR WITHIN SHOULDER							
Within 4 ft. from Travel Lane							
2 - 6 in.	Yes	Yes	100 ft.	100 ft.	No	No	No Shoulder
	No	Yes	40 ft.	40 ft.	No	No	No Shoulder
6 - 24 in.	Yes	Yes	40 ft.	40 ft.	No	No	No Shoulder
	No	Yes	20 ft.	20 ft.	No	No	No Shoulder
More than 4 ft. from Travel Lane							
2 - 6 in.	Yes	Yes	200 ft.	200 ft.	100 ft.	100 ft.	No Shoulder
	No	Yes	100 ft.	100 ft.	40 ft.	40 ft.	No Shoulder
6 - 24 in.	Yes	Yes	40 ft.	40 ft.	No	No	No Shoulder
	No	Yes	40 ft.	40 ft.	No	No	No Shoulder
DROP-OFF OUTSIDE OF SHOULDER EDGE							
Shoulder width < 4 ft.							
2 - 6 in.	Yes	No	100 ft.	100 ft.	No	No	Low Shoulder
	No	Yes	100 ft.	100 ft.	No	No	No Shoulder
6 - 24 in.	Yes	No	40 ft.	40 ft.	No	No	Low Shoulder
	No	Yes	40 ft.	40 ft.	No	No	No Shoulder
Shoulder width > 4 ft.							
2 - 6 in.	Yes	No	200 ft.	200 ft.	100 ft.	100 ft.	Low Shoulder
	No	Yes	100 ft.	100 ft.	40 ft.	40 ft.	No Shoulder
6 - 24 in.	Yes	No	100 ft.	100 ft.	40 ft.	40 ft.	Low Shoulder
	No	Yes	40 ft.	40 ft.	No	No	No Shoulder

L. Flagging and Traffic Control. The Contractor shall provide an adequate number of competent flaggers to control traffic when it is necessary to maintain alternating one-way traffic in one lane of a two-lane, two-way roadway, and at all other locations where construction operations, construction vehicles and equipment, and temporary traffic patterns related to the construction operations require positive temporary traffic control for safe, efficient traffic operations. They shall include, but are not limited to, locations where construction traffic enters, exits, or crosses open traffic lanes, temporary stoppage of traffic for work operations, rail crossings, locations requiring slowing of

traffic adjacent to work operations, on-ramps with restricted site distance, pedestrian crossings, intersections, and other locations where traffic needs to be alerted to unexpected conditions ahead. Multiple lane approaches shall be reduced to a single lane prior to the flagger station. Portable or temporary traffic signals used to control traffic at the Contractor's option in lieu of flaggers shall be provided at no additional expense to the State.

1. Flagger Training. All flaggers shall be adequately trained in flagging operations by recognized training programs, including the American Traffic Safety Services Association, the National Safety Council, unions, or construction industry associations, or by an individual who holds a current certification as a flagger training instructor from such a program. Prior to the start of flagging operations, the Contractor shall provide to the Engineer a list of certified flaggers to be used in the operation, identifying the source of flagger training for each individual. When requested by the Engineer, flaggers shall demonstrate their competency in flagging procedures. Flaggers not competent in flagging procedures to the satisfaction of the Engineer shall be retrained or replaced at once.

~~**2. Flagger Equipment.** Flaggers shall wear orange protective helmets and traffic control apparel in accordance with §107-05A. High Visibility Apparel. Flaggers shall be appropriately dressed, including apparel that covers the legs, torso and arms with sleeves a minimum of 4 inches long and appropriate footwear. Immodest or sloppy dress will not be permitted. Flaggers shall be equipped with an emergency air horn to alert workers of errant vehicles or other dangerous situations. Where flaggers are not within sight of each other, each flagger shall be equipped with a two-way radio or other means of communication with other flaggers. Where the distance between flaggers is more than 1/2 mile or where shown in the contract documents, the Contractor shall use pilot cars to lead lines of vehicles through the work zone.~~

~~—The standard signaling device for flagging operations, where one or more flaggers are controlling a single stream of traffic or two alternating streams of traffic in opposite directions, shall be STOP/SLOW signal paddles. Red signal flags may be used where display of the STOP and SLOW faces in opposite directions may be inappropriate or misleading.~~

2. Flagger Equipment. Flaggers shall wear orange protective helmets and traffic control apparel in accordance with §107-05A. *High Visibility Apparel.* Flaggers shall be appropriately dressed, including apparel that covers the legs, torso, and arms with sleeves a minimum of 100 mm long and appropriate footwear. Immodest or sloppy dress will not be permitted. Flaggers shall be equipped with an emergency air horn to alert workers of errant vehicles or other dangerous situations. Where flaggers are not within sight of each other, each flagger shall be equipped with a communication device, such as portable phone or two-way radio. The communication device shall only be used to communicate with other flaggers, other workers, or supervisor(s) regarding the flagging operations. Where the distance between flaggers is more than 1 km or where shown in the contract documents, the Contractor may use pilot cars to lead lines of vehicles through the work zone.

The standard signaling device for flagging operations, where one or more flaggers are controlling a single stream of traffic or two alternating streams of traffic in opposite directions, shall be STOP/SLOW signal paddles. Red signal flags may be used where display of the STOP and SLOW faces in opposite directions may be inappropriate or misleading.

3. Operational Control. Flaggers shall be located in a position clearly visible to, but not in the path of, approaching traffic, with an available escape path to avoid oncoming errant vehicle. The number of flaggers to be furnished for each operation shall be sufficient to provide safe, efficient flow of vehicle and pedestrian traffic.

For control of alternating one-way traffic, one flagger shall be provided at each end of the one-way section, with additional flaggers provided to control traffic entering the one-way section from intermediate intersections and major commercial driveways. Where the length of the one-way section is less than 150 feet, the posted speed limit is less than 40 mph, traffic volumes are

Comment [cjt92]:
EI 08-017

such that queues do not develop, and sight distances are adequate, the Contractor may request approval from the Engineer to use a single flagger.

For intersection control, at least one flagger shall be provided for each intersection approach. Where traffic speeds and/or volumes are unusually low, and adequate sight distance is available, such that safe operations can be ensured with fewer flaggers, the Contractor may request approval from the Engineer to use fewer flaggers. When flagging at an intersection with a traffic signal, the signal shall be turned off unless directed otherwise by the Engineer.

On roadways with posted speed limits of 40 mph or higher, the Contractor shall provide enhanced flagger stations consisting of a flag tree and additional cones at all approaches to flaggers in accordance with the Standard Sheet. Flag trees (6F.57) shall display a minimum of 3 orange warning flags, with the flags mounted such that the lowest corners of the flags are at a minimum height of 8 feet. On roadways with posted speed limits less than 40 mph the Contractor shall provide an enhanced flagger station at all approaches to flaggers where conditions permit placing the devices in a manner that will provide effective advanced warning to motorists, except in locations having obstructed traffic flow, such as those having controlled intersections along the approach or approaches.

Flaggers shall be alert at all times, and shall not stand with their backs to approaching traffic. Flaggers shall only direct traffic to stop, to slow or to proceed, using hand signals to supplement the signaling device in accordance with the flagging procedures shown in the MUTCD. Flaggers shall be provided periodic breaks (minimum 15 minutes every 4 hours) throughout the work day, with competent substitutes provided during breaks to maintain continuous coverage of the flagging operation.

A spotter shall be provided at all locations where construction vehicles or equipment must back across or into open travel lanes, sidewalks, or pedestrian walkways. A spotter shall only direct construction vehicles or equipment, and shall not direct traffic in any manner.

For ongoing flagging operations at a specific location, the Contractor may request approval from the Engineer to substitute portable traffic signals in lieu of flaggers.

4. Automated Flagging Device. (Vacant)

M. Maintain Existing Mailboxes. The Contractor shall not move any mailbox which contains mail. The Contractor will advise the owner to remove mail before the box is moved. Mailboxes shall not be mounted, either permanently or temporarily, on a channelizing device or a delineator. Before acceptance of the work, any mailbox which has been disturbed or moved shall be placed by the Contractor in a location consistent with the requirements of the U.S. Postal Service and the contract documents.

N. Contract Site Patrol. The Contractor shall provide adequate personnel and supervision to conduct operations and patrol the contract site to ensure that conditions are adequate for public safety and convenience at all times. The Contractor shall patrol the site as often as necessary during working and non-working hours to adjust and maintain signs, channelizing devices, and other traffic control devices and safety features.

O. Portable Traffic Signals. A minimum of 30 calendar days prior to initial deployment of the signal system, the Contractor shall submit a traffic control plan to the Engineer detailing the signal operation including phasing, clearances, detector operation and layout of the signal faces for review and approval by the Regional Traffic Engineer. A revised or separate traffic control plan may be required when a portable signal system is relocated to another location or its operation modified. Signal faces shall be visible to approaching traffic. The horizontal mast arm shall support one of the signal heads at least 15 feet above the traffic lane. The other signal head may be mounted on the vertical signal mast and shall be at least 8 feet above the roadway.

Portable traffic signals shall only be used when the work requires two-way, alternating flow and the Engineer has approved their use as an alternative to flaggers. The signal system should be supervised full time by a responsible and competent person trained in the operation and maintenance of that specific unit. If the portable signal will operate unattended by the Contractor's responsible

person, the signal heads shall be hard wired to the controller. The Contractor shall designate to the Engineer, in writing, the responsible person and certify that the responsible person has been trained to operate and maintain the signal. A responsible person shall be on-site or otherwise available to respond immediately to malfunctions or operational problems. Appropriate flagger equipment and apparel shall be maintained near each portable signal unit to facilitate flagging in the event of a malfunction or operational need.

Portable signals will not be permitted where there are intersections and/or commercial driveways within the controlled highway segment or where operations within the controlled highway segment will frequently disrupt traffic flow. If such disruptions are infrequent, the portable signals shall either be operated manually or turned off and flaggers provided on each end of the controlled section until normal flow is restored consistent with the signal operation.

When the work no longer necessitates use of the portable signal system, the signal units shall be removed or turned off and moved out of view from the traveled way. Signs shall be either removed or covered.

1. Review and Approval. At a minimum, the plan shall include or meet the following conditions:

- a. Signal Location. Specific location (± 10 feet) of proposed locations of portable signal units. Locations and distances shall be referenced to stationing, existing highway reference markers, or nearby landmarks or intersections.
- b. Location of the power supply/controller housing and poles. The housing and poles shall not encroach on a travel lane and should not encroach on the shoulder or a sidewalk. If locating the housing outside of the shoulder or sidewalk is impracticable, the shoulder or sidewalk shall be closed by appropriate signing and channelization and pedestrians detoured.
- c. Contractor Certification. The Contractor shall certify in writing that the signal operation and signal face layout complies with the MUTCD. The plan shall detail the signal face layout either in a scaled plan or a dimensioned schematic.
- d. Proposed signal phasing and timing including clearances. If actuated operation is to be provided by detectors, the location, type and operation of detectors should be detailed. Delays to drivers due to the signal operation shall not normally exceed 3 minutes.
- e. Pedestrian accommodations including any special signal phasing, crosswalks and sidewalk or shoulder use which forms a continuous and safe pedestrian path.
- f. The plan shall conform to the requirements for one-lane, two-way alternating traffic except:

1. The portable traffic signal system shall be substituted for the flaggers. The signal faces shall be located where they will provide the optimal balance of visibility and operational efficiency. At least one signal face should be continuously visible to approaching traffic traveling at the posted speed limit for at least eight seconds.
2. An orange SIGNAL AHEAD (W3-3) sign shall replace the FLAGGER AHEAD signs (W20-7a) at the same location.
3. Two orange warning flags shall be attached to each SIGNAL AHEAD sign. If the signal system is used at night, a Type B flashing warning light shall be attached to the top of the sign.
4. An 18 inch wide removable stop line with a STOP HERE ON RED (R10-6) sign shall be installed at the stop line or intended stopping point. The Engineer may waive the requirement for a stop line if the roadway is unpaved or it is otherwise impractical to install a stop line and the STOP HERE ON RED sign is in place.

2. Malfunctions. The Contractor shall immediately provide traffic control with flaggers if a portable traffic signal malfunctions; fails to properly or adequately control traffic; creates congestion, queues or gridlock which cannot be remedied by timely on-site adjustments to the signal operation; or is deemed inadequate by the Engineer,

619-3.03 Basic Work Zone Traffic Control (Daily Operations). The Contractor shall control traffic so that a person who has no knowledge of conditions may safely and with a minimum of discomfort and inconvenience ride, drive, or walk, day or night, over all or any portion of the highway and/or structure under construction where traffic is to be maintained. The Contractor will not be required to repair or maintain the roadway except to repair any damages resulting from its operations.

The Contractor shall cease operations; clear the traveled way, shoulders and roadside recovery areas of all obstructions including traffic control devices, construction equipment, and materials during any specific periods listed in the contract documents, at such times as traffic renders conditions unsafe to continue work, and during periods of darkness (before sunrise or after sunset), fog, snow or rain, high winds, or other inclement weather that renders conditions unsafe to continue work, for either the traveling public or the workers. The Engineer will determine when traffic or weather conditions render work operations unsafe.

The traveled way, shoulders, sidewalks and clear zones shall be cleared of all obstructions including traffic control devices, equipment, and materials and returned to normal operations at the conclusion of each work shift.

619-3.04 Temporary Business Signs. The Contractor shall provide temporary business signs mounted on temporary sign supports to identify business entrances in accordance with the contract documents. Entrances shall be identified by only a single sign. Temporary business signs shall be mounted at a minimum height of 7 feet, and at a location that will guide traffic seeking access to the business, but where they will not interfere with traffic flow or other traffic control devices.

619-3.05 Covering or Removal of Pavement Markings. The Contractor shall remove or cover existing permanent pavement markings and interim pavement markings, when indicated in the contract documents or directed by the Engineer, to accommodate traffic pattern changes by covering the markings with preformed removable pavement marking masking tape, or removing the markings, and/or painting over the markings. Masking and/or paint shall be placed in blocks to prevent the underlying shape of pavement marking symbols or letters from being confused with existing markings.

A. Removal of Pavement Markings. The removal method will be at the Contractor's option, subject to its ability to achieve satisfactory results. Removal shall be completed prior to the installation of temporary pavement markings or interim pavement markings. Grinding to remove pavement markings will typically remove 1/8 to 1/4 inch of pavement surface. Paint or similar coatings shall be used only to obliterate existing markings, including edge lines or other markings that are not crossed by traffic, on pavement surfaces that will subsequently be removed or overlaid.

Prior to installation, the existing marking and adjacent pavement shall be cleaned of debris by compressed air or sweeping. The Contractor shall apply the paint in accordance with the manufacturer's recommendations, and completely cover the existing marking. The paint shall be a substantial match to the pavement surface in color, such that appearance of a pavement marking is not visible to drivers under normal viewing conditions, day or night, wet or dry. Any painted-over markings on which the coating fails to adhere, or is worn away, or appears to be an in-service pavement marking, shall be removed or covered.

B. Masking Pavement Markings. Removable pavement tape shall be installed in accordance with the manufacturer's written instructions. Prior to installation, the existing pavement marking and adjacent pavement shall be cleaned by compressed air, sweeping, or other means adequate to remove debris, but that does not result in damage to the existing pavement marking. The width of the removable pavement marking masking tape shall be sufficient to completely cover the existing pavement marking.

The masking tape shall firmly adhere to the entire length and width of the existing pavement marking to be covered. The Contractor shall maintain the tape for the duration of its use. Any tape that is loosened, removed, or that fails to retain its original matte finish, or that for any other reason fails to obliterate the existing pavement marking shall be replaced immediately, at no additional expense to the State.

When the covered pavement markings are to be restored to service, masking tape shall be removed. Temporary adhesive residues will be allowed to remain, providing that the existing pavement marking visibility is not impaired.

Any damage to the existing pavement markings or to the pavement surface that results from the removal of the masking tape shall be repaired at no additional cost to the State. If the existing marking cannot be repaired satisfactorily, the Contractor shall remove damaged pavement markings completely and/or replace the pavement section at no additional cost to the State.

619-3.06 Temporary Pavement Markings. The Contractor shall install and maintain temporary pavement markings in accordance with the contract documents, using patterns and colors shown in the MUTCD to establish temporary traffic pattern(s) during construction. on any pavement, including milled or grooved surface, resurfaced, new pavement, or any other paved surface without pavement markings, for a maximum of 14 days. Within 14 days after placement, the Contractor shall either (1) install the succeeding pavement course or (2) install the remaining pavement markings including edge lines, stop bars, and simple crosswalks, with no hatching. Pavements which will be open to traffic shall be properly marked before being opened, before nightfall, or before the end of the work day, whichever is soonest, except areas that are open during the work shift with channelizing devices or flaggers. Traffic paint need not be removed before placing a subsequent course. Removable pavement tape, removable wet-night reflective tape and removable raised pavement markers shall be removed before placing a subsequent course. No additional payment will be made for removal of temporary pavement markings.

Temporary pavement marking stripes shall be 4 inches in width. Temporary pavement markings shall be applied to a clean, dry pavement in accordance with the manufacturer's recommendations. Temporary pavement markings on roadways open to traffic shall be applied in the direction of traffic. Hatch lines and symbols will not be required temporary pavement markings except as required by the contract documents.

Traffic paint shall be applied at a minimum wet film thickness of 20 mil, immediately followed by an application of glass beads for pavement markings at a rate of 6 lb/gal of paint.

Removable raised pavement markers, evenly spaced every 5 feet, shall be used to supplement a solid line. Two markers, evenly spaced 2 feet apart, shall be used to supplement a 2 feet long broken line. Three markers, evenly spaced 2 feet apart, shall be used to supplement a 4 feet long broken line. Four markers, evenly spaced shall be used to supplement a 10 feet long broken line. Removable raised pavement markers shall not be used to supplement marking letters or symbols.

If unanticipated rainfall prevents the application of temporary pavement markings, the Contractor shall apply raised reflectorized markers or pop-up tabs at no additional cost to the State, until such time as temporary pavement markings may be applied, or the next pavement course is installed.

A. Divided Highways. On divided highways, including freeways, expressways and parkways, the Contractor shall install broken lines a minimum of 2 feet long with a 40 feet cycle length to separate traffic lanes in the same direction. The Contractor shall install solid edge lines for a minimum of 100 feet on either side of the apex of a gore.

B. Undivided Multilane Highways. On three or more lane highways, and two or more lane highways with center two way left turn lanes, the Contractor shall install white broken lines a minimum of 2 feet long with a 40 feet cycle length to separate traffic flows in the same direction, and partial barrier or full barrier centerline pavement marking patterns to separate traffic flows in opposite directions.

C. Two-Lane, Two-Way Highways. Two-lane, two-way highways shall be marked with temporary pavement markings consisting of full barrier centerline in no passing zones and broken lines 2 feet in length placed on a 40 feet cycle length in passing zones.

Two-lane, two-way highways may be left unmarked for a maximum of 3 calendar days provided that NO CENTER STRIPE (W8-12) and DO NOT PASS (R4-1) signs and centerline markings are installed on a 40 feet cycle to delineate the centerline location at no additional cost to the State. Centerline markings shall be yellow squares consisting of reflective removable tape, a minimum of 4 inch square on the pavement surface or L shaped pop-up tabs. NO CENTER STRIPE signs shall be installed in advance of the area marked with centerline tracks, after major intersections and after

major traffic generators. The first DO NOT PASS sign shall be installed within 100 feet of the beginning of the area without pavement markings, the second DO NOT PASS sign shall be installed within 1,000 feet of the first sign and subsequent sign spacing shall not exceed 1/2 mile.

If passing is permitted on an approach to an unmarked roadway where passing will not be permitted, a NO PASSING ZONE (W14-3) pennant shaped sign with an orange background shall be installed on that approach. After 3 days, final centerline marking patterns shall be installed, consisting of full barrier centerline in no passing zones and broken lines 2 feet in length placed on a 40 foot cycle length in passing zones.

619-3.07 Interim Pavement Markings. The Contractor shall install and maintain interim pavement markings in accordance with the contract documents, to establish a construction traffic pattern or diversion during a construction phase or season, for a maximum of one year. After a winter season, interim pavement markings which are illegible shall be reapplied, if necessary, and for which additional payment will be made. Interim pavement marking stripes shall be 4 inches or 6 inches in width, to match preconstruction conditions. Epoxy pavement markings should not be applied to existing pavement that will not be replaced or overlaid, in order to prevent conflicting and/or confusing guidance to motorists. Any marking material that fails to provide both satisfactory daytime and nighttime visibility upon installation shall be replaced by the Contractor at no additional cost to the State.

A. Installation. Interim pavement markings shall be applied to a clean, dry pavement in accordance with the manufacturer's recommendations. Interim pavement markings on roadways open to traffic shall be applied in the direction of traffic. Interim pavement markings shall be installed in accordance with the contract documents.

Traffic paint and epoxy paint shall be applied at a minimum wet film thickness of 20 mil, immediately followed by an application of glass beads for pavement markings at a rate of 6 lb/gal of paint.

Painted markings may be supplemented with removable raised pavement markers. Removable raised pavement markers shall be spaced at 5 feet to supplement a solid line, and 4 markers evenly spaced shall be used to supplement a 10 foot segment of broken line. When used to supplement a solid or broken line, markers shall be spaced at a maximum of 80 feet on tangents and a maximum of 40 feet for curves with a radius less than 2,800 feet. Removable raised pavement markers shall not be used alone to simulate interim pavement markings.

B. Maintenance/Replacement. Traffic paint or removable tape shall be replaced upon (1) abrasion of the line such that more than 10 percent of the underlying pavement is visible within any 300 feet segment of line or (2) loss of more than 2 consecutive skip lines or (3) loss of more than 50 feet of continuous line or (4) failure of any line to be clearly visible at night under low-beam headlamp illumination when viewed from a distance of 200 feet.

Missing removable raised pavement markers shall be replaced upon (1) loss of more than 10 percent of the markers within a 300 feet long segment of line or (2) loss of more than 3 consecutive markers or (3) failure of any line to be clearly visible at night under low-beam headlamp illumination when viewed from a distance of 200 feet.

The Contractor will not be responsible for damage or loss caused by snowplowing. In the event that such pavement markings are damaged or lost, the Engineer will determine whether to replace the lost pavement markings in kind or with other marking materials. Separate payment will be made for pavement markings replaced, or installed due to damage or loss caused by snowplowing.

C. Removal of Pavement Markings. Interim pavement markings used to delineate construction traffic patterns shall be removed at the completion of that phase of the work and prior to the installation of the next construction pattern, or return to the permanent pattern.

The removal of interim pavement markings from detours and other areas is not required where they do not conflict with permanent markings at the completion of the work. Markings shall be removed where it is necessary to transition pavement marking patterns on the detour or temporary traffic pattern into permanent markings at the completion of the construction phase.

619-3.08 Temporary Rumble Strips. The Contractor shall install temporary rumble strips in three sets of 6-strip patterns with 10 feet between individual strips. The type of strip installed will be at the Contractor's option, except that sawcut or milled-in strips shall not be installed on new top course surfaces or existing surfaces that will not be paved over. Where there is no usable shoulder, or the shoulder is less than 3 feet wide, the rumble strips should be ended 3 feet short of the edge of usable pavement. On curbed roadways, rumble strips should end a minimum of 3 feet from the curb in order not to interfere with drainage. Rumble strips shall typically be placed in advance of each of the last three long-term advance warning signs such that drivers are alerted in time to see and read the signs. Rumble strips will typically be installed for a minimum of one week.

A. Raised Asphalt Rumble Strips. The roadway surface on which the rumble strips are to be attached shall be dry, free of surface contaminants such as dust or oil, and thoroughly swept with a stiff broom. The surface temperature of the pavement shall be 45°F or greater unless otherwise authorized by the Engineer. The pavement surface shall be cleaned with compressed air just prior to tack coating and subsequent installation of the rumble strips. The strips shall be formed using a rumble strip paver (drag box) pulled transversely across the pavement, or by hand placement between forms fixed to the pavement. If forms are used, they shall be removed prior to compaction of the asphalt mixture. Compaction shall be accomplished using a plate tamper or a static roller. Raised asphalt rumble strips shall have a width measured in the direction of traffic of between 6 inches and 9 inches and have a final compacted thickness of 3/8 inch ± 1/8 inch.

B. Raised Removable Tape Rumble Strips. Raised removable tape rumble strips shall be formed by applying one or more layers of removable preformed pavement marking masking tape. The tape shall be applied to a clean, dry pavement surface in accordance with the manufacturer's recommendations. The pavement surface shall be swept or cleaned with compressed air just prior to application of the tape.

C. Raised, Preformed Rumble Strips. Raised preformed rumble strips shall be applied to a clean, dry pavement surface in accordance with the manufacturer's recommendations. The pavement surface shall be swept or cleaned with compressed air just prior to application of the strip.

D. Saw-cut Rumble Strips. Saw-cut rumble strips shall be saw cut into existing pavement using wet cutting methods. The blade or blades shall be of such configuration that the desired dimensions of the saw cut can be made with one pass. No spacers between blades will be allowed.

Before a travel lane with saw-cut rumble strips is reopened to traffic, the pavement shall be cleaned by sweeping, flushing, or with a stream of compressed air. Sawing slurry from the wet-sawing process shall be flushed from the pavement surface immediately.

E. Milled-in Rumble Strips. Milled-in rumble strips shall be milled into existing pavement using a rotary-type cutting head with a maximum nominal outside diameter of 24 inches. The cutting head shall be on its own suspension system, independent from that of the power unit, to allow the head to align itself with the slope of the pavement and/or any irregularities in the pavement surface. The pattern of cutting tips on the head shall be arranged to produce a relatively smooth cut with no more than 3/32 inch between peaks and valleys. Prior to beginning work, the Contractor shall demonstrate to the Engineer the ability to achieve the desired surface without tearing or snagging the pavement.

Before a travel lane with milled-in rumble strips is reopened to traffic, the pavement shall be cleaned by sweeping, flushing, or with a stream of compressed air.

F. Removing Temporary Rumble Strips. The Contractor shall either completely remove raised rumble strips from the pavement or fill in the depressions from saw-cut or milled-in rumble strips prior to the start of the winter plowing season, prior to the placement of successive pavement courses, or as directed by the Engineer. Any damage to the pavement surface that results from the removal of raised rumble strips shall be repaired at no additional cost to the State.

Rumble strip depressions shall be filled in with hot mix asphalt. Before they are filled, the depressions shall be cleaned by sweeping, flushing, or with a stream of compressed air, and coated with Asphalt Emulsion Tack Coat. The rumble strips shall be overfilled slightly and compacted using a plate tamper or static roller so that the final compacted surface is flush with the existing pavement.

619-3.09 Interim Tubular Markers. The Contractor shall install interim tubular markers in accordance with the contract documents. The Contractor shall attach interim tubular markers to the pavement in a manner that prevents them from being moved or dislodged by traffic. Interim tubular markers shall be installed on pavement that has been cleaned to remove pavement markings, oil, dirt, or other debris or substances that may interfere with a proper bond. Attachment to the pavement shall be by mechanical fastener or by adhesive, in accordance with the manufacturer's recommendations. Bonding agents shall be of sufficient amount or size to ensure proper bonding of the base to the pavement.

Interim tubular markers removed or damaged by the Contractor's operations or by traffic shall be replaced immediately, so that positive separation is maintained between opposing lanes of traffic at all times. Damaged reflective sheeting on interim tubular markers shall be replaced before nightfall as necessary to maintain adequate visibility of the markers. In cases where only isolated individual markers are lost or damaged, and adequate visibility is maintained by the remaining markers, replacement will not be required until more than 3 consecutive markers, or 25 percent of all markers within 1/2 mile have been damaged or lost.

619-3.10 Portable Variable-Message Signs (PVMS). The Contractor shall provide, operate and maintain PVMSs at the locations shown and for the time periods indicated in the contract documents until the progress of work no longer requires their use. The message to be displayed shall be as required by the contract documents or as directed by the Engineer. When in use, the units shall be placed so that the base of the message panel is at least 7 feet above the adjacent pavement surface and aligned to provide optimum viewing by approaching motorists. The Contractor shall relocate or reorient PVMSs on a daily basis or more frequently, if necessary, as conditions dictate, at no additional cost to the State. The Contractor shall supply the Engineer with an accurate log of the text of all messages and times messages were displayed monthly, not later than the 15th of the following month. The log of messages may be either a listing in a manual register or printouts from the control software. The Contractor shall inform the Engineer of PVMS locations and update as they are relocated and removed.

PVMS with Cellular Communications Option shall have cellular telephone service provided by the Contractor. The Contractor shall supply the Engineer with a copy of control software a minimum of 10 work days prior to installation of the first unit. PVMS shall be made available to the Regional Transportation Management Center for emergency incident management within the contract limits.

619-3.11 Type III Construction Barricades. Type III construction barricades shall be installed at all locations where a highway, bridge, ramp, or other segment of the roadway is closed to traffic. Type III construction barricades shall be maintained upright, in proper alignment and orientation. If ballast is used to maintain alignment and position of the barricade, it shall consist of dry sand contained in a closed waterproof bag, and shall be placed at ground level.

Barricade rails shall be oriented such that the stripes slope downward toward the side on which traffic is to pass. If traffic may pass to either side, adjacent barricades shall be arranged such that the stripes slope downward toward each side starting at the center. Where no passage is intended or permitted, the stripes shall slope downward toward the center of the barricade or barricades.

At night, each Type III construction barricade used to close a roadway, a segment of a roadway or a sidewalk shall be equipped with one flashing warning light.

619-3.12 Temporary Concrete Barrier. The Engineer will inspect temporary concrete barrier sections upon delivery to the contract. Any barrier section having damage and/or defects in the concrete and/or joint connections will be rejected if the performance of the barrier may be affected.

When temporary glare screen is attached to the barrier, temporary delineation shall be mounted such that its visibility is not blocked by the glare screen.

Temporary concrete barrier sections shall be fastened together to form a continuous chain. After placement, each successive unit shall be pulled longitudinally to remove the slack in the joint between

units. When joined together, the barrier sections shall form a smooth and continuous barrier. Any sections damaged or misaligned while in service shall be corrected or replaced.

TABLE 619-4 FLARE RATES FOR POSITIVE BARRIER					
POSTED SPEED LIMIT (mph)	30	40	50	55	65
TEMPORARY CONCRETE BARRIER	8:1	11:1	14:1	16:1	20:1
BOX BEAM OR HEAVY POST CORRUGATED BEAM	7:1	9:1	11:1	12:1	15:1

TABLE 619-5 GUIDE RAIL & CONCRETE BARRIER STANDARD* DEFLECTION DISTANCES		
BARRIER TYPE	POST SPACING (ft)	DEFLECTION DISTANCES (ft)
CABLE GUIDE RAIL	16	11.0
	12	9.5
	8	8.0
	4	7.0
CORRUGATED W-BEAM (WEAK POST) GUIDE RAIL	12.5	8.0
	6.25	6.0
	4.16	5.0
CORRUGATED W-BEAM (HEAVY POST BLOCKED OUT)	6.25	4.0
	3.12	2.0
BOX BEAM GUIDE RAIL	6.0	5.0
	3.0	4.0
CORRUGATED W-BEAM (WEAK POST) MEDIAN BARRIER	12.5	7.0
	6.25	5.0
CORRUGATED W-BEAM (HEAVY POST) MEDIAN BARRIER	6.25	2.0
BOX BEAM MEDIAN BARRIER	6.0	3.0
CONCRETE BARRIER	Not Applicable	1.25
		0.9
		0.25

* Note: Standard Deflection is caused by a 4500 lb test vehicle traveling 60 mph impacting the barrier at a 25° angle.

Where space is available, approach ends of the barrier shall be flared at the taper rate shown in Table 619-4 Flare Rates for Positive Barrier and terminated in a tapered concrete end section, embedded in a slope, or otherwise protected against impact by errant vehicles. Tapered concrete end sections shall not be used in traversable medians, gores, and other areas where impacts on a tapered concrete end section could allow vehicles to penetrate into opposing or adjacent lanes of traffic. Where the posted speed limit is 45 mph or higher, a temporary impact attenuator or temporary sand barrel array shall be provided on approach ends of temporary concrete barrier when the offset from the edge of the traveled way to end of the full section barrier is less than 12 feet, and will be paid for separately.

In order to reduce movement of the barrier on structures and in areas where limited deflection is desired, the Contractor shall pin temporary concrete barrier where shown in the contract documents. Each pinned segment shall be pinned using a minimum of four (4) pins, two (2) on each side, in non-adjacent anchor recesses. Pins shall not project above the top surface of the anchor recess, and shall have the following minimum pin embedment lengths:

- Bridge Decks and Cement Concrete Pavement 5 in
- Flexible Pavement 18 in
- Unpaved Areas 30 in

After removal of the barrier, holes in the surface created to pin the barrier shall be filled, unless that area will be further disturbed. Holes in flexible pavement or unpaved areas shall be filled with material consistent with the subbase, base and surface material. Holes in portland cement concrete pavement or structural decks shall be filled with material meeting the requirements of §701-05 Concrete Grout Material or §721-03 Epoxy Polysulfide Grout.

A. Barrier Without Warning Lights. Where warning lights for temporary concrete barrier are not required, the Contractor shall provide and maintain delineation on the temporary concrete barrier. The delineation shall be maintained visible and free of dirt and snow, including during shutdown periods. The maximum spacing of delineation shall be 40 feet in tangents and 20 feet in curves with radii less than 2,800 feet.

B. Barrier With Warning Lights. Type C warning lights shall be provided on temporary concrete barrier with warning lights. The maximum spacing of warning lights shall be 40 feet in tangents and 20 feet in curves with radii less than 2,800 feet. Warning lights shall be attached to the barrier so that the lights remain securely in place and so that the attachment minimizes damage to the barrier.

All warning lights shall be kept clean, properly aligned and in operating condition. Batteries shall be replaced as necessary to maintain adequate visibility of the warning lights at night.

Where channelizing devices with Type B flashing warning lights are not provided immediately preceding a run of barrier to be marked with warning lights, the first warning light on that run of barrier shall be a Type B warning light.

619-3.13 Temporary Glare Screen. Temporary glare screen shall be installed in accordance with the manufacturer's instructions. All components of the glare screen shall be maintained in a safe and functional condition. Damaged components shall be repaired or replaced.

If blades are utilized, the blades shall be spaced and angled to provide approximately a 22° headlight cutoff angle. The screen shall not overhang the face of the barrier and shall not cover delineation or lights. The screen shall be kept plumb and properly positioned on the barrier, with reflectorization securely affixed to the screen. Cleaning of the reflectorization shall be by a method that does not damage the paddles, reflectorization or barrier, and is not hazardous to traffic.

The Contractor shall remove and dispose of the temporary glare screen upon completion of the contract or when it is no longer required. Upon removal of the temporary glare screen, there shall be no protrusions remaining on the top face of the barrier. Bolt holes or other damage to permanent barrier from glare screen installation shall be repaired by the Contractor at no additional cost to the State.

619-3.14 Temporary Impact Attenuator. The Contractor shall install temporary impact attenuators in accordance with the contract documents, the manufacturer's instructions and materials details. The Contractor shall provide the Engineer a copy of the manufacturer's materials details and installation instructions a minimum of 5 work days prior to use, to allow verification of the attenuator supplied and proper installation. The selection of the manufacturer and model of temporary impact attenuator shall be at the Contractor's option, provided the attenuator supplied is of the type indicated, gating or redirective; shields the hazard; and fits in the location without encroachment into travel lanes or required offsets.

The Contractor shall maintain temporary impact attenuators for continuous operation. If an attenuator is out of operation, the Contractor shall immediately mark the hazard with drums, vertical panels and or extra tall cones until repairs are made or a new attenuator is installed. The Contractor shall promptly begin repairs to damaged attenuators, and shall complete repairs to a damaged attenuator or mitigate the hazard within 1 work day. Attenuators damaged beyond repair shall be replaced within 3 work days.

When temporary impact attenuators are removed or moved to another location, the Contractor shall restore the location to match the surrounding area.

619-3.15 Temporary Sand Barrel Arrays. The Contractor shall install sand barrel arrays in accordance with the patterns shown on the Standard Sheet or a NCHRP 350 approved pattern and fill the barrels with sand to provide the desired module weight, plus or minus 5 %. Units that will be in use

between November 1 and March 31, shall have sodium chloride, as dry rock salt, equal to 3% - 5% by weight of the sand, thoroughly mixed into the sand to prevent freezing. The sand shall be placed in the modules loose, not in bags or sacks. If the contract documents indicate that the site necessitates securing of the modules, the work shall be performed as recommended by the manufacturer.

The Contractor shall maintain sand barrel arrays for continuous 24 hour operation. If an array is out of operation, the Contractor shall immediately mark the hazard with drums, vertical panels and or extra tall cones until repairs are made or new module(s) are installed. The Contractor shall promptly begin repairs to damaged arrays, and shall complete repairs to a damaged array or mitigate the hazard within 1 work day.

619-3.16 Vehicle Arresting Barrier (VAB). The vehicle arresting barrier (VAB) shall be installed in accordance with the contract documents and the manufacturer's instructions and materials details. The Contractor shall provide the Engineer a copy of the manufacturer's materials details and installation instructions a minimum of 5 work days prior to use, to allow verification of the barrier supplied and proper installation. The deceleration area behind the VAB shall be kept clear of workers, vehicles or stored materials. The Contractor shall provide for periodic surveillance of each VAB by workers or by electronic device.

The Contractor shall maintain vehicle arresting barrier for continuous operation. If a barrier is out of operation, the entire barrier shall be restored within 4 hours after the incident, or prior to the next shift the barrier will be used. No work may be progressed in an unprotected area, and the hazard shall be eliminated or minimized, until restorations have been completed.

The VAB, except anchorages, shall be dismantled and removed prior to reopening the road to traffic. After the last day of use, if directed by the Engineer, temporary anchorages shall be removed and disturbed areas shall be restored to match the surrounding area.

619-3.17 Maintain or Modify Traffic Signal Equipment. Traffic signals shall be maintained in proper operation, including the maintenance of all features of the traffic signal operation in effect and operating at the time any work begins on the contract. Traffic-actuated phases shall remain actuated, and signals operating within signal systems shall remain coordinated with the remainder of the system unless otherwise approved by the Engineer. Except for emergencies, no changes in the signal operation or timing shall be made without prior approval by the Engineer. If emergency conditions dictate a change in the operation, the Engineer shall be notified by the start of the next work day. Unless otherwise approved by the Engineer, an altered signal operation must be returned to the original signal operation within 24 hours.

The Contractor shall maintain in operation all equipment including signal heads, supports, cable, wiring, span-wire-mounted signing, controllers, master controllers, detector systems, conflict and current monitors, relays, switch packs, and all other accessory and necessary equipment. Maintenance shall also include the repair and replacement of existing detector loops, under separate items.

The Contractor shall have capable traffic signal repair personnel on call 24 hours a day, 7 days a week, and shall provide to the Engineer a single telephone number for contacting them. If for any reason a signal is not functioning properly, the Contractor shall commence work on the signal within 2 hours of notification. If directed by the Engineer, the Contractor shall notify the appropriate police agency for traffic control operations. If the police agency cannot or will not provide traffic control, the Contractor shall provide flaggers at locations specified by the Engineer within the 2-hour time period. The Contractor shall continue the flagger services until the signal is in proper operation. FLAGGER AHEAD (W20-7a) signs shall be used on all approaches to an intersection controlled by flaggers.

If the malfunction is in the equipment supplied by the State, due to an area wide power outage, or due to a localized power outage beyond the Contractor's control, the Contractor shall notify the Engineer and, if directed by the Engineer, provide flaggers until the malfunction is corrected or State personnel take over. Such flagging operations in excess of 4 hours for the first call and for any subsequent call will be considered extra work.

The Contractor shall provide the Engineer, on a monthly basis, with a record of all maintenance calls received and responded to, as well as a record of all corrective action taken by the Contractor.

A. Requirement A. The Contractor shall maintain in proper operation the indicated existing, relocated, modified, and newly installed signals in accordance with the contract documents. If such

signals are to be removed, the Contractor shall be responsible for operation and maintenance until the signals are removed. The Contractor shall be responsible for their continuous operation except for reasonable shutdown periods authorized by the Engineer during relocation and transfer operations.

B. Requirement B. The State shall assume operation and maintenance responsibility for the signal from the Contractor following successful completion by the Contractor of the installation /modification testing as required by Section 680 Traffic Signals. The six month warranty/guarantee period shall be measured from the day the State assumes maintenance responsibility.

C. Requirement C. At relocated, modified or newly installed signals, the Department will assume responsibility for the following items after successful testing as required by Section 680 Traffic Signals, has been completed. Assumption of the below listed responsibilities by the State will not relieve the Contractor of the responsibility for operation and maintenance of the signal. At existing microcomputer controlled traffic signals, the Department will be responsible for the following items:

1. Supply and maintenance of the microcomputer assembly and software.
2. Programming of the microcomputer furnished by the State.
3. Operation or timing changes directed by the Engineer.
4. Normal (no abuse or vandalism) equipment failures of existing, relocated, modified or new traffic signal equipment furnished by the State.

D. Modify Traffic Signal Equipment. Where the Contractor is required to temporarily modify or relocate existing traffic signals because of construction operations, all existing equipment, fittings, wire, cable, conduit, and related materials shall be reinstalled and extended where necessary. Temporary timber poles, guys, and related material shall be furnished and installed where necessary.

619-3.18 Temporary Traffic Signals. The Contractor shall install temporary traffic signals in accordance with the contract documents, and maintain signal systems, including traffic detectors, in proper operation until approved removal, and shall be responsible for its continuous 24-hour operation except for reasonable shutdown during relocation and transfer operations.

If for any reason a signal does not function as required, the Contractor shall commence repair work on this signal within 2 hours after notification of a malfunction. The Contractor shall provide an adequate number of flaggers to control traffic at each malfunctioning traffic signal, in accordance with §619-3.02L. Flagging and Traffic Control until the signal is restored to proper operation.

The Contractor shall provide a minimum of two signal faces per approach. On each approach, one signal face shall be at the right side of the approach or over the right half of the approach. One signal face shall also be installed at the left side of the approach or over the left half of the approach. The lateral distance between signal faces for each approach shall be a minimum of 8 feet and a maximum of 27 feet.

In the event flashing operation occurs, all signal faces shall show flashing red indications. Flashing operation of a signal is considered a malfunction. If the Contractor elects to use temporary traffic signals to control traffic in lieu of flaggers, the requirements of §619-3.02L. Flagging and Traffic Control shall apply. Substitution of temporary traffic signals for flaggers shall be at no additional cost to the State.

If the malfunction is due to an area wide power outage or due to a localized power outage beyond the Contractor's control, the Contractor shall notify the Engineer and, if directed by the Engineer, provide flaggers until the malfunction is corrected or State personnel take over. Flagging operations in excess of 4 hours for the first maintenance call shall be paid for as extra work.

619-3.19 Nighttime Operations. Work occurring after sunset and before sunrise will be considered nighttime operations. All workers involved in nighttime operations shall wear protective helmets and nighttime apparel in accordance with §107-05A. High Visibility Apparel at all times.

Vehicles operating on the pavement of a closed roadway or travel lane shall display four-way flashers or rotating amber beacons at all times. Vehicles using headlights, except for rollers and vehicles retrieving channelizing devices, shall travel facing in the same direction as adjacent traffic in order to avoid glare and confusion to drivers.

The Contractor shall meet the following additional requirements for work zone traffic control during nighttime operations.

A. Nighttime Operations and Lighting Plan. Thirty days prior to the start of nighttime operations, the Contractor shall submit a written Nighttime Operations and Lighting Plan to the Engineer for approval. The plan shall detail all aspects of the traffic control setup, the functions, responsibilities and identities of the traffic control supervisor and other details as necessary. It shall include a contingency plan identifying foreseeable problems and emergencies that may arise, and the approach that will be used to address them. This plan shall be revised and updated by the Contractor as necessary during the progress of the work to accommodate conditions on the contract.

The Contractor shall submit a Nighttime Operations and Lighting Plan to the Engineer, at a scale and printed size similar to the contract plans and appropriate to adequately describe the work, including the following:

- Layout showing location of light towers, including typical spacing, lateral placement and mounting height, and clearly show the location of all lights necessary for all work to be done at night.
- Description of light towers to be used and electrical power source.
- Specific technical details on all lighting equipment, including brand names, model numbers, power rating and photometric data.
- Details of any hoods, louvers, shields or other means to be used to control glare.
- Attachment and mounting details for lights to be attached to equipment.
- Lighting calculations confirming that the illumination requirements will be met by the layout.

The Contractor shall maintain a supply of emergency flares for use in the event of unanticipated situations such as traffic accidents, equipment breakdowns, failure of lighting equipment, etc.

B. Lighting for Nighttime Operations. Prior to the first night of nighttime operations, the Contractor shall set up and operate the lighting equipment at night as a trial run to demonstrate its ability to establish a safe, properly illuminated, nighttime operation. The Contractor shall furnish the Engineer with a photometer, capable of measuring the level of illumination, for use as necessary to check the adequacy of illumination throughout nighttime operations.

1. Equipment. The Contractor shall supply all lighting equipment required to provide a work zone safe for the workers and traffic. Material and/or equipment shall be in good operating condition and in compliance with applicable safety and design codes.

a. Light Towers. Light towers shall be provided as a primary means of illumination, and shall provide Level I illumination throughout the work space. They may be supplemented to the extent necessary by lighting fixtures mounted on construction equipment to provide Level II or Level III illumination where required for paving, milling and similar moving operations. Light towers shall be sturdy and free-standing without the aid of guy wires or bracing, and shall be capable of being moved as necessary to keep pace with construction operations. Light towers shall be positioned to minimize the risk of being impacted by traffic on the roadway or by construction traffic or equipment.

b. Light Towers on Paving, Milling, and Finishing Machines. If needed to supplement portable and/or trailer-mounted light towers, towers shall be affixed to paving, milling, and finishing machines to provide the required level of illumination for the specified distance in front of and behind the machine. No portion of machine-mounted light towers shall exceed a height of 13 feet above ground. Luminaires shall be aimed and adjusted to provide uniform illumination with a maximum uniformity ratio of 5:1. The hopper, auger, and screed areas of pavers and the operator's controls on all machines shall be uniformly illuminated.

c. Construction Equipment Lights. All construction equipment, including rollers, backhoes, loaders, and other equipment operating in areas not illuminated to a minimum of Level I Illumination, shall be equipped with a minimum of two 500 watt flood lights facing in each

direction to provide a minimum of 1 foot-candles of horizontal illumination measured 60 feet in front of and behind the equipment. In areas illuminated to a minimum of Level I, construction equipment may move unescorted. In non-illuminated areas, construction equipment shall be equipped with conventional vehicle headlights, shall be illuminated with flood lights on the vehicle, or shall be escorted to permit safe movement. Headlights shall not be permitted as the sole means of illumination while working.

d. Equipment Mounting. The Contractor shall provide suitable brackets and hardware to mount lighting fixtures and generators on machines and equipment. Mountings shall be designed so that light fixtures can be aimed and positioned as necessary to reduce glare and to provide the required illumination. Mounting brackets and fixtures shall not interfere with the equipment operator or any overhead structures, and shall provide for secure connection of the fixtures with minimum vibration.

e. Portable Generators. The Contractor shall provide portable generators to furnish adequate power to operate all required lighting equipment. Fuel tank capacity and availability of fuel on site shall be sufficient to permit uninterrupted operation throughout the planned shift. Adequate switches shall be provided to control the various lights. All wiring shall be weatherproof and installed in accordance with 29 CFR 1926 Subpart K requirements. All power sources shall be equipped with a Ground-Fault Circuit Interrupter.

2. Illumination Requirements. Tower-mounted luminaires, whether fixed, portable, trailer-mounted, or equipment-mounted, shall be of sufficient wattage and/or quantity to provide the required level of illumination and uniformity over the area of operation.

The uniformity of illumination, defined as the ratio of the average illumination to the minimum illumination over an area requiring an indicated illumination level, shall not exceed 5:1. Illumination levels on approach roadways should be increased sequentially to prevent motorists from becoming disoriented by rapid changes from full dark to very bright conditions.

Existing street and highway lighting shall not eliminate the need for the Contractor to provide lighting. Consideration will be given to the amount of illumination provided by existing lights in determining the wattage and/or quantity of lights to be provided. Such consideration shall be presented in the Contractor's Nighttime Operations and Lighting Plan. In the event of any failure of the lighting system, nighttime operation(s) shall be discontinued until the required level of illumination is restored.

a. Level I (5 foot-candles). Level I illumination shall be provided for all areas of general construction operations to include all work operations by Contractors' personnel, including work zone traffic control set-up and operations, staging, excavation, cleaning and sweeping, spoil disposal, landscaping, planting and seeding, layout and measurements ahead of the actual work, borrow areas, spoil areas, and truck cleanout areas. Level I illumination shall be provided at the area of lane and/or road closure tapers continuously, including the setup and removal of the closure tapers. Level I illumination shall be provided a minimum of 400 feet ahead and 800 feet behind a paving or milling machine, or for the entire area of concrete placement or pavement work if less than 1500 feet. This area shall be extended as necessary to incorporate all vehicle and equipment operations associated with the paving operation.

The only exception to the requirement for Level I illumination throughout the area of construction operations is that finish rollers can work beyond the area of Level I illumination using floodlights mounted on the roller.

b. Level II (10 foot-candles). Level II illumination shall be provided for flagging stations, asphalt paving, milling, and concrete placement and/or removal operations, including bridge decks, 50 feet ahead and 100 feet behind a paving or milling machine.

c. Level III (20 foot-candles). Level III illumination shall be provided for pavement or structural crack filling, joint repair, pavement patching and repairs, installation of signal

equipment or other electrical/mechanical equipment, and other tasks involving fine details or intricate parts and equipment.

3. Glare Control. All lighting shall be designed, installed, and operated to avoid glare that affects traffic on the roadway or that causes annoyance or discomfort for residences adjoining the roadway. The Contractor shall locate and aim lighting fixtures to provide the required level of illumination and uniformity in the work zone without the creation of objectionable glare. The Engineer will determine when glare exceeds acceptable levels, either for traffic or for adjoining residences.

The Contractor shall provide shields, visors or louvers on luminaires as necessary to reduce objectionable levels of glare. As a minimum, the following requirements shall be met to avoid objectionable glare on roadways open to traffic in either direction:

- Tower-mounted luminaires shall be aimed either generally parallel or perpendicular to the roadway.
- Luminaires shall be aimed such that the angle between the center of the beam axis and the vertical mounting pole is no greater than 45°.
- No luminaires shall be permitted that provide a luminous intensity greater than 20,000 candelas at an angle of 72° above the vertical.
- Except where prevented by overhead utilities or structures, towers shall be extended to their full working height when in use to reduce glare and provide uniform illumination.

619-3.20 Traffic Control Supervisor. When indicated in the contract documents, the Contractor shall provide a dedicated traffic control supervisor having adequate training, experience, and authority to implement and maintain all traffic control operations. The traffic control supervisor shall not be assigned other duties that interfere with performance as a traffic control supervisor.

The traffic control supervisor shall be adequately trained in traffic control operations by recognized training programs, including the American Traffic Safety Services Association "Traffic Control Supervisor", the National Safety Council, unions, or construction industry associations, or by an individual instructor from such a program. Traffic control supervisors not competent to the satisfaction of the Engineer shall be replaced immediately.

During setup and removal of lane closures and other traffic control setups, the traffic control supervisor shall be assisted by additional workers as necessary. The traffic control supervisor shall patrol the contract area to ensure that conditions on the site are adequate for public safety and convenience at all times, to monitor worker safety from intrusions into the work area, and to ensure that the work adheres to the provisions for work zone traffic control. The traffic control supervisor shall ensure signs, channelizing devices, barricades, barrier, impact attenuators and other traffic control devices are adjusted and maintained as necessary. The Contractor shall provide workers to install, maintain, adjust, and remove traffic control devices as required by the work operations.

When the work does not require closure of an active lane, roadway, or ramp; when no construction operations occur within 30 feet of active traffic lanes; and when there is no delivery of materials or equipment; the Engineer may waive the requirements for a traffic control supervisor.

619-3.21 Temporary Structures and Approaches. The Contractor shall design, construct, maintain and remove temporary structures and their approaches, or move and remove existing structures to provide temporary structures along with their temporary approaches. The Contractor shall install temporary approaches, including necessary earth support structures such as sheeting, in such a manner and sequence that interference with and inconvenience to the traveling public and the abutting owners is kept to a minimum. The Contractor shall be responsible for the workmanship, upkeep, and safety of all temporary structures and approaches. All fabrication shall conform to the current AASHTO Standard Specifications for Highway Bridges, Division II except as modified herein. Fabrication shall be performed by an AISC Category III-Certified Fabricator. Plans and design computations shall bear the stamp and signature of a Professional Engineer.

When specific details are not indicated in the contract documents, the Contractor shall design all elements of the temporary structure and approaches including the railing system. Design shall be done in conformance with the AASHTO Standard Specifications for Highway Bridges which is current on the

§619

date of advertisement for bids, except that the design live load shall be HS 20 and the bridge rail shall be designed for TL-2.

Prior to beginning construction of any structure designed by the Contractor or the Contractor's agents, the Contractor shall submit detailed plans to the DCES for review and approval in accordance with §585-3.02, Working Drawings. Such review, however, shall not relieve the Contractor of the responsibility for the adequacy and design of such temporary structures and approaches. If the Contractor proposes to construct with used materials, the Contractor's Engineer shall submit with the plans the method for documenting that all primary member material meets the physical properties required by the design. In the absence of record plans or other valid documentation for the used materials, physical testing shall be performed. Excluded from this provision are proprietary structures. All welding required for the fabrication of temporary steel structures shall be performed in accordance with the provisions of the NYS Steel Construction Manual. Complete penetration groove welds in primary members shall be radiographed as described therein. The DCES reserves the right to perform in-process fabrication inspection. The Contractor shall notify the DCES of the fabrication schedule 10 work days prior to commencement of fabrication.

Prior to opening a temporary structure to traffic, the structure shall be inspected by a Professional Engineer who shall certify in writing to the Engineer that the structure was constructed in accordance with the design. At least every month, the Contractor shall have the temporary structure inspected, under the direction of a Professional Engineer, by a person familiar with bridge construction. On or before each anniversary of the opening of a temporary structure that has been open to traffic for one year or more, the structure shall be inspected by a Professional Engineer, who shall certify in writing that:

1. The plans of the structure, including its foundations, have been reviewed.
2. A hands-on inspection of the structure has been performed in accordance with the latest edition of the NYSDOT Bridge Inspection Manual by an inspection team whose leader is a Professional Engineer and who was present for the inspection.
3. A detailed inspection of those areas of the structure critical to its integrity has been performed.
4. The structure is currently adequate for its design loads.

A signed and stamped copy of the inspection results shall be provided to the Engineer within one week of the inspection.

619-3.22 Pavement Patching. The Contractor shall place paving materials suitable to provide temporary pavement patches on paved surfaces where vehicular, bicycle or pedestrian traffic is to be maintained, including the traveled way, shoulders, sidewalks, and other paved surfaces damaged by traffic or environmental factors and not by Contractor operations. During periods of active work on the contract, the Contractor shall complete needed patches on a daily basis. During periods of winter shutdown, the Contractor shall inspect the contract on a regular basis, and pavement patches shall be installed as needed.

The Contractor shall place pavement patches to provide a relatively smooth, uniform driving surface suitable for safe travel at the posted speed limit. Pavement patches shall be placed to repair surface irregularities including, but not limited to, holes, depressions, cracks and uneven joints. Areas to be patched shall be adequately cleaned and tack-coated if necessary, and patching material shall be thoroughly compacted by hand or by roller.

619-3.23 Mailboxes. In the event the original mounting post has been lost, damaged, is unusable, or is not consistent with U.S. Postal Service requirements, the Contractor shall furnish and install a new mounting post and/or mailbox with mounting post as shown on the Standard Sheets at the designated location and at the proper height in accordance with the requirements of the U.S. Postal Service.

619-4 METHOD OF MEASUREMENT

619-4.01 General. (None Specified.)

619-4.02 Basic Work Zone Traffic Control. The work under basic work zone traffic control will be measured for payment on a lump sum basis.

619-4.03 Basic Work Zone Traffic Control (Daily Operations). The work under basic work zone traffic control (daily operations) will be measured for payment on a lump sum basis.

619-4.04 Temporary Business Signs. The quantity to be measured for payment will be in square feet to the nearest 0.1 square foot of business signs installed.

619-4.05 Covering or Removal of Pavement Markings. The quantity to be measured for payment will be in feet to the nearest whole foot along the centerline of the pavement stripes covered or removed, and will be based on a 4 inch wide stripe. No measurement will be made for the gaps between broken and dotted line segments. If preformed tape is used to cover an existing line, payment will be based on the width of the line covered. Measurement for covering or removal of striping with a width greater than 4 inches will be made by the following method:

$$\frac{\text{Width of Striping (in)} \times \text{Number of Feet}}{4 \text{ (in)}}$$

Letters and symbols will be measured by each unit covered or removed. A unit will consist of one letter or one symbol except that a double-headed arrow will be measured as two units and triple headed arrow will be measured as three units. Example: "SCHOOL" would be measured as six units. Each R in a railroad crossing marking will be measured as a single unit, but the "X" will be measured by the number of feet of 4 inch stripe.

619-4.06 Temporary Pavement Markings. The quantity to be measured for payment will be in feet to the nearest whole foot along the centerline of the pavement stripes installed, and will be based on a 4 inch wide stripe. No measurement will be made for the length of skips in the dashed line. Measurement for installation of striping with a width greater than 4 inches will be made by the following method:

$$\frac{\text{Width of Striping (in)} \times \text{Number of Feet}}{4 \text{ (in)}}$$

Letters and symbols will be measured by each unit installed. A unit will consist of one letter or one symbol except that a double-headed arrow will be measured as two units and triple headed arrow will be measured as three units. Example: "SCHOOL" would be measured as six units. Each R in a railroad crossing marking will be measured as a single unit, but the "X" will be measured by the number of feet of 4 inch stripe.

619-4.07 Interim Pavement Markings. The quantity to be measured for payment will be in accordance with §619-4.06.

619-4.08 Temporary Rumble Strips. The quantity to be measured for payment will be in feet to the nearest whole foot of individual temporary rumble strip installed, measured transverse to the direction of traffic flow.

619-4.09 Interim Tubular Markers. The quantity to be measured for payment will be the number of interim tubular markers installed.

619-4.10 Portable Variable-Message Signs (PVMS). Portable variable-message signs with a pay unit of each will be measured for payment as the number of signs installed. The work under portable variable-message signs with a pay unit of week will be measured for payment on a weekly basis.

619-4.11 Type III Construction Barricades. The quantity to be measured for payment will be the number of barricade units installed.

§619

619-4.12 Temporary Concrete Barrier. The quantity to be measured for payment will be in feet to the nearest foot along the centerline of temporary concrete barrier installed. The quantity to be measured for payment will be in feet to the nearest foot along the centerline of temporary concrete barrier with barrier warning lights installed.

619-4.13 Temporary Glare Screen. The quantity to be measured for payment will be in feet to the nearest foot along the length of the temporary glare screen installed.

619-4.14 Temporary Impact Attenuator. The quantity to be measured for payment will be the number of temporary impact attenuators installed.

619-4.15 Temporary Sand Barrel Arrays. The quantity to be measured for payment will be the number of individual sand barrel modules installed.

619-4.16 Vehicle Arresting Barrier. The quantity to be measured for payment will be the number of barriers installed.

619-4.17 Maintain or Modify Traffic Signal Equipment. The quantity to be measured for payment will be on a monthly basis to the nearest 1/4 month, for each signalized intersection being maintained or modified.

619-4.18 Temporary Traffic Signals. The work under temporary traffic signals will be measured for payment on a each location basis.

619-4.19 Nighttime Operations. The work under nighttime operations will be measured for payment on a lump sum basis.

619-4.20 Traffic Control Supervisor. The work under traffic control supervisor will be measured for payment on a monthly basis to the nearest 1/4 month.

619-4.21 Temporary Structures and Approaches. The quantity to be measured for payment will be the number of temporary structures installed.

619-4.22 Pavement Patching. The quantity to be measured for payment will be in cubic yards to the nearest 0.1 cubic yard of pavement patching installed.

619-4.23 Mailboxes. The quantity to be measured for payment will be the number of mailboxes installed.

619-5 BASIS OF PAYMENT

619-5.01 General. The price bid shall include all labor, materials and equipment necessary to complete the work. No payment will be made for damage caused by vehicle accidents, vandalism, or any other similar causes.

A. Non-Payment. For each calendar day during which there are substantial deficiencies in compliance with the requirements of this section, no payment will be made under basic work zone traffic control. The amount of such calendar day nonpayment will be deducted from monies due the Contractor in accordance with Table 619-6 Basic Work Zone Traffic Control Nonpayment.

TABLE 619-6 BASIC WORK ZONE TRAFFIC CONTROL NON-PAYMENT
--

Original Contract Amount		Nonpayment Amount
From More Than	To and Including	
\$ 0	\$ 500,000	\$ 200
\$ 500,000	\$ 2,000,000	\$ 400
\$ 2,000,000	\$ 5,000,000	\$ 500
\$ 5,000,000	\$ 10,000,000	\$ 750
\$ 10,000,000	\$ 20,000,000	\$ 1,000
\$ 20,000,000	-----	\$ 3,000

B. Liquidated Damages. If the Contractor fails to adequately correct substantial cited deficiencies within 24 hours of notification by the Engineer for any item under this section, or those deficiencies reoccur on a subsequent, but not necessarily concurrent calendar day, liquidated damages will be assessed for each calendar day or part thereof in addition to non-payment for deficiencies.

C. Major Non-Conformance. Where major non-conformance with the requirements of this specification is noted by the Engineer, and prompt Contractor compliance is deemed not to be obtainable, the Engineer may stop contract work.

Where major non-conformance with the requirements of this specification is noted by the Engineer, and the Contractor fails to correct deficiencies for a period of 24 hours, the Department may correct the adverse conditions by any means deemed appropriate, and will deduct the cost of the corrective work from any monies due the Contractor. The cost of this corrective work will be in addition to the non-payment for basic work zone traffic control, non-payment of any other items of work under this section and liquidated damages assessed.

619-5.02 Basic Work Zone Traffic Control. The lump sum price bid for basic work zone traffic control shall include all labor, materials and equipment necessary to complete the work. Construction signs; arrow panels; warning lights on signs, barricades and channelizing devices; the cost of temporarily terminating guide rail, median barrier, or bridge rail during non-work hours; work required to maintain drainage facilities during construction operations; and dust control shall be included in the lump sum price bid for basic work zone traffic control. Removal of debris from drainage features that was present at the time of contract award shall be paid for separately.

Progress payments will be made at 20 percent of the lump sum price bid when 10 percent of the contract work, excluding basic work zone traffic control, contingency items and mobilization, has been completed. The remaining 80 percent will be paid in subsequent contract payments, in proportion to the amount of other contract work completed, less any non-payment for deficient work zone traffic control. If the contract completion date is extended, no additional payment will be made for basic work zone traffic control.

619-5.03 Basic Work Zone Traffic Control (Daily Operations). The lump sum price bid for basic work zone traffic control (daily operations) shall include all labor, materials and equipment necessary to complete the work. Construction signs; arrow panels; warning lights on signs, barricades and channelizing devices; and the cost of temporarily terminating guide rail, median barrier, or bridge rail during non-work hours; shall be included in the lump sum price bid for basic work zone traffic control (daily operations).

Progress payments will be made at 20 percent of the lump sum price bid when 10 percent of the contract work, excluding basic work zone traffic control, contingency items and mobilization, has been completed. The remaining 80 percent will be paid in subsequent contract payments, in proportion to the amount of other contract work completed, less any non-payment for deficient work zone traffic control. If the contract completion date is extended, no additional payment will be made for basic work zone traffic control.

619-5.04 Business Signs. The unit price bid for temporary business signs shall include the cost of labor, materials and equipment necessary to complete the work, including sign supports.

619-5.05 Covering or Removal of Pavement Markings. The unit price bid for the removal of pavement markings shall include the cost of all labor, materials and equipment necessary to complete the work, including the costs of any repairs or replacement of damaged pavement or existing pavement markings resulting from pavement marking removal or covering operations.

Payment for removal of temporary pavement markings and interim pavement markings is included in those items, and additional payment will not be included under covering or removal of pavement markings.

619-5.06 Temporary Pavement Markings. The unit price bid for temporary pavement markings shall include the cost of furnishing all labor, materials and equipment necessary to complete the work. Payment shall be provided each time temporary pavement markings are first applied on a pavement course in accordance with the contract requirements.

No additional payment shall be provided for the installation of construction signs, temporary delineators, and channelizing devices necessitated by the Contractor's failure to place temporary pavement markings before the pavement is opened to traffic, or for temporary roadside pavement channelization until edge lines are placed. No additional payment shall be provided for markings required because the Contractor failed to place the next pavement course or the final pavement markings within 14 days.

619-5.07 Interim Pavement Markings. The unit price bid for interim pavement markings shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

619-5.08 Temporary Rumble Strips. The unit price bid for temporary rumble strips shall include the cost of all labor, materials and equipment necessary to complete the work. Payment will include the cost of pavement cleaning, asphalt concrete, and other materials used to form or fill in the rumble strips, and tack coat. On multiyear contracts where it is desired to have rumble strips in place for more than one construction season, the rumble strips will be paid for separately each year they are installed.

619-5.09 Interim Tubular Markers. The unit price bid for interim tubular markers shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, including removal and the cost of replacing damaged markers. Interim tubular markers that are in satisfactory condition may be relocated. When interim tubular markers are relocated, payment will be made for another interim tubular marker.

619-5.10 Portable Variable-Message Signs (PVMS). The unit price bid for portable variable-message signs shall include the cost of all labor, materials and equipment necessary to complete the work, including cellular telephone service initial start-up and monthly charges for the cellular communications option.

Progress payments for portable variable-message signs will be made for 70 percent of the unit price bid when each unit has been satisfactorily installed and is operational at the first location. The remaining 30 percent will be paid upon removal.

619-5.11 Type III Construction Barricades. The unit price bid for Type III construction barricades shall include all labor, materials and equipment necessary to complete the work, including lighting when required. When barricades are relocated or the diagonal stripes are changed to allow traffic to pass on the other side of the barricade, additional payment will be made for another barricade. Movements of the barricade from one side of the roadway to the other side, movements within 100 feet of the initial location, or daily replacement to approximately the same location, not requiring any change in the diagonal stripes, will not be considered as relocation and will not be paid for as additional barricades.

No payment will be made for Type III construction barricades used at the option of the Contractor in lieu of channelizing devices.

619-5.12 Temporary Concrete Barrier. The unit price bid for temporary concrete barrier shall include all labor, materials and equipment necessary to complete the work, including any required connection devices, end treatments, temporary delineation and repair of pavement after removal of

temporary concrete barrier. Temporary impact attenuators, if required, will be paid for separately. When temporary concrete barriers are relocated, except movements necessary to maintain, realign, or replace damaged units and daily relocation of segments to allow access to the work area which are restored at the end of the work shift, additional payment will be made for additional length of temporary concrete barrier.

The unit price bid for temporary concrete barrier with warning lights shall include the cost of furnishing all labor, materials, equipment, and electrical power necessary to complete the work. Should a barrier that is equipped with warning lights be moved to a new location where temporary concrete barrier with warning lights is required, payment will be made for additional length of temporary concrete barrier with warning lights.

Progress payments will be made at the unit price bid for 90 percent of the quantity, after placement and demonstration of satisfactory operation. The remaining 10 percent will be paid upon removal. No payment will be made for temporary concrete barrier installed at the Contractor's option, required solely due to a delay caused by the Contractor's operations, or installed to protect pavement edge drop-offs, unless required in the contract documents.

619-5.13 Temporary Glare Screen. The unit price bid for temporary glare screen shall include all labor, materials and equipment necessary to complete the work. When glare screens are relocated, except movements necessary to maintain, realign, or replace damaged units and daily relocation of temporary concrete barrier segments with glare screen attached to allow access to the work area which are restored at the end of the work shift, additional payment will be made for the length of glare screen relocated. No payment will be made for repair or replacement of damaged components.

619-5.14 Temporary Impact Attenuator. The unit price bid shall include the cost of all labor, materials, and equipment necessary to complete the work, including the back-up system, the pad, if indicated, and any excavation or backfill. When attenuators are relocated, payment will be made in for a new temporary impact attenuator, except minor movements within a site, such as movements to maintain, realign, or adjust an attenuator. No payment will be made to repair, restore or replace an attenuator damaged by public traffic or by the Contractor's operations.

619-5.15 Temporary Sand Barrel Arrays. The unit price bid for temporary sand barrel arrays shall include the cost of all labor, materials and equipment necessary to complete the work, including the cost of the sand fill and salt additive. Replacement of individual modules damaged by public traffic will be paid for at the unit price bid for each temporary sand barrel. Relocation of barrels to a new location will be paid for as a new installation.

619-5.16 Vehicle Arresting Barrier. The unit price bid for vehicle arresting barrier shall include the cost of all labor, materials and equipment necessary to complete the work. No payment will be made to repair, restore or replace an attenuator damaged by public traffic or by the Contractor's operations.

619-5.17 Maintain or Modify Traffic Signal Equipment. The unit price bid for maintaining traffic signal equipment shall include the cost of all labor, materials and equipment necessary to perform the work, with the exception of inductance loop replacement, if necessary, which will be paid for separately. The unit price bid for modifying traffic signal equipment per location shall include the cost of all labor, materials and equipment necessary to perform the work. The cost of the electric power shall be the responsibility of the original maintaining agency. No payment will be made during any period for which the Contractor has been granted an extension of time with engineering charges.

619-5.18 Temporary Traffic Signals. The unit price bid for temporary traffic signals per location shall include the cost of all labor, materials and equipment necessary to complete the work, including the cost of electric power necessary to operate the signal until its removal is approved or directed by the Engineer. A location may be an intersection, a work zone with two or more signal faces interconnected and operating together, or other limits as defined in the contract documents. Portable or temporary traffic signals used at the Contractor's option in lieu of flaggers shall be included in the lump sum price bid for basic work zone traffic control.

§619

Progress payments will be made at 50 percent of the unit price bid for each location after installation and demonstration of satisfactory operation. The remaining 50 percent will be paid in progress payments per week of temporary traffic signal provided. The amount of such weekly payment will be determined by dividing 50 percent of the unit price bid by the number of weeks the temporary traffic signal is to remain in operation, as shown on the approved progress schedule.

619-5.19 Nighttime Operations. The lump sum price bid for portable lighting shall include all labor, materials and equipment necessary to complete the work.

Progress payments will be made based on the lump sum price bid as follows: 20 percent when the Nighttime Operations and Lighting Plan has been accepted and satisfactory lighting of nighttime operations has begun; the remaining 80 percent will be paid in progress payments per week of nighttime operations completed. The amount of such weekly payment will be determined by dividing 80 percent of the lump sum amount bid by the number of weeks of nighttime operations in the approved Nighttime Operations and Lighting Plan.

619-5.20 Traffic Control Supervisor. The unit price bid for traffic control supervisor shall include the cost of furnishing all labor, materials, equipment, training and direct supervision necessary to provide and support the activities of a traffic control supervisor. No additional payment will be made for replacement or substitution of the traffic control supervisor during the course of the construction operations.

619-5.21 Temporary Structures and Approaches. The unit price bid for temporary structures and approaches shall include the cost of all labor, materials and equipment necessary to complete the work. Two temporary structures separated by a portion of an existing structure greater than 3 feet in length will be paid for as two separate structures.

Progress payments will be made at the unit price bid for 90 percent of the quantity after the temporary structures and approaches are complete and operable. The remaining 10 percent will be paid upon removal.

619-5.22 Pavement Patching. The unit price bid for pavement patching shall include the cost of furnishing all labor, materials and equipment necessary to patch pavement during periods of winter shutdown when work on the contract is inactive, or when hot mix asphalt material is not available, including mobilization of work crews and work zone traffic control.

The cost of all work associated with providing and installing suitable pavement patching materials to maintain pavements open to traffic in acceptable condition when work on the contract is active, or when hot mix asphalt material is available, will be paid under a hot mix asphalt sidewalk item if that item is in the contract, or alternatively, under a top course paving item, regardless of the material actually used.

619-5.23 Mailboxes. The unit price bid for mailboxes shall include all labor, materials and equipment necessary to complete the work. Only one payment for each mailbox will be made regardless of the number of times it is moved or replaced and shall be made when the mailbox has been placed in its final location. Where multiple mailboxes are installed on a single post, payment will be based upon the number of individual mailboxes so installed.

Payment will be made under:

Item No.	Item	Pay Unit
619.01	Basic Work Zone Traffic Control	Lump Sum
619.0101	Basic Work Zone Traffic Control (Daily Operations)	Lump Sum
619.04	Type III Construction Barricades	Each
619.06nn	Temporary Structures and Approaches	Each
619.07	Temporary Business Signs	Square Feet
619.0801	Remove Existing Pavement Marking Stripes	Feet
619.0802	Remove Existing Pavement Marking Letters or Symbols	Each
619.0803	Cover Existing Pavement Marking Stripes (Removable Tape)	Feet

619.27	Mailboxes	Each

SECTION 620 - BANK AND CHANNEL PROTECTION

620-1 DESCRIPTION. This work shall consist of furnishing all plant, labor, equipment, and materials to place a protective covering of erosion-resistant material on embankment slopes, streambanks, at culvert inlets or outlets on bottoms and side slopes of channels, at structure foundations, and at other locations shown on the plans or as directed by the Engineer. The work shall be done in accordance with these specifications and in conformity with the lines, grades, thicknesses, and typical sections shown on the plans or established by the Engineer.

620-1.01 Stone Filling. Stone filling shall consist of well graded stone placed as protective material on stream-banks, in channels and elsewhere, as required.

620-1.02 Dry Rip-Rap. Dry rip-rap shall consist of stone fitted and placed on streambanks or in channels in order to provide protection against erosion.

§620

620-1.03 Grouted Rip-Rap. Grouted rip-rap shall consist of stone similar to dry rip-rap but with all spaces between the stones filled with cement grout.

620-1.04 Bedding Material. Bedding material shall consist of granular material placed in a layer, where required, on the ground surface prior to placing stone filling or rip-rap. The purpose of the bedding material is to prevent underlying finer materials from passing into and through the stone filling or rip-rap.

620-1.05 Concrete Block Paving. Concrete block paving shall consist of concrete blocks placed on embankment slopes under structures as protection against erosion.

620-1.06 Gabions. Gabions shall consist of open wire mesh baskets, filled with stones.

620-2 MATERIALS

620-2.01 Soundness Approval. The soundness of all material used for stone filling or rip-rap shall be approved on the basis of a geologic evaluation in accordance with the control procedure in effect on the date of advertisement for bids. Prior to the evaluation, the Contractor shall stockpile the material. Where the State elects to conduct soundness tests, stone filling or rip-rap will be rejected if it exceeds 10% loss, by weight, after 10 cycles of the magnesium sulfate soundness test.

620-2.02 Stone Filling. The gradation of materials furnished for use as stone filling shall be as specified in Figure 620-1, and will be accepted or rejected based on a visual examination of the material by the Engineer.

Figure 620-2 is incorporated to assist the Engineer and the Contractor to evaluate the gradation of materials considered for use as Stone Filling and Rip-Rap.

620-2.03 Dry Rip-Rap. In addition to meeting the requirements set forth in §620-2.01, dry rip-rap shall consist of stones shaped as nearly as practicable in the form of right rectangular prisms. At least fifty percent, by weight, of the stones shall weigh in excess of 300 pounds each, and the remainder of the stones shall weigh from 100 to 300 pounds each. One dimension of each of the stones furnished shall be at least equal to the thickness of the rip-rap as shown on the plans.

The gradation of materials furnished for use as dry rip-rap will be accepted or rejected based on a visual examination of the material by the Engineer.

620-2.04 Grouted Rip-Rap. The requirements for the stone used for grouted rip-rap shall be the same as stated in §620-2.03.

The grout shall consist of one part cement conforming to the requirements for Portland Cement Type 2, §701-01 and three parts fine aggregate, conforming to the requirements for Concrete Sand in §703-07.

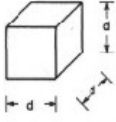

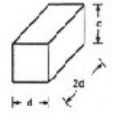

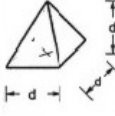

620-2.05 Bedding Material. Bedding material shall be composed of crushed stone, crushed air-cooled blast furnace slag, or gravel, free of soft, nondurable particles, organic material, and thin or elongated particles. Bedding material shall be stockpiled.

Bedding material shall meet the following gradation requirements:

Sieve Size Designation	Percent by Weight Passing
4 inch	100
1 inch	15 to 60
1/4 inch	0 to 25
No. 40	0 to 10

The procedure for acceptance or rejection of these materials shall be as described in the appropriate [Geotechnical Control Procedure \(GCP\)](#) ~~Soil Control Procedure (SCP)~~ Manual.

FIGURE 620-1 STONE FILLING GRADATION REQUIREMENTS			
Stone Filling Item	See Notes	Stone Size ¹	Percent of Total by Weight
Fine	2, 3, 4	Smaller than 8 inch	90 - 100
		Larger than 3 inch	50 - 100
		Smaller than No. 10 Sieve	0 - 10
Light	2, 3, 4	Lighter than 100 pounds	90 - 100
		Larger than 6 inch	50 - 100
		Smaller than 1/2 inch	0 - 10
Medium	2, 4	Heavier than 100 pounds	50 - 100
		Smaller than 4 inch 6 inch	0 - 10
Heavy	2, 4, 5	Heavier than 600 pounds	50 - 100
		Smaller than 6 inch	0 - 10

FIGURE 620-2 APPROXIMATE SHAPE					
Specified Weights and Sizes					
600 pounds	d = 18 inches	d = 23 inches	d = 15 inches	d = 23 inches	d = 27 inches
300 pounds	d = 15 inches	d = 18 inches	d = 12 inches	d = 18 inches	d = 21 inches
150 pounds	d = 12 inches	d = 15 inches	d = 9 inches	d = 15 inches	d = 17 inches
100 pounds	d = 10 inches	d = 13 inches	d = 8 inches	d = 13 inches	d = 15 inches
d = 8 inches	50 lbs.	25 lbs.	100 lbs.	25 lbs.	16 lbs.
d = 6 inches	20 lbs.	10 lbs.	40 lbs.	10 lbs.	7 lbs.

NOTES:

1. Stone sizes, other than weights, refer to the average of the maximum and minimum dimensions of a stone particle as estimated by the engineer.
2. Materials shall contain less than 20 percent of stones with a ratio of maximum to minimum dimension greater than three.
3. Air-cooled blast furnace slag, cobbles or gravel having at least one fractured face per particle are acceptable substitutes for stone under these items, provided that the soundness and gradation requirements are met.
4. Materials shall contain a sufficient amount of stones smaller than the average stone size to fill in the spaces between the larger stones.
5. Heavier gradings of this item may be required on some projects, in which case the requirements will be stated on the plans or in the proposal.

620-2.06 Concrete Block Paving. The concrete block shall comply with the requirements for Concrete Block (Slope Paving), §704-04. The block shall have the following nominal dimensions:

Length:	16 to 20 inches
Thickness:	6 inch (solid)
Width:	8 inches

The standard dimensions of the block shall be the specified nominal dimension minus 3/8 inch. The maximum permissible variation in dimensions of individual units from standard dimensions shall be not more than 1/8 inch. The size of block used shall be consistent throughout any continuously paved area, and only one nominal length shall be used in any contract. All units shall be sound and free from cracks

§620

or other defects that would interfere with the proper placing of the blocks or impair the strength, permanence and appearance of the construction.

Cushion sand for concrete block paving shall conform to the requirements for cushion sand set forth in §703-06. Grout, where used, shall consist of one part Portland Cement Type 2, conforming to the requirements of §701-01, and two parts Mortar Sand, conforming to the requirements of §703-03.

620-2.07 Gabions. The materials used in this work shall conform to the requirements of the following subsection of Section 700 - Materials and Manufacturing.

Gabions 712-15

620-3 CONSTRUCTION DETAILS

620-3.01 General. The ground surface on which bank or channel protection is to be placed shall be free of brush, trees, stumps, and other objectionable material and shall be dressed to a smooth surface. All soft or spongy material shall be removed to the depth shown on the plans or as directed by the Engineer and replaced with approved material. Filled areas shall be compacted in accordance with applicable provisions of Section 203, ~~Compaction~~ §203-3.12, ~~Compaction~~. Protection for structure foundations shall be provided as early as the foundation construction permits. The type of protection shall be placed in accordance with these specifications and the contract documents.

Comment [c93]:
E109024

620-3.02 Stone Filling. Stone filling shall be placed in a manner that will produce a reasonable well-graded mass of stone with smaller stone fragments filling the space between the larger ones, so as to result in the minimum practicable percentage of voids. The final section of stone filling shall be in conformance with the lines, grades, and thicknesses shown on the plans. Stone filling used for bank or channel protection shall be placed to its full course thickness in one operation, unless otherwise directed by the Engineer or specified in the special provisions, and in such a manner that the underlying material will not be displaced or worked into the layer of stone filling. Placement of stone upon finished bedding material, when used, shall be carefully controlled to avoid disruption and damage to the layer of bedding material. The stone shall be so placed and distributed that there will be no pockets of uniform size material.

The desired distribution of the various sizes of stone throughout the mass shall be obtained by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Rearranging of individual stones by mechanical equipment or by hand will be required to the extent necessary to secure the specified results. When stone filling is dumped under water, methods shall be used that will minimize segregation.

620-3.03 Dry Rip-Rap. The stones shall be placed so that the dimension approximately equal to the layer thickness is perpendicular to the slope surface and that the weight of the stone is carried by the underlying material and not by the adjacent stones. On slopes, the largest stones shall be placed at the bottom of the slope. The dry rip-rap shall be properly aligned and placed so as to minimize void spaces between the adjacent stones. The spaces between the stones shall be filled with spalls of suitable size.

620-3.04 Grouted Rip-Rap. The procedure of placing the stones shall be the same as described in §620-3.03, Dry Rip-Rap, except that the space between stones shall be filled with grout rather than spalls. Material upon which the grouted rip-rap is laid shall not be allowed to occupy the space between the stones.

When the stones are in place, the spaces between them shall be completely filled with grout and the surface of the stones cleaned to remove accumulation of grout. Rip-rap shall not be grouted in freezing weather. The grouted rip-rap shall be kept moist for seven days after grouting. A suitable curing compound may be employed, if approved by the Engineer.

The Engineer may direct that occasional spaces be left ungrouted for relief of hydrostatic pressure. The ungrouted spaces shall be chinked with spalls of suitable size.

620-3.05 Bedding Material. Where called for on the plans or directed by the Engineer, stone filling and dry rip-rap shall be placed on bedding material. The bedding material shall be placed on the prepared area to the full specified thickness of each layer in one operation, using methods which will not cause segregation of particle sizes. Contamination of bedding material by natural soils or other materials shall be prevented at all times. Bedding material that becomes contaminated shall be removed and replaced with uncontaminated bedding material at no expense to the State.

620-3.06 Concrete Block Paving. Blocks shall be laid on a 3 inch bed of cushion sand in running bond with the long dimension transverse to the slope and all joints tight. Blocks shall be thoroughly rammed in place to provide a uniformly even surface and solid bedding under each block.

In the areas where grouting is called for, the concrete block shall be laid in running bond with the length parallel to the slope and with 1/4 inch joints. Following the laying of blocks, in the area to be grouted, sufficient mortar sand shall be spread over the surface and swept into the joints to fill the latter to 4 inches from the surface. The block shall be wetted to the satisfaction of the Engineer before any grout is placed. The joints shall be filled with grout from the bottom flush with the top of the block.

After grouting has been completed and the grout has sufficiently hardened, the blocks shall be wetted, covered and cured with curing covers for the first seven days after grouting. Grout shall not be poured during freezing weatherwater.

620-3.07 Gabions. Each gabion unit shall be assembled by binding together all vertical edges with wire ties on approximately 6 inch spacing or by a continuous piece of connecting wire stitched around the vertical edges with a coil about every 4 inches. Empty gabion units shall be set to line and grade as shown on the plans. For structural integrity wire ties or connecting wire shall be used to join the gabions together along the perimeter of all contact surfaces according to the manufacturer's instructions. Internal tie wires shall be uniformly spaced and securely fastened in each outside cell of the structure in accordance with the manufacturer's instructions or where ordered by the Engineer. When gabions are being placed as slope protection the cross-connecting wire may be deleted if order by the Engineer.

A standard fence stretcher, chain fall, or iron rod may be used to stretch the wire baskets and hold alignment.

The gabions shall be filled with stone carefully placed by hand or machine to assure alignment and avoid bulges with a minimum of voids. After a gabion has been filled, the lid shall be bent over until it meets the side and edges. The lid shall then be secured to the sides, ends, and diaphragms with the wire ties or connective wire in the same manner described above for assembling.

620-4 METHOD OF MEASUREMENT

620-4.01 Stone Filling, Dry Rip-Rap, Gabions, Grouted Rip-Rap and Bedding Material. The quantity to be paid for under each of these items shall be the number of cubic yards computed from the payment lines shown on the plans, or as directed by the Engineer.

620-4.02 Concrete Block Paving. The quantity to be paid for under this item shall be the number of square yards computed from the payment lines shown on the plans, or as directed by the Engineer.

620-5 BASIS OF PAYMENT

620-5.01 Stone Filling, Dry Rip-Rap, Gabions, Grouted Rip-Rap and Bedding Material. The unit price bid per cubic yard for each of these items shall include the costs of furnishing all materials, labor and equipment necessary to satisfactorily complete the work, except that any necessary excavation will be paid for under its appropriate pay item.

620-5.02 Concrete Block Paving. The unit price bid per square yard for this item shall include the costs of furnishing all materials, labor and equipment necessary to satisfactorily complete the work, except that any necessary excavation will be paid for under its appropriate pay item.

Payment will be made under:

§620

Item No.	Item	Pay Unit
620.02	Stone Filling (Fine)	Cubic Yard
620.03	Stone Filling (Light)	Cubic Yard
620.04	Stone Filling (Medium)	Cubic Yard
620.05	Stone Filling (Heavy)	Cubic Yard
620.06	Dry Rip-Rap	Cubic Yard
620.07	Grouted Rip-Rap	Cubic Yard
620.08	Bedding Material	Cubic Yard
620.09	Concrete Block Paving	Square Yard
620.10	Galvanized Gabions	Cubic Yard
620.11	P.V.C. Coated Galvanized Gabions	Cubic Yard

SECTION 621 - CLEANING CULVERTS, DRAINAGE STRUCTURES AND EXISTING ROADSIDE SECTIONS

621-1 DESCRIPTION

621-1.01 General. This work shall consist of cleaning and keeping clean, existing culverts, closed drainage systems, drainage structures, and existing roadside sections as shown in the contract documents.

621-1.02 Definitions. The following general definitions shall be used in conjunction with this section:

- 1. Culvert.** A culvert is defined as an enclosed channel open at both ends carrying water from a stream or water course through an artificial barrier such as a roadway embankment.
- 2. Closed Drainage System.** A closed drainage system is a collection system for stormwater runoff that carries water to a discharge point. A closed drainage system consists of enclosed channel(s) closed at either one or both ends by a drainage structure, and may include intermediate drainage structures at junction points.
- 3. Drainage Structure.** A drainage structure includes catch basins, manholes, drop inlets, leaching basins and similar structures that collect and/or redirect runoff water.
- 4. Materials Removed.** Materials removed have been presumed not to include non-hazardous industrial waste or hazardous waste in accordance with §107-10 *Managing Surplus Material and Waste*.
- 5. Clean and Keeping Clean.** Clean and keeping clean is the activity of removing accumulated sediment, debris, and vegetation which impedes the flow of water to maintain a proper drainage path and re-establish the design capacity.
- 6. Graded Surfaces.** Grading surfaces entails forming and trimming surfaces to the lines and grades shown in the contract documents.

621-2 MATERIALS. None specified.

621-3 CONSTRUCTION DETAILS

621-3.01. General. Provide appropriate control and discharge practices for all water throughout the cleaning process. Include methods and schedules to be consistent with the soil erosion and sediment control plan in accordance with §209-3.01 *General* and perform all work in accordance with §107-12 *Water Quality Protection*.

621-3.02. Cleaning Culverts. Culvert locations identified in the contract documents shall be cleaned. Materials removed shall be disposed of in accordance with §203-3.02 B. *Disposal of Surplus Excavated Materials*. Removal of contaminated material shall be disposed of in accordance with Section 205 *Contaminated Soil*.

It is not guaranteed that placement of surplus materials of spoil will be allowed within the right of way. Additionally, disposal of turbid water generated via the cleaning process shall be subject to appropriate environmental regulations.

621-3.03 Cleaning Closed Drainage System. Closed drainage systems identified in the contract documents shall be cleaned. Materials removed shall be disposed of in accordance with §203-3.02 B. *Disposal of Surplus Excavated Materials*. Removal of contaminated material shall be disposed of in accordance with Section 205 *Contaminated Soil*.

It is not guaranteed that placement of surplus materials of spoil will be allowed within the right of way. Additionally, disposal of turbid water generated via the cleaning process shall be subject to appropriate environmental regulations.

621-3.04 Cleaning Drainage Structures. Drainage structures identified in the contract documents shall be cleaned. Materials removed shall be disposed of in accordance with §203-3.02 B. *Disposal of Surplus Excavated Materials*. Removal of contaminated material shall be disposed of in accordance with Section 205 *Contaminated Soil*.

It is not guaranteed that placement of surplus materials of spoil will be allowed within the right of way. Additionally, disposal of turbid water generated via the cleaning process shall be subject to appropriate environmental regulations.

621-3.05 Cleaning, Grading and Shaping Existing Roadside Section. The Contractor shall remove earth, turf, brush and debris, or provide necessary fill material to restore adequate roadside drainage. Ditches shall be shaped as shown in the contract documents. Material removed shall be disposed of in conformance with the provisions of §203-3.02 B. *Disposal of Surplus Excavated Materials*. Removal of contaminated material shall be disposed of in accordance with Section 205 *Contaminated Soil*.

The Contractor shall protect all fences, markers, culverts, underground structures, utilities and other appurtenances adjacent to the work area. Any damaged facilities and/or disturbed areas shall be replaced in kind at no additional cost to the state.

621-4 METHOD OF MEASUREMENT

621-4.01. General. None specified.

621-4.02. Cleaning Culverts. Cleaning culverts will be measured in linear feet of culvert cleaned, measured along the invert, to the nearest foot. Multiple barrel culverts will be measured along each individual barrel.

621-4.03 Cleaning Closed Drainage System. Cleaning closed drainage systems will be measured in linear feet of pipe cleaned, measured along the invert of the pipe, from the inside wall surface of the drainage structure to the inside wall surface of the next drainage structure, measured to the nearest foot.

621-4.04 Cleaning Drainage Structures. Cleaning drainage structures will be measured as the number of drainage structures cleaned.

621-4.05 Cleaning, Grading and Shaping Existing Roadside Section. Cleaning, grading, and shaping existing roadside section will be measured as the number of linear feet along the edge of the adjacent roadway.

621-5 BASIS OF PAYMENT

621-5.01. General. None specified.

621-5.02. Cleaning Culverts. The unit price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work including the cost of managing and disposing the materials used to clean and the materials removed from the culverts. Payment for cleaning culverts will be made only for those facilities designated in the contract documents. Only one payment for each length of facility will be made regardless of the number of times it is cleaned.

§620

621-5.03 Cleaning Closed Drainage System. The unit price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work including the cost of managing and disposing the materials used to clean and the materials removed from the closed drainage system. Payment for cleaning closed drainage systems will be made only for those facilities designated in the contract documents. Only one payment for each facility will be made regardless of the number of times it is cleaned. Cleaning intermediate drainage structures at junction points within a closed drainage system shall be paid for under its respective item.

621-5.04 Cleaning Drainage Structures. The unit price bid for each shall include the cost of all labor, materials and equipment necessary to satisfactorily complete the work including the cost of managing and disposing the materials used to clean and the materials removed from the drainage structures. Payment for cleaning drainage structures will be made only for those facilities designated in the contract documents. Only one payment for each facility will be made regardless of the number of times it is cleaned.

621-5.05 Cleaning, Grading and Shaping Existing Roadside Section. The unit price bid shall include the costs of furnishing all labor, material and equipment necessary to complete the work including the cost of disposing the materials removed from the roadside section and/or fill material to restore the shape.

Payment will be made under:

Item No.	Item	Pay Unit
621.01	Cleaning Culverts with Span of 50 in. or Less	Linear Foot
621.02	Cleaning Culverts with Span of More Than 50 in.	Linear Foot
621.03	Cleaning Closed Drainage Systems	Linear Foot
621.04	Cleaning Drainage Structures	Each
621.05	Clean, Grade and Shape Existing Roadside Section	Linear Foot
621.11	Cleaning Culverts (Contaminated Material) with Span of 50 in. or Less	Linear Foot
621.12	Cleaning Culverts (Contaminated Material) with Span of More Than 50 in.	Linear Foot
621.13	Cleaning Closed Drainage Systems (Contaminated Material)	Linear Foot
621.14	Cleaning Drainage Structures (Contaminated Material)	Each
621.15	Clean (Contaminated Material), Grade and Shape Existing Roadside Section	Linear Foot

SECTION 622 (VACANT)

~~**SECTIONS 621 AND 622 (VACANT)**~~

Comment [c94]:
EI09026

SECTION 623 - SCREENED GRAVEL, CRUSHED GRAVEL, CRUSHED STONE, CRUSHED SLAG

623-1 DESCRIPTION. This work shall consist of furnishing and placing, as shown on the plans or directed by the Engineer, screened gravel, crushed gravel, crushed stone, or crushed slag.

623-2 MATERIALS. The materials shall meet the requirements of §703-02, Coarse Aggregates, unless otherwise indicated, and shall be furnished in the sizes or combination of sizes indicated on the plans or ordered by the Engineer.

623-3 CONSTRUCTION DETAILS. Screened gravel, crushed gravel, crushed stone or crushed slag shall be placed as shown on the plans or as directed by the Engineer. ~~**623-3 CONSTRUCTION DETAILS.** Screened gravel, crushed gravel, crushed stone or crushed slag shall be placed on the plans or as directed by the Engineer.~~

623-4 METHOD OF MEASUREMENT

623-4.01 Measurement by Weight. The quantity to be paid for shall be the number of tons, loose measure, incorporated into the work conforming to the requirements of these specifications and in accordance with the lines, grades, and cross-sections shown on the plans or as directed by the Engineer.

623-4.02 In-Place Measure. The quantity to be paid for shall be the number of cubic yards of material placed, measured in the completed work, within the payment lines, as shown on the plans or as ordered by the Engineer.

623-5 BASIS OF PAYMENT. The unit price bid shall include costs of all labor, material and equipment necessary to properly complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
623.01	Screened Gravel (By Weight)	Ton
623.02	Crushed Gravel (By Weight)	Ton
623.03	Crushed Stone (By Weight)	Ton
623.04	Crushed Slag (By Weight)	Ton
623.10	Screened Gravel (In-Place Measure)	Cubic Yard
623.11	Crushed Gravel (In-Place Measure)	Cubic Yard
623.12	Crushed Stone (In-Place Measure)	Cubic Yard
623.13	Crushed Slag(In-Place Measure)	Cubic Yard

SECTION 624 - PAVED GUTTERS

624-1 DESCRIPTION. This work shall consist of the construction of asphalt concrete, precast, conventionally formed or machine formed Portland Cement concrete, or cobblestone gutters in accordance with these specifications and in reasonably close conformity with the lines and grades shown on the plans or established by the Engineer.

624-2 MATERIALS

624-2.01 Asphalt Concrete Gutters. The materials for hot mix asphalt gutters shall meet the requirements specified for a 3/8 inch mixture designed for <0.3 million Equivalent Single Axle Loads, ESALs using coarse aggregate Type F9.

624-2.02 Conventionally Formed Concrete Gutters. The materials and manufacture of concrete for this work shall meet the requirements for Class A concrete specified in Section 501 Portland Cement Concrete - General.

624-2.03 Precast Concrete Gutters. Precast concrete gutters shall comply with the requirements of §714-07, Precast Concrete Gutters.

624-2.04 Cobble Gutters. Cobble gutters shall be made of rounded “Hardheads,” 5 7/8 inch to 10 1/16 inch in diameter.

624-2.05 Machine Formed Concrete Gutter. The material requirements, mix preparation and manufacturing of concrete shall comply with the requirements for Class I concrete, as specified in Section 501 Portland Cement Concrete-General.

624-3 CONSTRUCTION DETAILS

624-3.01 Asphalt Concrete Gutters. Except as provided below, the construction requirements shall meet those of §402-3, Construction Details for Hot Mix Asphalt (HMA) Pavements.

A. Preparation of Bed. The location of the gutter shall be properly excavated and graded to conform with the gutter cross-section and line and grade. The excavated area shall be firm and dry before laying the gutter.

B. Placing. The asphalt concrete may be placed by handwork or by a paving machine approved by the Engineer. The gutter shall be uniform in texture, shape and density. The asphalt may be placed in a single layer providing that the section, line and grade after compaction are determined satisfactory by the Engineer.

C. Sealing. After compaction, the finished surface of the gutter shall be sealed by an application of bituminous material, 702-3001, in the quantity and manner directed by the Engineer.

624-3.02 Conventionally Formed or Machine Formed Concrete Gutters. Concrete gutters shall be either conventionally formed or machine formed to the size and shape shown on the standard sheets.

A. Conventionally Formed Gutters.

1. General. Unless otherwise indicated, concrete gutters shall be constructed in 8 foot sections of the shapes and types shown on the plans and/or standard sheet. A steel separation plate 1/8 inch thick and cut to fit the section shall be used in each joint and removed as the concrete hardens, or the gutter may be constructed in alternate sections, 24 hours to elapse before the construction of the intermediate sections. Excess concrete shall be screeded off perpendicular to the line of the gutter.

All construction joints shall be poured full with material meeting the requirements of 702-0700. Miscellaneous Asphalt Cement.

2. Curing. Curing of the gutters shall comply with the requirements of §502-3.11, Curing. Minimum curing periods for the various types of curing materials shall comply with the requirements of Table 502-3. A clear membrane curing compound may be used in lieu of a white-pigmented membrane.

B. Machine Formed Gutter. The machine forming requirements of concrete curb as specified under §609-3.03 shall apply except that contraction joints shall be formed or scored every 8 feet to depths sufficient to produce weakened planes in the concrete.

624-3.03 Precast Concrete Gutters. The location of the gutter shall be excavated and graded to conform with the gutter cross-section and line and grade. Gutter sections shall be placed to line and grade on a firm and dry subgrade.

All joints shall be poured full with material meeting the requirements of 702-0700, Asphalt Filler.

624-3.04 Cobble Gutters. The largest stones shall be selected and set along the inner edge and the center of the gutter. All stones shall be embedded in mortar composed of one part Type 1 or 2 cement, §701-01, and two parts of §703-07, Concrete Sand. All stone shall be laid to line and grade, with close joints, by skilled workmen using regular paving tools. The stones shall then be thoroughly rammed in place and brought to a uniform surface.

The joints shall be made of the same mortar as described above. The mortar shall completely fill the joints after being tamped.

624-4 METHOD OF MEASUREMENT

624-4.01 Asphalt Concrete Gutters. The quantity of asphalt gutters to be paid for will be measured by the number of ~~metric tons~~ of asphalt concrete furnished and placed in accordance with the plans, specifications and requirements of the Engineer. Quality payment adjustments will be measured as outlined in §402-4, Method of Measurement.

624-4.02 Conventionally Formed or Machine Formed Concrete Gutters. The quantity to be paid for under this work will be the number of square feet of exposed surface of concrete gutters placed in accordance with the plans and as specified by the Engineer. No reduction in the number of square feet will be made to account for drainage structure frames and grates, or any other obstruction placed within the gutter section.

624-4.03 Precast Concrete Gutters. The quantity to be paid for under this item will be the number of feet of gutter (laying length) placed in the work in accordance with the plans and specifications.

624-4.04 Cobble Gutters. The quantity of cobble gutters to be paid for under this work will be the number of square feet of exposed surface laid in accordance with the plans or as directed by the Engineer.

624-5 BASIS OF PAYMENT

624-5.01 Asphalt Concrete Gutters. The unit price bid per ton of asphalt concrete shall include the cost of furnishing all materials including the asphalt cement, the mixing, transporting, grading, placing, rolling and all equipment and labor necessary to complete the work including all necessary excavation below the finished surface, exclusive of any undercutting or excavation for special bedding materials. Payment of Quality Units will be made based on the Index Price listed in the contract documents. The index price shown in the itemized proposal for each Quality Unit shall be considered the price bid. The unit (index) price is not to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded and the original price will be used to determine the total amount bid for the Contract.

624-5.02 Conventionally Formed or Machine Formed Concrete Gutters. The unit price bid shall include the cost of furnishing all labor, materials and equipment necessary to complete the work including all necessary excavation below the finished surface exclusive of any undercutting or excavation for special bedding materials.

624-5.03 Precast Concrete Gutters. The provisions of §624-5.02 shall apply.

624-5.04 Cobble Gutters. The provisions of §624-5.02 shall apply.

Payment will be made under:

Item No.	Item	Pay Unit
624.01XX	Conventionally Formed or Machine Formed Concrete Gutters	Square Foot
624.020101	Asphalt Concrete Gutter	Metric Ton Ton
624.020110	Plant Production Quality Adjustment to 624.020101 M	Quality Unit
624.020601	Asphalt Concrete Gutters, as Detailed	Metric Ton Ton
624.020610	624.020611 Plant Production Quality Adjustment to 624.020601 Quality Unit	
624.03XX	Precast Concrete Gutters	Foot
624.0401	Cobble Gutters	Square Foot

Refer to the Standard Contract Pay Item Catalog for full Item Number and full Description.

SECTION 625 - SURVEY OPERATIONS

625-1 DESCRIPTION

625-1.01 General.

Some survey work is required be completed under the direction of a Land Surveyor or Professional Engineer in accordance with the professional license requirements contained in NYS Education Law.

625-1.02 Survey Operations.

This work shall consist of providing all necessary survey work to establish, spatially position, and verify the locations of existing and proposed terrain features and measure quantities of items in accordance with the contract documents or as directed by the Engineer. This work includes but is not limited to the establishment, reestablishment or localization of primary and secondary control, the stakeout or layout of proposed features, the initialization, calibration and navigation of automated equipment operations, the location or verification of existing terrain or of constructed features, the verification of geospatial data for proposed construction work and the coordination and sharing of engineering data with the Department or other contract stakeholders.

625-1.03 Right of Way Markers.

This work shall consist of furnishing, installing and certifying right of way markers at the positions described on the right of way appropriation maps, in accordance with the contract documents and the Standard Sheet.

625-1.04 Permanent Survey Markers.

This work shall consist of furnishing, installing, and certifying permanent survey markers in accordance with the details shown on the appropriate Standard Sheet.

625-1.05 Supplemental Site Survey.

This work shall consist of providing all necessary field survey and terrain mapping necessary to locate, spatially position, verify and digitally map the locations of existing above or below ground terrain features as described in the contract documents or as directed by the Engineer. The limits of this supplemental survey will be described in the contract documents.

625-1.06 GPS Inspection Units.

This work shall consist of furnishing, configuring, installing, maintaining and removing Global Positioning System (GPS) units as needed for use by the Engineer and their inspection staff, including the training of the Engineer and their representatives on the use of the GPS units provided.

625-2 MATERIALS

625-2.01 General. None specified.

625-2.02 Survey Operations. None specified.

625-2.03 Right of Way Markers.**A. Concrete Right of Way Markers.**

Concrete ROW Markers shall conform to the requirements of §712-05 *Precast Concrete Right-of-Way Markers*, and shall be in accordance with the details shown on the Standard Sheet.

B. Steel Pin and Cap Right of Way Markers.

Reinforcing steel used for the shank shall conform to ASTM A615, Grade 300 or Grade 420. It shall be epoxy coated for its entire length in accordance with §705-14 *Longitudinal Joint Ties* or §709-04 *Epoxy Coated Bar Reinforcement*.

The cap shall be aluminum or a corrosion resistant aluminum alloy. The cap shall weigh a minimum of 50 grams and fasten to the shank by means of threading or force fitting.

A commercial grade silicone sealant shall be used between the cap and the shank. Steel Pin and Cap-Type Markers shall be anchored into rock using Concrete Grouting Material meeting the requirements of §701-05 *Concrete Grouting Material*.

625-2.04 Permanent Survey Markers.

The concrete shall meet the requirements of Class A Concrete in Section 501 *Portland Cement Concrete--General*, except that the requirements for inspection facilities, automated batching controls and

recording do not apply. The batching, mixing and curing methods and the inspection facilities shall meet the approval of the Department. The Contractor may submit for approval by Director, Materials Bureau, a mix at least equivalent to Class A Concrete.

625-2.05 Supplemental Site Survey. None specified.

625-2.06 GPS Inspection Units.

Each GPS Unit shall include all necessary components, communication devices, integrated antennae and receiver, controller and/or data collector, cables, software, operating manuals, attachments, and fastening hardware to meet the minimum requirements described below.

A. All GPS Inspection Units.

1. All GPS units provided for a single contract shall be of the same model and manufacturer; and shall include, and be licensed to operate, the same versions of GPS planning software, data collection software, navigation software, stakeout software and post processing software. All software provided (including firmware) shall be the most current available from the manufacturer at the time of delivery of the GPS units. GPS units should be of the same manufacturer as those used by the Contractor. GPS units shall not be more than 2 years old from the date of manufacturing to the time of delivery. To verify the age of the GPS units, the Contractor shall provide a dated copy of the manufacturer's receipt(s) for the purchase, lease or rental of the units.
2. GPS units shall include both standard USB cable and Bluetooth wireless technology for data transfer.
3. Data shall be capable of being copied onto or from a removable industry standard data storage card (eg: secure digital SD Card). Each GPS Unit shall include 2 data storage cards, each with a minimum capacity of 4 GB.
4. GPS units shall include the ability to import/export and display point and alignment data which is in XML format, and also import graphics files which are in DGN or DXF format.
5. GPS units shall have an internal, or modular, rechargeable battery system capable of operating a minimum of 8 hours (may include interchangeable batteries), including the battery charger.
6. GPS units shall include a hard or soft shell carry case, and all appropriate operation manuals.

B. Survey Grade GPS Inspection Units.

1. GPS units shall be equipped to receive Global Positioning System (GPS), GLONASS and GNSS position data.
2. GPS units shall be equipped to receive, and be capable of utilizing, Real Time Kinematics (RTK) correctional data (current version of RTCM format) through internet protocol as provided from the NYS Continuously Operating Reference System (NYS CORS) Network. This shall include all necessary communication devices, repeaters and systems, data service plans and communications to meet the minimum required accuracy and not exceed a 2 second latency at the rover. Whichever communication method is utilized by the Contractor to broadcast the NYS CORS RTK correctional data, the Contractor shall ensure that the RTK data shall be available at all locations across the entire contract site during all hours of construction and inspection operations.
3. GPS units shall include the capability to "localize" both the horizontal and vertical control to local project monumentation (also known as calibrate), while utilizing RTK corrections from a reference network.
4. GPS units shall include either an integrated or modular communication device capable of receiving RTK correctional data to satisfy the requirement of using NYS CORS RTK corrections.
5. GPS units shall have the ability to display the number of satellites tracked at any one time, and indicate the accuracy quality of each measurement relative to the strength of signals, and the GDOP (Geometric Dilution of Precision).
6. GPS Unit shall include dual frequency receivers.
7. Minimum Required Kinematic Accuracy relative to primary project control (CORS):
Horizontal: 0.033 ft + 1.0 ppm; Vertical: 0.065 ft + 1.0 ppm

8. All necessary hardware and software shall be included (including communication drivers) to connect the GPS unit to a Department provided Tablet PC and communicate/exchange positional data with Bentley™ OnSite software. Firmware used on the GPS unit shall be verified as interoperable with Bentley™ OnSite software. If the firmware cannot be verified as being interoperable with Bentley™ OnSite, the next older version may be used.
9. The data controller shall permit the user to program and store multiple configurations (also known as user preferences) prior to the actual field measurements. Configurations shall be capable of being stored and recalled in the field.
10. GPS units shall include one fixed height rover rod of 6.56 feet in length, one attachable bipod which is compatible with the rover rod, and one topo shoe.
11. A GPS unit set up to operate as a base station shall include all necessary additional cables, hardware, fasteners or accessories necessary to install it in a fixed semi-permanent location, . will not be considered as a rover unit, and therefore will not require a rover rod, a bi-pod, or a topo shoe.

C. Mapping Grade GPS Inspection Units.

1. Minimum Required Kinematic Accuracy: less than 3.0 feet in real time.
2. GPS units shall also provide standard support for the Wide Area Augmentation System (WAAS) position correction services.

625-3 CONSTRUCTION DETAILS

625-3.01 General.

A. Professional Responsibilities.

The following types of Survey Operations shall be completed by the Contractor under the direction of a Land Surveyor. This requirement is directly or indirectly associated with the professional license requirements contained in Article 145 of the NYS Education Law.

1. Establishment, reestablishment or localization of primary or secondary control which shall be used for:
 - a. Establishing boundaries of new right of way appropriated for this contract.
 - b. Location of property or highway boundary markers.
 - c. Tie measurements to, or resetting of control points.
2. Location or resetting of existing highway and property boundary markers by reference ties to or from contract control to protect their integrity.
3. Establishment or certification of location of right of way markers and permanent survey markers.

The following types of Survey Operations shall be completed by the Contractor under the direction of either a Land Surveyor or Professional Engineer.

1. Establishment, reestablishment or localization of primary or secondary control which shall be used for:
 - a. Establishing location for horizontal or vertical roadway alignment.
 - b. Establishing location for the horizontal or vertical alignment of a structure.
 - c. Establishing or localizing reference base station for Global Positioning System (GPS) control work.
2. Establishing new horizontal or vertical roadway alignment in the field from contract control either by conventional stakeout methods or by use of automated equipment operations.

B. Survey/Engineering Geospatial Data.

All establishments or reestablishment of contract primary or secondary control, and the survey collection of terrain data shall be performed in accordance with the standards and procedures required in the Department's *Land Surveying Standards and Procedures Manual*. The Contractor shall incorporate the NYS CORS network into contract control to facilitate the use of GPS survey within the site and on the same datum by other project stakeholders, or to align with other adjacent projects.

When the Department provides electronic copies of engineering data to the Contractor, files should follow the standard file naming conventions listed in Appendix 14 of the Department's *Project Development Manual*.

1. Existing Terrain Data. When an existing digital terrain model was developed during design and provided for construction purposes, and possibly updated during construction by supplemental survey, the Department and Contractor shall use that information as a basis from which to develop contract pay item quantities. The Contractor shall consider all existing terrain data supplied by the Department as being within acceptable tolerances, except where changes or additions have been approved by the Engineer. If the Contractor questions the accuracy of the existing terrain data provided, the Contractor may verify any or all portion(s) of the existing terrain model, at no additional cost to the State, in accordance with §105-10 *Survey and Stakeout*. All exceptions or discrepancies found with the supplied existing terrain data shall be brought to the attention of the Engineer, in writing, and terrain data modifications shall be mutually agreed upon and shared with both parties prior to beginning construction operations within those areas being modified. Changes to existing terrain data will not be accepted by the Department where existing terrain is verified to be within Departmental accepted positional tolerances in accordance with the Department's *Land Surveying Standards and Procedures Manual*, or after the Contractor has disturbed the existing ground surface.

2. Proposed Data. When proposed digital terrain models (or surfaces), proposed alignments and proposed graphics were developed during design and provided for construction purposes, or revised during construction due to site changes or redesign, the Department and Contractor shall use that information from which to position and compute applicable contract pay item quantities and to field verify positional locations of constructed items. When the Contractor and Department agree to utilize the proposed digital terrain data (surface), alignments or graphics the Contractor shall first review its consistency with all other contract information, and review for any perceived physical conflicts or inconsistencies of information prior to using the data in the field for any construction purpose. All exceptions or discrepancies with the supplied data shall be brought to the attention of the Engineer, in writing, and terrain data, alignment or graphics modifications shall be approved by the Engineer prior to beginning construction operations within those areas being modified. All approved changes shall be shared electronically with both the Department and the Contractor, and both parties shall acknowledge acceptance of such changes before beginning the work.

When proposed digital terrain model (or surfaces), alignments or graphics are not provided by the Department, the Contractor may choose to develop their own terrain model surfaces from the contract plans to facilitate their use of Automated Machine Guidance, at no additional cost to the State. A request by the Contractor to use Automated Machine Guidance shall be made as part of the Contract Control Plan. The Contractor developed terrain model surfaces shall be shared with the Engineer in a Department accepted format prior to beginning construction operations. Generation of proposed terrain model surfaces or other electronic engineering data does not constitute a redesign of the project, and the Contractor retains all responsibility to complete the work in accordance with the engineering intent conveyed in the contract documents unless otherwise agreed to in writing by the Engineer.

625-3.02 Survey Operations.

All Survey Operations shall follow either Traditional *Survey Stakeout* or Automated Stakeout and *Automated Machine Guidance Operations*, or a combination of both, for the establishment, positioning, equipment guidance or verification of construction items. The proposed method shall be approved by the Engineer as part of the Contract Control Plan prior to beginning any field construction operations. Both methods include the same basic requirements that: (1) both parties (Contractor and Department) utilize the same contract control, the same existing terrain data, and the same proposed feature data; (2) both parties utilize the same accuracy and tolerance limits; and (3) both parties utilize equivalent survey verification techniques to ensure that field features are constructed as proposed.

The Contractor shall establish the center line of bearings for all bridge abutments and piers, by setting offset hubs or reference points, so located and protected to ensure they remain undisturbed until such time as they are no longer needed. The Contractor shall mark the location of anchor bolts to be installed, establish the elevation of bearing surfaces and check bearing plates to ensure installation at their proper elevation. Before the erection of structural steel or concrete beams the Contractor shall verify the locations, both vertically and horizontally, of all bearings and the distances between associated bearings. Control used to establish center line of bearings shall be included in the contract control plan.

On contracts which include proposed and existing roadway alignments and profiles, the Contractor shall verify the roadway tie-in locations of where existing and proposed alignments meet prior to beginning construction operations and report the results to the Engineer. This requirement is intended to verify that no changes have occurred to the existing roadway and that the proposed design is buildable as designed.

A. Contract Control Plan.

The Contractor shall develop and submit a Contract Control Plan for all contracts which include the contract pay item for Survey Operations. Contract control includes all statewide or local primary and secondary horizontal and vertical control which will be used for the geospatial positioning of work items. Upon the Contractor's completion of initial survey reconnaissance and control verification, but prior to beginning primary field operations, the Contractor shall submit a Contract Control Plan document which is to be signed and sealed by a Land Surveyor or Professional Engineer in accordance with §625-3.01.A *Professional Responsibilities*, for acceptance by the Engineer. The Contract Control Plan shall include the below listed required control information and follow the acceptance procedure.

All revisions or additions to contract control for the purpose of stakeout or layout of proposed work items shall be provided in writing to the Engineer prior to beginning that revised portion of stakeout or layout work.

1. Acceptance Procedure.

- a. The Contractor shall document required information and submit electronically to the Engineer at least 10 work days prior to beginning field operations.
- b. The Engineer will coordinate review with the Regional Land Surveyor and provide comments.
- c. Upon acceptance of the procedure by the Engineer, the Contractor shall submit 2 signed and sealed copies to the Engineer.

2. Control Information.

The Contractor shall list the following control information (tabular format is acceptable):

- a. All contract control shown in the contract documents or in the Survey Control Report.
Note: The NYS CORS Network provides primary control for most Department contracts.
- b. The following elements shall be submitted for all contract control points or benchmarks:
 - (1) Recovered in the field and did it appear undisturbed?
 - (2) Contract indicated coordinate or elevation.
 - (3) Field determined coordinate or elevation.
 - (4) Contractor adjusted coordinate or elevation, if necessary.
 - (5) Point or benchmark intended to be used for construction purposes.
- c. Adjustment method is used to balance or adjust the control (ex: Compass Rule for Baseline or Calibration Report for GPS, etc). Attach a copy of the adjustment/calibration report.
- d. Control network diagram (drawn to a legible scale) with roadways indicated.
- e. New York State Plane Coordinate System (NYSPCS) Zone utilized.
- f. Horizontal Datum used.
- g. Vertical Datum used.
- h. Combined Factor used to account for the ellipsoidal reduction factor and the grid scale factor.
- i. Additional (new) control is anticipated to be needed and where will they be set?

- j. When a GPS base station(s) is utilized on a project either for inspection or stakeout, provide the determined coordinate and elevation value of the station, and the datum differential from that localized value to a NYS CORS determined value.

3. Methods or Procedures.

The Contractor shall document and provide the following survey information on methods or procedures to be used:

- a. Survey method used to verify the control (ex: Total Station, GPS/RTK, Auto Level, etc).
- b. Survey method(s) used to stakeout which types of proposed features.
- c. Survey method(s) used to stakeout proposed ROW Markers.
- d. Survey method used for stakeout of proposed bridge structures (if applicable). How will control be set up and maintained around the bridge(s)?
- e. Proposed manufacturer, model and software version for GPS Inspection Units.
- f. Automated Machine Guidance (AMG) proposed for use on this contract.
- g. Type and frequency of quality control measures included to maintain the proper calibration and adjustment of the AMG systems.
- h. If GPS will be used for stakeout or for AMG, will the NYS CORS Network be used as its reference network or will base station(s) be used?
- i. If a base station is to be used, describe the mounting location, attachment technique, and instrumental protection included which ensures a sound and reliable reference station will be provided.

B. Traditional Survey Stakeout.

The Contractor shall field locate all features to be constructed from survey control points which are identified in the Contract Control Plan. Any error, apparent discrepancy or absence in the data shown or required to appropriately accomplish the stakeout survey shall be referred to the Engineer immediately for interpretation when such is observed or required.

The Contractor shall place two offset stakes or references points along the center line at maximum intervals of 50 feet and at such intermediate locations as required to determine location and direction. From computations and measurements made by the Contractor, these stakes shall be clearly and legibly marked with the center line station number, offset and cut or fill from which the establishment of the centerline location and elevation can be determined. If markings become illegible for any reason the markings shall be restored by the Contractor. The Contractor shall locate and place all cut, fill, slope, fine grade, or other stakes and points for the proper progress of the work with a maximum station spacing of 50 feet. All control points shall be properly protected and flagged for easy identification.

The Contractor shall be responsible for the accuracy of the work and shall maintain all applicable reference points, stakes, etc. Damaged or destroyed reference points or bench marks made inaccessible by the progress of the construction shall be replaced or transferred by the Contractor. All control points shall be referenced by ties (4 minimum) to specific points on acceptable objects and recorded. Any alterations or revisions in the ties shall be so noted and the information furnished to the Engineer. All stakeout survey work related to highway control shall be referenced to the control line (or survey baseline) shown in the contract documents. Computations and survey notes necessary to establish the position of the work from control points, shall be made and maintained in a neat, legible and acceptable format by the Contractor. Computations, survey notes and other survey information shall be made available to the Engineer within 3 work days from the request. The Engineer may check all or any portion of the stakeout survey work or notes made by the Contractor. Such checking by the Engineer shall not relieve the Contractor of any responsibilities for the accuracy or completeness of the work.

C. Automated Stakeout and Automated Machine Guidance Operations.

Should the Contractor choose automated methods for the establishment, layout, measurement, equipment guidance or verification of work to be constructed, they shall submit their proposed automated methods including quality control measures as part of their contract control plan for acceptance by the Engineer. When utilizing these methods, all horizontal and vertical survey control,

roadway alignment control, existing terrain data and proposed design engineering data shall be shared/exchanged electronically and kept current between the Contractor and the Engineer. All original version files of electronic contract data shall be maintained and stored by the Department. Prior to beginning field operations, the Contractor and Engineer shall mutually determine acceptable uses of and procedures for the technology being used, and how data can be exchanged for use in stakeout, automated machine operations, positional verification, quantity measurements and calculations. All record copies of engineering data shall be stored and shared in Department accepted standard formats, and shall be derived primarily from the original electronic data, when provided by the Department.

Automated survey operations have a high reliance on accurate control networks from which to make measurements, establish positions, and verify geospatial locations of features. Therefore, a strong contract control network in the field which is consistent with the project control used during the design of the contract is essential to the successful use of these technologies with the proposed digital terrain model and alignments. Consistent and well designed site calibration (localization) for all automated machine guidance, as described above under *Contract Control Plan*, is required to ensure the quality of the contract deliverables. The Contract Control Plan is intended to document which local horizontal and vertical control will be used for calibration during construction operations and how that calibration or adjustment will be maintained along the entire contract length. Continued incorporation of NYS CORS Network is essential to maintaining the integrity of positional locations and elevations of features.

The Engineer may perform quality assurance verifications of feature positions at any time during the contract. Dimensional tolerances shall hold a higher order of precedence than positional tolerances, but both may require verification. Quality assurance activities by the Engineer will not relieve the Contractor of any responsibilities for the quality control of the accuracy or completeness of the work.

The Department's verification of the positional locations of features, calculation and merging of supplemental terrain data surfaces, and the measurement and calculation for quantity payments will be performed using Department standard software. Both the Contractor and the Department shall utilize the following standards: (1) All terrain data collected for the purpose of being used for or merged with Department provided terrain data for the calculation of pay quantities shall be delivered in a format and correctly display in accordance with the current Departmental CADD Standards. (2) The Department will maintain record copies of electronic data files which will be available to the Contractor using the Department's designated file management system or other method. This will ensure that both parties utilize the same credible data from which to establish locations and measure quantities. The Department will provide all available CADD resource files for use by the Contractor.

The Contractor may choose to introduce an additional new automated survey method or technology which involves a new technique for positioning features, measuring quantities, or verifying constructed locations. The quality and accuracy of this data produced by this method shall be demonstrated to the Engineer, for acceptance, by a comparison of this method to previously accepted techniques over a mutually agreed upon portion of the work. The new technology shall meet or exceed the quality and accuracy results provided by previously accepted techniques, and the Engineer shall make the final determination as to the acceptability of its use based on the resulting performance, cost savings, safety and effectiveness of the operation. Previous uses of this same method on other contracts or by other contractors are not acceptable evidence of a technology's viability, due to inherent variations in operator's experience levels, data availability, changing field conditions and differing technologies.

625-3.03 Right of Way Markers.

The Contractor shall verify with the Engineer that it has the most current vested Right of Way Acquisition Maps to determine the geospatial positions of all proposed right of way markers. Right of way markers are indicated in the contract for approximate locations and quantities, and shall not be positioned according to the contract information, but rather by the positions shown for the equivalent points on the ROW Maps.

Right of way marker locations shall be determined under the direction of a Land Surveyor from a closed traverse or GPS network which is included in the contract control plan and in accordance with

Federal Geographic Data Committee (FGCC) C2-II, Second-Order, Class II (1 part in 20,000) accuracy, ensuring a local accuracy of 0.065 ft as described in the Department's *Land Surveying Standards and Procedures Manual*.

The Contractor shall install right of way markers at the station/offset positions specified on the vested Right of Way Acquisition Maps in accordance with the Standard Sheets to within an absolute positional tolerance of 0.065 ft relative to the primary project control network.

The Land Surveyor shall certify the as-built location of each installed right of way marker on certification forms provided by the Engineer, including contract information, and control line station and offset (proposed and as-built) to the marker. The record location of all right of way markers shall be recorded to the nearest 0.01 ft and reflect as-built coordinates from a closed traverse or GPS network which is included in the contract control plan and in accordance with FGCC C2-II, Second-Order, Class II (1 part in 20,000) accuracy.

Prior to placing the cap on a steel pin right of way marker, the cap shall be filled 2/3 full of silicone sealant and then fastened to the bar by threading or by force fit. During the driving operation for the steel pin right of way marker, the lettering on the cap shall be protected by the use of a metal sleeve or cushion block. The marker shall be driven so that the cap is flush with the ground surface.

625-3.04 Permanent Survey Markers.

The Contractor shall install permanent survey markers in accordance with the standard sheet at locations described in the contract documents and approved by the Engineer prior to installation. The Engineer will provide the Contractor with the sequential numbering required on the permanent survey marker caps in coordination with the Regional Land Surveyor.

The Contractor shall provide the as-built location of each installed permanent survey marker on certification forms provided by the Engineer, including contract information, as-built NYSPCS values, control line and centerline station and offset to the marker, distance and direction to adjacent markers, the elevation of the marker, and a sketch which shows the relative positions to the control line points, four physical ties to the markers, and a north arrow. The certification form shall be sealed and signed by a licensed Land Surveyor. The record location of all permanent survey markers shall be recorded to the nearest 0.01 ft and reflect as-built coordinates from a closed traverse or GPS network which is included in the contract control plan and in accordance with FGCC C2-II, Second-Order, Class II (1 part in 20,000) accuracy as described in the Department's "*Land Surveying Standards and Procedures Manual*."

625-3.05 Supplemental Site Survey.

The Contractor shall perform supplemental site survey work in accordance with §625-3.01 *General* and §625-3.02. *Survey Operations*. The limits of the survey and mapping and the need for property line or right of way determination shall be as described in the Special Note entitled *Supplemental Site Survey Requirements*. Changes to the contract established limits by the Engineer shall be considered changes to the scope of work. The work shall include:

1. The Engineer shall determine what level of detailed information may need to be added to the Contract Control Plan for a supplemental site survey. Significant additional requirements will be considered extra work.
2. For new locations, a minimum of 3 inter-visible horizontal control points and 2 benchmarks shall be set at each site.
3. All survey control and terrain data collection shall be performed in accordance with the standards and procedures required in the Department's *Land Surveying Standards and Procedures Manual*.
4. Survey shall include all readily identifiable surface and subsurface utilities, including, but not limited to drainage, sanitary, water supply, gas, electric and telephone. The Contractor shall contact the appropriate one call center to identify all underground utilities so they can be marked in the field at each site prior to survey.
5. If property or right of way markers are found inside of or within 30 ft of the survey limits, they shall be located and described as part of the survey.
6. For traffic signal intersection work, elevations of above-ground utilities at the poles and at sag points shall be provided for primary and secondary electric lines, telephone lines and cable television lines. Utility poles shall be identified, including pole numbers. The next pole by number, and next

manhole or valve. Sign inventory shall include only a type designation (e.g. stop sign, no parking sign, etc.) without MUTCD code, or a brief description of a private sign.

7. For underground utility surveys, the horizontal positions and vertical elevations of all exposed public and private utilities within the described limits shall be located, mapped and appropriately identified by the Contractor according to the utility's identification. Horizontal positions and vertical elevations shall be determined from project control to within 2 inches of its absolute location. Linear utilities shall be located at all bend or angle points, junctions or termini, and at a spacing of no more than 50 feet.

8. Copies of original survey field data, tie diagrams, and control diagrams shall be provided in Department accepted formats.

9. All terrain mapping deliverables (DGN & DTM) shall conform to the requirements included in Chapter 20 and 22 of the Department's *Highway Design Manual*.

10. File naming convention shall conform to standards listed in Appendix 14 of the Department's *Project Development Manual*.

625-3.06 GPS Inspection Units.

The Contractor shall furnish, configure, install, maintain and remove the GPS units, and provide the Engineer and/or their representatives with training on the operation of the GPS units. The Contractor shall ensure all GPS units are fully operational and training has been provided before construction begins.

All projects shall utilize the NYS CORS as the spatial reference datum network from which RTK corrections are derived. The Contractor shall choose which communication technique and devices will be used which will insure the consistent and reliable delivery of RTK correctional data from the NYS CORS to the GPS units. When geographic location or lack of a reliable communications network prohibits the use of the NYS CORS, the Engineer may approve the use of a Survey Grade GPS Inspection unit as a base station in place of the NYS CORS, which will be paid for separately. The Contractor shall semi-permanently mount the base station in a stable and secure location where it shall not be disturbed by construction activities nor be easily damaged by vandalism and where it shall be capable of providing radio signal coverage over the entire contract area. If the base station cannot broadcast a signal that covers the entire site, the Contractor shall provide adequate repeater radios or other communications. A GPS unit installed as a base station for inspection operations shall only be moved with the approval of the Engineer.

The GPS units shall be maintained and remain in service until either: (a) a maximum of one week after the Engineer requests its removal in writing, or (b) the State relinquishes the Engineer's Field Office. The Contractor shall maintain all GPS units and software in good working condition and shall provide replacement due to breakdown, damage, or theft within 2 work days. The Contractor shall retain ownership of all supplied GPS units at the end of the contract.

A. GPS Training Provisions.

1. For all GPS units, the Engineer and/or their representatives shall be provided with a minimum of one 8 hour training session for GPS localization/calibration of the contract site.

2. For all Survey Grade GPS units, the Engineer and/or their representatives shall be provided with a minimum of two separate 8 hour minimum training sessions on the use and operation of the GPS units during the first year of the contract. One of these two sessions shall occur within one week of delivery of GPS units to the site. The second of the two classes shall occur upon the request of the Engineer. One additional 8 hour minimum training session shall be provided during each additional contract year that the GPS units are in service.

3. For all Mapping Grade GPS units, the Engineer and/or their representatives shall be provided with a minimum of one training session during the first year of the contract, being at least 8 hours in length, and to occur within one week of delivery of GPS units to the site. This training shall be separate from the Survey Grade GPS Unit training.

4. All training shall be performed by a manufacturer-verified trainer who is approved by the Engineer. The training shall occur at the Engineer's Field Office or at a location agreed to by the Engineer.

625-4.01 General. (Vacant)

625-4.02 Survey Operations. This work will be measured on a lump sum basis.

625-4.03 Right of Way Markers. The quantity to be measured for payment will be the number of right of way markers installed.

625-4.04 Permanent Survey Markers. The quantity to be measured for payment will be the number of permanent survey markers installed.

625-4.05 Supplemental Site Survey. This work will be measured on a lump sum basis for each site location.

625-4.06 GPS Inspection Units. The quantity to be measured for payment will be the number of GPS Inspection units provided.

625-5 BASIS OF PAYMENT

625-5.01 General. (Vacant)

625-5.02 Survey Operations. The price bid shall include the cost of furnishing all labor, materials and equipment necessary to satisfactorily complete the work, including preparation of the contract control plan. Progress payments will be made in proportion to the amount of work completed.

625-5.03 Right of Way Markers. The unit price bid shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work. Payment will be made after the complete and proper installation of the marker, receipt of the certification form by the Engineer, and after approval of the certification by the Regional Land Surveyor.

625-5.04 Permanent Survey Markers. The unit price bid shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work. Payment will be made after the complete and proper installation of the marker, receipt of the certification form by the Engineer, and after approval of the certification by the Regional Land Surveyor.

625-5.05 Supplemental Site Survey. The price bid shall include the cost of furnishing all labor, materials and equipment necessary to satisfactorily complete the work. Payment will be made upon the satisfactory submission of the completed and certified mapping deliverables. Substantive additions to the work limits described in the contract will be considered extra work.

625-5.06 GPS Inspection Units. The unit price bid shall include the cost of labor, materials and equipment necessary to satisfactorily complete the work, including the cost of the required training and necessary maintenance.

Payment will be made under:

Item No.	Item	Pay Unit
625.01	Survey Operations	Lump Sum
625.03	Concrete Right of Way Markers Type H (High)	Each
625.04	Concrete Right of Way Markers Type L (Low)	Each
625.05	Steel Pin and Cap Right of Way Markers	Each
625.06	Permanent Survey Markers	Each
625.07nnnn	Supplemental Site Survey	Lump Sum
625.11nnnn	Survey Grade GPS Inspection Unit	Each

SECTION 625 – SURVEY OPERATIONS, ROW MARKERS, AND PERMANENT SURVEY MARKERS

625-1 DESCRIPTION

625-1.01 Survey Operations. This work shall consist of providing all necessary surveying to establish, spatially position, measure, navigate to and verify the locations of existing and proposed terrain features and measure quantities of items in accordance with the contract documents or as directed by the Engineer. This work includes but is not limited to the establishment or reestablishment of primary and secondary control, the stakeout of proposed features or the initialization and navigation of automated equipment operations, the location or verification of existing terrain or of constructed features, and the coordination and sharing of engineering data with the Department or other contract stakeholders.

625-1.02 Right of Way Markers. This work shall consist of furnishing, installing and certifying right of way markers at the specific positions described on the right of way appropriation maps, and in accordance with the details shown on the appropriate Standard Sheet.

625-1.03 Permanent Survey Markers. This work shall consist of furnishing, installing, and certifying permanent survey markers in accordance with the details shown on the appropriate Standard Sheet.

625-2 MATERIALS

625-2.01 Survey Operations. None specified

625-2.02 Concrete Right of Way Markers. Concrete right of way markers shall conform to the requirements of §712-05 Precast Concrete Right of Way Markers, and shall be in accordance with the details shown on the appropriate Standard Sheet.

625-2.03 Steel Pin and Cap Right of Way Markers. Reinforcing steel used for the shank shall conform to ASTM A615, Grade 300 or Grade 420. It shall be epoxy coated for its entire length in accordance with the coating application requirements of §705-14 Longitudinal Joint Ties or §709-04 Epoxy Coated Bar Reinforcement.

— The cap shall be aluminum or a corrosion resistant aluminum alloy. The cap shall weigh a minimum of 2 ounces and fasten to the shank by means of threading or force fitting.

— A commercial grade silicone sealant shall be used between the cap and the shank. All aluminum or aluminum alloy surfaces to be in contact with cement concrete shall be coated with Zinc Chromate Primer meeting the requirements of §708-04 or an alternate material approved by the Materials Bureau.—

— Steel Pin and Cap Type Markers shall be anchored into rock using Concrete Grouting Material meeting the requirements of §701-05.

625-2.04 Permanent Survey Markers. The concrete shall meet the requirements of Class A Concrete in Section 501 Portland Cement Concrete – General, except that the requirements for inspection facilities, automated batching controls and recordation do not apply. The batching, mixing and curing methods, and the inspection facilities shall meet the approval of the Department. The Contractor may submit for approval by Director, Materials Bureau, a mix at least equivalent to the specified Class A Concrete.

625-3 CONSTRUCTION DETAILS

— The following types of Survey Operations shall be completed under the direction of a Land Surveyor. This requirement is directly or indirectly associated with the professional license requirements contained in Article 145 of the NYS Education Law:

1.— Establishment or reestablishment of primary or secondary control which shall be used for:

~~Establishing boundaries of new right of way appropriated for this contract.~~

~~Location of property or highway boundary markers.~~

~~Tie measurements to, or resetting of control points.~~

~~2.— Location or resetting of existing highway and property boundary markers by reference ties to or from contract control to protect their integrity.~~

~~3.— Establishment or certification of location of right of way markers and permanent survey markers.~~

~~— The following types of Survey Operations shall be completed under the direction of either a Land Surveyor or Professional Engineer:~~

- ~~•— Establishment or reestablishment of primary or secondary control which shall be used for:~~
- ~~•— Establishing location for horizontal or vertical roadway alignment.~~
- ~~•— Establishing location for the horizontal or vertical alignment of a structure.~~
- ~~•— Establishing reference station for Global Positioning System (GPS) control work.~~
- ~~•— Establishing new horizontal or vertical roadway alignment in the field from contract control either by conventional stakeout methods or by use of automated equipment operations.~~

~~— Contract Control Plan— The Contractor shall develop and submit a Contract Control Plan for all contracts which include the Contract Pay Item 625.01 Survey Operations. Contract control includes all primary and secondary horizontal and vertical control which will be used for the construction of the contract. Upon the Contractor's completion of initial survey reconnaissance and control verification, but prior to beginning primary field operations, the Contractor shall submit a Contract Control Plan document (signed and sealed by the Land Surveyor or Professional Engineer who oversees its preparation) for acceptance by the Engineer which includes:~~

~~— A control network diagram of all existing horizontal and vertical control recovered in the field as contract control.~~

~~Include a summary of the calculated closures of the existing control network, and which control has been determined to have been disturbed or out of tolerance from its original positioning.~~

~~— An explanation of which horizontal and vertical control points will be held for construction purposes (include a NYSPCS coordinate list). If necessary, include all adjustments which may have been made to achieve required closures.~~

~~— An explanation of what additional horizontal and vertical control (including base stations) was set to accomplish the required stakeout or automated machine operations. Include how the position of these new control points was determined.~~

~~— Describe the proposed method and technique (technology and quality control) for utilizing the control to establish the existing and/or proposed feature locations and to verify the completed feature location and/or measured quantity.~~

~~— A listing of the horizontal and vertical datums to be used, the NYS Plane Coordinate System (NYSPCS) zone, and the combined factor to be used to account for the ellipsoidal reduction factor and the grid scale factor.~~

~~— If the NYS Continuously Operating Reference Stations (CORS) Network was used to establish the initial control for the design of this contract, or if the Contractor proposes to use CORS with any construction operation, the survey reconnaissance and control verification shall include verifying the contract control against at least two NYS CORS Stations, and reporting the accuracy results in the contract control plan.~~

~~— If the Contractor chooses to use automated machine operations as a method for measuring and controlling excavation, fill, material placement or grading operations, the Contract Control Plan shall include the method by which the automated machine guidance system will initially be site calibrated to both the horizontal and vertical contract control, and shall describe the method and frequency of the calibrations to ensure consistent positional results.~~

~~— All establishment or reestablishment of contract primary or secondary control shall be done in accordance with the Department's "Land Surveying Standards and Procedures Manual."~~

625-3.01 Survey Operations. All available contract control, alignment or terrain data to be used to establish, position, measure, guide and verify the locations and quantities of existing and proposed

features for the contract, will be managed and stored by the Department and shared electronically with the Contractor.

— Survey Operations shall utilize: ~~A. Conventional Survey Stakeout or B. Automated Machine Operations, or a combination of both, for the establishment, positioning, equipment guidance or verification of features. The proposed method shall be approved by the Engineer as part of the Contract Control Plan prior to beginning any field construction operations. Both methods include the same basic requirements that: (1) both parties (Contractor and Department) utilize the same contract control, the same existing terrain data, and the same proposed feature data; (2) both parties utilize the same accuracy and tolerance limits; and (3) both parties utilize equivalent survey verification techniques to ensure that field features are constructed as designed.~~

— After completion of the work, the Contractor shall reestablish and retie the contract control points as described in the Department's current "Land Surveying Standards and Procedures Manual."

— If an existing Digital Terrain Model (DTM) was developed during design and provided for construction purposes, and possibly updated during construction by supplemental survey, the Department will use that information to develop contract pay item quantities. If a proposed Digital Terrain Model (DTM) was developed during design and provided for construction purposes, or revised during construction due to site changes or redesign, the Department may use that information to develop applicable contract pay item quantities. If the Contractor does not agree with any of the information used, it may verify all or any portion of the existing or proposed DTM, at no additional cost to the State. All exceptions/changes to the supplied existing terrain data shall be brought immediately to the attention of the Engineer, in writing, and terrain data modifications shall be mutually agreed upon prior to beginning construction activities within the area(s) being modified. All existing terrain data supplied by the Department shall be considered as being within acceptable tolerances, except where changes or additions have been approved by the Engineer. Terrain data (DTM) changes will not be accepted by the Department where existing terrain is verified to be within Departmental accepted positional tolerances.

— If a proposed Digital Terrain Model (DTM) was not developed, the Department may use line and grade information contained in the contract documents, in conjunction with the original ground survey plus any supplemental survey it collected, to develop contract pay item quantities. If the Contractor does not agree with any of the information used, it may verify all or any portion of the information, at no additional cost to the State.

— The Contractor shall establish the center line of bearings for bridge abutments and piers, by setting offset hubs or reference points, so located and protected to ensure they remain undisturbed until such time as they are no longer needed. The Contractor shall mark the location of anchor bolts to be installed, establish the elevation of bearing surfaces and cheek bearing plates to ensure installation at their proper elevation. Before the erection of structural steel the Contractor shall verify the locations, both vertically and horizontally, of all bearings.

~~A. Conventional Survey Stakeout.~~ The field location of all features to be constructed shall be established from survey control points which were identified in the Contract Control Plan. Any error, apparent discrepancy or absence in the data shown or required to appropriately accomplish the stakeout survey shall be referred to the Engineer immediately for interpretation when such is observed or required.

— The Contractor shall place two offset stakes or reference points along the center line at maximum intervals of 50 feet and at such intermediate locations as required to determine location and direction. From computations and measurements made by the Contractor, these stakes shall be clearly and legibly marked with the center line station number, offset and cut or fill from which the establishment of the centerline location and elevation can be determined. If markings become illegible for any reason the markings shall be restored by the Contractor. The Contractor shall locate and place all cut, fill, slope, fine grade, or other stakes and points for the proper progress of the work (maximum station spacing of 66 feet). All control points shall be properly protected and flagged for easy identification.

— The Contractor shall be responsible for the accuracy of the work and shall maintain all applicable reference points, stakes, etc. Damaged or destroyed reference points or bench marks made inaccessible by the progress of the construction shall be replaced or transferred by the Contractor. All control points shall be referenced by ties (4 minimum) to specific points on acceptable objects and

recorded. Any alterations or revisions in the ties shall be so noted and the information furnished to the Engineer. All stakeout survey work related to highway control shall be referenced to the control line shown in the contract documents. Computations and survey notes necessary to establish the position of the work from control points, shall be made and maintained in a neat, legible and acceptable format by the Contractor. Computations, survey notes and other survey information shall be made available to the Engineer within 3 days from the request. The Engineer may check all or any portion of the stakeout survey work or notes made by the Contractor. Such checking by the Engineer shall not relieve the Contractor of any responsibilities for the accuracy or completeness of the work.

B. Automated Machine Operations. The Contractor may choose an automated method for the establishment, layout, measurement, equipment guidance or verification of work to be constructed. Under this method, all horizontal and vertical control, alignment control, existing terrain data and proposed design data shall be shared/exchanged electronically and kept current between the Contractor and the Engineer. All original active files of electronic contract data shall be maintained and stored by the Department. Prior to beginning field operations, the Contractor and Engineer shall mutually determine acceptable uses of and procedures for the technology being used, and how data can be exchanged for use in stakeout, automated equipment operations, verification and quantity calculations. All engineering data shall be stored and shared in Department standard formats, and shall be derived primarily from the original electronic data provided by the Department.

Automated equipment operations have a high reliance on accurate control networks from which to take measurements, establish positions, and verify locations of features. Therefore, a strong contract control network in the field which is the same or is strongly integrated with the project control used during the design of the contract is essential to the successful use of this technology with the proposed Digital Terrain Model (DTM). Consistent and well designed site calibration for all automated machine operations (as described above under Contract Control Plan) are required to ensure the quality of the contract deliverables. The Contract Control Plan is intended to document which horizontal and vertical control will be held for these operations. Continued incorporation of NYS CORS Stations (if included in the initial project control) is essential to maintaining the integrity of positional locations and elevations of features.

The Engineer may perform quality assurance verifications of feature positions and elevations at any time during the contract. Dimensional tolerances shall hold a higher order of importance than positional tolerances, but both may require verification. Quality assurance activities by the Engineer will not relieve the Contractor of any responsibilities for the quality control of the accuracy or completeness of the work.

Verification of the positional locations of features, calculation and creation of supplemental DTM surfaces, and the measurement and calculation of quantities shall be developed through the use of Department standard CADD software. Both the Contractor and the Department shall utilize the following standards: (1) All CADD alignment and land boundary data shall be processed using the Department's standard CADD software. (2) All terrain data collected for the purpose of being used for or merged with Department provided terrain data and/or for the calculation of pay quantities shall be formatted and displayed in accordance with the current "CADD Standards and Procedure Manual." (3) Field data collection and DTM creation shall be in accordance with procedures required in the current "Land Surveying Standards and Procedures Manual." (4) The Department will maintain electronic data files for access by the Contractor using the Department's designated file management system. This will ensure that both parties utilize the same credible data from which to establish locations and measure quantities. The Department will provide all available CADD resource files for use by the Contractor.

The Contractor may choose to introduce an additional new automated method which involves a different technique for positioning features, measuring quantities, or verifying constructed locations. The quality and accuracy of this data produced by this method shall be demonstrated to the Engineer, for acceptance, by a comparison of this method to previously accepted techniques over a mutually agreed upon portion of the work. The new technology shall meet or exceed the quality and accuracy results provided by previously accepted techniques, and the Engineer shall make the final determination as to the acceptability of its use based on the performance, cost savings, and effectiveness of the operation. Previous uses of this same method on other contracts or by other

~~contractors are not acceptable evidence of a technology's viability, due to inherent variations in operator's experience levels, data availability, changing field conditions and differing technologies.~~

~~**625-3.02 Right of Way Markers.** The Contractor shall verify with the Engineer that it has the most current vested Right of Way Acquisition Maps to determine the locations of the proposed right of way markers.~~

~~— Right of way marker locations shall be determined under the direction of a Land Surveyor from a closed traverse or GPS network which is included in the contract control plan and in accordance with Federal Geographic Data Committee (FGCC) C2-II, Second Order, Class II (1 part in 20,000) accuracy, ensuring a local positional accuracy of 1 tenth of a foot (0.10 feet) as described in the Department's "Land Surveying Standards and Procedures Manual."~~

~~— The Contractor shall install right of way markers at the station/offset positions specified on the vested Right of Way Acquisition Maps in accordance with the Standard Sheets to within an absolute positional tolerance of 6 hundredths of a foot (0.06 feet).~~

~~— The Land Surveyor shall certify the as-built location of each installed right of way marker on certification forms provided by the Engineer, including contract information, and control line station and offset (proposed and as-built) to the marker. The record location of all right of way markers shall be recorded to the nearest hundredth of a foot and reflect as-built coordinates from a closed traverse or GPS network which is included in the contract control plan and in accordance with FGCC C2-II, Second Order, Class II (1 part in 20,000) accuracy.~~

~~— Prior to placing the cap on a steel pin right of way marker, the cap shall be filled 2/3 full of silicone sealant and then fastened to the bar by threading or by force fit. During the driving operation for the steel pin right of way marker, the lettering on the cap shall be protected by the use of a metal sleeve or cushion block. The marker shall be driven so that the cap is flush with the ground surface.~~

~~**625-3.03 Permanent Survey Markers.** Permanent survey markers shall be installed in accordance with the standard sheet at locations described in the contract documents and approved by the Engineer prior to installation. The sequential numbering required on the permanent survey marker caps shall be coordinated with the Engineer and the Regional Land Surveyor.~~

~~— The Land Surveyor shall certify the as-built location of each installed permanent survey marker on certification forms provided by the Engineer, including contract information, as-built State Plane Coordinate values, control line and centerline station and offset to the marker, distance and direction to adjacent markers, the elevation of the marker, and a sketch which shows the relative positions to the control line points, four physical ties to the markers, and a north arrow. The record location of all permanent survey markers shall be recorded to the nearest hundredth of a foot and reflect as-built coordinates from a closed traverse or GPS network which is included in the contract control plan and in accordance with FGCC C2-II, Second Order, Class II (1 part in 20,000) accuracy as described in the Department's "Land Surveying Standards and Procedures Manual."~~

625-4 METHOD OF MEASUREMENT

~~**625-4.01 Survey Operations.** This work will be measured on a lump-sum basis.~~

~~**625-4.02 Right of Way Markers.** The quantity to be measured for payment will be the number of right of way markers installed.~~

~~**625-4.03 Permanent Survey Markers.** The quantity to be measured for payment will be the number of permanent survey markers installed.~~

625-5 BASIS OF PAYMENT

~~**625-5.01 Survey Operations.** The price bid shall include the cost of furnishing all labor, materials and equipment necessary to satisfactorily complete the work. Progress payments will be made in proportion to the amount of work completed as determined by the Engineer.~~

~~**625-5.02 Right of Way Markers.** The unit price bid per each shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work. Payment will be made upon the complete and proper installation of the marker, receipt of the certification form by the Engineer, and approval of the certification by the Regional Land Surveyor.~~

~~**625-5.03 Permanent Survey Markers.** The unit price bid per each shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work. Payment will be made upon the complete and proper installation of the marker, receipt of the certification form by the Engineer, and approval of the certification by the Regional Land Surveyor.~~

~~*Payment will be made under:*~~

Item No.	Item	Pay Unit
625.01	Survey Operations	Lump Sum
625.03	Concrete Right of Way Markers Type H (High)	Each
625.04	Concrete Right of Way Markers Type L (Low)	Each
625.05	Steel Pin and Cap Right of Way Markers	Each
625.06	Permanent Survey Markers	Each

SECTIONS 626 THRU 629628 (VACANT)

SECTION 629 – PETROLEUM STORAGE TANK CLOSURE

629-1 DESCRIPTION

629-1.01 General. This work shall consist of emptying, purging/inerting, cleaning, removing, and disposing of petroleum storage tanks; endpoint sample collection and analysis; and proper documentation of the work in accordance with the contract documents and as directed by the Engineer.

629-2 MATERIALS (Not Specified)

629-3 CONSTRUCTION DETAILS

629-3.01 General. All petroleum storage tanks shall be closed in accordance with the requirements of the NYS Department of Environmental Conservation (NYSDEC), as well as local fire and police agencies. NYSDEC shall be notified prior to the initiation of tank closure activities. For instances where tanks that have not been identified during the design process are discovered during construction, NYSDEC shall be notified as soon as possible after discovery of the tank(s). If evidence of a petroleum spill that was not previously reported is discovered during construction, the contractor shall call the NYSDEC Spills Hotline at 1 (800) 457-7362, within two hours of discovering the spill.

Excavation shall be performed in accordance with Section 206 *Trench, Culvert and Structure Excavation*. Segregation and stockpiling of contaminated soils shall be performed in accordance with Section 205 *Contaminated Soil*. If specified in the contract documents, or at the request of the Department in instances where tanks are not discovered until after construction has begun, the Contractor shall provide field organic vapor monitoring in accordance with §205-3.03 *Field Organic Vapor Monitoring* in the following instances: contaminated soil is present; there is a potential for nuisance petroleum odors; or if the work is being performed in close proximity to residences, schools, or other sensitive receptors.

The Contractor shall provide a schedule for tank closure activities to the Engineer a minimum of 35 calendar days prior to commencing work, except for when previously unidentified tanks are discovered during construction and the work will take place in less than 35 calendar days. In such instances, the Contractor shall notify the Engineer immediately upon discovery of the tank(s). The Department will notify appropriate NYSDEC personnel at least 30 calendar days prior to tank closure activities, except for when previously unidentified tanks are discovered as described above. In such instances, the Department will notify NYSDEC as soon as possible after discovery of the tank(s).

629-3.02 Removal/Disposal of Liquids from Petroleum Storage Tanks. Before the removal of any tank begins, it shall first be rendered free of product and water. All liquids shall be disposed of in accordance with §107-10 *Managing Surplus Material and Waste*. Product shall be managed with a preference toward recycling or beneficial reuse when such options are available. Liquids shall be transported to the disposal/recycling facility only by appropriately permitted haulers. During the removal operation (including cutting the tank open to remove product, if necessary) the following restrictions shall apply:

1. The work area shall be secured by, at a minimum, erecting a 4 foot construction fence to create an 25 foot controlled access perimeter around the tank pit and posting signs stating “Authorized Personnel Only” or equivalent. This perimeter shall be maintained until the tank has been disposed of and the tank pit has been backfilled.
2. All open-flame and spark producing equipment within the area shall be shut down.
3. All electrical and internal combustion equipment, unless it is designed to be “explosion proof” or “intrinsically safe”, shall be removed from the work area.
4. Only “non-sparking” tools shall be used.
5. Static electricity shall be controlled.
6. Smoking shall be prohibited in the work area.

629-3.03 Petroleum Storage Tank Closure. Tank closures shall consist of all of the following components, unless specifically noted in the contract documents.

A. Project Safety and Health. The Contractor shall ensure that all personnel directly involved in tank closure activities have been trained in conformance with the requirements of 29 CFR 1910.120 and 1926.65 (referred to hereafter as 1910.120). There shall be at least one person on site who has supervisor training as per 29 CFR 1910.120(E)(4) during all tank closure activities. The Project Safety and Health Plan (PSHP) required by §107-05B shall also meet the requirements of 29 CFR 1910.120 (b) (4).

B. Tank Atmosphere Monitoring. The contractor shall use a combustible gas indicator (CGI) or an explosion meter and an oxygen meter to monitor the tank atmosphere.

C. Tank Purging/Inerting. The Contractor shall make the tank atmosphere safe by purging the flammable vapors from the confined space to below 5% of the lower explosive limit (LEL) and, unless positive ventilation is used, the oxygen level is below 7%. Care shall be exercised to ensure that purging/inerting is completed before proceeding with tank cleaning and cutting. The Contractor shall purge/inert the tank atmosphere by using one of the following methods:

1. Dry Ice. The Contractor shall add dry ice (1.5 lb per 100 gallons of tank capacity) into the tank. The dry ice shall be crushed and distributed evenly over the greatest possible area of the tank interior. As the dry ice vaporizes flammable vapors will flow out of the tank, therefore, the Contractor shall observe all safety precautions regarding flammable vapors.

2. Carbon Dioxide. The Contractor shall add carbon dioxide gas directly into the tank to purge flammable vapors. A minimum of one, fully charged, 75 lb cylinder of carbon dioxide gas per 2,000 gallons of tank volume shall be used. Care shall be exercised to prevent buildup of any static charge. The nozzle shall be bonded or grounded and the gas introduced slowly to reduce static.

3. Nitrogen. The Contractor shall add nitrogen gas directly into the tank to purge flammable vapors. Vapors within the storage tank must be displaced with an amount of nitrogen gas equal to or greater than the volume of the tank atmosphere. Care shall be exercised to prevent buildup of any static charge. The nozzle shall be bonded or grounded and the gas introduced slowly to reduce static.

4. Positive Ventilation. With prior written approval from the Engineer, the Contractor may use positive ventilation to purge flammable vapors from a tank using an air eductor. If performed improperly, this can be a very dangerous procedure and is not recommended for on-site purging of flammable vapors especially in high density urban areas.

D. Tank Removal. Regardless of the method selected to purge/inert the tank atmosphere, removal work shall not start until the readings from the CGI or explosion meter indicate that a safe and non-explosive tank atmosphere has been achieved as evidenced by readings less than 5% of the LEL at all elevations within the tank and if dry ice, carbon dioxide, or nitrogen are used to purge/inert the tank, readings from the oxygen meter indicate that an atmosphere of less than 7% oxygen is present throughout the tank. Removal work shall be progressed diligently without interruption until its completion. The CGI or explosion meter shall be used to take subsequent readings continuously as work is progressing. If any reading indicates an atmosphere with greater than 10% of the LEL is present, or the LEL is rising steadily, work shall cease and purging/inerting shall be repeated. Tank-related piping and connecting lines shall either be disconnected and removed or securely capped and plugged.

The tank shall be removed from the tank pit and placed on 6 mil minimum plastic sheeting with the vents aligned at the top of the tank (the 12 o'clock position). The tank shall be blocked or chocked in order to prevent rolling.

Contaminated soil, if present in or around the tank, shall be handled and managed in accordance with provisions found in Section 205 *Contaminated Soil*.

E. Tank Interior Cleaning and Tank Cutting. Immediately after the tank has been removed from the ground and a safe atmosphere is confirmed, the tank shall be cut open with non-sparking equipment. Two large holes shall be made in the tank to allow for cross ventilation. The tank shall then be fully ventilated until the CGI or explosion meter indicates an atmosphere with less than 5% of the LEL and an oxygen concentration between 19.5% and 21.5% is present. All remaining sludge and residue shall be removed by vacuuming, non-flammable solvent washing, or sweeping with dry absorbents. The Contractor shall permit only trained and properly equipped personnel to enter the tank. Permit-required confined space entry procedures in accordance with 29 CFR 1910.120 shall be used for all tank entries. All product, product-soaked sorbents, cleaning solvents, and water generated by the operation, shall be transported by a hauler permitted under 6 NYCRR 364 and, disposed of in accordance with the waste disposal regulations of the receiving state.

In instances where there is insufficient work area available to safely perform tank interior cleaning and cutting on-site, the Engineer may permit the Contractor to move the tank to an alternative location for interior cleaning and cutting. Uncleaned tanks shall be transported only by transporters permitted under 6 NYCRR 364. Prior to transporting an uncleaned tank, all holes shall be plugged and the tank shall be placarded according to USDOT regulation 49 CFR 172.500. The tank shall be vented by means of a 1/8 inch hole in one of the plugs. The tank shall be securely fastened to the transporting vehicle, and oriented so that the plug with the hole in it is uppermost on the tank.

F. Documentation. Tank closure activities shall be documented both in written format and photographically. The Contractor shall document the number of tanks, tank capacities, tank types (i.e., steel, fiberglass, etc.) and conditions (i.e., sound, corroded but intact, leaking, etc.), products stored in tanks, soil conditions, presence/absence of field indications of soil/groundwater contamination, tank removal, and all subsequent tank closure activities until the tank has been loaded and secured for transportation off-site. The Engineer shall also be provided with copies of any chain-of-custody forms, laboratory reports, and documentation of the final disposition of the tank and any contaminated soil that was removed. When tank closure activities have been completed, the Department will submit a Tank Closure Report which includes all relevant documentation, including laboratory reports and tank disposal documents, to NYSDEC.

G. Tank Exterior Cleaning and Tank Disposal. All tanks shall be cleaned of all soil, residue and product clinging to their exterior surfaces prior to being transported off-site. All contaminated

soil, product, cleaning solvents, and water generated by the operation, shall be transported by a transporter permitted under 6 NYCRR 364 and, disposed of in accordance with §107-10 *Managing Surplus Material and Waste*. A tank that has been rendered free of product and cleaned is considered scrap, and shall be recycled or disposed of by the Contractor.

H. Backfilling. After the completion of endpoint sampling and documentation activities which require the tank pit to remain open, the Contractor shall backfill any resulting holes and trenches with suitable material.

629-3.04 Endpoint Sample Collection and Analysis. NYSDEC personnel, if present during tank closure activities, may advise the Engineer that endpoint samples are not required in order to obtain tank closure. If NYSDEC personnel are not on-site during tank closure, or if NYSDEC personnel are on site and suggest that endpoint samples will be required in order to obtain tank closure, endpoint samples shall be collected as follows:

After contaminated soil, if present, is removed to the extent practicable, a person, whose qualifications have been submitted in accordance with §205-3.01 B. 3. *Sampling Plan*, shall collect a total of five composite samples from the tank pit. A composite sample is defined as a sample composited from individual grab samples collected on an areal or cross sectional basis. Each composite sample shall be made up of equal volumes of grab samples collected in an identical manner. One composite sample shall be collected from each of the side walls at a distance approximately one third up from the bottom of the pit and one composite sample shall be collected from the bottom of the pit. Samples shall be collected into properly labeled laboratory provided glassware, which shall then be placed into re-sealable plastic bags and stored in a cooler with ice. The contractor shall deliver the samples, in accordance with appropriate chain-of-custody procedures and sample hold-times, to a NYS Department of Health Environmental Laboratory Approval Program (ELAP) Certified laboratory for the following analyses:

A. Gasoline Tanks: Submit samples for analysis of volatile organic compounds (VOCs) by USEPA Method 8021 (STARS list compounds + MTBE).

B. #2 Fuel Oil/Diesel Tanks: Submit samples for analysis of VOCs by USEPA Method 8021 (STARS list compounds + MTBE) and for analysis of polycyclic aromatic hydrocarbons (PAHs), also referred to as base/neutrals (B/N's), by USEPA Method 8270.

C. Waste Oil Tanks: Submit samples for analysis of VOCs by USEPA Method 8260 + MTBE, semi-volatile organic compounds (SVOCs) by USEPA Method 8270, RCRA Metals by USEPA Methods 6010 and 7471, and for polychlorinated biphenyls (PCBs) using USEPA Method 8082.

D. Tanks Containing Other Products: Submit samples for analyses specified in the contract documents. For previously unidentified tanks containing products other than gasoline, #2 fuel-oil/diesel, or waste oil that are discovered during construction, the Contractor shall contact NYSDEC for the appropriate analytical methods.

The Contractor shall provide the Engineer with a copy of the completed chain-of-custody form before the samples are taken off-site for delivery to the laboratory, and a copy of the laboratory report within 14 calendar days of sample collection.

629-4 METHOD OF MEASUREMENT

629-4.01 General. (Vacant)

629-4.02 Removal/Disposal of Liquids from Petroleum Storage Tanks. The quantity of removed/disposed of liquids to be measured for payment will be in gallons, measured to the nearest whole gallon. The Contractor shall provide disposal receipts from an approved facility that accepts the material to verify the quantity disposed.

629-4.03 Petroleum Storage Tank Closure. The quantity of tanks closed to be measured for payment will be the number of tanks within the indicated size range closed.

629-4.04 Endpoint Sample Collection and Analysis. The quantity to be measured for payment will be the number of samples collected and analyzed according to the specified methods.

629-5 BASIS OF PAYMENT.

629-5.01 General. Soil Handling, Field Organic Vapor Monitoring other than within the tank atmosphere, and removing and disposing of contaminated soil, except soil contaminated during the tank removal operations, will be paid for separately.

629-5.02 Removal/Disposal of Liquids from Petroleum Storage Tanks. The unit price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work, including laboratory analyses required for the proper disposal of the liquids. The maximum amount of payment will be the unit bid price multiplied by the capacity of the tank.

629-5.03 Petroleum Storage Tank Closure. The unit price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work, not including excavation and backfill.

Progress payments of 50% of the unit price bid will be paid after the tank removal has been completed, a completed Form HC 629 *Tank Closure Form* and, if endpoint samples were required, a completed chain of custody form showing that the samples were delivered to the laboratory. The remaining percentage will be paid after the Department has received from the Contractor all remaining documentation necessary for the Department to submit a complete Tank Closure Report to NYSDEC, including: invoices confirming the final disposition of: the tank, any liquids removed from the tank, any wastes generated during tank cleaning, and any contaminated soil that was removed; and, if endpoint samples were required, a final laboratory report.

629-5.04 Endpoint Sample Collection and Analysis. The unit price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work. Payment will be made after all analytical data has been received by the Department, and a Department representative has reviewed the data to verify that it is correct.

Payment will be made under:

Item No.	Item	Pay Unit
629.01	Removal/Disposal of Liquids from Petroleum Tanks	Gallon
629.02xx	Petroleum Storage Tank Closure (various size ranges)	Each
629.0301	Endpoint Sample Collection and Analysis (Gasoline Parameters)	Each
629.0302	Endpoint Sample Collection and Analysis (Diesel/#2 Fuel Oil Parameters)	Each
629.0303	Endpoint Sample Collection and Analysis (Waste Oil Parameters)	Each
629.0304	Endpoint Sample Collection and Analysis (Other Product Parameters)	Each

NOTE: xx -see Pay Item Catalog or Proposal for complete description.

Comment [cjt96]:
EI08025

SECTION 630 - BARRICADES

630-1 DESCRIPTION. This work shall consist of furnishing and erecting in accordance with the appropriate standard sheet, permanent type barricades for highway or highway-railroad installations at the locations indicated on the plans or as directed by the Engineer.

630-2 MATERIALS. Materials shall meet the requirements of the following subsections of Section 700 - Materials and Manufacturing.

Wood Posts

710-13

Galvanized Steel Barrier Posts	710-14
Corrugated Beam Guide Railing and Median Barrier	710-20
Reflective Sheeting	730-05

630-2.01 Barricades (All Permanent Types). Rails shall conform to §710-20 Corrugated Beam Guide Railing and Median Barrier, and to the details indicated on the appropriate standard sheet.

Posts shall be steel W6x15 or wood 6 x 8 inch (nominal) as indicated in the proposal and in accordance with the details shown on the appropriate standard sheet for Highway Barrier and Highway Railroad Barricade. All metal posts shall conform to §710-14 Galvanized Steel Barrier Posts.

630-3 CONSTRUCTION DETAILS

630-3.01 Barricades (All Permanent Types). Posts shall be set as shown on the plans, the applicable standard sheet, or as directed by the Engineer, and shall be set true to the line and grade and on a firmly tamped base.

Rails shall be erected in such a manner as to produce a smooth appearance, and approximately parallel with the grade of the ground surface. Bolts shall be drawn tight and shall extend 1/4 to 1/2 inch beyond the nuts unless otherwise permitted by the Engineer.

630-4 METHOD OF MEASUREMENT

630-4.01 Barricades (All Permanent Types). The quantity to be measured for payment under this work will be the number of feet of barricade outside to outside of end posts plus an allowance of 4 feet for each complete terminal assembly including all rails as specified on the plans.

630-5 BASIS OF PAYMENT

630-5.01 Barricades (All Permanent Types). The unit price bid per foot shall include the cost of all labor, equipment and material necessary to complete the work including inspection and testing information required as well as painting, excavating and backfilling. Any required signs will be paid for separately under the appropriate payment item.

Payment will be made under:

Item No.	Item	Pay Unit
630.01	Barricade (Steel Posts)	Foot
630.02	Barricade (Wood Posts)	Foot

SECTION 631 (VACANT)

SECTION 632 – CRIBBING

632-1 DESCRIPTION

~~**632-1.01 General.** This work shall consist of all the work required for furnishing and placing precast concrete cribbing or metal bin type retaining walls including all excavation and filling in the manner specified by the contract documents or by the Engineer. Other types of cribbing not shown on the standard sheets may be furnished and placed, if approved by the DCES.~~

~~**632-1.02 Definitions.** The following general definitions shall be used in conjunction with this section:~~

~~**A. Unit.** Any single piece used to construct precast concrete cribbing or metal bin type retaining walls. For precast concrete cribbing the work unit shall include but not be limited to, stretchers, headers (both closed and open face), coping, bearing blocks, full sections, half sections, end sections;~~

and leveling footings. For metal bin-type retaining walls the word unit shall include, but not be limited to, stringers, spacers, columns, column caps, stringer stiffeners and base plates.

~~B. Bin.~~ Any volumetric space which is designated to be filled with backfilling material, as defined in this section, and is enclosed on all four sides by precast concrete cribbing units, or metal bin-type retaining wall units.

~~C. Wall.~~ A series of units to form bins connected in unbroken sequence so that, when filled with backfill material, they will act as a single entity (i.e., a retaining wall).

632-2 MATERIALS

632-2.01 Unit Materials. Materials shall meet the requirements specified in the following subsections of Section 700—Materials and Manufacturing:

Precast Concrete Cribbing	704-06
Premoulded Resilient Joint Filler	705-07
Metal Bin Type Retaining Wall	715-11

632-2.02 Backfill. Backfill Material shall conform to the material requirements for either Stone Filling (Fine), as specified in §620-2.01 and 620-2.02, or Select Granular Fill and Select Structure Fill as specified in §203-2.01 and 203-2.02C.

632-3 CONSTRUCTION DETAILS

632-3.01 Precast Concrete Cribbing.

~~A. Excavation.~~ Excavation shall be conducted in accordance with the applicable requirements of Section 206, Trench, Culvert and Structure Excavation, and the details specified in the contract documents.

—Prior to erection of the cribbing, the foundation shall be inspected and approved by the Engineer.

~~B. Erection.~~ All units shall be assembled and handled in accordance with the manufacturer's instructions and the contract documents. In the event of a conflict between the contract documents and the manufacturer's instructions, the Engineer shall decide which course to follow. During erection, any units damaged beyond repair shall be removed and replaced, by the Contractor, with approved units.

—The Contractor shall use precast leveling footings. Cast in place leveling footings will not be permitted.

~~C. Backfill.~~ Immediately prior to backfilling, the Engineer shall inspect units for damage. Units which are determined by the Engineer to be damaged beyond repair shall be rejected. Rejected units shall be replaced by the Contractor.

—Filling the interior of the bins and behind the walls shall progress simultaneously with the erection of the units and the material shall be placed as specified in §203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.

~~D. Contractor Responsibility.~~ Movement of construction equipment and all other vehicles and loads over and adjacent to walls shall be done at the Contractor's risk. Any damage to bins and units from any cause whatsoever shall be repaired or replaced by the Contractor in a manner satisfactory to the Engineer.

~~**632-3.02 Metal Bin-Type Retaining Walls.** The provisions specified in §632-3.01, Precast Concrete Cribbing, shall apply with the following additions and modifications:~~

~~— The ends of all stringers and spacer units shall be bolted to corner columns by means of connecting channels.~~

~~— In the construction of a wall on a curve, the proper curvature for the face shall be obtained by the use of shorter stringers in the front or rear units of walls as designed on the plans or by the Engineer.~~

~~— The wall height and depth may be varied, but not to exceed the maximum dimension shown for the design selected. Two or more wall designs may be incorporated in the same wall by the use of standard split columns to make the connections on the step back.~~

632-4 METHOD OF MEASUREMENT

~~**632-4.01 Cribbing or Retaining Wall.** Cribbing or retaining wall shall be measured by the number of square feet of the front wall face computed between the payment lines shown on the plans or between payment lines established, in writing, by the Engineer.~~

~~**632-4.02 Excavation and Disposal of Excavated Material for the Installation of Cribbing or Retaining Wall.** Excavation and disposal of excavated material shall be measured by the number of cubic yards of material measured in its original position between the payment lines shown on the plans or between payment lines established, in writing, by the Engineer.~~

~~**632-4.03 Backfill for the Installation of Cribbing or Retaining Wall.** Backfill shall be measured by the number of cubic yards of material, computed between the payment lines shown on the plans or between payment lines established in writing by the Engineer. Deductions for the volume of units of precast concrete cribbing will be made. No deduction will be made for the volume of a metal bin unit.~~

632-5 BASIS OF PAYMENT

~~**632-5.01 Cribbing or Retaining Wall.** The unit price bid shall cover the cost of furnishing all materials, labor, and equipment necessary to complete the work including leveling footings required for precast concrete wall units, and the replacement or repair of any materials damaged by the Contractor's operations.~~

~~**632-5.02 Excavation and Disposal of Excavated Material for the Installation of Cribbing or Retaining Wall.** The unit price bid shall include the cost of all labor, material and equipment necessary to complete the work.~~

~~**632-5.03 Backfill for the Installation of Cribbing or Retaining Wall.** The unit price bid shall include the cost of all materials, labor, and equipment necessary to complete the work. No direct payment will be made for any loss of material which may result from compaction, foundation settlement, erosion, or any other cause; the cost of such losses shall be included in the price bid for this work. The cost of adding water for compaction of backfill shall be included in the price bid unless the item "Applying Water" is included in the proposal.~~

Payment will be made under:

Item No.	Item	Pay Unit
632.0101	Concrete Cribbing (Stretcher and Header Type)	Square Foot
632.0102	Concrete Cribbing (Precast Concrete Wall Unit Type)	Square Foot
632.02	Metal Bin Type Retaining Wall	Square Foot
632.0501	Excavation for Concrete Cribbing (Stretcher and Header Type)	Cubic Yard
632.0502	Excavation for Concrete Cribbing (Precast Concrete Wall Unit Type)	Cubic Yard
632.0503	Excavation for Metal Bin Type Retaining Wall	Cubic Yard
632.0601	Backfill for Concrete Cribbing (Stretcher and Header Type)	Cubic Yard

~~632.0602 Backfill for Concrete Cribbing (Precast Concrete Wall Unit Type) Cubic Yard~~
~~632.0603 Backfill for Metal Bin Type Retaining Wall Cubic Yard~~

SECTION 632 - PRECAST MODULAR WALLS

632-1 DESCRIPTION

632-1.01 General. This work shall consist of furnishing and installing a precast modular wall at the location(s) and to the elevation(s) shown in the contract documents.

A Precast Modular Wall is comprised of prefabricated concrete elements including leveling pads, unit infill, earth backfill, joint filler material and geotextile, and a subsurface drainage system to reduce hydrostatic pressure on the wall system.

Obtain all necessary materials, except unit infill, earth backfill and subsurface drainage system, from the approved wall system designer-supplier. Approved designers-suppliers wall systems appear on the Department’s Approved List, available on the Department’s web site.

632-1.02 Definitions. The following general definitions shall be used in conjunction with this section:

1. **Unit/Module.** A precast concrete element, with greater than or equal to 6 ft² wall face area, that are able to be arranged, stacked, placed, combined, or interchanged easily into an assembled wall system.
2. **Bin.** Any volumetric space which is designated to be infilled, as defined in this section, and is encompassed within the dimensions of the wall unit/modules.
3. **Wall.** A series of unit/modules assembled to form bins connected in unbroken sequence so that, when infilled with backfill material, they will act as a single entity (i.e., a retaining wall).
4. **Leveling Pad.** An un-reinforced cast-in-place, or precast, concrete pad which serves as a flat surface for placing the initial course of precast unit/modules.
5. **Joint Filler.** Materials necessary to occupy the joints required for unit/module separation.
6. **Joint Geotextile.** A filter fabric installed to prevent infill and/or backfill material from releasing through the joints.
7. **Unit Infill.** Fill material placed within the bin.
8. **Backfill.** Fill material placed directly behind and/or above the bins in conjunction with the wall assembly to the limits shown in the contract documents.
9. **Subsurface Drainage System.** A system for removing water from behind the wall and channeling it to a point of positive drainage.

632-2 MATERIALS

632-2.01 Unit/Module Materials. Materials shall meet the requirements specified in the following subsections of Section 700:

Precast Modular Walls and Precast Concrete Cribbing	§704-06
Premoulded Resilient Joint Filler	§705-07
Joint Geotextile (Geotextile Drainage)	§737-01 C.

632-2.02 Backfill. Backfill material shall conform to the material requirements as specified in Section 203, *Select Structural Fill*. ~~Backfill material shall conform to the material requirements as specified in §203-2.01 and §203-2.02 C. Select Structural Fill.~~

Comment [c97]:
EI09024

632-2.03 Unit Infill. Unit infill material shall conform to the material requirements as specified in Section 203, *Select Structural Fill*. ~~Unit infill material shall conform to the material requirements as specified in §203-2.01 and §203-2.02 C. Select Structural Fill.~~

Comment [c98]:
EI09024

Based on designer-supplier’s recommendations, unit infill may be modified to allow a coarser gradation. If dissimilar material is to be used for unit infill, submit the material requirements with the Precast Modular Wall design package for approval.

For systems which allow plantings to integrate the structure into the surrounding environment, the front pocket of the unit shall be filled with a minimum of 8 inches of topsoil conforming to the material requirements as specified in §713-01.

632-2.04 Subsurface Drainage. Material incorporated into the subsurface drainage system, not limited to the following, shall conform to the material requirements for:

Optional Underdrain Pipe	§605-2.01
Underdrain Filter, Type I	§605-2.02
Prefabricated Composite Structural Drain	§737-04

632-3 CONSTRUCTION DETAILS

632-3.01 Submittal. Obtain from the designer-supplier a Precast Modular Wall design stamped and signed by a Professional Engineer licensed and registered to practice in New York State. Include in the Precast Modular Wall design package the following:

- A. working drawings of the wall design,
- B. design calculations,
- C. fabrication drawings for precast unit/modules, and
- D. modified gradation for unit infill (if applicable), and
- E. the designer-supplier's Installation Manual.

Submit the Precast Modular Wall design package to the Department for approval in accordance with the requirements for Drawing in §704-03 Precast Concrete – General. Begin work only after receiving the Materials Bureau written approval.

632-3.02 Precast Modular Wall.

A. Excavation. Excavation shall be conducted in accordance with the applicable requirements of Section 206, Trench, Culvert and Structure Excavation, and the details specified in the contract documents.

B. Foundation. Prior to erection of the wall system, the foundation shall be inspected and approved by the Engineer. Grade the area under the Precast Modular Wall level for the width shown in the contract documents. A minimum of 90% of Standard Proctor Maximum Density will be required.

C. Subsurface Drainage System. Install the subsurface drainage system simultaneously with the erection and infill/backfill of the unit/modules to ensure a continuous, uninterrupted system to serve to prevent the accumulation of destabilizing water pressure on the wall. In all cases, the subsurface drainage system will be installed to drain all intercepted water to a point of positive drainage.

D. Erection. All unit/modules shall be assembled and handled in accordance with the designer-supplier's instructions and the contract documents.

During erection, any unit/modules damaged beyond repair shall be removed and replaced, by the Contractor, with approved unit/modules at no additional cost to the State.

The Contractor shall use precast or cast-in-place leveling pads to set the base unit/modules. The wall system shall be constructed to meet the line and grade shown in the contract documents.

E. Infill and Backfill. Immediately prior to backfilling, the Engineer shall inspect unit/modules for damage. Unit/Modules, which are damaged beyond repair as specified in §704-03 will be rejected.

Infilling the bins and backfilling behind the wall shall progress simultaneously with the erection of the unit/modules and the material shall be placed as specified in Section 203, *Select Structural Fill*, ~~§203-3-15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.~~

Comment [c99]:
EI09024

F. Contractor Responsibility. Movement of construction equipment and all other vehicles and loads over and adjacent to walls shall be done at the Contractor's risk. Any damage to bins and unit/modules from any cause shall be repaired or replaced by the Contractor at no additional cost to the State.

632-4 METHOD OF MEASUREMENT

632-4.01 Precast Modular Wall. A Precast Modular Wall will be measured by the number of square feet of the front wall face computed between the payment lines shown on the plans.

632-4.02 Backfill and Infill for Precast Modular Wall. Backfill and Unit Infill will be measured under a separate item. Deductions for the volume of the precast concrete element will be made in accordance with the Approved List drawings.

632-5 BASIS OF PAYMENT

632-5.01 Precast Modular Wall. The unit price bid shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work including leveling pads required to set the precast concrete wall unit/modules.

632-5.02 Backfill and Infill for Precast Modular Wall. The combination of backfill and unit infill shall be paid for jointly under a separate item irrespective of an infill's gradation change or topsoil substitution in the front pocket of a unit. The cost of adding water for compaction of backfill and unit infill shall be included in the price bid for the separate item unless the item "Applying Water" is included in the proposal.

Payment will be made under:

Item No.	Item	Pay Unit
632.10XX	Precast Modular Wall, No Color	Square Feet
632.11XX	Precast Modular Wall, Integral Color	Square Feet
<u>XX</u>	<u>Surface</u>	
01	Plain Concrete Surface	
02	Textured Surface (hand tooled, raked, etc.)	
03	Exposed Aggregate Surface	
04	Architectural Pattern (form liner or stamped)	
05	As Shown on Plans	

Comment [cjt100]:
EI08-020

SECTION 633 - CONDITIONING EXISTING PAVEMENT PRIOR TO HOT MIX ASPHALT (HMA) OVERLAY

633-1 DESCRIPTION. Cleaning, sealing, and filling joints and cracks in the existing pavement, removal and repair of deteriorated pavement sections, stress-relieving pavement repairs, and cleaning the existing pavement and shoulders prior to the application of a new HMA course.

633-2 MATERIALS. Use materials conforming to the requirements of the specifications listed below:

Hot Mix Asphalt True & Leveling	401 and 402
Hot Mix Asphalt Shim	401
Asphalt Filler	702-0700 (Table 702-2, Miscellaneous Asphalt Cements)
Asphalt Emulsions	Tables 702-5 and 702-6
Fine Aggregate	703-01

633-3 CONSTRUCTION DETAILS

633-3.01 Cleaning Existing Pavement and/or Shoulders. Clean existing pavement and shoulder surfaces to be overlaid, including ruts and depressions, by the use of mechanical sweepers, hand brooms, or other means until the surfaces are free of all material which might interfere with the bond between the overlay material and the existing surfaces. All cleaning equipment shall be approved by the Engineer prior to use.

Remove all debris from the pavement and shoulders surfaces and dispose of in an appropriate manner. Keep the pavement and shoulders clean until the overlay operations are completed. Cleaning of shoulders is required only when the shoulder surface is constructed of Portland Cement Concrete (PCC), Hot Mix Asphalt (HMA) or a surface treatment thereon.

633-3.02 Cleaning, Sealing and/or Filling Joints and Cracks. If the existing pavement requires stress relieving repairs, complete these repairs in accordance with §633-3.05, Stress Relieving Pavement Repairs, prior to joint and crack repair work.

Use a compressed air stream of at least 80 psi gage measured at the source, to clean all unsealed and inadequately sealed joints and cracks. Clean all joints and cracks in the pavement of all dirt and loose material to a depth equal to a minimum of twice the crack or joint width, by holding the cleaning jet 1 inch above the pavement surface. Old joint and crack sealer remaining after such cleaning operation need not be removed. Keep the joint and cracks clean until the sealing, filling, and paving operations are completed.

Joints and cracks less than 1/4 inch are not required to be cleaned or sealed. Seal joints and cracks in the existing pavement from 1/4 to 1 inch wide with an asphalt filler. To ensure that space will be available for expansion of the asphalt filler when the HMA is paved over the joint or crack, do not fill the joint or crack completely to the surface. Blot with fine aggregate, if required, to prevent tracking the bituminous material over the pavement surface.

Fill joints and cracks greater than 1 inch wide with HMA Shim or an approved cold, plant-mixed stockpile patching material.

633-3.03 Removal and Repair of Deteriorated HMA Pavement Sections. Remove and dispose of deteriorated HMA pavements to sound material, such that all excavated sides are vertical. Use a chipping hammer meeting the requirements of §580-3.02, Removal of Structural Concrete, a milling machine equipped with a means to suppress airborne particles, or by other appropriate means. If a chipping hammer is used, first sawcut the pavement around the perimeter of the designated repair area to the anticipated repair depth.

Clean and dry all surfaces exposed from removal operation such that they are clean and free of dust and debris. Uniformly apply asphalt emulsion to these surfaces and place the HMA in the repair areas only when the ambient temperature is 45°F or greater. The minimum HMA placement temperature shall be 250°F.

If the total depth of the patch is greater than 3 inches, compact the HMA in multiple lifts of approximately equal thickness with a maximum lift of 3 inches. When placing HMA in multiple lifts, thoroughly compact the lower lifts with a mechanical tamper. For the top lift, thoroughly compact with a roller meeting the requirements of §402-3.04, Rollers, or a small vibratory roller approved by the Engineer. Slightly overfill the patch with HMA such that the resulting patch is dense, smooth, and no more than 1/4 inch above the existing surface.

633-3.04 Removal and Repair of Loose, Broken, or Spalled PCC Pavement Sections.

Remove loose, broken, or spalled PCC pavements to sound material, but not exceeding a depth of 3 inches. Use a chipping hammer meeting the requirements of §580-3.02, Removal of Structural Concrete, a milling machine equipped with a means to suppress airborne particles, or by other appropriate means. If a chipping hammer is used, first sawcut the pavement around the perimeter of the designated repair area to the anticipated repair depth not to exceed 3 inches. Dispose of all the removed PCC material in an appropriate manner.

Clean and dry all surfaces exposed from removal operation such that they are clean and free of dust and debris. Uniformly apply asphalt emulsion to these surfaces and place the HMA in the repair areas only when the ambient temperature is 45°F or greater. The minimum HMA placement temperature shall be 250°F.

If the total depth of the patch is greater than 3 inches, compact the HMA in multiple lifts of approximately equal thickness with a maximum lift of 3 inches. When placing HMA in multiple lifts, thoroughly compact the lower lifts with a mechanical tamper. For the top lift, thoroughly compact with a roller meeting the requirements of §402-3.04, Rollers, or a small vibratory roller approved by the Engineer. Slightly overfill the patch with HMA such that the resulting patch is dense, smooth, and no more than 1/4 inch above the existing surface.

633-3.05 Stress Relieving Pavement Repairs. Unless indicated otherwise in the contract documents, the pressure relief joint shall be a minimum of 15 feet longitudinally and the full width of the pavement, including the curb, and gutter, if any. If an existing transverse joint is within the pressure relief joint repair, remove the existing transverse joint by a minimum of 12 inches. Saw cut the transverse lines of the designated repair area full depth to produce a neat cut. Remove the PCC pavements with minimum disturbance to the subbase. Dispose of all the removed PCC material in an appropriate manner.

Level and recompact the subbase, prior to the placement of the HMA.

Clean and dry all surfaces exposed from removal operation such that they are clean and free of dust and debris. Uniformly apply asphalt emulsion to these surfaces and place the HMA in the repair areas only when the ambient temperature is 45°F or greater. The minimum HMA placement temperature shall be 250°F.

Compact the HMA in multiple lifts of approximately equal thickness with a maximum lift of 3 inches. Thoroughly compact each lift with a roller meeting the requirements of §402-3.04, Rollers, or a small vibratory roller approved by the Engineer. Slightly overfill the patch with HMA such that the resulting patch is dense, smooth, and no more than 1/4 inch above the existing surface.

633-4 METHOD OF MEASUREMENT

633-4.01 Cleaning Existing Pavement and/or Shoulders. The quantity measured will be the number of square yards of existing pavement and/or shoulder surfaces cleaned.

633-4.02 Cleaning, Sealing, and/or Filling Cracks. The quantity measured will be on a lump-sum basis for work satisfactorily completed.

633-4.03 Cleaning, Sealing, and/or Filling Joints. The quantity measured will be on a linear feet basis for work satisfactorily completed.

633-4.04 Removal and Repair of Deteriorated HMA Pavement Sections. The quantity measured will be the number of square yards of existing pavement surface removed and repaired.

633-4.05 Removal and Repair of Loose, Broken, or Spalled PCC Pavement Sections. The quantity measured will be the number of square yards of existing pavement surface removed and repaired.

633-4.06 Stress Relieving Pavement Repairs. The quantity measured will be the number of square yards of existing pavement surface removed and repaired.

633-5 BASIS OF PAYMENT

633-5.01 Cleaning Existing Pavement and/or Shoulders. The unit price bid for this work shall include the cost of all labor, materials, and equipment necessary to complete the work.

633-5.02 Cleaning, Sealing, and/or Filling Cracks. The lump sum price bid for this item shall include the cost of all labor, materials, and equipment necessary to complete the work.

633-5.03 Cleaning, Sealing and/or Filling Joints. The unit price bid for this item shall include the cost of all labor, materials, and equipment necessary to complete the work.

§633

633-5.04 Removal and Repair of Deteriorated HMA Pavement Sections. The unit price bid for this work shall include the cost of all labor, materials, and equipment necessary to complete the work.

633-5.05 Removal and Repair of Loose, Broken, or Spalled PCC Pavement Sections. The unit price bid for this work shall include the cost of all labor, materials, and equipment necessary to complete the work.

633-5.06 Stress Relieving Pavement Repairs. The unit price bid for this work shall include the cost of all labor, materials, and equipment necessary to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
633.11	Cleaning Existing Pavement and/or Shoulder	Square Yards
633.12	Cleaning, Sealing and/or Filling Cracks	Lump Sum
633.13	Cleaning, Sealing and/or Filling Joints	Linear Foot
633.14	Removal and Repair of Deteriorated HMA Pavement	Square Yards
633.15	Removal and Repair of Loose, Broken, or Spalled PCC Pavement	Square Yards
633.16	Stress Relieving Pavement Repairs	Square Yards

SECTION 634 (VACANT)

SECTION 635 - CLEANING AND PREPARATION OF PAVEMENT SURFACES FOR PAVEMENT MARKINGS

635-1 DESCRIPTION. This work shall consist of cleaning and preparing portland cement and bituminous pavement surfaces for the application of reflectorized pavement marking materials. Examples of pavement markings requiring this item include, but are not limited to, reflectorized thermoplastic, preformed, and epoxy type marking materials.

635-2 MATERIALS. Materials and equipment for cleaning and preparing pavement surfaces may be selected by the Contractor, except that they will be approved by the Engineer and shall conform to all applicable Local, State or Federal law, regulation or codes.

635-3 CONSTRUCTION DETAILS

635-3.01 General. The work required to clean and prepare pavement surfaces shall be performed in accordance with these specifications, the contract documents and to the satisfaction of the Engineer. Before any work is begun, a schedule of operations shall be submitted for the approval of the Engineer. When the work is conducted under traffic, the Contractor shall supply all necessary flags, markers, signs, and other devices to maintain and protect traffic.

Whenever grinding, waterblasting, dry sandblasting or other operations are performed, the work shall be conducted in such a manner that the finished pavement surface is not damaged or left in a pattern that will mislead or misdirect the motorist. When these operations are completed the pavement surface shall first be power broomed and then blown off with compressed air to remove residue and debris resulting from the cleaning work. All such debris that remains on the roadway, including broken parts from cleaning equipment, shall be removed and disposed of in a manner satisfactory to the Engineer.

The Contractor shall conduct removal and cleaning work in such a manner as to minimize airborne dust, and similar debris so as to prevent a hazard to motor vehicle operation or nuisance to property.

Care shall be taken on bituminous and portland cement concrete surfaces when performing removal and cleaning work to prevent damage to transverse and longitudinal joint sealers.

Unless otherwise specified in the contract documents the area(s) and quantity of cleaning work will be determined by the Engineer at the job site when the contract is in progress. In addition the Engineer will have the authority of increasing the work area as the project continues.

635-3.02 Limits of Work. Cleaning and surface preparation work shall be confined to the surface area specified for the application of pavement marking materials; or the surface area of existing pavement markings that are specified for removal on the plans, or as directed by the Engineer.

Surface preparation work includes cleaning for lines or cleaning for letters and symbols. Lines will be meant to include: broken line; dotted line; channelizing line; barrier lines; stop lines; crosswalk line and crossbars.

When lines are cleaned, the area of preparation will be the width of the new pavement marking, or existing line, plus 1 inch on each side. When letters and symbols are cleaned the area of preparation will be sufficiently large to accommodate the new marking, or to remove the existing marking.

635-3.03 Cleaning Concrete Curing Compounds. On new portland cement concrete pavements, cleaning operations shall not begin until a minimum of 30 days after the placement of concrete. All new concrete pavements shall be cleaned by either sandblasting or water blasting. When water blasting is performed, pavement markings shall be applied no sooner than 24 hours after the blasting has been completed.

The extent of the blasting work shall be to clean and prepare the concrete surface such that:

- A. There is no visible evidence of curing compound on the peaks of the textured concrete surface.
- B. There are no heavy puddled deposits of curing compound in the valleys of the textured concrete surface.
- C. All remaining curing compound is intact; all loose and flaking material is removed.
- D. The peaks of the textured pavement surface are rounded in profile and free of sharp edges and irregularities.

635-3.04 Cleaning Existing Pavement Markings. Existing pavement markings shall be cleaned for the purpose of:

- A. Preparing the pavement surface for the application of new pavement markings in the same location as the existing markings.
- B. To remove existing markings that are in good condition which, if allowed to remain, will interfere with or otherwise conflict with newly applied marking patterns.

It shall be understood that in this context cleaning means the removal of an existing marking. It is not intended that all deteriorated existing pavement markings be removed. Example: If a new marking is applied to an unmarked "gap" in a broken line and the existing broken line pattern is worn or deteriorated, as determined by the Engineer, to the extent that it is not misleading or confusing to the motorist, the existing markings do not require removal.

Pavement markings shall be cleaned to the extent that 95% to 100% of the existing marking is removed. Removal operations shall be conducted in such a manner that no more than moderate color and/or surface texture change results on the surrounding pavement surface. When waterblasting is performed, pavement markings shall be applied no sooner than 24 hours after the blasting has been completed. Waterblasting shall not be allowed for cleaning markings requiring replacement within the same day as removal as specified under §635-3.05.

The determination of acceptable removal will be made by judgement of the Engineer and will be guided by the Department's pictorial standards of acceptable marking removal. Pictorial standards are available from the Materials Bureau.

635-3.05 Replacement of Pavement Markings. The Contractor shall not remove existing pavement markings and leave the highway unmarked overnight.

635-4 METHOD OF MEASUREMENT. Surface cleaning and preparation of pavement surfaces for lines will be measured in feet along the centerline of the prepared surface and will be based on a nominal 4 inches wide line. Measurement for cleaning surfaces for line widths greater than the nominal 4 inches will be made by the following method:

$$\frac{\text{Nominal Existing Width of Line (inches)} \times \text{Length (feet)}}{4 \text{ (inches)}}$$

No payment will be made for the additional 1 inch of cleaning on each side of the line required by §635-3.02.

No payment will be made for cleaning the number of feet of unmarked gaps between broken or dotted line segments.

Cleaning and preparation of letters and symbols on pavement surfaces will be measured by each unit cleaned. A unit will consist of one letter or one symbol. Example: "STOP" would be measured as four units.

The Engineer will adjust the quantities of these items as required to meet field conditions. This may result in substantial increases or decreases of the proposal quantities.

635-5 BASIS OF PAYMENT. The accepted quantities of cleaned pavement surface will be paid for at the contract unit price, which shall include the cost of furnishing all labor, materials and equipment to satisfactorily complete the work. The cost of maintaining and protecting traffic during the cleaning work will be included in the price bid. No payment will be made under this item for the removal of pavement markings required under §635-3.05.

Payment will be made under:

Item No.	Item	Pay Unit
635.0103	Cleaning and Preparation of Pavement Surfaces-Lines	Feet
635.0203	Cleaning and Preparation of Pavement Surfaces-Letters	Each
635.0303	Cleaning and Preparation of Pavement Surfaces-Symbols	Each

SECTION 636 (VACANT)

SECTION 637 - ENGINEER'S FIELD OFFICE, LABORATORY AND EQUIPMENT

637-1 DESCRIPTION. This work shall consist of providing, furnishing and maintaining an Engineer's Field Office and a Field Laboratory in good working condition and appearance for the exclusive use of, and occupancy by the inspection staff. The buildings shall be habitable environments, readily accessible to the public and free of any recognizable health or safety hazards. The work shall also consist of providing and maintaining equipment for use by the inspection staff.

637-1.01 Engineer's Field Office. This work shall consist of providing, for the Engineer's use a building, or a portion thereof, or a modular trailer of a specified type erected at a location approved by the Engineer.

637-1.02 Field Laboratory. This work shall consist of providing a Field Laboratory for soils and materials testing at a location approved by the Engineer.

637-1.03 Concrete Cylinder Curing Box. This work shall consist of providing a concrete cylinder curing box.

637-1.04 Mobile Telephone. This work shall consist of providing and maintaining mobile telephone equipment and service.

637-1.05 Pager. This work shall consist of providing and maintaining pager communication equipment and service.

637-1.06 Two-Way Radio System. This work shall consist of providing and maintaining a two-way radio system.

637-1.07 Digital Camera. ~~This work shall consist of providing and maintaining a fully operational digital camera system.~~ (Vacant)

Comment [cjt101]:
EI 08-010

637-1.08 Digital Camcorder. This work shall consist of providing and maintaining a fully operational digital camcorder system.

637-1.09 Rain Gauge. This work shall consist of providing and maintaining a wireless rain gauge system.

637-1.10 Inspection Vehicle. This work shall consist of providing and maintaining motor vehicle(s) for exclusive use by the Engineer and the Inspection Staff.

637-1.11 Inspection Boat. This work shall consist of providing and maintaining a motorized boat for exclusive use by the Engineer and the Inspection Staff.

637-1.12 Office Technology Supplies. This work shall consist of providing technology-related materials and supplies for use by the inspection staff.

637-1.13 (Vacant)

637-1.14 Partnering Workshop. This work shall consist of a partnering workshop coordinated and facilitated by an independent facilitator. The Department and the Contractor will share the cost of the partnering workshop equally.

637-2 MATERIALS.

637-2.01 Engineer’s Field Office. The Engineer’s Field Office shall be within a secured, weatherproof building or mobile trailer. If two (2) or more mobile trailer units are provided, they shall be joined with weatherproof connections. Mobile trailers shall be in new or like new condition. The Contractor may furnish equivalent facilities in an existing building, provided that the building is located to provide convenient service. The Contractor shall supply the Engineer with a copy of the Certificate of Occupancy for the existing building.

The Engineer’s Field Office shall be in accordance with the requirements of the New York State Uniform Fire Prevention and Building Code, 19 NYCRR, and any applicable local codes.

The electrical system shall be able to continuously operate all equipment and be provided with adequate receptacles. To accommodate computer equipment, the field office shall be provided with a dedicated 20 amp electrical service and a vacant floor-to-ceiling area with a 3 foot x 3 foot footprint along a wall for the installation of a computer hardware rack/cabinet. Electric light shall be provided by non glare-type luminaries to provide a minimum illumination level of 100 foot-candles at desk-height level. An ambient air temperature of 70°F ±5°F shall be maintained.

Fire extinguishers and smoke and carbon monoxide detectors shall be provided and installed.

The Engineer’s Field Office shall be partitioned to provide separate rooms, defined as either “small” or “large”, with adjoining doors. Table 637-1 below contains the minimum area requirements for each of the office types.

TABLE 637-1 ENGINEER’S FIELD OFFICE AREA REQUIREMENTS					
Physical Requirement	Engineer’s Field Office Type				
	1	2	3	4	5
Min. total floor area (sf)	530	860	1300	2500	2700

Min. number of small rooms	2	3	2	3	6
Min. floor area of small rooms (sf)	100	100	120	150	175
Min. number of large rooms	1	1	2	2	2

A. Potable Water. From a local municipal water supply, certified well or bottled with a heating/refrigerator unit to provide hot and cold water. An exterior frost-free hose bib shall be provided in a location adjacent to the Engineer’s Field Office. The hose bib need not be installed on a potable water line, and if the water in the line is not potable, it shall be clearly marked as such.

B. Restroom. A separately enclosed room, lockable from the inside, that is properly ventilated and in compliance with applicable sanitary codes. The Contractor shall provide all lavatory amenities, necessary paper and soap products, hot and cold running water and a toilet. The toilet shall be flush-type where sanitary facilities are available, and a type approved by the Engineer prior to installation where sanitary facilities are not available. The minimum required number of restrooms to be provided is specified in Table 637-2.

C. Parking Area. The Contractor shall provide and/or construct paved or hard surfaced (gravel or bankrun material) secure parking area with dedicated parking spaces adjacent to the Engineer’s Field Office. Each parking space shall be 9 feet by 18 feet, and the minimum required number of spaces to be provided is specified in Table 637-2.

D. Field Office Signs. The sign panel material shall be aluminum, fiberglass, plywood or lightweight plastic. The sign sheeting shall be ASTM Type III. The sign panel shall be 36 inches high by 48 inches wide with white legend on green background with the phrases as positioned and described below. If erected at a location where the sign might be struck by an errant vehicle, the sign support shall be a breakaway type.

The letters in the phrase "FIELD OFFICE" shall be 6 inches C series with the top of the letters 6 inches below the top of the panel. The letters in the phrase "ENGINEER-IN-CHARGE" shall be 6 inches B series with the top of the letters 18 inches below the top of the panel. The letters in the phrase "N.Y.S. DEPT. OF TRANSPORTATION" shall be 1 1/2 inches E series with the top of the letters 30 inches below the top of the panel. All phrases shall be centered horizontally on the panel.

If the Engineer’s Field Office is not located within or adjacent to the contract limits, two (2) additional signs shall be displayed conspicuously within the contract limits. The signs shall be similar to the above description, except that they shall be 48 inches high by 64 inches wide and have an additional bottom line of text containing the street address of the Engineer’s Field Office. The letters in the street address shall be 6 inch B series with the top of the letters 36 inches below the top of the panel and centered horizontally on the panel.

E. Mailbox. Standard mailbox (with post if necessary) or post office box meeting the requirements of the U.S. Postal Service.

F. Telephone and Answering System. A separate telephone and answering system for the exclusive use of the inspection staff. The minimum required number of telephone voice lines to be provided is specified in Table 637-2 (these lines are in addition to the separate lines to be provided for the facsimile machine and dial-up computer access). The telephone and answering system shall provide the ability to answer all voice lines from each voice line, transfer calls to all voice lines and be equipped with a single, dedicated answering system.

A minimum of one (1) telephone shall be cordless and a minimum of one (1) telephone shall be equipped with speaker and conference call capability. The remaining telephones, at least one (1) per required voice line, shall be extension telephones with minimum 25 foot long cords. The answering system shall be capable of recording outgoing messages up to 60 seconds long and receiving a minimum of 40 incoming messages of 60 seconds duration. The system must include automated voice marking of time and day of each message received and provide a message mark so that new messages may be played back without erasing old messages. The system shall include remote

programming of playback, backspace, and outgoing message re-record and allow for the retrieval of messages without a remote control unit.

G. Facsimile Machine. Plain paper laser or inkjet facsimile machine with a dedicated telephone line. The machine shall be capable of sending and printing a maximum paper size of 8 1/2 x 14 inches, have a minimum 20 page memory storage, a minimum 20-sheet document feeder, a minimum 50-sheet paper capacity, transmit at least 6 pages per minute and have an autodial/redial with a minimum of 50 phone number memory. The machine shall be capable of storing and printing outgoing message confirmation information and printing the sender's name, fax number and page number on incoming faxes.

H. Photocopier. Heavy duty, electric, dry-process photocopying machine. The machine shall be capable of duplex copying paper sizes of 8 1/2 x 11 inches, 8 1/2 x 14 inches and 11 x 17 inches, and have separate trays for each paper size. It shall have a document feeder, collator and the capability to reduce/enlarge copies between each paper size. One (1) case (5,000 sheets, 20 lb, white) of each paper size shall be provided as initial stock.

I. Paper Shredder. Automatic start, heavy duty cross-cut paper shredder. The shredder shall be able to receive 8 1/2 inch wide paper and shred a minimum of 15 sheets simultaneously along with CDs and staples.

J. Adding Machine. Tape type, four-function adding machine that registers to at least 10 digits. The minimum required number of adding machines to be provided is specified in Table 637-2.

K. Pencil Sharpener. Manual or electric pencil sharpener, minimum 1 per room.

L. Exterior Bulletin Board. An installed 4 foot x 8 foot weatherproof bulletin board in front of or adjacent to the Engineer's Field Office. The bulletin board may be attached to an outside wall of the office. The location selected must be handicapped accessible and clearly visible.

M. Interior Bulletin Board. An installed, wall-mounted 4 foot x 6 foot bulletin board made of cork or similar material in a large room, and one (1) 2 foot x 4 foot wall mounted bulletin board installed per room.

N. Dry Erase Board. Installed, wall-mounted 2 foot x 4 foot dry erase boards, minimum one (1) per room.

O. Storage Locker. Metal or wood storage locker with shelves, a tumbler lock and two (2) keys for the storage of survey, GPS and testing equipment. The total locker space footprint provided shall be a minimum of 9 square feet with a minimum height of 6 feet.

P. Fire Resistant Cabinet. Fire resistant, legal size filing cabinet with locks and two (2) keys each, meeting the requirements of ANSI/UL Standard 72 for Insulated Filing Devices, Class 350-1 hour. Each office shall be provided with two (2) 2-drawer cabinets, and the required number of additional 4-drawer cabinets as specified in Table 637-2.

Q. Bookcase. Self-standing, 3-shelf metal or wood bookcase, approximately 4 feet high, 4 feet wide and 1 foot deep. The minimum required number of bookcases to be provided is specified in Table 637-2.

R. Wastebasket. Minimum 7 gallon wastebasket, minimum one (1) per desk.

S. Refrigerator. Electric, top-freezer type providing a minimum storage space of 15 cubic feet for Engineer's Field Office Types 1 and 2, and a minimum storage space of 21 cubic feet for Types 3, 4 and 5.

T. Kitchenette. To include a minimum 1 cubic foot, 1,300 watt microwave oven, a sink with hot and cold running water with minimum dimensions of 15 inch x 15 inch x 6 inch deep, usable counter space with minimum dimensions of 5 feet long x 2 feet deep and cabinet space with minimum dimensions of 5 feet long x 1 1/2 feet deep x 2 1/2 feet high. If the water in the sink is not potable, it shall be clearly marked as such.

U. Stove. Electric, propane or bottle gas stove with a minimum of two (2) burners adequate for rapid drying of soil samples, including fuel or electrical supply. A stove is required when a separate Field Laboratory is not included.

V. First Aid Kit. A Type III kit in accordance with ANSI Z308.1 Minimum Requirements for Workplace First Aid Kits. The minimum number of first aid kits to be provided is specified in Table 637-2.

W. Thermometer. A minimum-maximum thermometer displaying in degrees Fahrenheit and mounted with an external probe to give the temperature both indoors and outdoors.

X. Coat Rack. A metal or wood coat rack or closet capable of holding at least 4 coats. The minimum required number of coat racks to be provided is specified in Table 637-2. A single coat rack may be provided as long as it holds the minimum number of coats as per Table 637-2.

Y. Office Desk and Chair. Fully assembled freestanding office desks and chairs. Each desk shall have a 5 feet long by 2 1/2 feet wide work surface and a height of 30 inches, at least 2 lockable drawers and include an adjustable shelf approximately 1 foot wide and no less than 2 1/2 feet long. Each desk shall also be provided with an adjustable chair with arms, 5 legs with casters and be adjustable from approximately 16 inches to 24 inches in height. Each desk shall have a dedicated electrical outlet receptacle. The required number of office desks and chairs to be provided is specified in Table 637-2.

Z. Office/Conference Table. Commercial-grade rectangular table with weather/spill resistant top a minimum of 8 feet long by 2 1/2 feet wide by 30 inches high. The minimum required number of office/conference tables to be provided is specified in Table 637-2.

AA. Folding Chair. Commercial-grade, folding steel chair with approximate overall dimensions of 30 inches high by 19 inches wide by 21 inches deep. The minimum required number of folding chairs to be provided is specified in Table 637-2.

BB. Drafting Table. Adjustable height, tilting top drafting table with brackets and legs and approximate dimensions of 6 feet long by 3 feet wide by 3 feet high. The minimum required number of drafting tables to be provided is specified in Table 637-2.

TABLE 637-2 ENGINEER'S FIELD OFFICE FURNISHING REQUIREMENTS	
Furnishing Description	Required Number per Engineer's Field Office Type

	1	2	3	4	5
Restrooms	1	1	2	2	3
Parking spaces	6	8	12	18	22
Telephone voice lines	2	3	4	6	8
Telephone line for computers	1	1	1	1	1
Telephone line for facsimile	1	1	1	1	1
Adding machines	2	2	2	3	6
Fire resistant cabinets (4-drawer)	2	3	4	6	8
Bookcases	5	7	10	12	16
First aid kits	1	1	1	2	2
Coat racks	1	2	3	4	5
Office desks and chairs	4	8	12	18	22
Office/conference tables	2	2	3	4	5
Folding chairs	4	6	8	10	15
Drafting tables	1	1	2	3	3
Drafting stools	2	2	4	6	6
Vertical plan filing racks	1	1	2	3	8
Roll file units	1	1	1	2	4

CC. Drafting Stools. Adjustable height stool with backrest. The minimum required number of drafting stools to be provided is specified in Table 637-2.

DD. Vertical Plan Filing Rack. Constructed of metal, capable of hanging up to 12 sets of plan drawings up to 3 feet x 4 feet in size, 12 hanging clamps included. The minimum required number of vertical plan filing racks to be provided is specified in Table 637-2.

EE. Roll File Unit. Twelve (12) compartments, each measuring approximately 6 inches x 6 inches. The minimum required number of roll file units to be provided is specified in Table 637-2.

637-2.02 Field Laboratory. The Field Laboratory shall be a secured, weatherproof room, building or mobile structure not less than 100 square foot floor area in size. The floor covering shall be linoleum, tile or other serviceable finish. A local exhaust system shall be provided. An ambient air temperature of 70°F ±10°F shall be maintained. The Contractor may furnish equivalent facilities in an existing building, provided that the building is located to provide convenient service. The Contractor shall supply the Engineer with a copy of the Certificate of Occupancy for the existing building.

The Field Laboratory shall be in accordance with the requirements of the New York State Uniform Fire Prevention and Building Code, 19 NYCRR, and any applicable local codes.

The electrical system shall be able to continuously operate all equipment and be provided with adequate receptacles. Where an electric hotplate or stove is provided, service shall be increased over 20 amperes by an amount equal to the rating of the device provided.

The Field Laboratory shall be sufficiently anchored to prevent damage from vibration caused by the laboratory equipment.

Fire extinguishers and smoke and carbon monoxide detectors shall be provided and installed.

A. Potable Water. From an existing system or from an external 55 gallon (minimum) gravity-feed storage tank connected to the sink faucet and refilled as necessary.

B. Sink. A sink at least 36 inches long by 24 inches wide by 18 inches deep, equipped with water faucet and drain line.

C. Counter. A work counter next to sink at least 24 inches long by 24 inches wide.

D. Cabinet. A storage cabinet or locker at least 2 feet square by 6 feet high, equipped with at least 4 shelves, a lock and 2 keys.

E. Table. A heavy duty work table not less than 8 feet long by 2 1/2 feet wide by 3 feet high.

F. Pedestal. A heavy wooden block for soil compaction tests, nominally 10 inches square by 12 inches high.

G. Stove. As specified in §637-2.01U.

H. Office Desk and Chair. As specified in §637-2.01Y.

637-2.03 Concrete Cylinder Curing Box. The concrete cylinder curing box shall be constructed of non corroding materials. A moisture proof seal shall be provided between the lid and body of the box. Provision for automatic control of water temperature to 72°F ±5°F shall be made when the box is located in an uncontrolled environment. A bimetallic thermometer shall be inserted with its sensing element in the storage water. The thermometer shall be capable of being read from the outside without opening the box. The thermometer shall have minimum gradations of 1°F and shall be protected from damage. Electric utility connections shall be made in a lockable switch box securely attached to the outside of the curing box.

A rustproof wire or metal rack shall be set above the bottom of the box to support cylinders in an upright position. The rack and all temperature control elements shall be positioned to allow free circulation of water around the cylinders. A combination hose connection and drain shall be provided at the lower front edge of the box so that it may be drained or water may be circulated. A drain shall also be provided on the box in such a position that when open will drain water to within 1 inch over the top of the cylinders. All areas of the box shall be easily drained and accessible for cleaning.

The concrete cylinder curing box shall be capable of maintaining the required water temperature through an ambient air temperature range of -10°F to +100°F. The box shall be capable of holding a minimum of nineteen (19) 6 inch x 12 inch cylinders. When filled with water, the box shall not leak enough so that the cylinders are exposed.

637-2.04 Mobile Telephone. Mobile telephone equipment shall meet the requirements below. All necessary hardware, cables, operating manuals, and other pertinent media for all the components shall be provided. The equipment shall be no more than one (1) year old. To verify the age of the equipment, the Contractor shall provide the Engineer with a dated copy of the receipt(s) for the purchase of the equipment. Once equipment has been provided, it does not require replacement every year. The number of mobile telephones shall be as identified in the contract proposal special note entitled "Section 637 Pay Item Quantities".

A. Telephone and Accessories

- Handheld and transportable
- Digital communications technology, if service is available, otherwise analog is acceptable.
- Two-way radio ('push-to-talk', 'walkie-talkie', etc.) capability, if service is available, otherwise 'mobile-to-mobile' calling feature is acceptable.
- Electronic locking capability
- Spare battery
- AC power charging unit
- Hands-free operation accessories
- Belt clip/holster
- DC power cord for in-vehicle use

B. Service

- Minimum 500 minutes per month telephone air time calling plan
- Continuous coverage across entire contract location, or best coverage available

- Local service so that most on-site and regional calls are not considered long-distance calls

637-2.05 Pager. The pager and its accessories shall meet the requirements below. All necessary hardware, cables, operating manuals, and other pertinent media for all the components shall be provided.

The number of pagers shall be as identified in the contract proposal special note entitled “Section 637 Pay Item Quantities”.

A. Pager and Accessories

- Pocket-sized paging device
- Capable of being activated by a public telephone call
- Audible and vibrating message alerts
- Message time-stamping
- Batteries
- Belt clip/holster for pager

B. Service

- Minimum 500 numeric pages per month pager service plan
- Continuous coverage across entire contract location (or best coverage available)
- Local or toll free pager number
- Voice mail (or alternate message recording option) with storage for a minimum of 15 messages

637-2.06 Two-Way Radio System. The two-way radio system shall meet the requirements below. All necessary hardware, cables, operating manuals, and other pertinent media for all the components shall be provided. The Contractor shall obtain all necessary FCC licenses, permits, and copies of FCC Regulations required for the operation of the equipment furnished. The number of base stations, in-vehicle radios and handheld radios shall be as identified in the contract proposal special note entitled “Section 637 Pay Item Quantities”.

A. Base Station

- Desktop two-way radio base station
- Power – Operate from a 110 VAC power supply, consuming no more than 50 Watts
- Frequency – Provide one channel (T/R) within the 150 MHz to 174 MHz range
- Desk microphone
- Tone coded squelch
- Transmitter
 - RF Power Output – 25 Watts (minimum)
 - Modulation – ± 5 KHz
 - Spurious and Harmonic Emissions – Down 60 dB below carrier
 - Frequency Stability – $+0.0005\%$ of assigned center frequency from -20°F to 140°F
 - FM Noise – Down -55 dB (minimum)
 - Audio Response – Within +1 dB to -3 dB over 300 Hz to 3000 Hz with 6 dB/octave pre-emphasis at less than 3% distortion (minimum)
- Receiver
 - Sensitivity – 0.35 microvolts for 20 dB quieting (minimum)
 - Squelch Sensitivity – 0.2 microvolts (minimum)
 - Selectivity – -70 dB EIA for two signals on 30 KHz channel spacing (minimum)
 - Frequency Stability – $+0.0005\%$ from -20°F to 140°F temperature range with 75°F reference (minimum)
 - Modulation Acceptance – + 6.5 KHz (minimum)
 - Audio Output – 3 watts with less than 5% distortion over 300 to 3000 Hz (minimum)
 - Intermodulation – $d\nu N_n$ -70 dB (minimum)
- Antenna

- Accepts RF energy up to 500 Watts in frequency band from 150 MHz to 174 MHz, into an impedance of 50 Ohms
 - Radiate energy with a gain of 5 dB in an omnidirectional pattern (minimum)
 - VSWR shall not exceed 1.5 to 1
 - Mast length of 20 feet (minimum)
 - Mounted with heavy duty galvanized steel wall mount set (or Engineer-approved alternative)
 - Grounded for lightning protection to N.E.C. standards
 - Transmission Line (Base Station to Antenna)
 - 1/2 inch coaxial cable with corrugated copper outer and copper clad aluminum inner conductors, and foam dielectric and vinyl sheath (or Engineer-approved alternative)
- All necessary connectors, adaptors, and installation hardware

B. In-Vehicle Radio

- Mobile, in-vehicle, dash-mounted two-way radio device
- One channel capability in the 150 MHz to 174 MHz band (minimum) with tone-controlled squelch
- Inside speaker
- Press-to-talk microphone
- Antenna
- All necessary cables and hardware
- Power Source – 12 V DC with negative ground
- Transmitter and receiver parameters shall be the same as those of the base station and handheld two-way radio units

C. Handheld Radio

- Handheld, portable, two-way radio device
- Power output – 4 Watt (minimum)
- Battery – Rechargeable w/ recharging unit
- Battery life – 12 hours (minimum), otherwise alternate provisions (extra radios, batteries, etc.)
- Belt clip or holster
- Durability – Meets Mil Std 810 C, D, and E

637-2.07 Digital Camera. ~~The digital camera system shall meet the requirements below. All necessary hardware, cables, operating manuals, and other pertinent media required for the operation of the camera unit itself, including connecting the camera to the office computer system shall be provided. The camera must be able to download the images to a computer without any proprietary software having to be installed on a computer. The equipment shall be no more than one (1) year old. To verify the age of the equipment, the Contractor shall provide the Engineer with a dated copy of the receipt(s) for the purchase of the equipment. Once equipment has been provided, it does not require replacement every year.~~

- ~~• Minimum 3.0 megapixel resolution with 3x optical zoom and autofocus operation~~
- ~~• 1 1/2 inch LCD screen and optical viewfinder~~
- ~~• Built in intelligent flash (auto/on/off)~~
- ~~• Time/date stamp on each picture~~
- ~~• A total of two (2) rechargeable sets of batteries (Lithium-Ion or NiMH) and high-capacity (approximately 1 hour) charging unit~~
- ~~• Two (2) 512 MB memory cards commercially available removable recording media~~
- Soft storage/carry case with shoulder strap **(Vacant)**

637-2.08 Digital Camcorder. The digital camcorder shall meet the requirements below. All necessary hardware, cables, operating manuals, and other pertinent media for all the components shall be provided, including connecting the camera to the office computer system. The camera must be able to

download the video to a computer without any proprietary software having to be installed on the computer. The equipment shall be no more than one (1) year old. To verify the age of the equipment, the Contractor shall provide the Engineer with a dated copy of the receipt(s) for the purchase of the equipment. Once equipment has been provided, it does not require replacement every year.

- Commercially available format
- Autofocus operation
- 2 1/2 inch LCD screen and optical viewfinder
- Equipped with Electronic Image Stabilization
- Low-light recording capable
- Time/date stamp on recording
- AC adapter and all cables and connections necessary for computer interface
- Two (2) rechargeable batteries (Lithium-Ion or NiMH) and charging unit
- Recording media to store 180 minutes of video footage
- Soft storage/carry case with shoulder strap

637-2.09 Rain Gauge. The wireless rain gauge system shall meet the requirements below. All necessary mounting materials and hardware, operating manuals and other pertinent media for the components shall be provided.

- Wireless remote transmission from outdoor weatherproof rainfall sensor to indoor display unit
- Self-emptying tipping bucket
- Display daily rainfall information and at least nine (9) day historical rainfall records
- Two (2) sets of rechargeable batteries for each component and charging unit
- No computer software shall be necessary for rain gauge operation or rainfall data storage/viewing

637-2.10 Inspection Vehicle. The vehicle(s) provided shall not be over four (4) years old or have over 35,000 miles on the odometer as of the delivery date. The supplied vehicle(s) shall be of such durability to carry occupants and equipment over rough terrain and contain sufficient weather protection for both the occupants and equipment. The vehicle(s) shall have sufficient cargo capacity to carry the equipment necessary for the work. The vehicle(s) shall be properly registered, maintained (including repairs, tires, lubrication, fuel, washing, etc.), and be provided with an owner's policy of liability insurance in conformance with §107-06B. The vehicle(s) shall be equipped with or meet the following minimum specifications:

- Manufacturer's Standard 4 or 6 cylinder engine
- Automatic transmission
- Manufacturer's Standard four (4) wheel drive or all-wheel drive
- Power steering
- Air conditioning
- Manufacturer's base level interior option
- Left, right and center mirrors
- Roof mount flashing yellow light
- All Standard Manufacturer equipment and accessories including spare tire, jack, owner's manual, etc. shall be included with the vehicle(s), along with vehicle registration and insurance cards

637-2.11 Inspection Boat. The boat provided shall comply with the following minimum requirements:

- All required capacity, maximum horsepower, and identification plates shall be affixed in the manner required by Coast Guard regulations.
- The motor's horsepower shall meet the rated requirements of the boat and be equipped with a forward, neutral, and reverse. The power train shall be equipped with an interlock so that the engine may not be started in gear. U.S. Coast Guard-approved fuel tanks shall be provided.

§637

- All equipment required by Coast Guard regulations shall be provided for the boat. The equipment shall include, but not be limited to, the following:
 - Class B-1 fire extinguisher
 - Life jackets for all persons aboard
 - One anchor, Danforth-type or Navy stockless, suitable for the specified boat
 - Bailing device
 - Power operated whistle or horn
 - Visual distress signals
 - Means for accessing work sites not accessible from land from the water (piers, floating equipment, etc.)
- Registration, licenses, and other legal requirements for boat operation shall be obtained by the Contractor and kept current by the Contractor for the length of time the boat is in operation.
- Dockage facilities shall be maintained by the Contractor and shall be constructed (if necessary) so that easy access to the boat is provided at all times under all tidal conditions.
- The Contractor shall maintain the boat in good, clean condition at all times as required. Fuel tanks shall be maintained full at all times.

A. Inspection Boat – Type A

- Boat lengths up to and including 18 feet
- The boat will be operated by an appropriately trained and certified member of the inspection staff.

B. Inspection Boat – Type B

- Boat lengths in excess of 18 feet
- An appropriately trained, certified and licensed operator shall be provided.

637-2.12 Office Technology Supplies. Materials as specified in the bid documents or by the Engineer.

637-2.13 (Vacant)

637-2.14 Partnering Workshop. None specified.

637-3 CONSTRUCTION DETAILS. The equipment, with the exception of the office technology supplies, shall be maintained by, and remain the property of, the Contractor.

637-3.01 Engineer's Field Office. The Contractor shall be responsible, until use and occupancy is relinquished by the State, for any and all damage, direct or indirect, of whatever nature, occurring to the property of the State and property of the inspection staff which is kept in the Engineer's Field Office. The Engineer will provide the Contractor with a detailed list of items kept in the office, with corresponding dollar values, and will provide the Contractor with updates when something on the list changes. Non-State-owned property shall only be those items used in the performance of contract-related work activities. Such property shall be replaced within 30 days of the reported damages and would include any loss caused by, but not limited to, fire, theft, vandalism or malicious mischief. The Contractor shall not be responsible for items kept in the Engineer's Field Office that are not on this list.

The Contractor shall install the Engineer's Field Office sign at a location approved by the Engineer. If the Engineer's Field Office is not located within or adjacent to the contract limits, two (2) additional signs shall be displayed conspicuously within the contract limits in locations directed by the Engineer.

The Engineer's Field Office shall be fully equipped and made available for use and occupancy by the inspection staff prior to the start of any contract work, and shall be made available after contract final acceptance as directed in writing by the Regional Construction Engineer.

All furniture and equipment shall be fully assembled, operational, clean and serviceable. The Engineer's Field Office shall be cleaned weekly or more often if required, and the timing of the cleaning operations shall be coordinated with the Engineer. The Contractor shall remove and dispose of all

rubbish generated in the office and shall keep the office free from pests. The Contractor shall remove snow from all areas subject to vehicular circulation and parking.

After completion, all portable buildings or trailers, fencing, surfacing and utilities shall be removed from the location and the areas cleaned, loamed and restored as required.

637-3.02 Field Laboratory. The Contractor shall be responsible for any and all damage, direct or indirect, of whatever nature, occurring to the property of the State which is kept in the Field Laboratory. The Engineer will provide the Contractor with a detailed list of items kept in the laboratory, with corresponding dollar values, and will provide the Contractor with updates when something on the list changes. Non-State-owned property shall only be those items used in the performance of contract-related work activities. Such property shall be replaced within 30 days of the reported damages and would include any loss caused by, but not limited to, fire, theft, vandalism or malicious mischief. The Contractor shall not be responsible for items kept in the Field Laboratory that are not on this list.

The Field Laboratory shall be fully equipped and made available for use and occupancy by the inspection staff prior to the start of any contract work. Such use and occupancy shall be made available after contract final acceptance as directed in writing by the Regional Construction Engineer.

All furniture and equipment shall be fully assembled, operational, clean and serviceable. The Field Laboratory shall be cleaned weekly or more often if required, and the timing of the cleaning operations shall be coordinated with the Engineer. The Contractor shall remove and dispose of all rubbish generated in the laboratory and shall keep the laboratory free from pests.

After completion, all portable buildings or trailers, fencing, surfacing and utilities shall be removed from the location, the areas cleaned, loamed and restored as required.

637-3.03 Concrete Cylinder Curing Box. Prior to the placement of any structural concrete, the Contractor shall furnish the Engineer a concrete cylinder curing box and two (2) locks with two (2) keys for each lock. The locks shall fit each securing latch of the curing box. This concrete cylinder curing box shall remain exclusively available to the Engineer at a location approved by the Engineer. The Contractor shall provide and maintain all necessary utility connections to operate the curing box.

637-3.04 Mobile Telephone. The Contractor shall submit to the Engineer a list of three (3) service providers with their available phone equipment and calling plan options. The list shall include the following information for each service provider:

- Service provider - include contact information (customer service telephone number and website address if available)
- Available calling plans
- Available telephone equipment (including a picture of the telephone)
- Service contract details (year commitment, etc.)
- Pricing information

The Engineer will select the service provider, equipment, and calling plan from the Contractor's list. The Contractor shall provide the designated equipment within one (1) week after selection to the Engineer. The Contractor shall supply qualified instruction to the inspection staff regarding proper equipment operation. The mobile telephones shall be for the exclusive use of Department personnel and their authorized representatives. The Contractor shall provide replacement due to breakdown, damage, loss, or theft within 24 hours of notification.

The Contractor shall provide the Engineer with legible copies of the monthly bills for the mobile telephone(s) provided. The bills shall show the number of minutes usage, or voice message units, and the total usage charges for the billing period.

637-3.05 Pager. The Contractor shall submit to the Engineer a list of three (3) service providers with their available pager equipment and service plan options. The list shall include the following information for each service provider:

§637

- Service provider - include contact information (customer service pager number and website address if available)
- Available service plans
- Available pager equipment (including a picture of the pager)
- Service contract details (year commitment, etc.)
- Pricing information

The Engineer will select the service provider, equipment, and service plan from the Contractor's list. The Contractor shall provide the designated equipment within one (1) week after selection to the Engineer. The Contractor shall supply qualified instruction to the inspection staff regarding proper equipment operation. The pagers shall be for the exclusive use of Department personnel and their authorized representatives. The Contractor shall provide replacement due to breakdown, damage, loss, or theft within 24 hours of notification.

The Contractor shall provide the Engineer with legible copies of the monthly bills for the pagers provided.

637-3.06 Two-Way Radio System. The Contractor shall provide, install, and maintain the two-way radio system in the locations designated by the Engineer. The Contractor shall make the system fully operational prior to the start of any contract work. The Contractor shall submit to the Engineer the details for the proposed two-way radio system to be provided. The details shall include the following information:

- Equipment/service provider - include contact information (customer service telephone number and website address if available)
- The proposed system components to be provided (exact transmission/hardware options), including pictures of the equipment

Once the Engineer approves the proposed system, the two-way radio system shall be installed in a timely manner. The Engineer may direct the Contractor to submit alternate system proposals. The Contractor shall supply training to the inspection staff regarding proper operation of the two-way radio system. The two-way radio system shall be for the exclusive use of Department personnel and their authorized representatives. The Contractor shall provide replacement due to breakdown, damage, loss, or theft within 24 hours of notification.

The Contractor shall be responsible for all modifications to the Engineer's field office, vehicle(s), and/or any other designated locations necessary to make it compatible with and capable of supporting the two-way radio system such as, but not limited to the electrical system.

~~**637-3.07 Digital Camera.** The Contractor shall provide and maintain a digital camera system for the exclusive use of Department personnel and their authorized representatives. The digital camera shall be fully operational prior to the start of any contract work and the Contractor shall supply qualified instruction to the inspection staff regarding proper equipment operation. The Contractor shall provide replacement due to breakdown, damage, loss, or theft within 24 hours of notification. The State may retain ownership of any data storage media, data storage containers and consumables.~~ **(Vacant)**

637-3.08 Digital Camcorder. The Contractor shall provide and maintain a digital camcorder system for the exclusive use of Department personnel and their authorized representatives. The digital camcorder shall be fully operational prior to the start of any contract work and the Contractor shall supply qualified instruction to the inspection staff regarding proper equipment operation. The Contractor shall provide replacement, due to breakdown, damage, loss, or theft within 24 hours of notification. The State may retain ownership of any data storage media, data storage containers and consumables.

637-3.09 Rain Gauge. The Contractor shall provide, install and maintain the wireless rain gauge system in accordance with the manufacturer's instructions in a location approved by the Engineer. The Contractor shall make the system fully operational in a timely manner, at a minimum, prior to any soil

disturbance at the site. The Contractor shall provide replacement due to breakdown, damage, loss, or theft within 24 hours of notification.

637-3.10 Inspection Vehicle. Prior to the start of any contract work, the Contractor shall make the inspection vehicle(s) available for inspection by the Engineer. The Contractor shall make arrangements for delivery to the site on the date specified by the Engineer. The vehicle(s) will be driven by the Engineer and other personnel authorized by the Engineer possessing a valid driver's license.

The Contractor shall provide fuel, oil, proper maintenance, tires, and replacement parts as required to keep the vehicle(s) in safe operating condition, and undertake all repairs, including repairs arising from the vandalism, accidents or other damages. The Contractor shall either establish an account at a local gas station or provide the inspection staff with the monetary means to fuel the vehicles. If any vehicle requires maintenance or repairs which cannot be completed on the same day, a comparable replacement vehicle shall be provided while the vehicle is out of service. If the vehicle is lost or stolen, the Contractor shall replace the vehicle within five (5) work days with a comparable vehicle.

637-3.11 Inspection Boat. The Contractor shall furnish the boat (and operator for Type B Inspection Boats) within five (5) work days after written notification by the Engineer, and the boat (and operator for Type B Inspection Boats) shall, thereafter, be available at all times to the Engineer and other personnel authorized by the Engineer.

637-3.12 Office Technology Supplies. The Contractor shall provide office technology-related supplies for the exclusive use of Department personnel and their authorized representatives. The supplies shall be provided within two (2) work days of the Engineer's request, unless the Engineer agrees to a longer delivery time. The Department shall retain ownership of the technology-related materials and supplies.

637-3.13 (Vacant)

637-3.14 Partnering Workshop. The Contractor and the Regional Construction Engineer will jointly select a facilitator and a location for the workshop. A list of potential facilitators is available from the Department. The facilitator shall present a one (1) to two (2) day Partnering Workshop for this contract between the time of award and the start of work. For long duration, multi year projects, a subsequent follow-up workshop may be convened, with the agreement of the Contractor and the Regional Construction Engineer, at an appropriate point during the progression of the work. The associated costs for this subsequent workshop will be reimbursed under this item.

637-4 METHOD OF MEASUREMENT

637-4.01 Engineer's Field Office. The Engineer's Field Office will be measured for payment as the number of months satisfactorily provided, measured to the nearest 0.25 months.

637-4.02 Field Laboratory. The Field Laboratory will be measured for payment as the number of units satisfactorily provided.

637-4.03 Concrete Cylinder Curing Box. The concrete cylinder curing boxes will be measured for payment as the number of units furnished and installed.

637-4.04 Mobile Telephone. The mobile telephone will be measured for payment on a fixed price Dollars-Cents pay unit basis.

637-4.05 Pager. The pager will be measured for payment on a fixed price Dollars-Cents pay unit basis.

637-4.06 Two-Way Radio System. The two-way radio system will be measured for payment on a monthly basis, measured to the nearest 0.25 months.

637-4.07 Digital Camera. ~~The digital camera will be measured for payment on a fixed price Dollars-Cents pay unit basis.~~ (Vacant)

637-4.08 Digital Camcorder. The digital camcorder will be measured for payment on a fixed price Dollars-Cents pay unit basis.

637-4.09 Rain Gauge. The rain gauge will be measured for payment as the number of units furnished and installed.

637-4.10 Inspection Vehicle. The inspection vehicle(s) will be measured for payment on a monthly basis, measured to the nearest 0.25 months.

637-4.11 Inspection Boat. The inspection boat will be measured for payment on a monthly basis, measured to the nearest 0.25 months.

637-4.12 Office Technology Supplies. Office technology supplies will be measured for payment on a fixed price Dollars-Cents pay unit basis.

637-4.13 (Vacant)

637-4.14 Partnering Workshop. The Partnering Workshop will be measured for payment on a Dollars-Cents pay unit basis.

637-5 BASIS OF PAYMENT. For the items to be paid on a Dollars-Cents pay unit basis, the total cost shown in the itemized proposal will be considered the price bid even though payment will be made only for actual equipment and materials supplied. The unit price amount is not to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded, and the original price will be used to determine the total amount bid for the contract.

637-5.01 Engineer's Field Office. The unit price bid per month for the Engineer's Field Office shall include the cost of all labor, materials and equipment necessary to complete the work including property rental, utility charges and incidental expenses. Payment will be made for each month of availability for occupancy by the Engineer and inspection field staff.

No payment will be made under Engineer's Field Office for each calendar day during which there are deficiencies in compliance with these requirements. The first calendar day shall commence 24 hours after notice to the Contractor of such a deficiency. This nonpayment shall be deducted from the next contract payment. The amount of such calendar day nonpayment will be determined by dividing the unit price bid per month by 30.

If the cited deficiencies exceeds 72 hours or is permitted to recur, liquidated damages will be assessed at twenty percent (20%) of the rate shown in Table 108-1 of §108-03 Failure to Complete Work on Time for each subsequent calendar day or part thereof that the cited deficiency resulting in nonpayment is not corrected.

Monthly payments may be terminated prior to contract final acceptance by written notification by the Regional Construction Engineer that such office will no longer be required on the contract. Payment for each month's occupancy of the Engineer's Field Office after the date of contract final acceptance will be made as part of the final contract payment. Failure of the Contractor to supply documentation required to complete the final estimate may result in nonpayment during this delaying period.

During periods of contract extension of time where Engineering Charges are assessed, no payment will be made for occupancy and services, except that payment for each month's occupancy after the date of final acceptance will be made as part of the final estimate.

637-5.02 Field Laboratory. The unit price bid for each Field Laboratory shall include the cost of furnishing all labor, materials and equipment necessary to complete the work including property rental, utility charges and incidental expenses.

Payment will be made for each Field Laboratory when it has been placed on the work site and is fully operational.

637-5.03 Concrete Cylinder Curing Box. The unit price bid for each concrete cylinder curing box shall include the cost of all labor, materials and equipment necessary to complete the work including property rental, relocation, repair or replacement, painting, cleaning, maintenance, and utility charges.

637-5.04 Mobile Telephone. The mobile telephone is a “draw down” item. As materials are supplied, the receipts for the materials shall be submitted to the Engineer. The Contractor will be reimbursed for receipted costs of materials plus 5% for profit and overhead (“materials” includes all labor, materials and equipment, including services and service contracts provided to furnish, install, maintain and remove all components of the mobile telephone system).

The number of mobile telephones to be provided shall be in accordance with the contract proposal special note entitled “Section 637 Pay Item Quantities”.

The Contractor will be reimbursed for any receipted penalties incurred for breaking an approved service contract with the telephone service provider. If the length of the service contract extends beyond the estimated completion of construction, the Contractor will only be reimbursed for penalties relating to the remainder of the service year in which the contract was terminated. Unless a credit is provided by the service provider, the Contractor will be penalized for the number of days of nonuse of the equipment due to service interruption or malfunctioning of the equipment. The penalty will be based on the per-day cost derived from the bill. No payment will be made for service during periods of contract extensions of time where engineering charges are assessed.

637-5.05 Pager. The pager is a “draw down” item. As materials are supplied, the receipts for the materials shall be submitted to the Engineer. The Contractor will be reimbursed for receipted costs of materials plus 5% for profit and overhead (“materials” includes all labor, materials and equipment, including services and service contracts provided to furnish, install, maintain and remove all components of the pager).

The number of pagers to be provided shall be in accordance with the contract proposal special note entitled “Section 637 Pay Item Quantities”.

The Contractor will be reimbursed for any receipted penalties incurred for breaking an approved service contract with the pager service provider. If the length of the service contract extends beyond the estimated completion of construction, the Contractor will only be reimbursed for penalties relating to the remainder of the service year in which the contract was terminated. Unless a credit is provided by the service provider, the Contractor will be penalized for the number of days of nonuse of the equipment due to service interruption or malfunctioning of the equipment. The penalty will be based on the per-day cost derived from the bill. No payment will be made for service during periods of contract extensions of time where engineering charges are assessed.

637-5.06 Two-Way Radio System. The unit price bid per month for the two-way radio system shall include the cost of all labor, materials and equipment, including services to install, maintain and remove all components of the two-way radio system. A deduction of 1/30 of a month will be made for each 24-hour period, or portion thereof, during which the two-way radio system does not comply with these specified requirements. When directed in writing by the Engineer, payment for each month's use of the two-way radio system after the date of acceptance will be made as part of the final estimate. Payment will begin the first month the two-way radio system is furnished and made available for use. Monthly payments may be terminated on a specified date prior to acceptance of the Contract by written notification by the Engineer that the two-way radio system will no longer be required.

The number of components of the two-way radio system, including the base stations, in-vehicle radios and handheld radios to be provided shall be in accordance with the contract proposal special note entitled “Section 637 Pay Item Quantities”.

637-5.07 Digital Camera. ~~The digital camera is a “draw down” item. As materials are supplied, the receipts for the materials shall be submitted to the Engineer. The Contractor will be reimbursed for receipted costs of materials plus 5% for profit and overhead (“materials” includes all labor, materials and~~

~~equipment, including services to furnish, maintain, and remove all of the components of the digital camera system).~~

~~—If new equipment is not provided, the Engineer will determine a reasonable cost for the equipment. The Contractor shall provide a copy of the original receipt for the equipment to assist the Engineer in assessing the current value of the equipment. Used equipment less than one (1) year old shall be assessed at no more than fifty percent (50%) of the original receipted cost. Equipment over one (1) year old shall not be considered for approval. (Vacant)~~

637-5.08 Digital Camcorder. The digital camcorder is a “draw down” item. As materials are supplied, the receipts for the materials shall be submitted to the Engineer. The Contractor will be reimbursed for receipted costs of materials plus 5% for profit and overhead (“materials” includes all labor, materials and equipment, including services to furnish, maintain, and remove all of the components of the digital camcorder system).

If new equipment is not provided, the Engineer will determine a reasonable cost for the equipment. The Contractor shall provide a copy of the original receipt for the equipment to assist the Engineer in assessing the current value of the equipment. Used equipment less than one (1) year old shall be assessed at no more than fifty percent (50%) of the original receipted cost. Equipment over one (1) year old shall not be considered for approval.

637-5.09 Rain Gauge. The unit price bid for each rain gauge shall include the cost of furnishing all labor, materials and equipment necessary to complete the work including installing and maintaining all components of the wireless rain gauge system.

Payment will be made for the rain gauge when it has been installed and is fully operational.

637-5.10 Inspection Vehicle. The unit price bid per month shall include all costs in connection with furnishing properly registered vehicles, maintaining the vehicles (including repairs, tires, lubrication, fuel, washing, etc.), and providing an owner’s policy of liability insurance for the vehicles in conformance with §107-06B. A deduction of 1/30 of a month will be made for each 24-hour period, or portion thereof, during which the vehicle is unavailable to the Engineer, or personnel authorized by the Engineer, regardless of the reason for the vehicle's unavailability. When directed in writing by the Engineer, payment for each month of use after the date of acceptance will be made as part of the final estimate. Payment will begin the first month the vehicle is furnished and made available for use. Monthly payments may be terminated on a specified date prior to acceptance of the Contract by written notification by the Engineer that the vehicle will no longer be required.

637-5.11 Inspection Boat. The unit price bid per month shall include the cost of furnishing all labor, fuel, maintenance, repairs, registration permits, the operator (for Type B Inspection Boats), and other necessary incidentals for operation of the boat. A deduction of 1/30 of a month will be made for each 24-hour period, or portion thereof, during which the boat is unavailable to the Engineer, or personnel authorized by the Engineer, regardless of the reason for the boat's unavailability. When directed in writing by the Engineer, payment for each month of boat use after the date of acceptance will be made as part of the final estimate. Payment will begin the first month the boat is furnished and made available for use. Monthly payments may be terminated on a specified date prior to acceptance of the Contract by written notification by the Engineer that the boat will no longer be required.

637-5.12 Office Technology Supplies. Office technology supplies is a “draw down” item. As the materials are supplied, the receipts shall be submitted to the Engineer. The Contractor will be reimbursed for receipted costs of materials plus 5% for profit and overhead (“materials” includes all labor, materials and equipment, including services and service contracts provided).

637-5.13 (Vacant)

637-5.14 Partnering Workshop. The Department will reimburse the Contractor for fifty percent (50%) of the costs for the facilitator and the facility upon submission of original receipts. Receipted costs eligible for 50% reimbursement include the fee for the facilitator and the costs for the facilitator’s travel

and expenses; associated workshop costs such as charges for the rental of the meeting room, required audio/visual equipment and any handouts, notes or workshop materials. The costs for travel, lodging, meals and salaries of workshop attendees, other than those of the facilitator, will not be eligible for reimbursement under this item.

Payment will be made under:

Item No.	Item	Pay Unit
637.01	Field Laboratory	Each
637.03	Concrete Cylinder Curing Box	Each
637.11	Engineer's Field Office – Type 1	Month
637.12	Engineer's Field Office – Type 2	Month
637.13	Engineer's Field Office – Type 3	Month
637.14	Engineer's Field Office – Type 4	Month
637.15	Engineer's Field Office – Type 5	Month
637.21	Mobile Telephone	Dollars-Cents
637.22	Pager	Dollars-Cents
637.23	Two-Way Radio System	Month
637.24	Digital Camera	Dollars-Cents
637.25	Digital Camcorder	Dollars-Cents
637.26	Rain Gauge	Each
637.31	Inspection Vehicle	Month
637.32	Inspection Boat - Type A	Month
637.33	Inspection Boat - Type B	Month
637.34	Office Technology and Supplies	Dollars-Cents
637.35	Partnering Workshop	Dollars-Cents

SECTION 638 - WHITE SYNTHETIC RESIN BINDER CONCRETE

638-1 DESCRIPTION. This work shall consist of the construction of white synthetic resin binder concrete pavement in accordance with these specifications and in reasonably close conformity with lines and grades shown on the plans or established by the Engineer.

638-2 MATERIALS. The materials shall meet the requirements of §402-2, Materials, except as modified below.

638-2.01 Aggregates. The requirements of §703-05, Fine Aggregate for White Portland Cement Concrete, shall apply except that the gradation shall meet the general limits described in §638-2.05, Mix Design. A sample of the white aggregate will be obtained by the Department from the stockpile located at the mixing plant and submitted to the Materials Bureau at least 10 days prior to the production of the mix for color approval by the Director, Materials Bureau. Unless otherwise approved by the Regional Director, the material shall be stockpiled in advance and in sufficient quantity to complete the work. Any additions to the stockpile or apparent contamination of the aggregate, as determined by the Engineer, will require submission of samples to the Materials Bureau for evaluation and approval by the Director, Materials Bureau.

638-2.02 Mineral Filler. Mineral Filler, if required in the mix to meet gradation requirements shall be hydrated lime.

638-2.03 Binder. The binder shall conform to the requirements of §702-70. The synthetic resin binder shall be supplied by a manufacturer appearing on the Department's Approved List of Synthetic Resins. When the one component binder is used, the binder shall be available 10 days prior to production of the mix so representative samples of the binder can be obtained by the Engineer and tested by the Materials Bureau for conformance to §702-70.

§638

638-2.04 Pigment. The pigment shall conform to the requirements of §712-16, Pigment for Colored Synthetic Resin Binder Concrete.

638-2.05 Mix Design. The job mix formula stating the proposed aggregate gradation, binder and pigment contents shall be prepared by the synthetic resin binder concrete producer according to the requirements of §401-2.01, Hot Mix Asphalt Designs, except for the modifications in this specification.

The general limits for the mix are as follows:

Sieve Size	General Limits (1) % Passing	Job Mix % Tolerance
1/4 inch	100	0
1/8 inch	90–100	±5
No. 20	42–68	±7
No. 40	20–50	±6
No. 80	10–22	±3
No. 200	6–12	±2
Synthetic Binder Content (2)	7.0–8.0	_____
Pigment (1,3)	2.3–2.7	_____
Mix and Placing Temperature	250°F –325°F	_____

NOTES:

1. Based on total aggregate weight.
2. Based on total mix weight.
3. The pigment shall be considered as mineral filler passing the No. 200 sieve.

638-2.06 Tack Coat. The tack coat shall be supplied by a manufacturer appearing on the Department's Approved List of Synthetic Resins. The tack coat shall conform to the requirements of §702-71. The tack coat material shall be available 10 days prior to production of the mix so representative samples of the tack coat can be obtained by the Engineer and tested by the Materials Bureau for conformance of §702-71.

638-3 CONSTRUCTION DETAILS. Except as provided in this specification, the construction requirements shall meet those of §402-3, Hot Mix Asphalt (HMA) Pavements - Construction Details.

638-3.01 Weather Limitations. The requirements for top course mixes in §402-3.01, Weather and Seasonal Limitations, shall apply.

638-3.02 Preparation of Mixture. The mixing plant shall meet the requirements of §401-3.08 unless otherwise approved by the Director, Materials Bureau. Before the pugmill is allowed to produce white synthetic resin binder concrete, it shall be thoroughly cleaned by charging a minimum of two (2) successive batches of hot dry aggregate into the pugmill and mixing each batch for a minimum of four (4) minutes. In addition, the first batch of white synthetic resin binder concrete produced, after a change from normal asphalt concrete production, shall not be incorporated into the work. Such batches shall be at least fifty (50) percent of the rated pugmill capacity. This batch may also be used for the first material passed through the paver as described in §638-3.04, Paving. The white aggregate shall be introduced into the pugmill, between the limits of 250°F to 350°F and the temperature of the synthetic resin binder (one component) shall be maintained between the limits of 260°F and 300°F. When the binder is added directly into the pugmill in cold, prepackaged units (two components), the temperature of the aggregate may be increased accordingly to meet the specified mix temperature, but shall not exceed 425°F. For either method of binder addition, the resulting mix temperature shall be in the range of 250°F to 325°F.

The pigment, resin chips, plasticizing oil and hydrated lime shall be added to the pugmill in whole bag units. If the pigment and/or hydrated lime is not delivered from the manufacturers as whole units, the

Contractor may weigh and repackage in a manner approved by the Engineer so that the pigment and/or hydrated lime may be added as whole units. The hydrated lime may be added in a manner approved by the Engineer, if difficulties are encountered in maintaining the specified mix temperature when adding the hydrated lime directly to the pugmill.

Batching and mixing requirements for the White Synthetic Resin Binder Concrete are as follows:

A. One Component Binder. After the hot aggregate is discharged into the pugmill, add the pigment and hydrated lime in whole bag units as required and dry mix for a minimum of 15 seconds. After the dry mix the synthetic resin binder should be added and wet mixed for a minimum of 45 seconds.

B. Two Component Binder. After the hot aggregate is discharged into the pugmill add resin chips in whole bag units as required. This should be immediately followed by the addition of the hydrated lime in whole bag units and dry mixed for 30 seconds. Following the dry mix add the plasticizing oil and pigment in whole bag units in that order and wet mix for 30 seconds after all components are in the pugmill.

Any increase in pigment content above that specified on the job mix formula for the convenience of mixing shall be made at no additional cost to the Department. The pigment content may be increased within the general limits, as directed by the Engineer, to obtain a satisfactory color during production.

638-3.03 Preparation of Surface. All surfaces to be paved shall be thoroughly cleaned of all foreign material, including membrane curing compound of Portland Cement concrete pavement, prior to the placing of the pavement. A tack coat, consisting of a uniform application of rapid curing synthetic resin liquid, §702-71, shall be applied at a uniform rate between 0.03 to 0.05 gallons per square yard over the areas to be paved. The tack coat shall be applied with either a paint roller or spray unit to assure uniform application. The tack coat shall not be poured onto the pavement surface for application. After the tack coat application, curing time shall be sufficient to permit the coating to become tacky before paving. No traffic shall be permitted on the tack coated surface.

638-3.04 Paving. The mix shall be laid between the temperatures of 250°F to 325°F as specified by the Engineer. All areas of uniform width of 4 feet or more shall be paved with an approved paving machine. Areas of narrow or variable width may be placed without a paver but in a manner approved by the Engineer. All paving edges shall be formed in a manner approved by the Engineer to obtain a true edge. The equipment including trucks, paving machine rollers and tools which come in contact with the white synthetic resin binder concrete shall be thoroughly cleaned before use. In addition, the paving machine shall be cleaned of excess asphalt by spraying with solvent. This shall be directly followed by the passage and subsequent wastage of at least one (1) ton of the white material. The material may be from the same batch used to clean the pugmill.

638-3.05 Compaction. Provisions of §402-3.07 Compaction shall apply except that a minimum of two passes of a nominal 10 ton steel wheel tandem roller shall be used for compaction. The edge forms shall be removed prior to applying the second roller pass. This shall be done as expeditiously as possible so that the second roller pass is completed while the mat is still hot. Forms used for the formation of transverse drainage troughs shall be kept in place until the completion of all rolling operations. Narrow areas which are subject to overstressing with a 10 ton roller may be rolled with a small roller as approved by the Engineer. The paving edge forms shall be removed prior to applying the final roller pass with the small roller as previously described for the 10 ton rollers. The use of a pneumatic tire roller will not be required for this item.

638-4 METHOD OF MEASUREMENT. The quantity of white synthetic resin binder concrete shall be measured by the number of ~~metric tons~~ tons of compacted material in place.

§638

638-5 BASIS OF PAYMENT. The unit price bid per ~~metric-ton~~ of white synthetic resin binder concrete shall include the cost of all materials, equipment and labor necessary to complete the work including the synthetic resin binder, pigment and tack coat.

Payment will be made under:

Item No.	Item	Pay Unit
638.0104	White Synthetic Resin Binder Concrete	Ton

SECTION 639 - CONSTRUCTION CONTRACT MANAGEMENT SYSTEMS

639-1 DESCRIPTION. The work in this section shall include work required for construction contract management systems.

639-2 MATERIALS. Materials shall be as specified in the special specifications.

639-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

639-4 METHOD OF MEASUREMENT. As specified in the special specifications.

639-5 BASIS OF PAYMENT. As specified in the special specifications.

~~SECTION 639 (VACANT)~~

Comment [c103]:
EI09-014

SECTION 640 - REFLECTORIZED PAVEMENT MARKING PAINTS

640-1 DESCRIPTION. Under this work, the Contractor shall furnish and apply painted reflectORIZED pavement marking paint at the locations and in accordance with the patterns indicated on the plans or as directed by the Engineer, and in accordance with the MUTCD and these specifications.

640-2 MATERIALS. ReflectORIZED pavement marking paints shall be selected from the Department's Approved List of White and Yellow ReflectORIZED Pavement Marking Paints. Project acceptance will be based on the appearance of an approved brand name on the container label.

All paints shall conform to Federal, State, and local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. Environmental Protection Agency, and the New York State Department of Environmental Conservation.

Reflective glass beads shall conform to §727-05 Glass Beads for ReflectORIZED Pavement Marking Paints.

Details for obtaining Approved List status are available from the Materials Bureau.

640-3 CONSTRUCTION DETAILS

640-3.01 General. All pavement markings and patterns shall be placed as shown in the contract documents and in accordance with the MUTCD.

Before any pavement marking work is begun a schedule of operations shall be submitted to and approved by the Engineer.

When pavement markings are applied under traffic, the Contractor shall provide all the necessary flags, signs, cones, shadow vehicles, flashing arrow boards, etc. to maintain and protect traffic, to protect the work operation, and to protect the painted pavement markings until thoroughly dry and serviceable. No additional payment will be made for these items. The application of pavement markings shall be done in the general direction of traffic. Striping against the direction of normal flow of traffic shall not be allowed.

The Contractor shall be responsible for cleaning the pavement, to the satisfaction of the Engineer, of dust, dirt, and other foreign material which may be detrimental to the adhesion of the paint film.

When necessary, the Contractor shall establish marking line points at 30 feet intervals throughout the length of the pavement or as directed by the Engineer.

The Contractor shall be responsible for removing, to the satisfaction of the Engineer, all tracking marks, spilled paint, and paint applied in unauthorized areas.

640-3.02 Application of Pavement Markings. At the time of paint application, the pavement surface and ambient temperature shall not be less than 50°F, the relative humidity shall not exceed 85%, and the pavement surface shall be dry. Traffic paint shall not be applied during periods of rain or if rain is imminent. Waterborne traffic paint shall not be applied if rain is expected within 4 hours after application.

Paint shall be applied in strict accordance with the manufacturer’s recommendations for use. In no case shall the paint be heated above 150°F.

The painted pavement markings shall be uniformly applied to the pavement surface at the minimum specified wet film thickness. Immediately following paint application, reflective glass beads shall be uniformly applied to the wet paint film at the rate of 6 lb/gal of paint. The applied pavement markings shall have clean-cut edges and true and smooth alignment.

On pavements where traffic is to be maintained and the final marking pattern is known, traffic paint shall be applied before the end of the work shift. If the Contractor is unable to apply final pavement markings and traffic is to be maintained, then removable pavement markings offset from the final pavement markings shall be installed in accordance with Section 619 Work Zone Traffic Control at no additional cost to the State.

640-4 METHOD OF MEASUREMENT. Pavement striping will be measured in feet along the centerline of the pavement stripe and shall be based on a 4 inches wide stripe. Measurement for striping with a plan width greater or less than the basic 4 inches as shown in the contract documents or as directed by the Engineer, will be made by the following method:

$$\frac{\text{Plan Width of Striping (inches)} \times \text{Feet}}{4 \text{ inches}}$$

No payment will be made for the number of feet of gaps in between the dashed lines. Letters and symbols will be measured by each unit applied. A unit will consist of one letter or one symbol. Examples: “SCHOOL” will be measured as six units. Double and triple headed arrows will each be measured as a single unit. The “X” in railroad grade crossing markings (MUTCD figure 263-33) will be measured by feet of 4 inch stripe.

640-5 BASIS OF PAYMENT. The accepted quantities of pavement markings will be paid for at the contract unit price bid, which shall include the cost of furnishing all labor, materials, and equipment to satisfactorily complete the work. The cost for maintaining and protecting traffic during the painting operations shall be included in the price bid. The application of Short-Term Pavement Markings, necessitated by the Contractor’s failure to apply the required Reflectorized Pavement Marking Paints, shall be at no additional cost to the State.

Payment will be made under:

Item No.	Item	Pay Unit
640.10	White Paint Reflectorized Pavement Stripes – 15 mils	Feet
640.11	Yellow Paint Reflectorized Pavement Stripes - 15 mils	Feet
640.12	White Paint Reflectorized Pavement Letters - 15 mils	Each
640.13	White Paint Reflectorized Pavement Symbols - 15 mils	Each
640.20	White Paint Reflectorized Pavement Stripes – 20 mils	Feet
640.21	Yellow Paint Reflectorized Pavement Stripes - 20 mils	Feet
640.22	White Paint Reflectorized Pavement Letters - 20 mils	Each
640.23	White Paint Reflectorized Pavement Symbols - 20 mils	Each

SECTION 641 - BRIDGE WASHING

641-1 DESCRIPTION. The work in this section shall include work required for bridge washing.

641-2 MATERIALS. Materials shall be as specified in the special specifications.

641-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

641-4 METHOD OF MEASUREMENT. As specified in the special specifications.

641-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 642 - ROADSIDE MAINTENANCE

642-1 DESCRIPTION. The work in this section shall include work required for roadside maintenance. Examples of the type of work are mowing, litter pick up, cleaning and shaping ditches. Work involving slope repair, asphalt patching, culvert repairs, etc shall be specified in other sections.

642-2 MATERIALS. Materials shall be as specified in the special specifications.

642-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

642-4 METHOD OF MEASUREMENT. As specified in the special specifications.

642-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 643 – NOISE BARRIERS

643-1 DESCRIPTION. The work in this section shall include work involved with construction of noise barriers.

643-2 MATERIALS. Materials shall be as specified in the special specifications.

643-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

643-4 METHOD OF MEASUREMENT. As specified in the special specifications.

643-5 BASIS OF PAYMENT. As specified in the special specifications.

~~SECTIONS 641, 642 AND 643 (VACANT)~~

Comment [c104]:
EI09-014

SECTION 644 - OVERHEAD SIGN STRUCTURES**644-1 DESCRIPTION**

644-1.01 General. Under this work the Contractor shall fabricate, furnish and erect sign structures for overhead signs in accordance with the contract documents.

The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all overhead sign structures in accordance with §106-01 Sources of Supply.

644-1.02 Definitions. Overhead Sign Structures (OSS) are structures with vertical supports and horizontal arms or chords used to support signs over any portion of the roadway, including the shoulders. Span Wire Assemblies supporting overhead signs, and structures supporting both traffic signal equipment and overhead signs are covered under Section 680, Traffic Signals. Bridge fascia mounted signs, where the signage is intended for the under roadway, are also not covered in this Section.

OSS are classified into the following three standard types (See Figure 644-1).

- A. Single Arm Cantilever. Single (horizontal) arm supported by a single (vertical) post.
- B. Trussed Arm Cantilever. Two trussed arms supported by a single post. (If the arms are not trussed, the structure shall be classified as Non-Standard).
- C. Span. Single span, four-chord (quad-chord) superstructure supported by trussed end posts.

OSS that fall outside these categories are Non-Standard. This includes butterfly structures, multi-span structures, structures that are a combination of span and cantilevers, and all other overhead sign structures not included in §644-1.02.

644-2 MATERIALS

644-2.01 Steel for Sign Structures. Steel for component parts of sign structures shall meet the requirements of the New York State Steel Construction Manual and the following:

All material greater than 1/2 inch thick shall meet the Charpy V-Notch toughness requirements of §715-01, Structural Steel. Chords, cantilevered arms, end posts, base plates, end and face plates for cantilever arm to post connections, and flange splice plates shall be considered main members. Diagonals, struts and gusset or tab plates shall be considered secondary members. Upon receipt at the fabrication plant, all main member material shall be traceable to a mill test report and traceability shall be maintained throughout the duration of the fabrication.

All main member material thickness shall be a minimum of 1/4 inch.

**FIGURE 644-1**

A. Pipe. Pipe shall meet the requirements of one of the following specifications:

ASTM A53,	Welded and Seamless Steel Pipe, Grade B, Type E or S.
ASTM A500,	Welded and Seamless Steel Pipe, Grade B (Rounds Only)
ASTM A252,	Welded and Seamless Steel Pipe, Grade 2 or 3, provided that the chemical certifications meet the requirements for ASTM A53, Grade B, Type E or S.
API 5L	American Petroleum Institute Specification 5L, Grade B

In addition to the above material requirements, all pipe used for welded applications shall have a maximum Carbon Equivalency (CE) of 0.40 using the following equation:

$$CE = \%C + \%Mn/6 + \%Cu/40 + \%Ni/20 + \%Cr/10 - \%Mo/50 - \%V/10$$

B. Structural Steel. Structural steel for structural shapes, plates, and bars shall meet the requirements of §715-01, Structural Steel, and the ASTM Specification noted on the contract documents. Cutting and drilling shall be done in such a manner that the resulting surfaces are free from any gouges or burrs.

C. Anchor Bolts, Nuts and Washers. Anchor bolts, nuts and washers shall meet the requirements of the following:

ASTM F1554,	Grade 55 with Supplementary Requirement S4, Charpy Impact Requirement
-------------	---

Anchor bolts, nuts, and washers shall be galvanized in accordance with the requirements of Materials Detail 719-01 Type II, Galvanized Coatings and Repair Methods - Zinc Coating (Hot Dip) on Iron and Steel Hardware. Anchor bolts shall be the Unified Course Thread Series with Class 2A threads, and shall be galvanized full length. Nuts shall be Grade A, Heavy Hex.

D. High Strength Steel Bolts, Nuts and Washers. Bolted steel connections shall be made with bolts, nuts and washers meeting the material requirements of §715-14, High Strength Bolts, Nuts and Washers, and the galvanizing requirements of §719-01, Galvanized Coatings and Repair Methods. Additionally, the Contractor shall provide documentation that the zinc coated fastener assemblies have satisfied the requirements of ASTM A325 Section 6.2, R.C. testing.

Fasteners in main members shall be sampled and tested in accordance with Section 1001.5 of the New York State Steel Construction Manual, with the exception that the waiver for lot sizes less than 20 bolts shall not apply.

E. U-Bolts. U-Bolts shall conform to material specification ASTM F1554, Grade 36, and shall be galvanized in accordance with the requirements of Type II of §719-01, Galvanized Coatings and Repair Methods.

F. Galvanizing. All steel shall be galvanized in accordance with §719-01 Type I, except as noted above in §644-2.01 C, D & E. Galvanizing shall provide a minimum coating of 5 mils. All welding, cutting and drilling shall be done prior to galvanization, and all bolting shall be done after galvanization, except as approved by the Engineer.

G. Acceptance. All steel furnished shall be documented in accordance with the requirements of §715-01 Basis of Acceptance.

644-2.02 Concrete. All overhead sign structure foundations shall meet the requirements of Class A concrete in Section 501, Portland Cement Concrete - General. The Contractor may submit, for approval by Director, Materials Bureau, a mix at least equivalent to the specified Class A Concrete.

All precast concrete overhead sign structure foundations shall meet the requirements of §704-03, Precast Concrete - General.

644-3 CONSTRUCTION DETAILS

644-3.01 Drawings. Shop drawings shall be required for all OSS in the contract documents. The Contractor must submit shop drawings in accordance with the requirements of Section 2 in the New York State Steel Construction Manual.

644-3.02 Fabrication. All fabrication, inspection, transportation and erection shall be performed in accordance with the requirements of the New York State Steel Construction Manual.

A. Storage of Materials. Structural material shall be stored in a manner that will protect the materials from deformation, surface deterioration and accumulations of dirt, oil, or other foreign matter.

B. Straightening Materials. Prior to fabrication in the shop, all deformed structural materials shall be properly straightened by methods which are non-injurious. Sharp kinks and bends, and deep dents shall be cause for rejection.

C. Anchor Bolts. Where anchor bolts have been or are being set under a separate contract, the Contractor shall check the size, location, and spacing of anchor bolts before fabricating the structure.

D. Pole Markings. A Sign Structure Identification Number (SIN) shall be attached to the post using white numbers on a green background. The background shall be Green, Class A, Engineer Grade reflective sheeting as described in §730-05, Reflective Sheeting, and shall be 12 inches wide by 6 inches high, with the corners cut to a 1 1/2 inch radius. The numbers shall be cut out from White, Class A, Engineer Grade reflective sheeting and shall be 3 inches high. The sheeting and numbers shall be applied in accordance with the manufacturer's recommendations. The numbers shall be placed on the right near post, 45 degrees from the viewing direction of traffic, approximately 6 feet above the base plate, so as to be visible to the traveling public. For structures spanning more than one direction of traffic, or structures that span non-contiguous travel lanes, two posts shall be marked to facilitate identification by inspectors.

The following information shall be stamped into the base plate in 1/2 inch letters to such a depth as to be clearly visible through subsequent galvanizing:

Required Information	Example
Manufacturer's name or logo	ABC Fabricating
Month and year of manufacture	06/2003
D Number	D123456
SIN Number	SIN 12345

For span type structures the marked base plate shall correspond to the marked posts, except that only one end of the span must be marked.

E. High Strength Bolts. Each bolt shall be furnished with a galvanized flat washer installed under the turned element. All connections shall be made by first tightening all nuts and bolts sufficiently to bring all components into full contact with each other. After full contact has been achieved, all connections shall be brought to a condition beyond snug tight as required by Table 1001.3b of the New York State Steel Construction Manual.

Fasteners shall be inspected after installation in accordance with Section 1001.4 of the New York State Steel Construction Manual. The inspection shall apply to a minimum of 10% of the connections randomly throughout the entire span of the structure.

All holes for high strength bolts in main members shall be made in accordance with Section 613 of the New York State Steel Construction Manual. This requirement also includes all secondary members that are welded to main members.

F. Quality. Fabricators shall be certified in accordance with the American Institute of Steel Construction's Quality Certification Program in the Simple Steel Bridge Structures Category, or an equivalent program acceptable to the DCES.

G. Inspection. Provisions for shop inspection shall be in accordance with the New York State Steel Construction Manual.

H. Assembly. All OSS shall be fully assembled in the fabrication shop to ensure proper fitup.

I. Acceptance For Shipping. Each section of a sign structure shall bear the QA inspector's mark of acceptance prior to shipping.

644-3.03 Transportation. Sign structures (including posts and post assemblies) shall be shipped by flat bed trailer or other similar means. Structures shall be shimmed, braced, blocked, and tied down to prevent distortion or other damage from occurring during transportation. The use of any device which does not support the member for its entire length, as described below, shall not be permitted. This prohibition includes, but is not limited to, dolly wheels and pole trailers.

Sections less than 50 feet in length shall be, at a minimum, supported at the midspan and end points. Sections 50 feet and longer shall be, at a minimum, supported at the ends and at the quarter points.

Adhering to these requirements does not relieve the Contractor of the responsibility for damage to the structure en route.

644-3.04 Excavation. All excavation shall conform to Section 206, Trench, Culvert and Structure Excavation.

Excavation shall not be performed until immediately before installation of the footings, or any other appurtenances. The excavated material shall be placed in a location or locations selected by the Contractor so as to cause the least inconvenience to vehicular and pedestrian traffic and to avoid interference with surface drainage. All surplus excavated material shall be removed and disposed of by the Contractor as specified in [Section 203, Disposal of Surplus Excavated Material](#) ~~§203-3.08, Disposal of Surplus Excavated Materials.~~

Excavation shall be backfilled as specified in [Section 203, Select Structural Fill](#) ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.~~

Comment [c105]:
EI09024

Comment [c106]:
EI09024

The outline of all areas to be removed in sidewalks, driveways, and pavement shall be saw cut to a depth of at least 3 inches prior to removal. Cuts shall be neat and true along score lines with no shatter outside the removal area. Damaged saw cut areas shall be recut.

Pavement, shoulder, sidewalks, curbs, driveways, lawns, plants and other such features shall be replaced in kind with material of equal quality or as shown in the contract documents. For transverse sidewalk, curb or gutter cuts in concrete the entire square or section shall be removed and replaced with the same kind and quality of material. For longitudinal cuts in concrete sidewalks only the area removed between sawcuts shall be replaced unless specified otherwise in the contract documents.

Whenever a part of a square or slab of existing concrete sidewalk, curb, gutter or driveway is broken or damaged by this work, the entire square, section or slab shall be removed and replaced with the same kind and quality of material, at no additional cost to the State.

644-3.05 Concrete Foundations. Foundations shall be constructed as shown in the contract documents. The Contractor shall establish the location and elevation of foundation, prior to the start of construction, based on the information shown in the contract documents and data derived from field surveys. Locations and elevations will be verified by the Engineer prior to the start of construction.

The Contractor has the option, unless specifically disallowed in the contract documents, to use either Drilled Shafts or Rectangular Footings for Overhead Sign Structures, if both types are detailed in the contract plans. When both foundation types are detailed and permitted, the Department has prepared the contract documents based on the presumed less expensive foundation type. If the Contractor elects to change from one type of foundation to the other under this option, it shall be done at no additional cost to the State. The Contractor shall notify the Engineer of the decision to change foundation type.

Excavation for these items shall be as specified in §644-3.04. All concreting operations shall conform to Section 555, Structural Concrete. Reinforcing steel shall conform to Section 556, Reinforcing Steel for Concrete Structures.

The allowable tolerance from verticality for the drilled shaft or pedestal shall be 2.5%. The allowable tolerance for the top of shaft elevation or pedestal elevation shall be + 1/4 inch, -0 inch.

Stripping of forms and subsequent loading of foundations shall be in accordance with §555-3, in Table 555-1, under "Pier Columns". Placing the sign panels on an overhead sign structure is assumed to be equivalent to placing superstructure loads on a bridge.

A. Drilled Shafts for Overhead Sign Structures. Work under this item shall consist of the layout and construction of Drilled Shaft foundations for Overhead Sign Structures. This work may require rock drilling, installing rock sockets, dewatering, the use of temporary casing, slurry, or other means necessary to keep the hole open. Formwork shall be required for the portion of the shaft above finished grade.

Holes for drilled shafts shall be pre-augered. Precaution shall be taken to protect the holes from collapse. Holes shall contain no free water, nor any loose material at the time of concrete placement. The holes shall be filled with Class A concrete placed in direct contact with the soil. Casing, if used, shall be removed prior to concrete placement. Precast shafts shall not be permitted.

B. Rectangular Footings for Overhead Sign Structures. Work under this item shall consist of the layout and construction of conventional rectangular spread footings, either cast-in-place or precast. This work may require the use of protective sheeting.

644-3.06 Erection of Sign Structures

A. Methods and Equipment. Before starting work, the Contractor shall submit details of the method of erection and types of equipment he proposes to use, to the Engineer for review and approval. Approval shall not relieve the Contractor of the responsibility for the safety of the methods or equipment, or for damage to the structures due to overloading.

B. Handling and Storage. Structural members shall be loaded, moved, and unloaded in a manner that prevents stresses in excess of those provided for by the structure design. Permanent distortion, or other damage attributable to the Contractor's operations, shall be cause for rejection.

Members stored either in the fabricator's storage area, or at the work site, or at other storage areas, shall be supported off the ground in a manner that will not allow distortion, or other damage to occur.

C. Lifting. Erection of overhead sign structures shall be done in accordance with §107-05P. *Lifting.* Lift Plans are required, and shall be provided in accordance with §107-05P.3. Nylon slings, or an equivalent approved by the Engineer, shall be used for all lift operations. Picking points for the superstructure portion of span type OSS shall be made at the panel points that are closest to the third points of the span, in order to ensure that no members are overstressed during lift operations. Two picking points, one at each end, shall be used for the superstructure portion of cantilever OSS. Picking shall be made by wrapping the entire cross section of the structure. When alternate pick points are used, supporting calculations shall be submitted in accordance with §107-05P.5. *Lift Operations.* However, lifting by chains or by individual members shall not be permitted.

D. Field Inspection. All sign structures shall be visibly inspected, and components shall be clean prior to erection. Damage that is attributable to the Contractor's operations shall be cause for rejection. Damage includes, but is not limited to, bends, kinks, dents, cracks and pits. Rejected structures, or components, shall be removed from the work site and repaired, or replaced as required by the DCES All work relating to the repair or replacement, of defective structures, or components, shall be done at no additional cost to the State.

E. Anchor Bolts. The following procedure shall be used for placing and tightening anchor bolts:

1. Anchor bolts shall be carefully set to the proper location, alignment, and elevation by using templates. Templates shall be as detailed in the contract documents, and shall be used at both the top and bottom of the anchor bolt pattern. Bottom templates shall be cast into the footing. Top templates shall be placed near the top of the anchor bolts so as not to interfere with concrete operations, and shall be left in place for 24 hours after concrete placement. Undamaged top templates may be reused.
2. Anchor bolts shall be set vertical, within 2.5%, and shall not be realigned by bending to fit the base plate. Anchor bolts that do not fit the base plate, or anchor bolts that are more than 2.5% out of plumb, shall be rejected. The Contractor may propose a remediation method for rejected anchor bolts, subject to the approval of the Engineer. Rejected anchor bolts, and the concrete they are embedded in shall be replaced by new materials at no cost to the State.
3. The exposed portion of the anchor bolts shall be cleaned with a wire brush. The leveling nuts and washers under the base plate shall be threaded onto the anchor bolts, leaving a gap between the top of concrete and the bottom of the leveling nuts of no more than one anchor bolt diameter, and no less than 3/8 inch.
4. The post(s) alone, without the arms attached, shall be placed on the leveled anchor bolts and washers. Posts shall not be raked back to account for camber. The base plate shall bear directly and evenly on the washers and leveling nuts.
5. Beeswax, or the equivalent, shall be applied to the bearing face and the threads inside the top nut. The top anchor bolt nuts and washers shall then be placed and tightened by hand. All cleaning and lubricating shall be done immediately prior to nut placement and tightening. Top nuts and leveling nuts shall be checked for full bearing against the base plate, and any loose nuts shall be tightened by hand. The top nuts shall then be snug tightened using 20 - 30% of the torque values listed in Table 644-1. The snugging sequence shall be as shown in Figure 644-2. The leveling nuts shall then be similarly checked for snug tightness, using 20 - 30% of the values listed in Table 644-1.
6. Fully tighten all top nuts according to the torques listed in Table 644-1. The tightening sequence shall be as shown in Figure 644-2. There shall be no rotation of the leveling nut during this procedure.
7. An additional nut shall be installed and tightened against the top nut to lock the installation. This lock nut shall be prepared and tightened as defined in 5.) and 6.) above. There shall be no rotation of the lower top nut during this procedure.

TABLE 644-1	
Anchor Bolt Size (English)	Required Torque (±5%) (ft-lbs)
1 ½	650
1 ¾	1,000
2	1,500
2 ¼	2,200

 6 Bolt Pattern 8 Bolt Pattern

FIGURE 644-2

F. Bolting. Bolted steel connections shall be made with bolts, nuts and washers meeting the material requirements of §715-14, High Strength Bolts, Nuts and Washers, and the galvanizing requirements of §719-01, Galvanized Coatings and Repair Methods. Each bolt shall be furnished with a galvanized flat washer installed under the turned element. All connections shall be made by first tightening all nuts and bolts sufficiently to bring all components into full contact with each other. Any gaps between the faying surfaces after snug tightening that exceed 1/16 inch shall not be considered in full contact and shall be cause for rejection. The Contractor may propose remediation measures subject to approval by the DCES. Rejected components shall be replaced or repaired at no cost to the State. Bolts shall not be fully tightened before said tolerances are checked. After full contact has been achieved, all connections shall be brought to a condition beyond snug tight as required by Table 1001.3b of the New York State Steel Construction Manual.

Fasteners shall be inspected after installation in accordance with Section 1001.4 of the New York State Steel Construction Manual.

G. Welding. Field welding shall not be permitted on any part of the structure, except as approved by the DCES.

H. Galvanized Metal Repair. The Contractor shall repair any damage to galvanized surfaces in conformance with the field repair requirements specified in §719-01, Galvanized Coatings and Repair Methods, except that zinc paint applied by the spray method shall not be permitted.

644-4 METHOD OF MEASUREMENT

644-4.01 Sign Structure. The work will be measured as the number of sign structures installed without sign panels.

644-4.02 Drilled Shafts for Overhead Sign Structures. The payment quantity shall be the concrete volume shown for the shaft in the table in the contract documents, multiplied by the number of drilled shafts in the contract, unless the Engineer orders a modification to the details shown in the contract documents. If the Engineer orders a modification to the details shown in the contract documents, the payment quantity shall be the volume of concrete ordered by the Engineer. If the Engineer orders a change from a drilled shaft to a rectangular footing, an order-on-contract shall be negotiated. No adjustment shall be made for the Contractor's election to use a rectangular footing, unless the Engineer orders a change to the details shown in the contract documents.

644-4.03 Rectangular Footing for Overhead Sign Structures. The payment quantity shall be the concrete volume shown for the footing and pedestal in the table in the contract documents, multiplied by the number of footings in the contract, unless the Engineer orders a modification to the details shown in the contract documents. If the Engineer orders a modification to the details shown in the contract documents, the payment quantity shall be the volume of concrete ordered by the Engineer. If the Engineer orders a change from a rectangular footing to a drilled shaft, an order-on-contract shall be negotiated. No adjustment shall be made for the Contractor's election to use a drilled shaft, unless the Engineer orders a change to the details shown in the contract documents.

644-4.04 Anchor Bolts. The payment quantity shall be the mass shown in the anchor bolt table in the contract documents times the number of bolts installed.

644-5 BASIS OF PAYMENT

644-5.01 Sign Structure. The unit price bid for each structure for supporting sign panels shall be compensation in full for fabricating, furnishing and erecting the structure complete as specified including upright support(s), span and/or cantilever arm or truss assemblies, diagonal bracing, all necessary hardware, nuts, bolts, and washers, and all other material, equipment and labor necessary to properly complete the work as shown in the contract documents and called for in the specifications. Footings and anchor bolts shall be paid for under separate items or will be furnished by others.

The cost of all shop drawings, prints and reproducible prints required by the New York State Steel Construction Manual shall be included in the unit price bid for this item.

644-5.02 Foundations for Overhead Sign Structures. The unit price bid per cubic yard shall include the excavation, any protective system(s) required to ensure the safety of the workers and the public, dewatering, backfill (select granular backfill or concrete), formwork, concrete, bar reinforcement for concrete, excavation and backfilling of test holes, conduit and fittings, restoration of surfaces in kind, disposal of excess excavated material, and saw cutting.

644-5.03 Anchor Bolts. The unit price bid pound shall include the furnishing and installing the anchor bolts and all necessary hardware, including galvanizing, as shown in the contract documents and called for in the specifications. This includes the anchor bolts, all templates used to ensure the proper alignment of the anchor bolt system, all nuts, and all washers necessary to complete the work as shown in the contract documents.

Payment will be made under:

Item No.	Item	Pay Unit
-----------------	-------------	-----------------

§644

644.11	Anchor Bolts	Pound
644.20	Drilled Shaft for Overhead Sign Structures	Cubic Yard
644.30	Rectangular Footing for Overhead Sign Structures	Cubic Yard
644.41xxyy	Single Arm Cantilever Sign Structure	Each
644.42xxyy	Trussed Arm Cantilever Sign Structure	Each
644.43xxyy	Single Span Sign Structure	Each
644.44nn	Non-Standard Sign Structure	Each

NOTE:

1. xx, yy and nn denote serialized pay items. See §101-02, Definition of Terms, under "Specifications".
2. xx denotes span or arm length in yards. For Single Arm and Trussed Arm Cantilever Sign Structures, xx varies from 04 to 16 in whole number increments. For Single Span Sign Structures, xx varies from 15 to 65 in 5 yard increments.
3. yy denotes sign area in square yards. For Single Arm Cantilever Sign Structures, yy is 03, 05 or 08 square yards. For Trussed Arm Cantilever Sign Structures, yy varies from 05 to 30 in 5 square yard increments. For Single Span Sign Structures, yy varies from 30 to 90 in 30 square yard increments.

SECTION 645 - SIGNS

645-1 DESCRIPTION. This work shall consist of fabricating, installing and covering traffic sign panels, sign support systems, sign posts, and illuminated sign panels in accordance with the contract documents, standard sheets, the MUTCD and as directed by the Engineer.

645-1.01 Definitions. The following definitions shall apply to all work equipment and materials included under this section:

1. Sign Face - the side of a sign panel with reflective sheeting attached.
2. Sign Face Layout - a dimensional representation of the sheeting mounted on the sign panel.
3. Sign Panel - a uniform sheet of aluminum or fiberglass reinforced plastic with reflective sheeting mounted on it. It may be constructed with or without additional sheets of aluminum or fiberglass reinforced plastic attached on the larger sheet. Multiple sheets of aluminum or fiberglass reinforced plastic may be used provided the sheets are of a uniform material and thickness and not separated.
4. Sign Panel Assembly - a group of contiguous sign panels with a maximum separation of 6 inches.
5. Sign Support System - the apparatus a sign panel is mounted.

645-2 MATERIALS

645-2.01 General. Materials shall meet the requirements of the following subsections of Section 700 *Materials and Manufacturing*:

Wood Preservative - Water Borne	708-31
Stress Graded Timber and Lumber	712-14
Stainless Steel Connecting Products	715-16
Rubber Impregnated Woven Cotton-Polyester Fabric	728-01
Rubber Impregnated Random Fiber Pad	728-02
Aluminum Sign Panels	730-01
Reflective Sheeting	730-05
Reflectorized Sheeting Sign Characters (Type IV)	730-12
Reflectorized Sheeting Sign Characters (Type V)	730-13
Stiffeners, Overhead Brackets, and Miscellaneous Hardware	730-22
Fiberglass Reinforced Plastic Sign Panels	730-23
Type A Sign Supports	730-24
Type B Sign Posts	730-25
Breakaway Bases and Hinge Assemblies	730-26
U-Bolts	ASTM F1554, Grade 36

645-2.02 Sign Panels. Fabrication of all components shall produce a finished sign panel. Holes may be punched or drilled. Edges shall be smooth and true and free from burrs or ragged breaks. Sign panels

shall be fabricated as shown on the standard sheets. Details for signs that are not shown on the standard sheets shall be similar to the closest shown sign blank size. All sign panels shall be clearly marked in the lower right corner on the back of the sign panel to show the Contract Number and the installation date (month/year). Markings shall be a minimum of 1 inch high and shall be permanently engraved, labels attached with pressure-sensitive adhesives, marked with an indelible ink or paint, or established by another method approved by the Engineer. U-Bolts used to attach sign panels to overhead sign structures shall be Type II galvanized in accordance with §719-01 *Galvanized Coatings and Repair Methods*.

A. Ground-Mounted Sign Panels.

1. Ground-Mounted Sign Panels without Z-bars. Ground-Mounted signs without Z-bars shall be 10 gauge thick meeting the requirements of §730-01 *Aluminum Sign Panels*. Or 0.135 inch thick meeting the requirements of §730-23 *Fiberglass Reinforced Plastic Sign Panels* for sign panels up to 4 feet x 4 feet.

2. Ground-Mounted Sign Panels less than or equal to 30 square feet (with Z-bars). Ground-Mounted signs with Z-bars less than or equal to 30 square feet shall be 10 gauge thick meeting the requirements of §730-01 *Aluminum Sign Panels*. Or 0.135 inch thick, meeting the requirements of §730-23 *Fiberglass Reinforced Plastic Sign Panels* for sign panels up to 4 feet x 4 feet.

3. Ground-Mounted Sign Panels greater than 30 square feet (with Z-bars). Sign panels for Ground-Mounted Sign Panels greater than 30 square feet shall be 8 gauge thick meeting the requirements of §730-01 *Aluminum Sign Panels*.

B. Overhead-Mounted Sign Panels. Sign panels for Overhead-Mounted Sign Panels shall be 8 gauge thick meeting the requirements of §730-01 *Aluminum Sign Panels*.

C. Sign Panels with Multiple Sheeting types. The panel thickness for sign panels with multiple types of sheeting types shall be determined using the total area of the sign panel, and meet the materials requirements above.

D. Reflective Sheeting. Reflective sheeting materials used on sign panels shall conform to the requirements of §730-05 *Reflective Sheeting*. Type I (Class A) sheeting may be used on tourist and motorist services signs. Type III (Class B) sheeting shall be used on regulatory, warning, route marker, and guidance signs unless specified otherwise below.

Type I (Class A) sheeting shall be used whenever brown reflective sheeting is specified, and may be processed by a sign fabricator in its shop. The legend for a sign with brown background shall be made by applying cut-out letters or symbols of Type I (Class A) yellow sheeting.

1. High-Visibility Sheeting. Signs with the following MUTCD codes shall be fabricated using Type IX (Class E) sheeting: R1-1, R1-2, R1-4, R1-5, R3-1, R3-2, R3-4, R3-18, R5-1, and R5-1a.

2. High-Visibility Fluorescent Yellow Sheeting. Signs with the following MUTCD codes shall be fabricated using Type IX (Class E) fluorescent yellow sheeting for the yellow portion of the sign face, and the appropriate nonfluorescent Type IX (Class E) color for the remainder of the sign face: E11-1, E11-1a, E11-1b, E11-1c W1-6, W1-7, and W1-8.

3. High-Visibility Fluorescent Yellow-Green Sheeting. Signs with the following MUTCD codes shall also be fabricated using Type IX (Class E) fluorescent yellow-green sheeting for the yellow portion of the sign face, and the appropriate nonfluorescent Type IX (Class E) color for the remainder of the sign face: NYR2-7, NYR2-8, S1-1, S3-1, S4-3, S4-5, W11-1, W11-2, W11-9, W15-1, W16-1, and W16-7p. In addition, signs with the following MUTCD codes mounted on the same support system shall also be fabricated using Type IX

(Class E) fluorescent yellow-green sheeting for the yellow portion of the sign face, and the appropriate nonfluorescent Type IX (Class E) color for the remainder of the sign face: W16-2, W16-2a, W16-3, W16-3a, W16-4, and W16-9p.

E. Sheeting Sign Characters. Characters include letters, numerals, route shields, symbols, and borders. Characters shall be the size, series and color specified in the MUTCD and as specified in the contract documents. Only Type IV or Type V Characters, as appropriate, shall be used. White legends and borders shall be formed with directly-applied Type IV Characters. Interstate shields for signs shall be either demountable panels or directly-applied panels with Type V reverse-screened characters. Sign face characters and background shall be reflective, but black portions of a sign face shall not be reflective.

F. Sign Face Layouts. Sign face shape, color, dimensions, and characters shall be in accordance with:

1. Manual on Uniform Traffic Control Devices for Streets and Highways (FHWA).
2. New York State Supplement to the National Manual on Uniform Traffic Control Devices for Streets and Highways
3. Standard Highway Signs Book – (FHWA)

After contract award, two copies of non-standard sign face layouts will be provided to the Contractor. The Contractor shall verify dimensions on the sign face layouts prior to fabrication. (Standard sign face layouts for MUTCD codes without the prefix NY are shown in the Standard Highway Signs Book written by the Federal Highway Administration.)

G. Sign Structure Bearing Pads. Type A Sign Structure Bearing Pads shall be made from Rubber Impregnated Woven Cotton-Polyester Fabric. Type B Sign Structure Bearing Pads shall be made from Rubber Impregnated Random Fiber Pad

645-2.03 Type A Sign Posts. Type A sign posts shall be selected from the Department's Approved List of Type A Sign Supports. The standard strength (i.e., moment capacity) of a Type A sign post shall be 2100 ft-lbs, although weaker or stronger posts may be substituted.

A. Type A Sign Posts With Extra Embedment. Type A sign posts with extra embedment (more than 3 feet) shall meet the requirements of the Materials Details for Type A sign Supports.

B. Soil Plates for Type A Sign Posts. Type A sign posts with soil plates shall meet the requirements of the Materials Details for Type A Sign Supports.

C. High-Capacity Type A Sign Posts. High-Capacity Type A sign posts are defined as any Type A sign post system shown in the Materials Details for Type A Sign Supports that has a total combined capacity for the entire two- or three-post system higher than 7800 ft-lbs. The Contractor shall calculate the design moment of the sign panel, and select an appropriate High-Capacity Type A sign post system capable of resisting that moment, subject to the Engineer's approval.

645-2.04 Type B Sign Posts. Type B sign posts shall be fabricated in accordance with the requirements of §730-25 *Type B Sign Posts*.

A. Rustic Type B Sign Posts. Rustic Type B sign posts shall be ungalvanized weathering steel meeting the requirements of ASTM A588 or A242.

B. Breakaway Bases and Hinge Assemblies. Breakaway bases and hinge assemblies shall be fabricated in accordance with the requirements of §730-26 *Breakaway Bases and Hinge Assemblies*.

645-2.05 Concrete Foundations. Cast-in-place concrete for foundations shall meet the requirements of Class A concrete in Section 501, *Portland Cement Concrete-General*. Precast concrete foundations shall meet the requirements of §704-06 *Precast Concrete Cribbing*. The batching, mixing and curing methods, and the inspection facilities shall meet the approval of the Department. The Contractor may submit a mix at least equivalent to Class A Concrete for approval by the Engineer.

645-2.06 Breakaway Wooden Sign Posts. Breakaway wooden sign posts shall be either Grade 2 Southern Yellow Pine or Grade 2 Douglas Fir-Larch, surfaced four side (S4S) as designated by the National Design Specification (NDS) for Wood Construction, and meeting the requirements of §712-14 *Stress Graded Timber and Lumber*. The bending stress (Modulus of Rupture) shall not be less than 3900 psi using the clear wood properties of ASTM D2555. Posts shall be pressure treated in accordance with §708-31 *Wood Preservative - Water Borne*, dried to a maximum moisture content of 15% before and after pressure treating. The embedded portion of each post shall be sealed to 2 inches above the ground surface or above the steel tube insert, with a heavy coat (12 mil dry film thickness) of an emulsified asphalt conforming to AASHTO M140.

All 3 1/2 inch x 5 1/2 inch posts shall have two 1 1/2 inch diameter breakaway holes drilled through the center of the post parallel to the sign face 4 inches and 18 inches above grade and filled with flexible caulk. All 5 1/2 inch x 7 1/2 inch posts shall have two 3 inch diameter breakaway holes drilled through the center of the post parallel to the sign face 4 inches and 18 inches above grade and filled with flexible caulk. Nails and fasteners shall be stainless steel meeting the requirements of §715-16. Cuts and holes made at the contract site shall be field treated with copper naphthenate having a minimum 2% metallic solution, in accordance with AWP Standard M4. Breakaway holes shall be field treated with copper naphthenate before filling with flexible caulk.

645-2.07 Pole-Mounted Sign Support System. Bands, brackets, hardware, and fasteners necessary to mount a sign panel or a sign panel assembly on traffic signal poles, street lighting poles or other poles shall be stainless steel. Bands shall be a minimum of 0.75 inch x 0.02 inch. Other methods of attachment may be substituted with prior written approval of the Engineer. A sign panel assembly is defined as a group of contiguous sign panels with a maximum separation of 6 inches.

645-2.08 Illuminated Signs. Illuminated Sign Panels shall be aluminum alloy 8 gauge thick meeting the requirements of §730-01, *Aluminum Sign Panels*. All materials necessary to illuminate the sign panels shall be as shown in the contract documents.

645-2.09 Sign Covering Material. Material used to cover sign panels shall be of an opaque, porous, and windproof fabric. Plastic, mesh, translucent or transparent materials will not be allowed. The covering material shall be a single neutral color, except orange or yellow, and shall not contain any wording or images.

645-3 CONSTRUCTION DETAILS

645-3.01 General. Sign panels, overhead panels, overhead vertical brackets, vertical and horizontal Z-bars, sign support systems, sign posts, breakaway bases and hinge assemblies, and foundations for Type B sign posts shall be constructed in accordance with the contract documents, standard sheets, MUTCD and materials details. Sign locations shown in the contract documents are approximate, and the exact location for each sign will be approved by the Engineer in the field.

The Contractor shall erect new signs and remove existing signs in such a manner that the traveling public is provided all necessary regulatory, warning, and guidance information at all times. Certain items may be designated to be performed prior to other items of work.

An inspection of installed signs will be made in the daylight for color, reflectivity, location, vertical post alignment, visibility, and appearance. The installed signs will also be inspected at night for color, orientation and reflectivity, traits which will be more conspicuous at night.

A. Wind Loads. The wind pressures given on the standard sheets have been calculated according to the procedure in the AASHTO *Standard Specifications for Structural Supports for Highway Signs,*

Luminaires, and Traffic Signals (1994). All wind loading shall be adjusted for height, drag, and gusting in accordance with AASHTO's *Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals (1994)*. Allowable sign areas shall be reduced when the sign centroid height is at an elevated site condition (e.g., an overpass) where the influence of the ground on the wind is reduced. For example, a sign centroid between 29 feet and 49 feet above the existing ground would result in a 37.5% increase in wind pressure (refer to the section "Loads" in aforementioned AASHTO Specifications).

TABLE 645-1 WIND LOAD CRITERIA				
	Region	Wind Velocity (mph)	Wind Pressure at Panel Centroid ≤ 140-14.0 ft (psf)	Wind Pressure at Panel Centroid > 140-14.0 ft (psf)
Type A Post	1, 2, 6, 8, and 9	60	14.4	19.2
	3, 4, 5, 7, 10, and 11	70	20.4	25.2
Type B Post	1, 2, 6, 8, and 9	70	NA	25.2
	3, 4, 5, 7, 10, and 11	80	NA	33.6

NOTE: Panel centroid height measured above the surrounding terrain.

645-3.02 Sign Panels. Sign panels shall be installed as shown on the standard sheets or as shown in the contract documents. Layout of sign panels and assemblies shall be as shown in the contract documents. Aluminum Overhead Mounted Sign Panels shall be separated from steel overhead sign structures in order to prevent corrosion by a Type A Sign Structure Bearing Pad or a Type B Sign Structure Bearing Pad as shown in the contract documents.

645-3.03 Type A Sign Posts. The Contractor shall install Type A sign posts individually or in groups to provide the required moment resistance. Type A sign posts with Extra Embedment, and Soil Plates for Type A sign post, shall be installed where extra embedment depth and/or soil plates are required. High-Capacity Type A sign posts shall also be installed where extra moment capacity is required.

The number of Type A sign posts indicated in the contract documents is based on the information available during design. The number and strength of Type A sign posts installed shall be based on conditions at the final sign location approved by the Engineer. The Contractor shall determine the required moment resistance for the Type A sign post(s) due to the wind loads indicated in §645-3.01A.

Wind Loads, and propose an appropriate number and strength of Type A sign posts for the approval of the Engineer. The Contractor shall submit the approved Materials Details, and any computations, to the Engineer, and install the required number of Type A sign posts subject to the following criteria:

1. For signs with a nominal width greater than 30 inches, at least two posts are required, except that the nominal 30 inch x 30 inch diamond panel and the nominal 36 inch wide "YIELD" panel require only one post.
2. The maximum number of posts installed within a 7 foot path shall be as described on the approved Materials Details.
3. For single flanged channel post installations only, the required moment resistance for the post shall be increased by 25% to account for torsional shear. The Materials Details include this adjustment.

645-3.04 Type B Sign Posts. The Contractor shall install Type B sign posts, breakaway bases, hinge assemblies and foundations in accordance with the details shown on the standard sheets or the manufacturer's approved materials details.

The Type B sign post type, size and number shown in the contract documents are based on the information available during design. The sign post type, size and number to be installed by the Contractor shall be based on conditions at the final location approved by the Engineer. The Contractor shall determine the required moment resistance for the Type B sign post(s) based on the wind loads

indicated in §645-3.01A. *Wind Loads* and verify the sign post type, size, number, hinge capacity and 7 foot wheel path criteria for the approval of the Engineer. The Contractor shall submit any computations to the Engineer.

The Contractor may install breakaway type bases under the contract pay item for nonbreakaway type posts provided that nonslotted hinge plates are used on both flanges and the installation is outside the clear zone or otherwise protected.

A. Rustic Type B Sign Posts. Rustic Type B sign posts shall be installed in the same manner as Type B sign posts.

B. Breakaway Bases and Hinge Assemblies. Breakaway bases and hinge assemblies shall be installed in accordance with the standard sheets or the manufacturer's approved materials details.

When breakaway bases and hinge assemblies are used with rustic Type B sign posts, the breakaway bases and hinge assemblies shall be installed as follows:

1. The front (approach) flange hinge plate of rustic Type B sign posts shall be installed as shown on the contract drawings, except that an additional galvanized steel flat washer shall be installed on all four bolts between each post and the slotted hinge plate to assure proper slippage.
2. All miscellaneous visible galvanized steel hardware, except in the vicinity of the hinge plate slots, shall be painted with Weathered Brown Guide Rail Paint.

645-3.05 Concrete Foundations. Concrete foundations shall be constructed in accordance with the Materials Detail Sheets and contract documents. Upon completion of the sign installation the Contractor shall restore the area to its original state.

Wooden Post Section (inches)	Embedment (ft)	60 mph Wind Velocity				70 mph Wind Velocity			
		Height to Panel Centroid (ft)				Height to Panel Centroid (ft)			
		6.0	8.0	10.0	12.0	6.0	8.0	10.0	12.0
3.5 x 3.5	5.0	14.6	11.0	8.7	7.3	10.3	7.7	6.1	5.2
3.5 x 5.5 3.5 x 3.5	6.0	35.1	26.3	21.1	17.5	24.7	18.6	14.8	12.4
5.5 x 7.5	7.0	93.1	69.7	55.8	46.5	65.6	49.3	39.4	32.8

NOTE: For 1 post, reduce allowable sign areas by 60%.
 For 3 posts, increase allowable sign areas by 50%.
 For 3 posts, separate outer posts by more than 8 feet.

645-3.06 Breakaway Wooden Sign Posts. Breakaway wooden sign posts shall be installed in accordance with Table 645-2, *Allowable Sign Areas on 2 Breakaway Wooden Posts* and Materials Details.

Each sign stringer to post attachment shall be bolted completely through the post using two 3/8 inch diameter stainless steel bolts with nuts and washers. Posts shall use a concrete foundation as noted in Subsection 645-2.05 in this specification, with a steel tube insert or be backfilled with compacted cushion sand or stone screening, as noted in the Materials Detail Sheets and contract documents.

645-3.07 Pole-Mounted Sign Support System. Pole-Mounted Sign Support System, as defined in 645-2.07, shall be firmly attached to the pole in accordance with the standard sheets and/or manufacturer's instructions.

A. Panels without Z-bar stiffeners:

Sign panels less than or equal to 18 inches wide, shall be attached to the pole with at least two bands. Sign panels less than or equal to 18 inches wide and longer than 30 inches, shall be attached to the pole with at least three bands.

B. Panels and assemblies with Z-bar stiffeners:

Sign panels greater than 18 inches wide and sign panel assemblies shall be banded to the pole at each horizontal Z-bar stiffener, as shown on the standard sheets.

Sign Panels mounted with this type of sign support shall not be greater than 48 inches wide, and shall not be greater than 60 inches in height. Sign panel assemblies mounted with this type of sign support shall not be greater than 48 inches wide. ~~645-3.07 Pole Mounted Sign Support System. Pole Mounted Sign Support System, as defined in 645-2.07, shall be firmly attached to the pole in accordance with the standard sheets and/or manufacturer's instructions.~~

Comment [c107]:
E108-043

~~— Sign panels or sign panel assemblies less than or equal to 18 inches wide, and sign panels not requiring Z-bar stiffeners, shall be attached to the pole with at least two bands. Sign panels greater than 18 inches wide, sign panel assemblies, and sign panels requiring Z-bar stiffeners, shall be banded to the pole at each horizontal Z-bar stiffener, as shown on the standard sheets.~~

~~— Mountings for sign panels or sign panel assemblies greater than 18 inches wide and mounted on traffic signal poles, street lighting poles or other poles shall be designed by the contractor to withstand the wind loadings shown in Table 645-1. The contractor shall make computations available to the Engineer for verification.~~

645-3.08 Illuminated Signs. Illuminated sign panels shall be installed as shown in the contract documents. All work on the illumination system shall be performed in accordance with the National Electrical Code and the requirements of the local utility. Electrical circuits shall be tested by the Contractor for insulation resistance and ground resistance in accordance with the requirements below.

Testing equipment shall be supplied by the Contractor and the tests shall be performed in the presence of the Engineer.

A. Insulation Resistance Test. Each circuit including ballasts and protective devices shall be insulation tested using an insulation tester according to manufacturers instructions. The Contractor shall compute a polarization index by dividing a ten-minute reading by a one-minute reading. The polarization index shall be greater than 4.0 for acceptance of new circuits, and greater than 2.0 for acceptance of existing circuits. The lighting system shall be properly grounded and disconnected while this test is conducted.

B. Ground Resistance Test. A ground test shall be performed by the Contractor using an earth tester with resolution to a minimum of 0.1 ohm. The test shall be performed, and the results interpreted, according to manufacturer's instructions. Readings of 5.0 ohms or less will be required for acceptance.

C. Functional Test. After satisfactory completion of all other tests, a functional test shall be performed consisting of not less than ten consecutive days of satisfactory operation. If unsatisfactory performance of any component of the lighting system is discovered during this time, the condition shall be corrected and the Engineer may require the test repeated until ten days of continuous satisfactory operation is obtained.

Temporary shutdowns caused by power interruption or vehicle impact will not constitute discontinuity of the functional test.

645-3.09 Covering Signs. Signs shall be covered to eliminate noncurrent, conflicting, or unneeded information. The cover shall be held in place and positioned so that none of the sign face shows. More than one layer of fabric may be required to prevent legibility of the sign legend to be covered.

The cover shall be folded over the top and bottom of panel edges, but not on the sides, and secured to the back of the sign panel. Tape shall not be attached to the face of the sign panel nor shall holes be drilled in the sign panel or posts. Coverings that work loose shall be resecured by the Contractor at no additional expense to the State. The cover shall remain in place until the sign is no longer in conflict with current conditions.

645-4 METHOD OF MEASUREMENT

645-4.01 General. (Vacant)

645-4.02 Sign Panels. The work will be measured as the number of square feet measured to the nearest 0.1 square feet of sign panel satisfactorily covered or installed.

The area of each panel will be measured as the area shown on the standard sheets. For sign panels not shown on the standard sheets, the area will be measured as the product of length and width, with no reduction for rounded corners. When sign panels are mounted back-to-back, each panel face will be measured separately.

A. Panels with Multiple Sheeting types. Panels with multiple types of sheeting will be measured as the number of square feet measured to the nearest 0.1 square feet for each of the types of sheeting applied to the sign panel. The sum of the all the areas of the sheeting types measured shall equal the total area of the sign panel measured as the product of length and width.

645-4.03 Type A Sign Posts. The work will be measured as the number of Type A sign posts required, which is the greater of either:

1. The number of posts required based on the width of the sign; or,
2. The number of posts of standard strength (2100 ft-lbs moment capacity) required to resist the moment due to wind load.

A. Type A Sign Posts With Extra Embedment. The work will be measured as the number of Type A sign posts with extra embedment satisfactorily installed with these modified bases.

B. Soil Plates for Type A Sign Posts. The work will be measured as the number of soil plates for Type A sign posts satisfactorily installed on either standard Type A sign posts, or on Type A sign posts with extra embedment.

C. High-Capacity Type A Sign Posts. The work will be measured as the number of high-capacity Type A sign posts satisfactorily installed. Post systems in which two posts are combined to function as a single post, such as the back-to-back flanged channel or the telescoping square tube, are measured as one post.

645-4.04 Type B Sign Posts and Rustic Type B Sign Posts. The work will be measured as the number of Type B sign posts or rustic Type B sign posts satisfactorily installed. When the Engineer directs that a different size Type B sign post be installed at a location that is called for in the contract documents, and there is no contract pay item in the contract for the directed post, the original quantity shall be multiplied by the following factor: lb/ft of directed post divided by lb/ft of original post.

645-4.05 Concrete Foundations. The work will be measured as the number of concrete foundations for Type A Sign Posts, High-Capacity Type A Sign Posts, or Breakaway Wooden Sign Posts with steel tube inserts satisfactorily installed.

645-4.06 Breakaway Wooden Sign Posts. The work will be measured as the number of breakaway wooden sign posts satisfactorily installed.

645-4.07 Pole-Mounted Sign Support System. The work will be measured as the number of pole-mounted sign support systems satisfactorily installed.

645-4.08 Illuminated Sign Panels. The work will be measured as the number of square feet measured to the nearest 0.1 square feet of illuminated sign panel satisfactorily installed.

645-4.09 Covering Sign Panels. (Vacant).

645-5 BASIS OF PAYMENT

645-5.01 General. The unit price bid for all items shall include the cost of furnishing all labor, materials, and equipment necessary to complete the work.

645-5.02 Sign Panels. The unit price bid for sign panels shall include the panels, sheeting, horizontal and vertical stiffeners (Z-Bars), vertical overhead brackets to mount sign panels to overhead structures, and fasteners and miscellaneous hardware necessary to complete the work. The cost of sign panels that are to become part of larger signs (e.g., route shields on large guide signs) shall be included in the unit price bid for the main panel.

A. Panels with Multiple Sheeting types. Panels with multiple types of sheeting will be paid separately under their respective contract pay items.

645-5.03 Type A Sign Posts. The unit price bid for Type A sign posts, Type A sign posts with extra embedment, soil plates for Type A sign posts, and high-capacity Type A sign posts shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

645-5.04 Type B Sign Posts. The unit price bid for Type B sign posts shall include the posts, breakaway base and hinge assemblies, and concrete footings. Breakaway bases provided in lieu of nonbreakaway posts at the Contractor's option will be paid for at the bid price for nonbreakaway bases.

645-5.05 Concrete Foundations. The unit price bid for Concrete Footing for Type A, High-Capacity Type A or Breakaway Wooden Sign Posts with steel tube inserts shall include the cost of furnishing all labor, materials and equipment necessary to install the footing and hardware.

645-5.06 Breakaway Wooden Sign Posts. The unit price bid for breakaway wooden sign posts shall include the posts and backfill if required.

645-5.07 Pole-Mounted Sign Support System. The unit bid price for each pole-mounted sign support system shall include the cost of furnishing all labor, materials and equipment necessary to install the sign panel or sign panel assembly on a pole, regardless of the number of bands used.

New or relocated sign panels or sign panel assemblies and any required Z-bar stiffeners will be paid under their respective items.

645-5.08 Illuminated Sign Panels. The unit price bid for illuminated sign panels shall include the work required under §645-5.02 *Sign Panels*, and all luminaires, bulbs, ballasts, wiring, conduit, and fittings from a point just above the footing to the most extreme luminaire. The unit price bid for illuminated sign panels shall also include the cost to energize and test the illuminated sign panel. The cost of energy necessary to illuminate sign panels before final contract acceptance shall be borne by the Contractor. The cost of controllers will be paid separately.

645-5.09 Covering Sign Panels. The unit price for covering sign panels shall include the work required for covering permanent signs: covering construction signs will be paid under Construction Signs.

Payment will be made under:

Item No.	Item	Pay Unit
645.5101	Ground-Mounted Sign Panels without Z-bars	Square Foot
645.5102	Ground-Mounted Sign Panels less than or equal to 30 SF with Z-bars	Square Foot
645.5103	Ground-Mounted Sign Panels greater than 30 SF with Z-bars	Square Foot
645.5201	Ground-Mounted Sign Panels without Z-bars, High-Visibility Sheeting	Square Foot
645.5202	Ground-Mounted Sign Panels less than or equal to 30 SF with Z-bars, High-Visibility Sheeting	Square Foot
645.5203	Ground-Mounted Sign Panels greater than 30 SF with Z-bars, High-Visibility Sheeting	Square Foot

645.61	Overhead Sign Panels	Square Foot
645.62	Overhead Sign Panels with High-Visibility Sheeting	Square Foot
645.76	Illuminated Sign Panels	Square Foot
645.77	Covering Sign Panels	Square Foot
645.81	Type A Sign Posts	Each
645.8104	Type A Sign Posts with Extra Embedment	Each
645.8105	Soil Plate for Type A Sign Post	Each
645.8106	High-Capacity Type A Sign Posts	Each
645.8107	Concrete Footing for Type A, High-Capacity Type A or Breakaway Wooden Sign Posts With Steel Tube Inserts	Each
645.82	Breakaway Wooden Sign Posts	Each

SECTION 646 - DELINEATORS, REFERENCE MARKERS AND SNOWPLOWING MARKERS

646-1 DESCRIPTION. This work shall consist of furnishing and installing delineators, reference markers and snowplowing markers in accordance with the MUTCD, Reference Marker Manual, standard sheets, plans or as ordered by the Engineer.

646-1.01 Delineators. Delineators are reflective units placed on supports along the highway to serve as driving aids.

646-1.02 Reference Markers. Reference markers are panels with a legend, placed at approximately 1/10 mile intervals along the highway, to provide a numerical location reference.

646-1.03 Snowplowing Markers. Snowplowing markers are reflective units installed along the highway to identify guiderail sections for snowplow operators.

646-2 MATERIALS. Materials for delineators, reference markers and snowplowing markers shall meet the requirements of the following subsection of Section 700-Materials and Manufacturing except as provided for below:

Galvanized Coating and Repair Methods	719-01
Aluminum Sign Panels	730-01
Reflective Sheeting	730-05
(Materials Designations 730-05.02 and 730-05.03)	
Acrylic Plastic Reflex Reflectors for Delineators	730-10
Sign Posts and Footings	730-20
Flexible Delineator Posts	730-21
Stiffeners, Overhead Brackets and Miscellaneous Hardware	730-22.

646-2.01 Posts. Posts shall be fabricated from galvanized steel as shown on the standard sheets and/or plans, or an approved flexible post meeting the requirements of §730-21 Flexible Delineator Posts.

646-2.02 Reflective Material. Delineators and snowplowing markers shall be fabricated from either Reflective Sheeting, Material Designations 730-05.02 (Class B) or 730-05.03 (Class C), or from Acrylic Plastic Reflex Reflectors. On any one contract all of the delineators must be fabricated from the same material and all of the snowplowing markers must be fabricated from the same material, but the material may differ between the delineators and the snowplowing markers.

Reference markers shall be fabricated from Reflective Sheeting, Materials Designation 730-05.02 (Class B).

646-2.03 Aluminum Panels. Aluminum panels for delineators, reference markers and snowplowing markers shall be of aluminum alloy 6061-T6 in accordance with the standard sheets.

646-2.04 Fasteners. Fasteners shall be fabricated from stainless steel, galvanized steel or aluminum as shown on the standard sheets.

646-2.05 Brackets. Mounting brackets shall be fabricated from either aluminum alloy 6061-T6 or galvanized steel or polycarbonate (0.080 inch) as shown on the standard sheets.

646-2.06 Corrosion Protection. All steel surfaces shall be prevented from coming in direct contact with the aluminum brackets by means of either an approved mastic or 1/8 inch thick pad placed between the dissimilar metals.

646-3 CONSTRUCTION DETAILS

646-3.01 Fabrication. Delineators and snowplowing markers shall be fabricated as shown on the standard sheets. Reference markers shall be fabricated as shown on the standard sheets from reflective sheeting with the legends applied by reverse silk screening and/or directly applied reflective characters using green background and white letters. Legend content shall be as shown on the plans.

646-3.02 Location. Delineators shall be installed at the locations and spacing as shown on the plans or as ordered by the Engineer. Directional orientation, arrangement, number and color of reflector units, at any given location shall be as shown on the plans.

Reference markers shall be installed at approximately 1/10 mile intervals along the highway. The Contractor will be given the location of each marker.

Snowplowing markers and supplementary snowplowing markers shall be installed at the locations shown on the plans or as ordered by the Engineer.

646-3.03 Erection. Delineators, reference markers and snowplowing markers are to be erected on posts, brackets, existing posts and structures in the manner shown on the standard sheets.

646-3.04 Inspection. After the installation of delineators, reference markers and snowplowing markers, an inspection by the Engineer shall be made in the day time for proper location, line and grade, vertical post alignment and visibility. They shall also be inspected at night for improper orientation, specular reflection and other defects more conspicuous at night. All apparent defects disclosed after the day and night inspections shall be corrected by the Contractor to the satisfaction of the Engineer and the cost thereof shall be included in the Contractor's unit price bid.

646-3.05 Damage. When delineators and markers are installed on walls, bridges, existing posts, poles or structures, care shall be taken so as not to damage the appearance or structural features of the existing facilities. All damaged features shall be repaired or replaced, at no additional cost, to the satisfaction of the Engineer.

646-3.06 Marker Relocation. The existing markers shall be carefully removed and stockpiled above ground in a neat and skilled manner, to the satisfaction of the Engineer, by the Contractor at the site or sites within the R.O.W. limits as designated by the Engineer. Care shall be exercised in removing the

markers to prevent damage to any part of the reflectorized panels. All markers so damaged shall be replaced at the Contractor's expense.

The contractor shall remove and dispose of all existing posts or hardware used only for the support of the existing markers.

Markers removed shall be re-erected on new posts, brackets, or bands at the locations called for on the plans or specified by the Engineer.

646-4 METHOD OF MEASUREMENT. Delineators, reference markers and snowplowing markers shall be measured as the number of complete markers and/or delineators furnished and installed. In the event a section of highway is under construction by others and reference markers cannot be installed, they will be measured as the number of marker panels furnished only.

Relocated markers shall be measured as the number of markers relocated in accordance with these specifications and in a manner approved by the Engineer.

646-5 BASIS OF PAYMENT. The unit price bid shall include the cost of all materials, equipment and labor necessary to satisfactorily complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
646.0601	Delineator, Single Unit, One Way on Post	Each
646.0602	Delineator, Single Unit, Back to Back on Post	Each
646.0603	Delineator, Single Unit, Two Way on Post	Each
646.0604	Delineator, Single Unit, Three Way on Post	Each
646.0605	Delineator, Single Unit, Four Way on Post	Each
646.0606	Delineator, Double Unit on Post	Each
646.0607	Delineator, Single Unit, Band or Bracket Mounted	Each
646.0608	Delineator, Double Unit, Band or Bracket Mounted	Each
646.0609	Delineator, Single Unit, Back to Back, Band or Bracket Mounted	Each
646.0610	Delineator, Single Unit, Two Way, Band or Bracket Mounted	Each
646.0611	Delineator, Single Unit, Three Way, Band or Bracket Mounted	Each
646.0612	Delineator, Single Unit, Four Way, Band or Bracket Mounted	Each
646.0623	Delineator, White, Single Unit, One Way on Flexible Post	Each
646.0624	Delineator, White, Single Unit, Back to Back, on Flexible Post	Each
646.0625	Delineator, White, Double Unit on Flexible Post	Each
646.0633	Delineator, Yellow, Single Unit, One Way on Flexible Post	Each
646.0634	Delineator, Yellow, Single Unit, Back to Back, on Flexible Post	Each
646.0635	Delineator, Yellow, Double Unit on Flexible Post	Each
646.0701	Reference Marker, 4 foot Mounting Height	Each
646.0702	Reference Marker, 7 foot Mounting Height	Each
646.0703	Reference Marker, Band or Bracket Mounted	Each
646.0704	Reference Marker, On Existing Post	Each
646.0705	Reference Marker, Furnish Panel Only	Each
646.0801	Snowplowing Marker, Single Unit	Each
646.0802	Snowplowing Marker, Double Unit	Each
646.0803	Supplementary Snowplowing Marker	Each
646.09	Marker-Relocation	Each

SECTION 647 - REMOVING, STORING AND RELOCATING SIGNS

647-1 DESCRIPTION. This work shall include the removal, or removal and storage, or relocation of existing State signs and/or sign structures designated on the plans or specified by the Engineer. The sign components shall include sign panels, stringers, vertical brackets, miscellaneous hardware used solely for the support of the designated sign panels, upright supports, bracing and structures.

647-2 MATERIALS. All materials used in this work shall meet the requirements of §645-2.

647-3 CONSTRUCTION DETAILS

647-3.01 Removal of Signs. Existing traffic signs requiring removal, but not storage, shall become the property of the Contractor and shall be removed from the work site in a neat and skillful manner to the satisfaction of the Engineer.

647-3.02 Removal and Storage of Signs. Existing traffic signs shall be removed and stockpiled off the ground in a neat and skillful manner, to the satisfaction of the Engineer, by the Contractor at the site or sites within the R.O.W. limits as approved by the Engineer.

647-3.03 Removal of Concrete Sign Footings. All concrete sign footings shall be completely removed, or if allowed by the Engineer, shall be cut to a depth of 1 foot below existing ground and be replaced with suitable material as specified by the Engineer.

647-3.04 Relocation of Signs. Existing sign panels shall be removed and stockpiled off the ground in a neat and skillful manner by the Contractor to the satisfaction of the Engineer, at the site or sites within the R.O.W. limits as designated by the Engineer. Care shall be exercised in removing the sign panels to prevent damage to any part of the reflectorized sign face or characters, or the existing stringers or stiffeners. Any damage shall be repaired or the damaged part replaced to the satisfaction of the Engineer at the Contractor's expense.

Existing sign posts shall become the property of the Contractor and shall be removed from the work site in a neat and skillful manner.

The Contractor shall erect new sign posts and mount the existing sign panels at the locations shown on the plans or specified by the Engineer. The requirements of §645-3, Construction Details, shall apply to this work.

647-4 METHOD OF MEASUREMENT. The quantity to be paid for will be the number of completely removed or relocated installations having sign areas of the following sizes:

- Size A: 0 to 10 Square Feet
- Size B: 11 to 20 Square Feet
- Size C: 21 to 40 Square Feet
- Size D: 41 to 100 Square Feet
- Size E: Over 100 Square Feet
- All Overhead Sign Panels (Any Size)

647-5 BASIS OF PAYMENT. The unit price bid for removing or removing and storing or relocating an existing installation shall be compensation in full for the furnishing of all labor, equipment, and materials necessary described in this section.

Payment will be made under:

Item No.	Item	Pay Unit
647.01	Removal of Signs - Size A (0 to 10 Square Feet)	Each
647.02	Removal of Signs - Size B (11 to 20 Square Feet)	Each
647.03	Removal of Signs - Size C (21 to 40 Square Feet)	Each
647.04	Removal of Signs - Size D (41 to 100 Square Feet)	Each
647.05	Removal of Signs - Size E (Over 100 Square Feet)	Each
647.06	Removal and Storage of Signs Size A (0 to 10 Square Feet)	Each
647.07	Removal and Storage of Signs Size B (11 to 20 Square Feet)	Each
647.08	Removal and Storage of Signs Size C (21 to 40 Square Feet)	Each
647.09	Removal and Storage of Signs Size D (41 to 100 Square Feet)	Each
647.10	Removal and Storage of Signs Size E (Over 100 Square Feet)	Each
647.11	Relocating Signs Size A (0 to 10 Square Feet)	Each
647.12	Relocating Signs Size B (11 to 20 Square Feet)	Each
647.13	Relocating Signs Size C (21 to 40 Square Feet)	Each
647.14	Relocating Signs Size D (41 to 100 Square Feet)	Each
647.15	Relocating Signs Size E (Over 100 Square Feet)	Each
647.18	Removal of Overhead Sign Panels	Each

647.19	Removal and Storage of Overhead Sign Panels	Each
647.20	Removal of Cantilever Sign Structure	Each
647.21	Removal of Single Span Sign Structure	Each
647.22	Removal of Multi-Span Sign Structure	Each

SECTION 648 - SUBSURFACE EXPLORATIONS

648-1 DESCRIPTION. This work shall consist of furnishing equipment, drilling for soil and rock samples, and preparing a driller's log in accordance with these specifications and the direction of the Engineer.

648-2 MATERIALS. Materials for this work shall meet the requirements of the following Subsections of Section 700 - Materials and Manufacturing:

Drill Rigs	732-01
Drive Pipe	732-02
Casing	732-03
Samplers	732-04
Thin-Walled Sample Tubes	732-05
Coring Bits	732-06
Sample Storage Bags	732-07
Sample Jars	732-08
Jar Cartons	732-09
Boulder and Rock Core Boxes	732-10
Open Well Piezometers	732-11
Grout	732-12

648-3 CONSTRUCTION DETAILS

648-3.01 General. This work shall consist of furnishing equipment, clearing of all drill holes in accordance with New York State Department of Public Service Rule 753, drilling for soil and rock samples, back filling all drill holes to the satisfaction of the Engineer, and preparing a driller's log in accordance with these specifications. Any proposed variation from the methods and techniques in the specifications shall be submitted in writing by the Contractor to the Engineer who shall forward the proposal to the Director of the Geotechnical Engineering Bureau for review. Approval, if granted, will be based on the decision of the Director of the Geotechnical Engineering Bureau as to the capabilities of the proposed variation to provide satisfactory samples and subsurface information. If granted, this approval will remain in force only so long as all conditions set forth in the approval are met and satisfactory results are obtained. In the event unsatisfactory results are obtained, the approval will be withdrawn and all remaining work shall be completed in accordance with this specification. Boring work shall not commence until all equipment stated in the proposal is on the project and approved. In addition, the following shall apply:

A. Furnishing Equipment for Making Borings. The Contractor shall furnish the number of drill rigs, conforming to §732-01, stated in the proposal or work order, maintain this equipment, and remove it from the site at the time indicated by the Engineer. All equipment shall be acceptable to the Engineer.

B. Driller's Logs. The forms for the driller's logs, Form 282e, will be furnished by the State and shall have the following information legibly printed on them by the Contractor:
 Region
 County

Contractor Name
 Contract Number
 Project Identification Number (PIN)
 Project Name
 Date Started and Finished
 Hole Number
 Weight and Fall of Hammer (Casing)
 Weight and Fall of Hammer (Sampler)
 Casing and Sampler Size
 Inspector Name (Regional Geotechnical Engineer on Log)
 Structure Name/Number
 Penetration Records (Blows on Casing, Drive Pipe and Sampler)
 Sample numbers

Groundwater Data

Depth at which drill water was first used
 Depth at which groundwater was first encountered
 Depth to groundwater at the beginning and end of each day's operation

Rock Core

Length of Run
 Percent Recovery
 Number of Pieces
 Depth Core Obtained
 Size of Core Obtained
 Type of Core Barrel

All pertinent remarks and comments

The hole designation on the final log and sample containers should reflect the actual method of progressing the hole. Any change in hole designation (due to an alternate hole progression method) shall be forwarded to the Engineer in writing in a timely manner.

Provide all measurements and dimensions in U.S. Customary units on the final log.

Ensure that the completed driller's log is signed by the drill rig operator, the drill rig inspector, and the Chief Inspector.

Deliver the samples and a copy of the completed driller's log to the location indicated in the Contract documents, between the hours of 8:00 A.M. and 3:00 P.M., within five working days following completion of the hole, except holidays. In addition, deliver another copy of the completed driller's log to the Departmental Geotechnical Engineer. Submit the original copy of the completed driller's log to the Engineer.

C. Groundwater Determinations. The level at which groundwater is first encountered in the borings shall be noted. Water level readings shall be taken at the end of each day after the last sample has been taken and the sample and rods have been removed. No soil shall be left in the casing at the end of the day. Do not fill the casing with water unless there is a need to compensate for a condition such as running sand. Measure and record the change in water level when resuming work. Capped borings shall be vented. Groundwater levels shall be measured before and after the casing or drive pipe is pulled. Each water level reading shall be recorded showing the date and time the reading was made, the depth of the drive pipe or casing, and the depth to water. Any loss or gain of water in the boring, except that caused by deliberately introducing water and/or inserting or removing tools, shall be recorded. This record shall show the date and time the loss or gain is noted, the depth of the casing and the depth to water. The height of artesian rise shall be recorded.

All water level readings and related data shall be recorded on the boring logs under "Remarks". If necessary, additional forms shall be used for recording groundwater data.

Artesian pressures shall be permanently sealed at the elevation at which they were encountered. This seal shall be satisfactory to the Engineer before casing is removed from the hole.

648-3.02 Split Barrel Samples

A. Progressing the Hole. The hole shall be progressed by advancing flush-joint casing, flush-coupled casing, or extra-strength drive pipe by driving or drilling, or where permitted, by a drilling mud process or by using a hollow flight auger. When driven casing is used a 300-lb (± 3 percent) hammer falling freely 18 inches shall be used. Actuate the hammer by means of a rope and cathead, or by automatic hammer, when casing or drive pipe is driven.

Casing refusal shall be considered as 300 blows for less than 12 inches of penetration. When refusal is encountered, the casing shall be cleaned and a sample shall be attempted, if no sample is recovered, coring will commence.

Prior to sampling, the drill hole shall be cleaned to the sampling elevation by using equipment that will not disturb the material to be sampled. Bottom discharge bits, including samplers, will not be allowed. A roller bit may be used as a clean out tool if it is of a type that deflects water to the sides rather than downward into the material to be sampled. The Engineer may order a new roller bit at any time he deems the one in use to be unacceptable. "N" size drill rods or larger shall be used in 3 inch or larger inside diameter casing.

The Engineer shall be advised of the time of the last sampling operation so he may be present when the hole is measured for payment purposes.

B. Sampling. Samples shall be taken at every change in stratum, but in no case at intervals greater than 5 feet. Continuous sampling may be directed by the Engineer. The sampler shall be placed on the bottom of the cleaned out hole and then driven 18 inches with a 300-lb (± 3 percent) hammer falling freely 18 inches. Actuate the hammer by means of a rope and cathead, or by automatic hammer. When the Standard Penetration Test (SPT) is required, use equipment and procedures conforming to ASTM D1586-84, except as modified by this specification.

The number of blows required to drive the sampler each increment of 6 inches shall be recorded. If refusal is encountered before the desired sample length is attained, and the sampler proves to have no recovery, the sampler shall be removed from the hole and core drilling started; however, if refusal is encountered and the material retained represents the best obtainable sample as determined by the Engineer, the hole may be progressed to the next sample elevation or change in soil strata. Refusal shall be 50 hammer blows for less than 6 inches of penetration for the 300-lb hammer. When the SPT is used, refusal shall be as defined in ASTM D1586-84.

When a recovery of less than 6 inches of sample in a split barrel sampler is retrieved, the sampler shall be re-driven at the same elevation in an attempt to obtain more material. Only the first set of blows shall be recorded on the boring log, but a note shall be included under "Remarks" indicating that a second sampling attempt was made. The Engineer may direct that a basket or other spring type retainer be used on any or all sampling attempts. Flap or trap valves will only be used when specifically directed by the Engineer. When sampling material below the water table, the hole shall be kept full of fluid during the removal of tools to prevent flowback, unless otherwise directed by the Engineer.

All samples, regardless of the amount of recovery, shall become the property of the State and shall be packaged, transported and delivered in accordance with this specification.

C. Marking, Packaging and Transporting Sample. Samples shall be placed in tied plastic storage bags placed in jars conforming to §732-08 in such a manner so as to maintain the natural structure of the sample. The jar shall be labeled to show the project name, PIN, sample number, hole number, and the depths from which the sample was taken. Jars shall be placed in cartons conforming to §732-09. Samples must be protected from freezing or extreme heat. The samples shall be delivered by the Contractor to the location indicated in the Contract documents between the hours of 8:00 A.M. and 3:00 P.M., within five working days following completion of the hole, excepting holidays.

If samples are not delivered in a timely manner, work will be suspended until the samples have been delivered as required by the contract.

D. Acceptance. Samples having less than 6 inches of recovery or more than 2 inches of wash material will be considered unacceptable unless, in the judgment of the Engineer, the actual recovery represents the best sample obtainable. All samples shall become the property of the State.

648-3.03 Thin-Walled Tube Samples

A. Progressing the Hole. The hole shall be a minimum of 4 inches in diameter. Drilling mud may be used if permitted in writing by the Engineer. Hollow stem augers will not be allowed. The hole shall be cleaned using methods and equipment which will not disturb the soil to be sampled. Bottom discharge bits, including samplers, will not be allowed.

The 2 inches of soil directly above the sampling elevation shall be removed with a clean-out jet auger without the use of water. "N" size drill rod or larger shall be used.

B. Sampling. Thin-walled tube samples shall be taken in the strata designated by the Engineer. Samples shall be recovered with a stationary piston type sampler or a hydraulically operated piston sampler, modified to accept the thin-walled tubes specified in §732-05. Samplers with piston rods extending to the ground surface must be provided with clamps which positively lock the piston against upward travel during lowering of the sampler until the sampling depth is reached. During the press the piston rods shall be locked in a stationary position to eliminate any movements either up or down. In addition, the sampler shall also be provided with positive locks to secure the piston rods prior to removal of the sampler after penetration.

At the elevation to be sampled, the tube shall be pressed into the soil with a continuous motion a distance of 18 inches. Care must be taken to allow air and water to flow freely through the vent thus preventing compression of the soil sample. After pressing to the required depth and waiting for 5 minutes, the sampler shall be carefully rotated and removed from the hole.

During the removal of the sampler the hole shall be kept full of fluid. Before the thin-walled tube is removed from the piston, the piston rod shall be backed off to admit air past the flattened threads to break the vacuum. For other approved types of equipment, the necessary vacuum breaking measures shall be taken. The length of sample in the tube and also the distance pressed, shall be measured and recorded.

Should a thin-walled sample not be retained, a 2 inch driven sample shall be taken.

The bottom of the sample shall be carefully squared off at least 1 inch back from the end of the tube and a wax seal, approximately 1 inch thick, shall be poured in the bottom end of the tube. The soil at the top of the tube shall be carefully squared off and a wax seal, approximately 1/2 inch thick, shall be poured. Any space remaining between the top or bottom of the sample tube and the wax seal shall be filled with sawdust or paper after the wax has hardened. Wax will be furnished by the Geotechnical Engineering Bureau. The ends of the tubes shall be sealed with snugly fitting plastic caps which shall be secured in place with friction tape. Wax shall not be placed on the outside of the tube. Labels shall be placed on the tube below center and secured with strips of tape.

C. Marking, Packaging and Transporting Samples. Thin-walled tubes shall be labeled to show the Project Identification Number, Location, hole number, sample number, and depths from which the sample was taken. The samples shall be handled, stored and transported using care to prevent the samples from being subjected to freezing, drying, jarring and any other disturbance. The tubes properly packaged shall be stored and transported in an upright position at all times. The tubes shall be delivered by the Contractor to:

New York State Department of Transportation
Laboratories
State Campus, Building 7
1220 Washington Avenue
Albany, New York 12206

between the hours of 8:00 A.M. and 3:00 P.M., within five working days after obtaining the tubes, excepting holidays.

D. Acceptance. Thin-walled tubes having less than 12 inches of undisturbed recovery will be unacceptable for payment unless in the judgment of the Engineer, based on a recommendation by the Director of the Geotechnical Engineering Bureau, the actual recovery represents the best available. Thin-walled tubes which have been frozen will be unacceptable for payment. Samples that are not taken in accordance with the specification, or that are not properly sealed, or transported may be rejected.

648-3.04 Rock Core Samples

A. Progressing the Hole. The hole shall be progressed through the overburden in accordance with §648-3.02A until refusal is encountered. Continuous core drilling shall then be progressed in boulders and ledge rock at locations and to depths determined by the Engineer.

B. Sampling. Core shall be drilled using a double tube, swivel type core barrel. If at any time the core barrel is withdrawn more than 1 1/4 inches, the core barrel shall be removed from the hole and the core removed from the barrel.

C. Marking, Packaging and Transporting Samples. Rock cores shall be labeled in accordance with the current Geotechnical Engineering Bureau Drawing entitled "Proper Labeling of Rock Cores." They shall be placed in core boxes constructed in accordance with the current Geotechnical Engineering Bureau Drawing entitled "Core Box - AX, BX, HX, NX Sizes" and delivered to the Department's Regional Office or to a location designated in the proposal within two weeks after completion of the hole.

D. Acceptance. Rock core recoveries of less than 85 percent of each run will be considered unacceptable unless, in the judgment of the Engineer, all obtainable state-of-the-art equipment and methods have been used and actual recovery represents the best obtainable.

648-3.05 Open Well Piezometer

A. Progressing the Hole. A 4 inch nominal diameter cased drill hole shall be progressed to the depth specified on the contract documents. Equipment conforming to the requirements contained in §732-01 shall be used.

B. Installing the Well Pipe. The open well piezometer shall be assembled to form a continuous pipe as recommended by the manufacturer or as directed by the Engineer. The open well piezometer shall be placed in the hole as shown in the Open Well Piezometer drawing to the elevation or depth specified in the contract documents or as directed by the Engineer. No grout, debris or other foreign material shall enter the PVC pipe during the installation.

C. (Vacant)

D. Placing the Bentonite Seal. After the final sand placement the steel casing shall be withdrawn an additional 12 inches. and the bentonite pellets placed to form a 12 inch thick seal.

E. Grouting and Casing Removal. The hole shall be grouted from the bottom using the mix found at the end of this subsection or in proportions approved by the Engineer. The contractor shall withdraw the casing. As the casing is being withdrawn, the level of grout shall be maintained within 5 feet of the top of the hole at all times. The PVC pipe shall not be allowed to move vertically while withdrawing the casing.

COMPONENT	NYSDOT SPECIFICATION REQ.	PROPORTION BY VOL.
PORTLAND CEMENT TYPE 1 OR 2	§701-01	2 PARTS
WATER	§712-01	12 PARTS
BENTONITE (ground to pass a No. 200 sieve)	N/A	1 PART

F. Finishing. Wait 18 hours for the grout to cure. If the grout bleeds or shrinks, the hole shall be backfilled with sand to within 12 inches of the top of the hole. The manhole shall be mortared over the top of the open well piezometer as shown in Open Well Piezometer drawing.

648-3.06 Bore Hole Grouting. Prior to placing the grout, the sides of the boring shall be supported to the satisfaction of the Engineer using casing or some other positive means. The Contractor shall mix the grout in the following proportions, by volume:

BENTONITE	1 PART
DRY CEMENT	12 PARTS
WATER	18 PARTS

or in proportions approved by the Engineer. After the boring is cleaned out, a grout pipe shall be placed to the bottom of the hole and grout pumped through the pipe to completely fill the boring for the full depth of the boring. After grouting, the casing shall be removed, and the boring topped off with grout. All mixing and placing operations shall be performed to the satisfaction of the Engineer.

648-4 METHOD OF MEASUREMENT

648-4.01 Furnishing Equipment for Making Borings. The quantities to be paid for will be the number of drill rigs, including barges, platforms and support vessels where required on water, specified in the proposal or work order, and for additional drill rigs ordered on the project by the Engineer. Payment will not be made for any drill rig that does not work at least 75 percent of the total working time computed from the date of actual commencement of the work to the final completion date, except for additional drill rigs ordered to the project by the Engineer.

648-4.02 Split Barrel Sample. The quantity to be paid for will be the number of acceptable samples obtained.

648-4.03 Thin-Walled Tube Sample. The quantity to be paid for will be the number of acceptable samples obtained.

648-4.04 Rock Core Drilling. The quantity to be paid for will be the number of linear feet drilled from which acceptable core was obtained. Measurement for payment shall be made in the presence of the Engineer.

648-4.05 Drill Hole (2 1/2 inch and 4 inch diameter). The quantity to be paid for will be the number of linear feet of boring progressed in overburden, less a deduction equal to the specified sampling interval for each unacceptable sample. Measurement shall be made from the surface elevation where the boring starts (including top of bridge deck or the water surface if working from a floating platform) at each hole. Measurement for payment shall be made in the presence of the Engineer.

648-4.06 Open Well Piezometer. The quantity to be paid for will be the number of linear feet of PVC pipe satisfactorily installed in accordance with this specification, measured from the top of the pipe to the bottom of the slotted screen.

648-4.07 Bore Hole Grouting (2 1/2 inch and 4 inch diameter). The quantity to be paid for will be the number of linear feet of drill hole grouted in accordance with these specifications.

648-5 BASIS OF PAYMENT

648-5.01 Furnishing Equipment for Making Borings (on land or water). The unit price bid for each drill rig shall include the cost of all labor, materials and equipment including barges, platforms and support vessels necessary to furnish, transport and maintain the drill rig, and dismantling and removing the equipment.

648-5.02 Split Barrel Sample. The unit price bid per sample shall include the cost of all labor, material and equipment necessary to obtain, mark, package and deliver the sample. The jars, cartons and samples shall become the property of the State.

648-5.03 Thin-Walled Tube Sample. The unit price bid per sample shall include the cost of all labor, materials and equipment necessary to obtain, mark, package and deliver the sample. The tubes and samples shall become the property of the State.

648-5.04 Rock Core Drilling. The unit price bid per foot shall include the cost of all labor, material and equipment necessary to obtain, mark, package and deliver the samples. The core boxes shall become the property of the State.

648-5.05 Drill Hole (2 1/2 inch and 4 inch diameter). The unit price bid per foot shall include the cost of all labor, clearing of all drill holes in accordance to New York State Department of Public Service Rule 753, and material and equipment used to progress the hole from which an acceptable sample or samples were obtained and acceptably recorded on a driller's log. The unit price bid shall be based on 50 foot incremental depths as follows:

0 - 50 feet 50 - 100 feet 100 - 150 feet 150 - 200 feet over 200 feet

648-5.06 Open Well Piezometer. The unit price bid for this item shall include the cost of all labor, materials and equipment necessary to satisfactorily install and protect the open well piezometer. The Contractor will receive full payment after the open well piezometer has been approved by the Engineer.

648-5.07 Bore Hole Grouting (2 1/2 inch and 4 inch diameter). The unit price bid for grouting borings shall include the cost of furnishing all labor, materials and equipment necessary to complete the work as required by these specifications. The cost for progressing the boring will be paid under its appropriate item.

Payment will be made under:

Item No.	Item	Pay Unit
648.01	Drill Hole, 2 1/2 inch diameter 0 to 50 feet Depth Range	Foot
648.02	Drill Hole, 2 1/2 inch diameter 50 to 100 feet Depth Range	Foot
648.03	Drill Hole, 2 1/2 inch diameter 100 to 150 feet Depth Range	Foot
648.04	Drill Hole, 2 1/2 inch diameter 150 to 200 feet Depth Range	Foot
648.05	Drill Hole, 2 1/2 inch diameter greater than 200 feet Depth Range	Foot
648.06	Drill Hole, 4 inch diameter 0 to 50 feet Depth Range	Foot
648.07	Drill Hole, 4 inch diameter 50 to 100 feet Depth Range	Foot
648.08	Drill Hole, 4 inch diameter 100 to 150 feet Depth Range	Foot
648.09	Drill Hole, 4 inch diameter 150 to 200 feet Depth Range	Foot
648.10	Drill Hole, 4 inch diameter greater than 200 feet Depth Range	Foot

§648

648.11	Split Barrel Sample	Each
648.12	Thin-Walled Tube Sample	Each
648.13	Rock Core Drilling AX	Foot

648.22	Grouting 4 inch Bore Hole	Foot

SECTION 649 (VACANT)

SECTION 650 - TRENCHLESS INSTALLATION OF CASING

650-1 DESCRIPTION. Under this work the Contractor shall furnish and install a casing by trenchless installation methods in accordance with the contract documents and as directed by the Engineer. The casing length, type, and size shall be as indicated in the contract documents. Acceptable methods of trenchless installation include Auger Boring, Slurry Boring, Pipe Jacking, Microtunneling, or Horizontal Directional Drilling. Pipe Ramming or Soil Compaction methods will not be allowed. For an installation under a railroad, methods which leave an uncased bore hole through the embankment will not be allowed.

650-1.01 Definitions. The following definitions were obtained from the NCHRP Synthesis 242 Trenchless Installation of Conduits Beneath Roadways.

A. Auger Boring (AB). A technique that forms a bore hole from a drive shaft to a reception shaft by means of a rotating cutting head. Spoil is transported back to the drive shaft by helical-wound auger flights rotating inside a steel casing that is being jacked in place simultaneously. AB may provide limited tracking and steering capability. It does not provide continuous support to the excavation face. AB is typically a 2-stage process (i.e., casing installation and product pipe installation).

B. Slurry Boring (SB). A technique that forms a bore hole from a drive shaft to a reception shaft by means of a drill bit and drill tubing (stem). A drilling fluid (i.e., bentonite slurry, water, or air pressure) is used to facilitate the drilling process by keeping the drill bit clean and aiding with spoil removal. It is a 2-stage process. Typically, an unsupported horizontal hole is produced in the first stage. The pipe is installed in the second stage.

C. Pipe Jacking (PJ). A technique for installing a prefabricated pipe through the ground from a drive shaft to a reception shaft. The pipe is propelled by jacks located in the drive shaft. The jacking force is transmitted through the pipe to the face of the PJ excavation. The excavation is accomplished, and the spoil is transported out of the jacking pipe and shaft manually or mechanically. Both the excavation and spoil removal processes require workers to be inside the pipe during the jacking operation.

D. Microtunneling (MT). A remotely controlled, guided pipe-jacking process that provides continuous support to the excavation face. The guidance system usually consists of a laser mounted in the drive shaft communicating a reference line to a target mounted inside the MT machine's articulated steering head. The MT process provides ability to control excavation face stability by applying mechanical or fluid pressure to counterbalance the earth and hydrostatic pressures.

E. Horizontal Directional Drilling (HDD). A 2-stage process that consists of drilling a small diameter pilot directional hole along a predetermined path and then developing the pilot hole into a

suitable bore hole that will accommodate the desired utility and then pulling the utility into place. The HDD process provides the ability to track the location of the drill bit and steer it during the drilling process. The vertical profile of the bore hole is typically in the shape of an arc entrapping drilling fluid to form a slurry pathway rather than an open hole. This entrapped slurry provides continuous support to the bore hole.

F. Utility Tunneling (UT). A 2-stage process in which a temporary ground support system is constructed to permit the installation of a utility. The temporary tunnel liner is installed as the tunnel is constructed. Workers are required inside the tunnel to perform the excavation and/or spoil removal. The excavation can be accomplished manually or mechanically.

650-2 MATERIALS.

650-2.01 Casing.

A. General. Casing shall be of sufficient length and type and size as indicated on the contract documents.

B. Pipe Jacking or Utility Tunneling Cutting Shield. For a Pipe Jacking or Utility Tunneling operation, provide a steel cutting shield or poling plates designed to support the anticipated loading. The design shall allow for the attachment of temporary louvers in case collapsible soil conditions are encountered.

1. Full Tunnel Shield. The advancing face shall be provided with a hood extending not more than 20" beyond the face and extending around no less than the upper two-thirds of the circumference. It shall be of sufficient length to permit the installation of at least one complete ring of liner plates within the shield before it is advanced for the installation of the next ring of liner plates. It shall conform to and not exceed the outside dimensions of the pipe being installed by more than 1" at any point on the periphery, unless otherwise approved. It shall be adequately braced and provided with necessary appurtenances for completely bulkheading the face.

2. Partial Tunnel Shield. The advancing face shall be provided with a hood extending not more than 20" beyond the face and extending around no less than the upper one-third of the circumference. It shall conform to and not exceed the outside dimensions of the pipe being installed by more than 1" at any point on the periphery, unless otherwise approved.

3. Poling Plates. Poling plates shall be designed to support the ground outside the bounds of the tunnel through beam action. The beam action shall be capable of extending not more than 20" beyond the face and extending around no less than the upper one-third of the circumference. The poling plates shall conform to the configuration of the pipe being installed.

C. Utility Tunneling Liner Plates. For a Utility Tunneling operation, provide tunnel liner plates designed to support the anticipated loading. When a shield is used, the tunnel lining shall be designed to withstand the thrust from jacking the shield.

1. Steel Tunnel Liner Plates. Provide tunnel liner plates manufactured from steel meeting the metallurgic requirements of ASTM A569 with the following mechanical properties before cold forming:

- Minimum tensile strength: 42,000 psi.
- Minimum yield strength: 28,000 psi.
- Elongation, 2": 30%.

Tunnel liner plates shall be 2-flange with a minimum 0.209" thickness or 4-flange with a minimum 0.239" thickness. The nominal diameter shall be as indicated in the contract documents. Actual liner plate thickness shall be determined by the Contractor.

All tunnel liner plates shall be formed to provide circumferential flanged joints. Longitudinal joints may be flanged or offset lap seam type. All plates shall be punched for bolting on both longitudinal and circumferential seams or joints. Bolt spacing in circumferential flanges shall be in accordance with the manufacturer's standard spacing and shall be a multiple of the plate length so the plates having the same curvatures will be interchangeable and will permit staggering of the longitudinal seams. Bolt spacing at flanged longitudinal seams shall be in accordance with the manufacturer's standard spacing. For lapped longitudinal seams, bolt size and spacing shall be in accordance with the manufacturer's standard but not less than the required to meet the longitudinal seam strength requirements of AASHTO Standard Specifications for Highway Bridges, Section 15 Steel Tunnel Liner Plates.

All liner plates in the tunnel shall be the same type, and shall be interchangeable.

Liner plates shall be hot-dip galvanized in accordance with ASTM A123.

Bolts and nuts shall be not less than 5/8" in diameter. The bolts and nuts shall conform to ASTM A307 Grade A with rolled threads on bolts. Circumferential seam bolts shall conform to ASTM A307 or better.

Grout holes shall be 2" minimum diameter tapped couplings welded into place over holes cut in the liner plate. Provide a minimum of three grout holes, one every ring alternating 10, 12 and 2 o'clock position. Grout holes shall be provided with steel or iron threaded plugs.

2. Precast Concrete Tunnel Liner Plates. Precast concrete tunnel liner plates shall conform to the details shown in the contract documents and requirements of AASHTO Standard Specifications for Highway Bridges, Section 8 Concrete Structures. If such details are not provided, the Contractor may elect to propose the use of precast concrete liner plates.

650-2.02 Filler Material.

A. Controlled Low Strength Material (CLSM). Fill any abandoned borings with controlled low strength material (CLSM) (no fly ash) meeting the requirements of Section 204.

B. Grout. Fill any voids/ annular space between the casing and excavated boring with grout meeting the following requirements:

Material	Subsection
Portland Cement, Type 1 or 2	701-01
Grout Sand	703-04
Water	712-01
Bentonite (Optional) Bentonite Additives	There are no material requirements for bentonite, except that it shall be supplied in powdered form.

650-2.03 Equipment. Furnish equipment of adequate capacity and power to install the casing by trenchless installation methods. Supplement each rig with the necessary auxiliaries, appurtenances, tools, and other equipment required for proper operation. Tunnels may be excavated manually or by the use of tunnel boring machines (TBM's or "moles").

A. Safety Equipment for Tunnel Entry.

For safe personnel entry to the confined space,

- Provide a four gas meter atmospheric testing device, including oxygen, explosive gases, hydrogen sulfide and carbon monoxide. Testing equipment shall be calibrated as required by manufacturer and be in proper working condition.
- Provide mechanical ventilation (portable blower with flexible duct work) to purge the confined space and provide continuous ventilation.
- Provide body harness, life line, and mechanical retrieval equipment. If the confined space working environment has obstructions or turns such that mechanical retrieval equipment is not practical or creates more of a hazard, on-site rescue shall be immediately available prior to entry.

650-3 CONSTRUCTION DETAILS

650-3.01 Approval. Construction drawings, showing the proposed method and procedure of trenchless installation, construction of entrance and exit pits, and schedule of activities required to perform all trenchless installations indicated in the contract documents shall be submitted to the Engineer for approval before work on the trenchless installation operation is started. Approval of construction drawings shall not relieve the Contractor's responsibility to perform the work without damage to existing facilities. Field conditions may require changes in the approved drawings and such changes shall be subject to the approval of the Engineer. Approval will remain in force only as long as all conditions set forth in the approval are met and satisfactory results are obtained. In the event that unsatisfactory results and/or damage occurs, the Contractor shall stabilize the area and stop work, modify the methods of installation, and submit them for review and approval.

Clear all drill hole(s) and path locations in accordance with 16 NYCRR 753 *Protection of Underground Facilities*. For an installation under a railroad, additionally contact the railroad company to identify the location of railroad underground facilities and the company's additional requirements pertaining to the method of installation.

Install casing of the length(s), size(s), and type(s) specified in the contract documents to the alignment(s) and profile(s) shown on the plans. For an installation under a railroad, work shall be carried out under the joint supervision of the Department and the railroad company, in accordance with §105-09 Work Affecting Railroads.

A. Trenchless Installation Under Railroad. Construction drawings, methods, work and necessary precautions related to trenchless installation under a railroad shall be submitted to, meet the requirements of, and have the approval of the Chief Engineer of the railroad company. No work shall commence until such approval has been received from the railroad company.

B. Submittal. Do not start work prior to receiving the Engineer's written approval. Approval will be based on the decision of the Deputy Chief Engineer for Technical Services (DCETS) as to the acceptability of the proposed work plan and any variations to provide satisfactory installation of the casing and avoid damage to the surrounding area and/or structure(s)/utilities. Installation of casing under railroads shall be jointly approved by the Department and the railroad company.

Information in this work plan shall include, but not be limited to, the following:

1. General.

- a. Qualifications of the Contractor showing that all trenchless installation operations will be performed by a competent driller who has successfully installed casing on two projects in the past five (5) years, of similar size and type shown on the plans, via the proposed trenchless method. Completed projects with details of the types of installations, owner contact names, and telephone numbers shall be included.
- b. Designed drill path indicating compliance with the contract documents. Unless otherwise indicated in the contract documents or directed by the Engineer, the minimum separation below the existing road surface and the top of casing shall be 5 feet. The minimum separation between the final ground surface and the top of pipe outside the pavement area shall be 3 feet.
- c. Equipment list including make and model number and specifications (catalog cuts) of all major equipment proposed for use. The Contractor is responsible for the final determination of the drill rig size based on the length and depth of the actual runs, the subsurface conditions expected, etc.
- d. Monitoring plan for the proposed path of the casing installation, including location of monitoring points and surveying intervals.
- e. Method for CLSM placement, including CLSM mix design, used for abandoning a boring.

- f.* Method for grouting (e.g. grout hole locations, attachment of grout tube to outer circumference of casing, grid pattern for ground surface approach, etc.), including grout mix design, used for filling voids/ annular space between the casing and excavated boring.
- g.* For instances where a utility is to be installed in the casing, method of installation and identification of the material to be placed between the casing and the utility carrier pipe. The material shall be nonconductive and retain its insulating properties during long-term submergence in water.

2. Auger Boring.

- a.* Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, cuttings and pit spoil-handling areas, and final placement areas.
- b.* Boring procedure, thrust block design, tooling for drilling. Include details on the mechanical device that will prevent the cutting head from protruding ahead of casing and the need for a cutting shield at the head of casing.
- c.* Design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau (DGEB).
- d.* Steering (e.g. articulated steering head) and tracking equipment (e.g. sonde transmitter & receiver, water level line, etc.), procedures, and proposed locations requiring surface or subsurface access.

3. Slurry Boring.

- a.* Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, location of slurry, cuttings and pit spoil-handling areas, and final placement areas.
- b.* Boring procedure, tooling for drilling, water source for drilling operations, method to control slurry.
- c.* If pit launched, design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the DGEB.
- d.* Materials list including bentonite and bentonite additives proposed for use on the project, along with material safety data sheets for all other materials used in the trenchless installation method.
- e.* Steering (e.g. articulated steering head) and tracking equipment (e.g. sonde transmitter & receiver, water level line, electromagnetic down-hole navigational system, etc.), procedures and proposed locations requiring surface or subsurface access.

4. Pipe Jacking.

- a.* Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, location of slurry for pipe lubrication, cuttings and pit spoil-handling areas, and final placement areas.
- b.* Boring procedure, thrust block design, tooling for drilling, verification that size and type of casing can withstand installation stresses and method to verify that installed casing is

- acceptable. Include details on the cutting shield at the head of casing and type of soil conveyance system to be utilized (e.g. wheeled carts, belt conveyor, slurry system, auger system, vacuum extraction system).
- c. Design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the DGEB.
 - d. Materials list including bentonite and bentonite additives proposed for pipe lubrication, along with material safety data sheets for all other materials used in the trenchless installation method.
 - e. Steering and tracking equipment (e.g. laser & survey tools), procedures and proposed locations requiring surface or subsurface access.
 - f. Outline of work in accordance with §107.05 Safety and Health Requirements, R. Confined Spaces and a written confined space plan (addresses prevention of unauthorized entry, type of hazard, work practices, monitoring, provision for attendant, duties of employees, rescue and emergency medical services, multi-employer operations, and provisions for review procedures).

5. Microtunneling.

- a. Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, location of slurry for pipe lubrication, cuttings and pit spoil-handling areas, and final placement areas.
- b. Boring procedure, thrust block design, tooling for drilling, verification that size and type of casing can withstand installation stresses and method to verify that installed casing is acceptable. Include details on spoil removal system and controlling ground conditions via earth pressure balance at the face of the microtunneling boring machine (MTBM) (i.e. slurry or auger).
- c. Design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the DGEB.
- d. Materials list including bentonite and bentonite additives proposed for use on the project, along with material safety data sheets for all other materials used in the trenchless installation method.
- e. Steering and tracking equipment (e.g. laser & survey tools), procedures and proposed locations requiring surface or subsurface access.

6. Horizontal Directional Drilling.

- a. Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, location of slurry, cuttings and pit spoil-handling areas, and final placement areas.
- b. Boring procedure, tooling for drilling, water source for drilling operations, method to control slurry.
- c. If pit launched, design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in

the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the DGEB.

- d. Materials list including bentonite and bentonite additives proposed for use on the project, along with material safety data sheets for all other materials used in the trenchless installation method.
- e. Steering (e.g. offset jets incorporated into a direction sensing and steering head) and tracking equipment (e.g. sonde transmitter & receiver, electromagnetic down-hole navigational system, etc.), procedures and proposed locations requiring surface or subsurface access.

7. Utility Tunneling.

- a. Plan showing the work zone equipment configuration at the ends of the bore(s), staging areas, storage areas, cuttings and pit spoil-handling areas, and final placement areas.
- b. Boring procedure and tooling for tunneling. Include details on how to control the tunnel face (i.e. design calculations for a full tunnel shield or poling plates) and type of soil conveyance system to be utilized (e.g. wheeled carts, belt conveyor, auger system, vacuum extraction system).
- c. Design of entrance and exit pits including shoring elements, type, depth, bracing size, etc. All flexible wall-system designs that are part of the construction submittal shall be stamped by a licensed and currently registered New York State Professional Engineer and shall be done in accordance with the procedures contained in the appropriate Departmental publication, Geotechnical Design Procedure for Flexible Wall Systems (GDP-11). This publication is available upon request to the Regional Director or the DGEB.
- d. Steering and tracking equipment (e.g. laser & survey tools), procedures and proposed locations requiring surface or subsurface access.
- e. Outline of work in accordance with §107.05 Safety and Health Requirements, R. Confined Spaces and a written confined space plan (addresses prevention of unauthorized entry, type of hazard, work practices, monitoring, provision for attendant, duties of employees, rescue and emergency medical services, multi-employer operations, and provisions for review procedures).
- f. Engage the services of a professional engineer currently registered in the State of New York to provide the design of the Utility Tunnel.
 - i. Steel tunnel liner plate(s) shall be designed in accordance with AASHTO Standard Specifications for Highway Bridges, Section 15 Steel Tunnel Liner Plates. The design of the tunnel shall incorporate the combined effects of live and dead loads, hydrostatic loads, and loads, both temporary and permanent caused by the Contractor's methods of construction. The design shall meet the following minimum criteria:
 - Tunnel liner design shall meet the following minimum factors of safety:
 - Minimum Stiffness: 3.0.
 - Critical Buckling: 2.0.
 - Seam Strength: 3.0.
 - ii. Precast concrete tunnel liner plate(s) shall be designed in accordance with AASHTO Standard Specifications for Highway Bridges, Section 8 Concrete Structures. The design of the tunnel shall incorporate the combined effects of live and dead loads, hydrostatic loads, and loads, both temporary and permanent caused by the Contractor's methods of construction. Submit working drawings and design calculations including descriptions of materials to be used, plate dimensions, reinforcement details, connecting details, and erection procedures.

650-3.02 Trenchless Installation Procedures. Shore entrance and exit pits in accordance with the approved design.

Adequately protect any utilities located within the thrust block's zone of influence.

Survey the existing ground surface along the proposed path of casing installation prior to the start of work to set baseline data. Establish survey points in accordance with the approved design to determine presence/extent of ground movements.

A. Installation. Install the casing as follows:

1. The alignment of the casing shall conform to the following requirements:
 - Choose the ground entry and exit angles such that the casing can be installed along the alignment and profile indicated on the contract plans.
 - The entrance point(s) and exit point(s) shall be approved by the Engineer and physically located in the field by the Contractor.
 - The exit point shall be no more than $\pm 1\%$ of the bore length left or right of the location marked in the field.
 - The vertical depth, as specified in the contract documents, is the depth to which the casing shall be installed.
2. Direct all drilling operations using steering and tracking systems capable of producing the required alignment within an allowable accuracy of $\pm 1\%$ of the bore length. Maintain the grade within 2 inches throughout the bore length. The steering control system shall provide an angle of inclination reading and the direction in which the cutting tool is pointing. Provide access to the Engineer at all times to all measuring or gauging devices used for the drilling operations, including drilling logs maintained by the Contractor.
3. Closely monitor the trenchless installation process to eliminate ground movements. If ground movements occur, stop work and immediately stabilize the area of concern. If it is determined during the installation process that the proposed lines and grades for the casing cannot be achieved, stop work. The Contractor shall then modify the methods of installation and submit them for review and approval as stated in §650-3.01. Approval. Corrective stabilization actions are at the Contractor's expense.
4. In the event that the drill hole must be abandoned before completion of the installation or the installation is out of tolerance, fill the abandoned drill hole with CLSM to prevent subsidence. Start pumping from the farthest point of progression of the abandoned drill hole back to the surface to eliminate encapsulating voids. The progression and restoration of the abandoned drill hole by CLSM placement will be at the Contractor's expense. The location of the new drill hole shall be approved by the DCETS prior to progression of the operation as per §650-3.01. Approval.
5. For larger diameter casings, several passes with progressively larger cutting tools is allowable for producing the appropriate bore hole diameter.
6. For entry into casing by personnel:
 - Provide confined space training prior to entry, when there is a change in operations, or when deviation in policy occurs.
 - Entry Supervisor shall verify the requirements of the Entry Permit, ensure means of rescue are readily available, cancels or terminates entry as required, removes unauthorized personnel, and periodically monitors the Pipe Jacking operation for conformance.
 - Attendant shall maintain accurate account of authorized entrants, remains at entry site until relieved by another attendant or until work is complete, monitors conditions around space and maintains communication with entrant(s), and performs non-entry rescue or summons rescue and medical services, as needed.
 - Entrant(s) shall properly use required equipment, maintain communication with Attendant, and evacuate if emergency occurs.
 - Confined spaces shall be monitored for oxygen, carbon monoxide, and explosive gases before and during entry. When organic material is present, hydrogen sulfide levels will be tested. Testing shall be conducted from top down as space allows at various levels. Test results shall be recorded on the permit. Entry shall not be made or the space shall be vacated when:
 - Oxygen levels are less than 19% or greater than 23%; or

§650

- Explosive gases are greater than 10% of lower explosion limit; or
 - Toxic gases greater than permissible exposure limits; or
 - Carbon Monoxide levels are greater than 35 ppm; or
 - Hydrogen Sulfide levels are greater than 10 ppm.
- Excavation shall not be advanced beyond the edge of the hood, except in rock, or with extreme care, to remove obstructions.
7. Grout voids/ annular space between the casing and excavated boring in accordance with the methods approved in the submittal process as stated in §650-3.01.Approval.
8. For instances where a utility is to be installed in the casing, place the utility carrier pipe within the casing such that they are electrically insulated from each other.

B. Trenchless Installation Records. After completion of the casing installation(s), submit to the Engineer the installation records detailing the As-Built location of the casing(s).

C. Trenchless Installation Under Railroad. Rail hangers shall be installed in accordance with the Temporary Track Support System item prior to the trenchless installation operation if required by the railroad company. In instances where unforeseen ground movements have occurred as a result of the trenchless installation operation, the rail hangers will not be removed by railroad forces until all ground movements of the embankment have been stabilized by the Contractor to the satisfaction of the railroad company.

650-3.03 Subsidence. The Contractor shall be held responsible for surface subsidence and damage or disturbance to adjacent property and facilities that may result from the construction methods. In case loose material is encountered and cave-ins occur or are anticipated, all trenchless installations shall be discontinued, approved shoring shall be provided and all voids filled either by pressure grouting or other approved methods before installations is continued.

Field conditions may require that the actual trenchless installation operations be continued without interruption in order to prevent undermining the roadway or the railroad roadbed and tracks. Should the Engineer permit interruption of trenchless installation operations in these instances, the Contractor shall provide bulkheads and dewatering measures as approved by the Engineer.

650-3.04 Railroad Responsibility. Any settlement or upheaval of the railroad tracks resulting from the casing installation and occurring within one year from the date the work is completed, will be corrected by the railroad company.

650-4 METHOD OF MEASUREMENT. The quantity to be paid for under this work will be the number of feet of casing, measured to the nearest foot, satisfactorily installed to the required length, grade, and alignment in accordance with the contract documents and as directed by the Engineer.

650-5 BASIS OF PAYMENT

650-5.01 General. The unit price bid per linear foot shall include the cost of furnishing all labor, materials, and equipment (including dewatering if required) necessary to satisfactorily complete the work.

Rail hangers (if required) shall be furnished, installed, and removed as called for in the Temporary Track Support System item included in the contract documents. This work will be paid for separately.

Costs incurred by the railroad company to correct settlement or upheaval of the railroad tracks resulting from the casing installation and occurring within one year from the date of work is completed, will be reimbursed to the railroad company directly by the State at no cost to the Contractor.

Surveying for the presence/extent of ground movements during the trenchless installation shall be paid for separately.

Payment will be made under:

Item No.	Item	Pay Unit
650.10XX	Trenchless Installation of Casing Under Highway with a diameter less than or equal to 24".	Foot

650.11XX	Trenchless Installation of Casing Under Highway with a diameter greater than 24" and less than or equal to 42".	Foot
650.12XX	Trenchless Installation of Casing Under Highway with a diameter greater than 42".	Foot
650.20XX	Trenchless Installation of Casing Under Railroad with a diameter less than or equal to 24".	Foot
650.21XX	Trenchless Installation of Casing Under Railroad with diameter greater than 24" and less than or equal to 42".	Foot
650.22XX	Trenchless Installation of Casing Under Railroad with a diameter greater than 42".	Foot

NOTE: XX denotes casing diameter size.

SECTION 651 - COMMUNICATION FACILITIES

651-1 DESCRIPTION. The work in this section shall include special construction of communication facilities which are required for outside agencies such as police and fire departments.

The construction details for this work will be covered by special provisions in the contract documents.

SECTION 652 - FURNISHING AND APPLYING SALTS

652-1 DESCRIPTION. Under this work the Contractor shall furnish and apply salt for soil stabilization, as a dust palliative or for other purposes as specified.

652-2 MATERIALS. Materials for this work shall conform to the requirements of the following subsections of Section 700 - Materials and Manufacturing:

- Calcium Chloride 712-02
- Sodium Chloride 712-03

652-3 CONSTRUCTION DETAILS

652-3.01 Stabilized Gravel Surface Course. The Contractor shall apply salt for stabilization in accordance with the construction details specified in §411-3.

652-3.02 Dust Control. The Contractor shall apply salt on the highway to control dust at the locations and during periods as the Engineer may direct. The salt shall be applied on the dampened road surface by means of approved line spreader or equal equipment. An approved sprinkler or other approved method may be used to dampen the road surface. The recommended application rates for calcium chloride are as follows:

- 1 1/2 pounds per square yard per application
- 4 1/10 pounds per square yard per year

652-4 METHOD OF MEASUREMENT. Salt shall be measured by the number of the tons furnished and applied.

652-5 BASIS OF PAYMENT. The unit price bid per ton shall include all labor, material and equipment necessary to complete the work including necessary water to dampen the road surface.

Payment will be made under:

Item No.	Item	Pay Unit
652.01	Furnishing and Applying Calcium Chloride	Ton
652.02	Furnishing and Applying Sodium Chloride	Ton

SECTION 653 (VACANT)

SECTION 654 - IMPACT ATTENUATORS

654-1 DESCRIPTION. The Contractor shall furnish and install, remove and dispose, remove and store, relocate, or refurbish impact attenuators of the indicated types and sizes at or from the locations indicated in the Contract Documents or those directed in accordance with these specifications, the Contract Documents, materials details, manufacturer’s directions and drawings, and the directions of the Engineer.

654-2 MATERIALS. Materials shall conform to the following subsections of these specifications:

Class A Concrete	501-2
White Pavement Marking Paints	640-2
Concrete Grouting Material	701-05
Anchoring Material- Chemically Curing	701-07
Epoxy Coated Bar Reinforcement, Grade 60	709-04
Sodium Chloride	712-03
Inertial Barrier Modules	712-07
Impact Attenuator, Reusable, HDPE Cylinders and Cables	712-18
Impact Attenuator, Quad Beam Type with Expendable Modules	712-19
Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips	712-20
Impact Attenuator, Thrie Beam Type with Expendable Modules	712-21
Impact Attenuator, HDPE Cylinders with Monorail and Diaphragms	712-22
Galvanized Coating and Repair Methods	719-01
Aluminum Sign Panels	730-01
Reflective Sheeting	730-05

654-3 CONSTRUCTION DETAILS.

654-3.01 General. The following shall apply to all impact attenuators to be installed under this section.

A Drawings. Prior to installing any materials required under this section, the Contractor shall submit three (3) copies of the manufacturer’s drawings, modified as necessary to reflect site conditions, to the Engineer. The submission shall include certification that modifications made to reflect site conditions will not impair the satisfactory performance of the impact attenuator. Manufacturer’s drawings, modified as necessary to reflect site conditions, will be referred to in this section as “working drawings.” Working drawings will take precedence over manufacturer’s drawings.

Working drawings shall show supports, transition pieces, connections, miscellaneous parts, concrete or steel back-up structure, and anchorages not detailed in the plans, but which are necessary to develop the full performance of the impact attenuator. The Contractor shall not commence installation of the impact attenuator earlier than five (5) days following submission of the above mentioned working or manufacturer’s drawings unless authorized by the Engineer to do so.

B Manuals. In addition to the drawings mentioned above, the Contractor shall deliver to the Engineer three (3) copies of design manuals, installation manuals, parts lists, and maintenance manuals prepared for each type impact attenuator being installed. The Contractor shall not commence installation of the impact attenuator earlier than five (5) days following submission of the above mentioned manuals, unless authorized by the Engineer to do so.

C Coordination with Other Work. The work under this section shall be coordinated with the removal or installation of shielded objects, guide rail and median barriers, impact attenuators or end terminals so as to minimize the time that motorists are exposed to unnecessary hazard. Also, the

Contractor shall minimize exposure of vehicular traffic to the possibility of impact on the back-up structure. Unless modified in the contract documents, minimize shall mean seven (7) or fewer calendar days.

D Traffic Protection. Traffic control devices, such as cones, drums, lights, signs, barricades, or other articles directed by the Engineer shall be provided and maintained under their respective pay items. These devices shall not be removed until the impact attenuator, including required transition pieces, is fully operational. If the impact attenuator is to be installed in lighted areas, or in areas to be lighted, the mentioned traffic control devices shall not be removed unless the lighting system is operational.

654-3.02 Impact Attenuators Requiring Foundations. If the work of furnishing and installing impact attenuators requires the provision of a foundation slab, the following shall apply:

A Excavation. Necessary excavation shall be performed in accordance with Section 203 of the Standard Specifications. If the foundation slab is to be installed in a pavement that is to remain in place in the completed project, the limits of excavation in such pavement shall be saw cut full depth prior to removal of the pavement and performance of the excavation work. Unless indicated otherwise, the limits of pavement excavation shall be 24 inches outside the perimeter of the foundation slab.

B Foundation Slab. The Contractor shall construct the reinforced concrete foundation slab and back-up structure to the dimensions indicated in the working or manufacturer's drawings. The foundation slab shall be not less than the thickness indicated on the working drawings, manufacturer's drawings, or 8 inches, whichever is greatest.

The concrete shall be Class A concrete batched in accordance with §501-3 Portland Cement Concrete, Construction Details. If accelerators are needed, the Contractor shall submit the concrete mix design to the Materials Bureau for prior approval. The concrete shall be formed, placed, finished, and cured in accordance with §502-3 Portland Cement Concrete Pavement, Construction Details.

The reinforcing bars shall be in conformance to §709-04 Epoxy Coated Bar Reinforcement, Grade 60. The size, length, and bending details of reinforcement shall be as shown in the foundation slab details in the manufacturer's drawings or in the working drawings. The minimum allowable reinforcing shall be #5 longitudinal bars, spacing 16 inches on centers, and #5 cross bars, spacing 6 feet on centers. Longitudinal bars shall be placed such that they will not be cut during anchorage installation.

C Pavement Restoration. The excavated section of pavement between the new foundation slab and the limits of excavation shall be restored to the full height of the surrounding sound pavement in accordance with §402-3.05 Conditioning of Existing Surface, or in the manner directed by the Engineer.

654-3.03 Anchorages. The impact attenuator shall be anchored to the new foundation slab or existing concrete foundation as shown on the manufacturer's drawings or the working drawings. Anchor bolts and studs not cast integrally into the new foundation slab shall be anchored with approved concrete expansion anchors, concrete grouting material conforming to §701-05, or approved chemically curing anchoring material conforming to §701-07. Such anchor bolts or studs shall be set into holes drilled with rotary impact drills of the size recommended by the manufacturer of the anchor. Core drills will not be acceptable. Care shall be taken that anchor studs projecting from the surface and exposed to foot or wheeled traffic be well marked by barricades, plastic drums, or protected by other means as approved by the Engineer.

654-3.04 Inertial Barrier Modules. The Contractor shall furnish and install Inertial Barrier Modules of the size and number required at the locations and to the configurations indicated on the contract plans, or at the locations and to the configurations directed by the Engineer. In addition to the requirements

§654

indicated in §654-3.01 General, the Contractor shall also paint and label the layout pattern and weights on paved surfaces using traffic or other durable paint. Glass beads will not be required. Either the metric weight or the U.S. customary weight, as directed by the Engineer, shall be marked.

The 200 pound units shall be restrained from movement by mechanical means, or by other means as approved by the Engineer.

654-3.05 Impact Attenuator, Thrie Beam Type or Quadbeam Type with Expendable

Modules. In addition to the requirements indicated in §654-3.01 General, §654-3.02 Impact Attenuators Requiring Foundation (if applicable,) and §654-3.03 Anchorages, the Contractor shall furnish and install Impact Attenuators, Thrie Beam Type or Quadbeam Type with Expendable Modules on existing or new foundations, as indicated, of the indicated width and length and at the locations indicated on the contract plans, in accordance with these specifications, the manufacturer's directions and drawings, the working drawings, and the directions of the Engineer.

The manufacturer's steel backup assemblies shall be used, except when protecting concrete piers, concrete parapets, concrete walls, or other rigid objects. In these excepted cases, either the manufacturer's steel backup assembly or the manufacturer's recommended concrete backup assembly may be used at the option of the Contractor, unless directed otherwise on the plans or by the Engineer. The Contractor shall furnish and install the appropriate standard transition piece. If there is no appropriate standard transition piece available, a manufacturer's approved special transition piece shall be furnished and installed.

654-3.06 Impact Attenuator, HDPE Cylinder Types.

A. General. In addition to the requirements indicated in §654-3.01 General, §654-3.02 Impact Attenuators Requiring Foundation, and 654-3.03 Anchorages, the Contractor shall furnish and install Impact Attenuator, HDPE Cylinders and Cable Type or Impact Attenuator, HDPE Cylinders with Monorail and Diaphragm Type on existing or new foundations, as indicated, of the indicated number of cylinders of the required thicknesses and dimensions in accordance with these specifications, the manufacturer's directions, and the working drawings.

B. Impact Attenuator, HDPE Cylinders and Cable Type. In addition to the above in A. General, the following shall also apply. The base of concrete barriers and other similar solid objects shall be cut back at a 45° angle, and transition pieces shall be provided on both sides between the backup structure and the concrete barrier or other similar object.

C. Impact Attenuator, HDPE Cylinders with Monorail and Diaphragm. In addition to the above in A. General, the following shall also apply. Unless indicated otherwise, the Contractor shall select, furnish, and install either a metal backup structure or concrete backup structure. In bidirectional situations, a transition piece shall be installed to shield the back of the backup structure from impact by traffic.

654-3.07 Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips. The Contractor shall furnish and install Impact Attenuators, Corrugated Beam Type with Metal Tearing Strips on new or existing foundations, as indicated, of the indicated number of bays at the locations indicated in the contract documents in accordance with these specifications, the manufacturer's instructions and drawings, the working drawings, and the directions of the Engineer.

654-3.08 Impact Attenuators, All Types, Remove and Dispose. The Contractor shall remove impact attenuators of the indicated type and associated foundation slabs, if required, from their existing locations. Upon removal, the impact attenuators and foundation slabs shall become the property of the Contractor, and the Contractor shall dispose of them in a manner and at a location approved by the Engineer.

Holes in and other damage to the surfaces underlying the impact attenuator shall be repaired to the satisfaction of the engineer. Anchor bolts or studs that are no longer required or usable shall be removed

or cut off flush with the surface. Voids resulting from the removal of foundation slabs shall be filled with compacted suitable material or compacted granular material, or other designated material as directed.

654-3.09 Impact Attenuators, All Types, Remove and Store. The Contractor shall remove impact attenuators of the indicated type from their existing locations with reasonable skill and care in a manner that preserves their condition. The impact attenuators shall remain the property of the State, and the Contractor shall store and protect them in a manner and at locations satisfactory to the Engineer. Damaged parts shall be replaced with like parts in satisfactory condition or repaired in a manner approved by the Engineer.

If required, pavement slabs shall be removed and disposed in a manner and at locations satisfactory to the Engineer. Voids resulting from the removal of foundation slabs shall be filled with compacted suitable material or compacted granular material, or other designated material as directed.

Holes and other damage to the surfaces underlying the impact attenuator shall be repaired to the satisfaction of the engineer. Anchor bolts or studs that are no longer required or usable shall be removed, or cut off flush with the surface.

654-3.10 Impact Attenuators, All Types, Relocate. The Contractor shall remove impact attenuators of the indicated type from their existing locations with reasonable skill and care in a manner that preserves their condition, and reinstall them at the same location or install them at another designated location. If required, the Contractor shall construct a new foundation slab. The impact attenuators shall remain the property of the State during the course of the work. If intermediate storage is required during the relocation, the Contractor shall store and protect impact attenuators in a manner and at locations approved by the Engineer. Damaged parts shall be replaced with like parts in satisfactory condition or be repaired in a manner approved by the Engineer.

If required, pavement slabs shall be removed and disposed of in a manner and at locations satisfactory to the Engineer. Voids resulting from the removal of foundation slabs shall be filled with compacted suitable material, compacted granular material, or other designated material, as directed.

Holes and other damage to the surfaces underlying the impact attenuator shall be repaired to the satisfaction of the Engineer. Anchor bolts or studs that are no longer required or usable shall be removed or cut off flush with the surface.

§654-3.01C Coordination with Other Work, §654-3.01D Traffic Protection, and §654-3.09 Impact Attenuators, All Types, Remove and Store shall apply. If required, a new foundation slab shall be constructed in accordance with the requirements of §654-3.02, Impact Attenuators Requiring Foundations.

654-3.11 Impact Attenuators, All Types, Refurbish. The contractor shall refurbish bays of designated impact attenuators of the indicated type in accordance with these specifications, the directions of the manufacturer, and as approved by the Engineer. Damaged parts shall be replaced with like parts in satisfactory condition or repaired to the satisfaction of the Engineer. §654-3.01C Coordination with Other Work, and §654-3.01D Traffic Protection shall apply. In addition, the Contractor shall repair the anchorages in accordance with §654-3.03 Anchorages, if they are damaged.

654-4 METHOD OF MEASUREMENT.

654-4.01 General. Measurement will be taken as the number of impact attenuators of the indicated type and size satisfactorily furnished and installed on existing foundations; as the number of impact attenuators of the indicated type and size satisfactorily furnished and installed on new foundation slabs; as the number of impact attenuators of the indicated type satisfactorily removed and disposed; as the number of impact attenuators of the indicated type satisfactorily removed and stored; as the number of impact attenuators of the indicated type and size satisfactorily relocated to existing foundation; as the number of impact attenuators of the indicated type and size satisfactorily relocated to a new foundation slab, including construction of the new foundation slab; or as the number of individual bays of impact attenuators of the indicated type satisfactorily refurbished, all in accordance with these specifications, the directions of the Engineer, and the manufacturer's or working drawings and manufacture's directions.

§654

654-4.02 Number of Bays. Under the contract items for furnishing and installing Impact Attenuators, Quad Beam Type with Expendable Modules and the contract items for furnishing and installing Impact Attenuators, Corrugated Beam Type with Metal Tearing Strip, the nose will not be counted as a bay. Under the contract items for refurbishing Impact Attenuators, Quad Beam Type with Expendable Modules the nose will be counted as a bay.

654-5 BASIS OF PAYMENT.

654-5.01 General. Except as modified below, the following shall apply to contract items under this section. The unit prices bid for furnishing and installing, removing and disposing, removing and storing, relocating, or refurbishing Inertial Barrier Modules and Impact Attenuators of the various types shall include the cost of all labor, materials, and equipment necessary to satisfactorily perform the work.

A. Site preparation. Site preparation, if any, shall be paid for separately under appropriate contract items.

B. Pavement sawing. Pavement sawing in pavement to remain as finished surface, or that directed by the Engineer shall be separately paid. That conducted for the convenience of the contractor shall be at no additional expense to the State.

C. Excavation, and removal of existing foundation slabs. Excavation for new foundation slabs and for the removal of existing foundation slabs will be separately paid for under the contract item for unclassified excavation and disposal.

D. Pavement restoration. Pavement restoration shall be separately paid under the contract items for Truing and Leveling. If there are no contract pay items for Truing and Leveling, then pavement restoration shall be paid under the contract item for the top course of hot mix asphalt. If no contract items exist in the contract for paving items, then no separate payment for pavement restoration will be made.

E. Parts. The cost of replacing or repairing parts damaged during the course of the work shall be at no additional expense to the State. The cost of replacing or repairing parts having pre-existing damage shall be separately paid for under the provisions of Extra Work.

F. Maintenance and protection of Traffic. Maintenance and protection of traffic will be measured and paid for under appropriate items.

654-5.02 Progress Payments. The contract items under this section are eligible for progress payments as indicated below. The balance of payment will be made upon satisfactory completion of the work.

A Working Drawings. Contract items requiring working drawings will be eligible for progress payment of ten (10) percent upon submission of the working drawings and certification that the modifications thereon will not impair the satisfactory performance of the impact attenuator. Submission of manufacturer's drawings that are not working drawings, as determined by the Engineer, will not entitle the Contractor to a progress payment.

B Impact Attenuators with New Foundation Slabs. Contract items requiring the construction of new foundation slabs will be eligible for progress payments of ten (10) percent upon satisfactory finishing and initiation of curing of the foundation slab.

Payment will be made under:

SECTION 655 - FRAMES, GRATES AND COVERS

655-1 DESCRIPTION. This work shall consist of furnishing and placing frames, grates, covers and curb boxes for drainage structures as shown on the plans or as directed by the Engineer.

655-2 MATERIALS

655-2.01 Castings. All cast gratings, covers, frames and curb boxes manufactured in conformance to the Standard Sheets “Cast Manhole Frames, Grates and Covers”, or “Cast Frames and Curb Boxes and Welded Frames”, or “Telescoping Manhole Casting & Ring” shall meet the requirements of §715-05 Iron Castings, Class No. 30B or Class No. 35B. All other gratings, covers, frames and curb boxes shall meet the requirements of §715-02, Steel Castings, Grade N-1; or §715-07, Proof Loaded Iron Castings, Class No. 30B or Class No. 35B; or §715-09, Malleable Iron Castings, Grade 32510, at the Contractor's option. No substitutions will be allowed.

655-2.02 Fabricated Articles. All frames, grates and appurtenant parts shall be fabricated from steel conforming to ASTM A36, AISI Grade 1020 Steel, AISI Grade 1025 Steel, or ASTM A529 Gr. 50, except that the longitudinal bars for grates G1, G2, G3, 10 PCB, 11 PCB and 12 PCB shall meet the requirements of ASTM A529, Gr. 50. The Contractor shall submit mill certifications, to the Engineer, for ASTM A529, Gr.50. Welding or splicing by welding of any member of the frame or grate, other than the welds shown on the standard sheets, plans, approved shop drawings, approved Materials Details, or in the proposal will not be permitted. Galvanizing shall be in accordance with §719-01 Type I, unless indicated otherwise.

Welding shall comply with the requirements specified in the New York State Steel Construction Manual, except that radiographic inspection will not be required.

655-3 CONSTRUCTION DETAILS

655-3.01 Frames and Grates. Frames, covers and grates shall be placed true to line and grade. Covers, grates and frames shall make firm, full and even bearing on their respective underlying surfaces and shall be non-rocking under the influence of traffic or other loads. On all frames, the Contractor shall have the option of drilling and tapping holes or drilling holes in and welding nuts to the bottom of the frame to facilitate the stud bolts used to hold down the grate.

Unless otherwise specified, the hole shall be drilled and tapped or the nut welded to the frame before galvanizing. The threads shall be tapped sufficiently oversize to conform to the dimensions for coarse thread with class 2B tolerances prescribed in the American National Standards for Unified Screw Threads, ANSI Bi.1., after galvanizing.

655-3.02 Field Repairs for Improperly Fitting Systems. The Contractor may propose to the Engineer reasonable field repair procedures for improperly fitting castings. No field repairs of improperly fitting fabricated frames and grates shall be allowed. Field repairs may include grinding and/or proper welding techniques for the materials involved. Repairs that involve welding shall be allowed only on steel castings, and not on iron, and only with prior approval of the DCES. Implemented repairs must result in systems whose constituent parts have full, uniform and even bearing contact on their respective underlying surfaces and that do not rock or move under the influence of traffic and other loads. All such repairs must be completely satisfactory to the Engineer or the work shall be rejected and replaced with satisfactory systems. All repairs shall be done at no cost to the State.

655-4 METHOD OF MEASUREMENT

655-4.01 Frames and Grates. The quantity to be measured for payment will be the number of frames and grates satisfactorily installed.

655-5 BASIS OF PAYMENT

655-5.01 Frames and Grates. The unit price bid for each frame and grate shall include the cost of furnishing all labor, materials and equipment necessary to satisfactorily complete the work, including the cost of any field repair work for improperly fitting castings or to render the frame and grate non-rocking.

Payment will be made under:

Item No.	Item Description	Pay Unit
655.0701	Cast Frame F1, Mountable Curb Box CM1 & Reticuline Grate G1	Each
655.0702	Cast Frame F2, Mountable Curb Box CM2 & Reticuline Grate G2	Each
655.0703	Cast Frame F3, Mountable Curb Box CM3 & Reticuline Grate G3	Each
655.0704	Cast Frame F1, UnMountable Curb Box CU1 & Reticuline Grate G1	Each
655.0705	Cast Frame F2, UnMountable Curb Box CU2 & Reticuline Grate G2	Each
655.0706	Cast Frame F3, UnMountable Curb Box CU3 & Reticuline Grate G3	Each
655.0801	Cast Frame F1, Mountable Curb Box CM1 & Parallel Bar Grate 6 PCB	Each
655.0802	Cast Frame F2, Mountable Curb Box CM2 & Parallel Bar Grate 7 PCB	Each
655.0803	Cast Frame F3, Mountable Curb Box CM3 & Parallel Bar Grate 8 PCB	Each
655.0804	Cast Frame F1, UnMountable Curb Box CU1 & Parallel Bar Grate 6 PCB	Each
655.0805	Cast Frame F2, UnMountable Curb Box CU2 & Parallel Bar Grate 7 PCB	Each
655.0806	Cast Frame F3, UnMountable Curb Box CU3 & Parallel Bar Grate 8 PCB	Each
655.0901	Parallel Bar Frame 10 PCB & Parallel Bar Grate 10 PCB	Each
655.0902	Parallel Bar Frame 11 PCB & Parallel Bar Grate 11 PCB	Each
655.0903	Parallel Bar Frame 12 PCB & Parallel Bar Grate 12 PCB	Each
655.1003	Welded Frame & Rectangular Grate 3	Each
655.1006	Welded Frame & Rectangular Grate 6	Each
655.1011	Welded Frame & Rectangular Grate 11	Each
655.1016	Welded Frame & Rectangular Grate 16	Each
655.1022	Welded Frame & Rectangular Grate 22	Each
655.1103	Welded Frame & Reticuline Grate 3	Each
655.1106	Welded Frame & Reticuline Grate 6	Each
655.1111	Welded Frame & Reticuline Grate 11	Each
655.1116	Welded Frame & Reticuline Grate 16	Each
655.1122	Welded Frame & Reticuline Grate 22	Each
655.1201	Manhole Frame & Grate	Each
655.1202	Manhole Frame & Cover	Each
655.1301	Telescoping Manhole Frame & Grate	Each
655.1302	Telescoping Manhole Frame & Cover	Each

Comment [c108]: E108-048

655-4 METHOD OF MEASUREMENT

~~**655-4.01 Frames and Grates.** The quantity to be measured under this work will be the number of square feet measured inside the frame containing the grate and computed to the nearest 1/10 square foot. The payment areas shown on the standard sheets need not be computed.~~

655-5 BASIS OF PAYMENT

~~**655-5.01 Frames and Grates.** The unit price bid per square foot for cast or prefabricated frames and grates shall included the cost of furnishing all labor, materials and equipment necessary to satisfactorily complete the work, including the cost of any field repair work for improperly fitting castings or to render the frame and grate non-rocking.~~

Payment will be made under:

Item No.	Item	Pay Unit
655.0101	Frames and Grates (Castings)	Square Foot
655.0201	Frames and Grates (Fabricated)	Square Foot
655.0301	Frames and Grates (Parallel Bar Type)	Square Foot
655.0401	Frames and Grates (Parallel Bar Type with Cast Frames)	Square Foot
655.0501	Steel Fabricated Grates In Cast Frames	Square Foot
655.0601	Telescoping Manhole Frames and Covers	Square Foot

SECTION 656 - MISCELLANEOUS METALS

656-1 DESCRIPTION. This work shall consist of furnishing and placing all metal component parts in accordance with the specifications which are not included in other items of work and which are specifically identified on the plans to be reimbursed at the unit bid price for Miscellaneous Metals.

656-2 MATERIALS. Metals required for this work shall meet the requirements of the following Subsections of Section 700 - Materials and Manufacturing:

Castings, Forgings, and Metals (As Specified)	715
Miscellaneous Metals and Plastics (As Specified)	725

656-3 CONSTRUCTION DETAILS

656-3.01 Drawings. Shop drawings shall be prepared, approved and distributed in accordance with the provisions of the SCM. When applicable, the manufacturer's specification data sheet (catalog clip) may be furnished in lieu of shop drawings. The Engineer may waive the shop drawing requirement for any non-welded component part that can be fabricated directly from the details shown on the plans.

656-3.02 Welding. Welding shall comply with the requirements specified in the *New York State Steel Construction Manual*.

656-3.03 Galvanizing. When materials for this work are to be galvanized, the process and spelter coating shall conform to the requirements of §719-01, Galvanized Coatings and Repair Methods.

656-3.04 Painting. All unembedded metal except castings shall be painted in accordance with Section 574, Localized Painting of Structural Steel. Galvanized material shall be painted in accordance with Section 657.

656-4 METHOD OF MEASUREMENT. Payment for this work shall be measured by the number of pounds of metal furnished and placed in accordance with the plans and specifications.

656-5 BASIS OF PAYMENT. The unit price bid per pound shall include all labor, materials and equipment necessary to complete the work.

§656

Payment will be made under:

Item No.	Item	Pay Unit
656.01	Miscellaneous Metals	Pound

SECTION 657 - PAINTING GALVANIZED AND ALUMINUM SURFACES

657-1 DESCRIPTION. This work shall consist of painting galvanized and aluminum surfaces. The surfaces will not have been painted previously. See special note entitled "Galvanized and Aluminum Surface to be Painted" for the description of serialized items.

657-2 MATERIALS

657-2.01 Paint For Use On Galvanized Surfaces. Material for this work shall meet the requirements of:

708-06 Paint for Galvanized Surfaces

657-2.02 Paint for Use On Aluminum Surfaces. The portions of aluminum or aluminum alloys that will be in contact with cast or projected concrete shall meet the requirements of:

708-04 Zinc Chromate Primer

Substitutions for this material will be considered, provided the material is specifically formulated for use over aluminum and to reduce alkali attack.

Aluminum surfaces not in contact with concrete shall be painted as described in the contract documents with;

708-07 Paint for Aluminum Surfaces

657-2.03 Paints.

A. Data Sheets. At least five work days prior to the start of work, the Contractor shall supply the Engineer with one copy of the paint manufacturer's current technical data and materials safety data sheets for each coat to be applied. If manufacturer's recommendations are more restrictive or require additional effort not defined in this specification, then the manufacturer's recommendations shall be followed.

B. Storage. Paint in storage shall be protected from damage and maintained in accordance with manufacturer's recommendations. Paint will be considered in storage if it is onsite for more than 8 hours prior to application.

C. Color. The color of the primer will be the Contractor's option; however, it shall contrast with the underlying substrate. The color of the topcoat shall be in accordance with the contract documents or defined by §708-05. A 'Rustic' color shall be Weathered Brown.

D. Labeling. Paint arriving at the work site in new, unopened containers and labeled with the manufacturer's name, product name, component part, batch number, color, and shelf life date shall be used. Paint in containers having expired shelf life dates shall not be used. They shall be immediately removed from the work site.

657-2.04 Water for Pressure Washing. Water shall be clean, fresh potable water.

657-2.05 Abrasive for Sweep Blasting Galvanizing Surfaces. Abrasive size shall range between 8 and 20 mils, and shall have a Mohr's hardness of 5 or less. Use of steel grit or shot is prohibited.

657-2.05 Paint Inspection Equipment. Prior to the start of and throughout the duration of the work, the Contractor shall ensure that the Engineer or Inspector is supplied with the following equipment in good working order:

- One bound copy of the Steel Structures Painting Council surface preparation specification, SSPC - SP COM "Surface Preparation Commentary for Steel and Concrete Substrates".
- One bound copy of the Steel Structures Painting Council surface preparation specification, SSPC SP-1 - "Solvent Cleaning".
- One bound copy of the Steel Structures Painting Council surface preparation specification, SSPC-SP 7, "Brush-Off Blast Cleaning".
- One bound copy of the Steel Structures Painting Council method SSPC-PA2, Paint Application Specification No. 2 - "Measurement of Dry Film Thickness With Magnetic Gages".
- ASTM A123 Standard Specification for Zinc (Hot-Dipped Galvanized) Coatings on Iron and Steel Products.
- ASTM D4417 Test Method for Field Measurement of Surface Profile of Blast Cleaned Steel.
- ASTM D4285 Test Method for Indicating Oil or Water in Compressed Air.
- One Air Thermometer, pocket type, 10°F to 110°F.
- One Magnetic Dry-Film Thickness Gage, Type 2 (fixed probe).
- Two Wet-Film Thickness Gages, Prong-Type, capable of measuring 1 mil to 10 mil in 1 mil increments.
- Sling Psychrometer and US Weather Bureau Psychrometric Tables.

657-3 CONSTRUCTION DETAILS

657-3.01 Classification and Surface Preparation of Surfaces. For the purposes of this specification, a surface will be considered weathered if the galvanizing has been uncoated and exposed to a well-ventilated environment for a minimum of two years. A surface will be considered new if it was galvanized less than two years ago.

A. Weathered Galvanized Surfaces. All surfaces to be painted shall be pressure washed using equipment operating at a minimum pressure of 1800 PSI, a water temperature of 185°F to 200°F, and a minimum flow of 4 gallons/minute. The nozzle shall be held at a distance of 6 inches to 12 inches from the surface.

When the washing is completed, the cleaned surfaces shall be free of dust, dirt, oil and grease, animal waste, salts, and other debris. Oil and grease shall be removed by solvent cleaning as described in SSPC SP1. The areas shall be pressure washed again following this cleaning.

B. Newly Galvanized Surfaces. All surfaces to be painted shall be pressure washed, using equipment operating at a minimum pressure of 3000 psi, and a minimum flow of 4 gallons/minute. The nozzle shall be held at a distance of 6 inches to 12 inches from the surface.

When the washing is completed, the cleaned surfaces shall be free of dust, dirt, oil and grease, animal waste, salts, and other debris. Oil and grease shall be removed by solvent cleaning as described in SSPC SP1. The areas shall be pressure washed again following this cleaning.

Once cleaned, all galvanized surfaces shall receive a light sweep blast using abrasive blasting equipment. All compressed air used to satisfy the requirements of this specification shall be clean. The cleanliness shall be verified with a white blotter test according to ASTM D4285 at least once per shift.

The light blast shall remove zinc oxides from the galvanizing as well as etch the surface. The light sweep blast shall not remove excessive amounts of zinc from the galvanized surface. The sweep blast shall impart to the galvanized surface an anchor profile of 1 to 1 1/2 mils as measured using profile tape and a spring-loaded micrometer according to ASTM D4417.

The initial thickness of the galvanizing prior to sweep blasting shall be established using a magnetic thickness gage in a manner as described under ASTM A123. If the sweep blast results in a 15% or greater loss of galvanized coating, the article shall be rejected. The sweep blast shall be performed in a manner that does not result in disbondment and flaking of the galvanizing.

After sweep blasting, the galvanized surfaces shall be thoroughly blown down with clean compressed air to remove all blast residue. Any sharp, protruding defects in the galvanized surface such as that commonly found on edges and holes shall be removed by hand tools.

Application of the primer shall be performed within 12 hours of sweep blasting the galvanized surface. If more than 12 hours elapse prior to priming, the galvanized surfaces shall be reblasted according to this specification at no additional cost to the State. If re-blasted, the item shall not have lost 15% or more of its original galvanized coating thickness.

C. Aluminum Surfaces. Aluminum surfaces shall be prepared using methods and technologies as described in the latest version of SSPC-SP COM, *Surface Preparation Commentary for Steel and Concrete Substrates*. Chemical stripping and water jetting methods for surface preparation are prohibited. The effectiveness of the method chosen shall be verified prior to production work for its ability to remove aluminum oxides and provide a surface profile as required by the paint manufacturer.

657-3.02 Painting.

A. Atmospheric Conditions. No paint shall be applied when the receiving surface and ambient temperatures are less than 40°F or greater than 100°F. If the manufacturer's recommendations for temperature are more restrictive than those listed in this specification, the manufacturer's temperature limits shall be used for application requirements. No paint shall be applied unless the receiving surface is absolutely dry.

Paint shall not be applied when the relative humidity is more than 85% unless the coating manufacturer's requirements are more stringent. No paint shall be applied during rain.

Manufacturer's recommended humidity and dew point restrictions shall be observed.

B. Mixing Paint. All paint shall be thoroughly mixed with mechanical mixers in accordance with the manufacturer's recommendations. After mixing, the bottom of the container shall be free of any unmixed pigment prior to use.

C. Solvents and Thinners. Paint may be thinned if recommended by the manufacturer and approved by the Engineer. Under no circumstance should the paint be thinned where the resulting VOC level exceeds 340 g/L. The manufacturer shall be able to advise the Contractor and Engineer as to the maximum amount of thinner allowed.

Use of unauthorized solvents and thinners or using excess amounts of solvents and thinners is prohibited. Paint thinned excessively or incorrectly shall be removed at no additional cost.

D. Paint Application. Painting shall not begin until cleaned surfaces have been inspected. The Contractor shall also provide sufficient time for the work to be inspected at various stages of completion. The item(s) shall cure in an environment that is free of airborne dust and dirt until the paint is dry to the touch. Paint may be applied using brush or roller, unless otherwise indicated by the contract documents. All paint shall be applied to produce a uniform, even coating free of runs, sags, drips, ridges or other defects. Areas exhibiting these defects shall be re-cleaned at no additional cost to the State.

Brushes and rollers used to apply the paint must be of a quality to produce a smooth uniform coating and not leave fibers in the coating. The roller nap length shall be limited in accordance with the paint manufacturer's recommendation.

If the surface becomes contaminated before paint is applied, the surface shall be cleaned as described in this specification at no additional cost.

E. Paint Film Thickness. Paint shall be applied to produce the specified dry-film thickness as directed by the paint manufacturer’s data sheets.

The actual dry-film thickness over galvanizing shall be determined in accordance with SSPC-PA 2, Paint Application Specification No. 2 - Measurement of Dry-Film Thickness with Magnetic Gages, using a Type 2 fixed-probe magnetic gages. The gage(s) shall be properly calibrated over the galvanized surface according to their manufacturer’s recommendation prior to paint application.

The actual dry-film thickness over aluminum surfaces will be estimated using a wet-film thickness gauge.

Areas failing to meet the specified minimum dry film thickness shall be overcoated with the same type of paint to produce the total dry film thickness required. The overcoating must be performed within the paint manufacturer’s specified recoat window.

657-4 METHOD OF MEASUREMENT. The unit measurement for this work is lump sum.

657-5 BASIS OF PAYMENT. The unit price bid shall include the cost of all labor, materials, and equipment necessary to complete the work.

657-5.01 Progress Payments. Progress payments will be made based on the ratio of area cleaned and painted to the total area to be painted as described in the contract documents.

Payment will be made under:

Item No.	Item	Pay Unit
657.01nnnn	Painting Weathered Galvanized Surfaces	Lump Sum
657.02nnnn	Painting Newly Galvanized Surfaces	Lump Sum
657.03nnnn	Painting Aluminum Surfaces	Lump Sum

*nnnn Serialized number identified structure detailed in contract documents.

SECTION 658 (VACANT)

SECTION 659 - TELECOMMUNICATION UTILITIES

659-1 DESCRIPTION. The work in this section shall include special construction required for telecommunications service utilities, including telephone, cellular telephone and cable television that are publicly, privately or cooperatively owned. The extent of work and construction specifications will be covered by special provisions in the contract documents.

659-2 MATERIALS. Materials shall meet the requirements specified by the respective utility company.

659-3 CONSTRUCTION DETAILS

659-3.01 General. The installation and testing procedures shall conform to the requirements specified by the utility company.

659-3.02 Schedule of Work. Work shall be scheduled for minimum interruption of service and must meet the approval of the utility company and the Engineer. A specified advance notice period must be given to the utility company and Engineer prior to interruption of services for construction.

659-3.03 Excavation. The requirements specified in Section 206, Trench, Culvert and Structure Excavation, shall apply.

659-3.04 Backfill. The requirements specified in ~~Section 203, Select Granular Fill §203-3.15, Fill and Backfill at Structures, Culverts, Pipes and Conduits and Direct Burial Cables~~, shall apply.

Comment [c109]:
EI09024

659-4 METHOD OF MEASUREMENT. As specified in the special specifications.

659-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 660 - UTILITIES

660-1 DESCRIPTION. The work in this section shall include special construction required for service utilities that are publicly, privately or cooperatively owned. The extent of work, and construction specifications will be covered by special provisions in the contract documents.

660-2 MATERIALS. Materials shall meet the requirements specified by the respective utility company.

660-3 CONSTRUCTION DETAILS

660-3.01 General. The installation and testing procedures shall conform to the requirements specified by the utility company.

660-3.02 Schedule of Work. Work shall be scheduled for minimum interruption of service and must meet the approval of the utility company and the Engineer. A specified, advance notice, period must be given to the utility company and Engineer prior to interruption of services for construction.

660-3.03 Excavation. The requirements specified in Section 206, Trench, Culvert and Structure Excavation, shall apply.

660-3.04 Backfilling. The requirements specified in [Section 203, Select Granular Fill](#) ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes and Conduits and Direct Burial Cables~~, shall apply.

Comment [c110]:
EI09024

660-4 METHOD OF MEASUREMENT. As specified in the special specifications.

660-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 661 - ELECTRIC UTILITIES

661-1 DESCRIPTION. The work in this section shall include special construction required for electric service utilities that are publicly, privately or cooperatively owned. The extent of work and construction specifications will be covered by special provisions in the contract documents.

661-2 MATERIALS. Materials shall meet the requirements specified by the respective electric utility company.

661-3 CONSTRUCTION DETAILS

661-3.01 General. The installation and testing procedures shall conform to the requirements specified by the electric utility company.

661-3.02 Schedule of Work. Work shall be scheduled for minimum interruption of service and must meet the approval of the utility company and the Engineer. A specified advance notice period must be given to the utility company and Engineer prior to interruption of services for construction.

661-3.03 Excavation. The requirements specified in Section 206, Trench, Culvert and Structure Excavation, shall apply.

661-3.04 Backfill. The requirements specified in [Section 203, Select Granular Fill](#) ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes and Conduits and Direct Burial Cables~~, shall apply.

Comment [c111]:
EI09024

661-4 METHOD OF MEASUREMENT. As specified in the special specifications.

661-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 662 - GAS, OIL & STEAM UTILITIES

662-1 DESCRIPTION. The work in this section shall include special construction required for gas, oil and steam service utilities that are publicly, privately or cooperatively owned. The extent of work and construction specifications will be covered by special provisions in the contract documents.

662-2 MATERIALS. Materials shall meet the requirements specified by the respective utility company.

662-3 CONSTRUCTION DETAILS

662-3.01 General. The installation and testing procedures shall conform to the requirements specified by the utility company.

662-3.02 Schedule of Work. Work shall be scheduled for minimum interruption of service and must meet the approval of the utility company and the Engineer. A specified, advance notice period must be given to the utility company and Engineer prior to interruption of services for construction.

662-3.03 Excavation. The requirements specified in Section 206, Trench, Culvert and Structure Excavation, shall apply.

662-3.04 Backfill. The requirements specified in [Section 203, Select Granular Fill](#) ~~§203-3-15, Fill and Backfill at Structures, Culverts, Pipes and Conduits and Direct Burial Cables~~, shall apply.

Comment [c112]:
EI09024

662-4 METHOD OF MEASUREMENT. As specified in the special specifications.

662-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 663 - WATER SUPPLY UTILITIES

663-1 DESCRIPTION. This work shall consist of the construction or reconstruction of water supply utilities in accordance with these specifications, the contract documents and the standard sheets.

663-2 MATERIALS

663-2.01 General. Materials requirements are specified in the following subsections:

Portland Cement Concrete	501
Reinforced Concrete Pipe Classes II, III, IV, V	706-02
Prefabricated Adjustment Rings, Frames and Utility Valve Risers for Drainage Units, Manholes and Utilities	715-13
High Strength Bolts, Nuts and Washers	715-14
Pins and Rollers	715-15
Stainless Steel Connecting Products	715-16
Ductile Iron Water Pipe, Fittings and Encasement	722-01
Steel Water Pipe and Fittings	722-02
Concrete Water Pipe	722-03
Water Valves and Hydrants	722-04
Plastic Water Pipe and Fittings	722-05
Water Service Pipe, Service Valves and Fittings	722-06
Wedge Type Mechanical Restraint Glands	722-07
Insulation for Water Mains	722-08
Steel Pipe	ASTM A53

Materials for water systems shall meet the appropriate American Water Works Association (AWWA) standards and American National Standards Institute (ANSI) specifications, except as modified by these specifications. Asbestos cement pipe or lead tipped gaskets shall not be used. The materials provided shall meet the requirements specified in the “Owner Requirements for Water Mains and Appurtenances”.

663-2.02 Concrete. All concrete for thrust blocks and cradles for water mains shall meet the requirements of Class A Concrete in Section 501, Portland Cement Concrete General, except that the requirements for inspection facilities, automated batching controls and recordation will not apply. Class A concrete for thrust blocks and cradles, or other concrete that comes into contact with ductile iron or cast iron materials for water mains, including pipe, fittings, hydrants, valves and valve boxes shall not contain fly ash. The batching, mixing and curing methods and the inspection facilities shall meet the approval of the Department, or its representative. The Contractor may submit, for approval by Director, Materials Bureau, a mix at least equivalent to the specified Class A Concrete.

663-3 CONSTRUCTION DETAILS

663-3.01 General. All work shall be done in accordance with applicable AWWA standards, the plans and specifications, and shall be completed to the satisfaction of the Engineer. Owner requirements will be specified in the contract documents under the special notes “Owner Requirements for Water Mains and Appurtenances”. The Contractor shall make all necessary arrangements, obtain all local permits, and pay all charges as required to satisfy the requirements and regulations of the system Owner. Any required health agency permits will be obtained by the system Owner. The local fire department shall be notified by the Contractor a minimum of forty-eight (48) hours prior to interruption of service to any existing hydrant and within twenty-four (24) hours after a hydrant is placed into service. The Contractor shall notify the Owner, in writing, of any hydrant installed with the drain hole plugged.

The locations of the existing mains as shown on the contract plans are often approximate, as indicated by the underground utility quality level designation. Where new water main connections, not including service connections of 2 inch diameter pipe and smaller, to existing facilities are proposed, existing utility type, size and/or condition shall be determined by excavating test pits prior to the start of installation. The Contractor shall submit details for connecting existing pipe(s) to the proposed main(s) and drawings or catalog cuts of water pipes and appurtenances comprising the work to the Engineer, with sufficient time to allow for local approval, prior to ordering materials. At any time pipe laying is not in progress, the open ends of the working pipe shall be kept plugged and watertight with plugs, stoppers or other means acceptable to the Engineer.

The Engineer shall be notified immediately of the discovery of any suspected asbestos-containing water supply utilities not identified in the contract documents. Any asbestos-containing water supply utility not identified in the contract documents and encountered during the work shall not be disturbed. No cutting, grinding or any disturbance of asbestos-containing utility shall be performed under the items in this section.

663-3.02 Removals. Removal of existing water main shall include the removal of all appurtenances and fittings within the trench excavation width for that size pipe as shown on the standard sheets, except that an existing concrete thrust block need not be removed unless its presence will interfere with proposed work. Existing items requiring removal and disposal shall become the property of the Contractor and shall be removed from the work site to the satisfaction of the Engineer. Existing items requiring removal and storage shall be removed and stored by the Contractor for pick up by the Owner. The Contractor shall exercise care in removing items to be stored to prevent damage. Unusable or unwanted material shall be disposed of by the Contractor. Removal of an existing water service connection shall include the removal of the service pipe from the main to the highway boundary or other location(s) shown in the contract documents and the removal of the curb stop and curb box. Unless otherwise noted in the Owner requirements, corporation stops shall be removed and the hole plugged with a solid brass or iron plug.

Disturbance of asbestos-containing water supply utility requires use of a New York State Department of Labor (NYS DOL) licensed contractor using NYS DOL certified asbestos handlers. Removal of

asbestos-containing water supply utility encountered during excavation or exploration shall not be performed under the removal items contained in this section.

663-3.03 Shutdowns. A shutdown of any portion of a water system to make connections to existing mains shall be made with the consent of the system Owner. Approvals for shutting off a water service shall be obtained from the Engineer. The Contractor shall give a minimum of forty-eight (48) hours notice to each customer prior to interruption of service, unless the system Owner requires a longer notification period. Such notice may be provided by posting a written notice at the entrance to the building from the street. When a residential service is to be interrupted for more than eight (8) hours, the Contractor shall, when directed by the Engineer, provide a temporary water service. When a commercial service is to be interrupted for more than 60 minutes during the establishment's normal business hours, the Contractor shall, when directed by the Engineer, provide a temporary water service. A temporary water service shall be required only when specified in the plans, or when directed by the Engineer, and will then be paid for under the Temporary Water Service item.

663-3.04 Excavation and Backfill. The Contractor shall meet the requirements specified in Section 206, Trench, Culvert and Structure Excavation, except as modified by the contract documents. The payment width of trench excavation shall be as shown on the standard sheet for this section. Bell holes shall be excavated no larger than required to allow joint assembly and to allow the pipe to lay flat in the trench. Trenches for pipe sizes from 3 to 24 inch diameter shall provide a minimum of 6 inch clearance to rocks or boulders and trenches for pipe sizes from 30 to 64 inch diameter shall provide a minimum of 9 inch clearance to rocks or boulders. Longitudinal excavation and backfill limits shall be 3 feet beyond the connection or termination point with an existing main, and 2 feet beyond the barrel of a hydrant.

The Contractor shall meet the requirements of [Section 203, *Select Granular Fill*](#), ~~§203-3.15, *Fill and Backfill at Structures, Culverts, Pipes, Conduits, and Direct Burial Cables*~~. Materials containing fly ash or slag, including Controlled Low Strength Material that contains flyash, shall not be used as backfill or allowed to come into contact with ductile iron or cast iron materials for water mains, including pipe, fittings, hydrants, valves and valve boxes. Bedding and embedment material used for backfill around plastic pipe shall have a maximum particle size of 3/4 inch.

Comment [c113]:
EI09024

663-3.05 Thrust Restraint. Thrust forces produced in water mains at changes in direction or size shall be restrained in order to keep the main intact. Thrust restraint may be provided by restrained joints, retainer glands, thrust blocks or tie rods, as required by the Owner. The minimum required thrust block areas and volumes shown on the standard sheet are for a standard water system test pressure, soil bearing capacity and soil unit weight. These values shall be adjusted for higher water system test pressure requirements or different soil conditions in the field. The Contractor shall be responsible for providing the proper size and type of thrust restraint, based on the standard sheets, the Owner requirements and the contract plans. Thrust restraint for sizes larger than 24 inch diameter pipe will be designed on a case by case basis, and will be shown in the contract documents.

663-3.06 Pipe.

A. General. Pipe shall be laid in close conformity to line and grade having a full, firm and even bearing at each joint and along the entire length of pipe. Pressurized pipe need not be laid with the bells upstream. Only gaskets certified by the Manufacturer for use with the type of pipe or fitting installed shall be used. Existing gray iron pipe shall be cut with an abrasive pipe saw, rotary wheel cutter, guillotine pipe saw, milling wheel saw or a hydraulic squeeze cutter. The Contractor shall repair, realign or replace pipe that is damaged or disturbed through any cause occurring prior to acceptance of the contract. Pipe which is defective from any cause, including damage caused by handling and determined by the Engineer to not be repairable, will be unacceptable for installation and shall be replaced as directed by the Engineer at no cost to the State.

B. Ductile Iron Cement Lined Water Pipe. Ductile iron water mains shall be installed in accordance with AWWA Standard C600.

Unless otherwise noted in the Owners requirements, ductile iron pipe up to 12 inch diameter shall be pressure class 350 or thicker, and the cement lining shall be 1/16 inch thick.

Unless otherwise noted in the Owners requirements, ductile iron pipe from 14 to 24 inch diameter shall be pressure class 250 or thicker, and the cement lining shall be 3/32 inch thick. Unless otherwise noted in the Owners requirements, ductile iron pipe from 30 to 64 inch diameter shall be pressure class 250 or thicker and the cement lining shall be 1/8 inch thick. Ductile iron pipe joints shall be installed with deflections not exceeding that listed in the table on the standard sheet. Ductile iron pipe selected for cutting shall be field gauged in order to ensure that after smoothing and beveling (if required), the cut end will provide a sound joint. Ductile iron pipe shall be cut with an abrasive pipe saw, rotary wheel cutter, guillotine pipe saw or milling wheel saw. Ductile iron pipe shall be cut with an oxyacetylene torch only when recommended by the Manufacturer and approved by the Engineer. Cut ends and rough edges shall be ground smooth. Cut ends shall be beveled if using push-on joints. The Contractor shall ensure that the cement mortar lining of ductile iron pipe is not damaged during cutting operations.

C. Steel Water Pipe. Steel water pipe shall be installed in accordance with the contract documents and the Owner requirements. Steel pipe may be cut with an abrasive pipe saw, rotary wheel cutter, guillotine pipe saw or milling wheel saw. Steel pipe shall be welded in accordance with AWWA Standards and with the provisions of the “NYS Steel Construction Manual”. Fittings for steel pipe shall be shop fabricated in accordance with AWWA Standard C208. Linings and coatings shall be installed in accordance with the appropriate AWWA Standard for the specified material.

D. Concrete Water Pipe. Concrete water pipe shall be installed in accordance with the contract documents and the Owner requirements.

E. Plastic Water Pipe. Plastic water mains shall be installed in accordance with AWWA Standard C605. Unless otherwise noted in the Owners requirements, plastic water pipe shall be pressure class 150. Plastic water pipe may be cut with a hand saw, circular saw or similar equipment. After cutting plastic water pipe, ends shall be smoothed or beveled similar to factory ends to provide sound joint connections.

Plastic water pipe shall be re-marked with an insertion line to allow proper joint make-up. Unless otherwise noted in the Owners requirements, plastic water pipe shall be installed with a coated tracing wire above the pipe to facilitate location. A portion of the wire shall be stripped and firmly connected to valves, hydrants, corporation stop and curb stops to provide electrical connectivity.

F. Bridge Mounted Water Pipe. Water pipe shall be installed on a bridge in accordance with the contract plans. This shall include, but is not limited to, expansion devices, rollers, chairs, connectors, insulation, insulation covering and sleeves.

G. Handling and Assembly of Pipe. Pipe and fittings shall be inspected prior to placement. The inside of pipe, fittings and existing water mains shall be kept free of dirt and foreign material. If dirt or potentially contaminated water has entered the inside of a water main, the main shall be cleaned and disinfected prior to placement to facilitate the disinfection process on the completed installation. Pipe and fittings shall be lowered into place, and shall not be rolled, dropped or allowed to fall into a trench or pit.

663-3.07 Polyethylene Encasement and Insulation.

A. Polyethylene Encasement. When called for in the contract documents, ductile-iron pipe shall be polyethylene encased in accordance with the methods outlined in AWWA Standard C105.

B. Insulation for Buried Water Pipe. When called for in the contract documents, insulation shall be installed in accordance with the contract plans and the Manufacturer’s recommendations. Insulation for underground installation shall use appropriate material or be covered with an appropriate waterproof jacket or insulator, as specified in the Owner requirements.

663-3.08 Valves & Valve Boxes.

A. General. Valves shall have an asphaltic or epoxy coating as required under AWWA Standard C509 or C515. Valves shall open in the direction specified in the Owner requirements. Valves shall be lowered into place, and shall not be rolled, dropped or allowed to fall into a trench or pit. Valves shall not be lifted or moved by the valve stem.

B. Valve Installation. Valves shall be installed where shown on the contract plan during the progress of the pipe laying. Valves shall be laid with full, firm and even bearing. Bearing shall be provided by concrete blocks, or a minimum of 6 inches of well-compacted granular fill or crushed stone, as required in the Owner requirements or as shown on the plans.

C. Handling of Removed or Relocated Valves. All valves shown on the plans to be removed or relocated shall be carefully detached, cleaned and stored in locations acceptable to the Engineer within the job site. The Contractor shall take special precautions to prevent damage to the valve during disconnection, movement and reinstallation.

D. Valve Relocation. Valves shall be removed from the existing location, checked, all foreign material removed from the interior and placed in operating condition before reinstallation. Exterior rust and corrosion shall be removed and the valve exterior recoated with an asphaltic coating prior to installation.

E. Valve Boxes. Unless otherwise noted in the Owner requirements, valve boxes shall be slide type adjustable, set plumb over the center of the valve and to the proper grade. Any valve box which has moved sufficiently from the original position so as to prevent the application of the valve key shall be reset by the Contractor at no additional cost to the State. New valve box covers shall be cast with the word "WATER" on the top as a means of identification.

663-3.09 Hydrants.

A. General. Each hydrant shall include bonnet, upper barrel, lower barrel and shoe with all internal operating parts. Hydrants shall be dry-barrel, traffic type, incorporating a frangible connection on the hydrant barrel or at the groundline joint and on the operating rod. The outside of the hydrant upper barrel shall be painted with a minimum of one coat of primer and one finish coat of industrial enamel in the color noted in the Owner requirements or to match existing hydrants if not noted. Unless otherwise noted in the Owner requirements, all hydrants shall have a 5 inch diameter main valve and be equipped with a 4 1/2 NST steamer nozzle and two 2 1/2 NST hose nozzles. Non-operational hydrants shall be bagged or covered, in a manner acceptable to the Engineer, until they are tested and placed in service.

B. Hydrant Installation. Hydrants shall be installed during the laying of pipe. Hydrants shall be restrained, typically from the main to the hydrant shoe, using one of the methods outlined under §663-3.05 "Thrust Restraint". Hydrants shall be set plumb at the proposed locations. The groundline marked on the hydrant, or identified by the manufacturer using an offset from a point on the hydrant, shall be within 1 inch above or below finished grade. The hydrant shall be installed so that no portion of the lower barrel, (that portion remaining if the hydrant top is broken off) extends more than 4 inches above grade. The measurement will be taken over a 5 feet horizontal span when a change in grade occurs within 5 feet of the hydrant. Hydrant drainage material meeting the specifications of §703-02, Table 703-4, Size Designation 1 or 2, shall be placed around the hydrant at the drip location (1/4 cubic yard minimum) to drain the barrel, except as noted on the standard sheets or the contract plans. Hydrant barrels shall be rotated so that the steamer nozzle is facing the roadway, unless otherwise noted in the contract documents.

C. Handling of Removed or Relocated Hydrants. All hydrants shown on the plans to be removed or relocated shall be carefully detached, cleaned and stored in locations designated by the Engineer within the job site. The Contractor shall take special precautions to prevent damage to the hydrant assembly during disconnection, movement and reinstallation.

D. Hydrant Relocation. Hydrants shall be removed from the existing location, checked, all foreign material removed from the interior of the barrel and placed in operating condition before reinstallation. Exterior rust and corrosion shall be removed and the hydrant repainted the color specified by the Owner prior to reinstallation. When the hydrant is ready for service, the hydrant shall be opened and closed to verify that all parts are in working condition. The barrel interior shall be inspected for proper drainage after reinstallation is completed.

663-3.10 Hydrant Fenders. Fenders shall be installed where shown on the contract plans, in accordance with the standard sheets.

663-3.11 Dry Hydrants. Dry hydrants shall be furnished and installed in accordance with the contract documents.

663-3.12 Tapping Sleeve, Valve & Valve Boxes and Line Stop & Tapping Fittings. Fittings shall be installed in accordance with the Manufacturers recommendations. All valves shall be installed in accordance with the requirements of §663-3.08.

663-3.13 Bolted, Sleeve Type Couplings. All couplings shall meet the requirements of AWWA Standard C219.

663-3.14 Iron Water Main Fittings. All fittings shall be compact ductile iron (AWWA C153) unless specifically required otherwise in the Owner requirements. When approved by the Owner, the Contractor may provide a comparable full body fitting (AWWA C110) when not specifically required.

663-3.15 Wedge Type Mechanical Restraint Glands. Glands shall be installed in accordance with the Manufacturer’s recommendations, using break away wedge bolts. If a gland needs to be moved or adjusted, the Contractor shall reinstall the wedges using a torque indicating wrench to within the torque range recommended by the Manufacturer.

663-3.16 High Deflection Restrained Joint Fittings. All fittings shall be compact ductile iron (AWWA C153) unless specifically required otherwise in the Owner requirements.

663-3.17 Water Service Connections. A water service connection shall include the installation of everything, except water service pipe, required to provide a connection from a main to a customer at the highway boundary, including corporation stop, curb stop, curb box, tapping sleeve or saddle, if required, and all necessary fittings.

Taps should be a minimum of 24 inches from a pipe end. Multiple taps should be a minimum of 18 inches apart, measured along the axis of the main. If taps are made at the 2 or 10 o’clock positions, the Contractor shall ensure that the high point in the water service pipe meets the minimum cover requirement. Taps greater than 2 inch diameter shall be made using a tapping sleeve and valve.

For ductile iron pipe, unless otherwise noted in the Owner requirements, maximum allowable direct tap sizes shall be as shown in Table 663-1. For plastic pipe, unless otherwise noted in the Owner requirements, taps up to 1 inch diameter may be directly tapped into a main, and taps from 1 1/4 to 2 inch diameter shall be tapped using a tapping saddle.

TABLE 663-1 MAXIMUM ALLOWABLE DIRECT TAP SIZE FOR DUCTILE IRON PIPE (inches)			
Pipe Size (inches)	Pressure Class		
	250	300	350

4	--	--	3/4
6	--	--	1
8	--	--	1
10	--	--	1
12	--	--	1-1/4
14	1-1/4	1-1/2	1-1/2
16	1-1/2	2	2
18	2	2	2
20	2	2	2
24	2	2	2

NOTE: All thickness class sizes of ductile iron pipe may be direct tapped.

Unless otherwise noted in the Owner requirements, water service pipe shall be Type K copper. Unless otherwise noted in the Owner requirements, polyethylene water service pipe shall be installed with a coated tracing wire to facilitate location. A portion of the wire shall be stripped and firmly connected to the corporation stop and the curb stop to provide electrical connectivity.

The Contractor will have the option to install water service pipe using boring, drilling or other trenchless method. Trenchless installation shall be performed in a manner acceptable to the Engineer. Water service pipe installed using a trenchless method shall be installed in a single length free of couplings or other fittings over that length.

663-3.18 Water Meter Pits, Type A. All pits shall be furnished in accordance with details in the contract documents and the Owner requirements. Type A pits are concrete or masonry structures capable of holding water meters and valves, and allow personnel entry for service and repair. Unless otherwise noted in the Owner requirements, meters to be installed in water meter pits will be supplied by the Owner at no cost to the Contractor or to the State.

663-3.19 Water Meter Pits, Type B. All pits shall be furnished and installed in accordance with the standard sheets and the Owner requirements. Unless otherwise noted in the Owner requirements, meters to be installed in water meter pits will be supplied by the Owner at no cost to the Contractor or to the State.

663-3.20 Temporary Water Service for Water Main Installation. The Contractor shall, when called for in the contract documents or directed by the Engineer, provide temporary water service to customers during interruptions caused by water main work. The service may be provided by temporary piping or other method approved by the Engineer.

663-3.21 Adjust Valve Box Elevation. Prior to the placement of the top course and after the placement of the binder course, when required, the Contractor shall install adjustment rings or frames for valve boxes. The Contractor shall be responsible for ensuring that the adjustment rings or frames are compatible with the existing valve boxes. The adjustment ring or frame shall be placed so the valve box cover will not protrude above the finished surface of the pavement, and is no more than 3/16 inch below finished grade. The Contractor shall have the option of resetting the existing valve box to the required grade.

To ensure a firm and secure fit with the adjustment ring or frame, the seat of the existing valve box shall be free of all foreign material at the time of installation. The entire assembly shall be set on the seat of the existing valve box and secured. The valve box cover shall then be set upon the seat of the adjustment ring or frame. All rings or frames shall be protected from displacement caused by traffic maintained on the roadway or equipment used in the paving operation.

663-3.22 Disconnect and Cap Existing Water Main. Existing water main shall be disconnected and capped in accordance with the contract documents.

663-3.23 Hydrostatic Testing. Hydrostatic pressure and leakage tests shall be performed in accordance with AWWA C600. Prior to formal testing, the mains shall be thoroughly flushed. Hydrostatic pressure and leakage tests shall be made on installations (water mains, valves, fittings, etc.) having diameters larger than 2 inches. The testing shall include any filling points, sampling points or other appurtenances required to conduct the tests. The total leakage per day shall not exceed the amounts allowable under AWWA C600. Unless otherwise noted in the Owner requirements, the system shall be subjected to the pressure/leakage test with water under a hydrostatic pressure of 1035 kPa for two (2) hours.

663-3.24 Disinfection. Upon completion of all water supply related construction, all mains, valves, hydrants and other appurtenances built under this contract shall be flushed, disinfected and tested for bacteriological quality in accordance with AWWA C651. Tablets shall not be used for chlorination of solvent welded plastic or screwed-joint steel pipe due to danger of fire or explosion from the reaction of joint compounds with calcium hypochlorite.

663-4 METHOD OF MEASUREMENT

663-4.01 Water Pipe. The quantity to be measured for payment will be in feet of laying length to the nearest 0.1 m. The measurement for pipe will not include the length of fittings.

663-4.02 Water Service Pipe. The quantity to be measured for payment will be in feet of laying length to the nearest whole foot. The measurement for pipe will not include the length of fittings.

663-4.03 Steel Pipe Bends and Fittings. Steel pipe bends and fittings will be measured in feet of equivalent lengths of steel pipe, to the nearest 1/2 foot. The length of bends will be the length of the circular arc using the angle of the bend and the radius of bend used to make the desired connection. The length of special fittings for steel pipe will be the length along the centerline from an intersecting centerline, as in a tee or wye. The lengths may be measured for different diameters on a tee or wye having legs of unequal diameter. Refer to AWWA Standard C208, Figure 1 and Table 1 for lengths.

663-4.04 Bridge Mounted Water Pipe. The quantity to be measured for payment will be in feet to the nearest 1/2 foot from a point 5 feet behind the back surface of each structure abutment or backwall, or to points indicated in the contract documents for installations that do not pass through an abutment or backwall.

663-4.05 Valve & Valve Boxes. The quantity to be measured for payment will be the number of units of each size furnished and incorporated into the work in accordance with the contract documents.

663-4.06 Hydrants. The quantity to be measured for payment will be the number of units furnished and incorporated into the work in accordance with the contract documents.

663-4.07 Hydrant Fenders. The quantity to be measured for payment will be the number of fenders furnished and incorporated into the work in accordance with the contract documents.

663-4.08 Dry Hydrants. The quantity to be measured for payment will be the number of dry hydrants, including all necessary pipe and fittings furnished and incorporated into the work in accordance with the contract documents.

663-4.09 Tapping Sleeve, Valve & Valve Boxes; Line Stop and Tapping Fittings; and Bolted, Sleeve Type Couplings. The quantity to be measured for payment will be the number of units of each size furnished and incorporated into the work in accordance with the contract documents.

663-4.10 Iron Water Main Fittings. The quantity to be measured for payment will be the bare weight of fittings installed, as listed in AWWA Standard C110 or C153, as applicable. Total contract quantity will be measured to the nearest whole pound. No measurement will be made for the weight of

gaskets, other appurtenant hardware, retainer glands provided solely for thrust restraint or thrust restraints rods. The quantity measured for payment for fittings not listed in the AWWA Standards will be based upon Manufacturer certifications.

663-4.11 Wedge Type Mechanical Restraint Glands and High Deflection Restrained Joint Fittings. The quantity to be measured for payment will be the number of units furnished and incorporated into the work in accordance with the contract documents.

663-4.12 Polyethylene Encasement for Water Mains and Insulation for Water Mains. The quantity to be measured for payment will be the number of feet along the pipe axis measured to the nearest whole foot furnished and incorporated into the work in accordance with the contract documents.

663-4.13 Water Service Connections and Curb Stop & Curb Box. The quantity to be measured for payment will be the number of complete units furnished and incorporated into the work in accordance with the contract documents.

663-4.14 Water Meter Pits, Type A and Water Meter Pits, Type B. The quantity to be measured for payment will be the number of complete units furnished and incorporated into the work in accordance with the contract documents.

663-4.15 Temporary Water Service for Water Main Installation. Payment for Temporary Water Service for Water Main Installation will be made on a lump sum basis.

663-4.16 Relocate Existing Water Valve & Valve Box, Relocate Existing Hydrant Assembly and Relocate Existing Curb Stop & Curb Box. The quantity to be measured for payment will be the number of units of each relocated in accordance with the contract documents.

663-4.17 Adjust Existing Valve Box Elevation, Adjust Existing Hydrant Elevation and Adjust Existing Curb Box Elevation. The quantity to be measured for payment will be the number of units of each adjusted in accordance with the contract documents.

663-4.18 Disconnect and Cap Existing Water Main. The quantity to be measured for payment will be the number of mains disconnected and capped in accordance with the contract documents.

663-4.19 Remove and Dispose of Existing Water Main. The quantity to be measured for payment will be in feet along the pipe axis measured to the nearest whole foot in accordance with the contract documents.

663-4.20 Remove and Dispose of Existing Water Valve & Valve Box and Remove and Dispose of Existing Hydrant. The quantity to be measured for payment will be the number of units removed and disposed of in accordance with the contract documents.

663-4.21 Remove and Dispose of Existing Water Service Connection. The quantity to be measured for payment will be the number of units removed and disposed of in accordance with the contract documents.

663-4.22 Remove and Store Existing Water Valve & Valve Box and Remove and Store Existing Hydrant. The quantity to be measured for payment will be the number of units removed and stored in accordance with the contract documents.

663-5 BASIS OF PAYMENT

663-5.01 General. The unit price bid shall include the cost of all materials, labor and equipment necessary to complete the work, except that test pits, excavation and backfill will be paid for separately. Unless otherwise noted in the contract documents, payment for thrust restraint shall be included in the

price bid for pipe and appurtenances. No additional payment will be made for permits, cutting existing mains, thrust restraint, disinfection or testing. Progress payments for installed or relocated items will be made at the unit bid price for 80 percent of the quantity installed, when the installation is completed and backfilled to a minimum of 2 feet over the top of the pipe plus additional cover required to protect the installation from vehicular and construction traffic. The remaining 20 percent will be paid for when required testing and disinfection of the system has been satisfactorily completed.

663-5.02 Steel Pipe Bends and Fittings. The payment for steel pipe bends and fittings will be made under the steel water pipe item for equivalent lengths of steel pipe. The payment item for a reducer will be based on the larger diameter.

663-5.03 Bridge Mounted Water Pipe. The unit price bid shall include the cost of all labor, materials and equipment necessary to complete the work, including, but not limited to, expansion devices, rollers, chairs, connectors, insulation, insulation covering and sleeves, except that structural utility support members will be paid for under a structural steel item.

663-5.04 Water Service Pipe. The unit price bid for plastic pipe and polyethylene water service pipe will include the installation of tracing wire, if required. If the Contractor opts to install water service pipe using a trenchless method, excavation and backfill will be paid for as if the standard installation method had been used. No additional payment will be made for surface restoration not required due to use of trenchless installation.

663-5.05 Hydrants. The unit price bid for each hydrant shall include a length or lengths of anchor pipe, installed at any point between the main and the hydrant up to 6 1/2 feet long at no additional cost to the State. Hydrant drainage material will be included in the payment for each hydrant at no additional cost to the State.

663-5.06 Hydrant Fenders. The unit price bid shall include the cost of all labor, materials and equipment necessary to complete the work. The work shall include excavation for the fenders, installation and backfill. The excavation for the concrete collars and slabs and the concrete required will be paid for separately.

663-5.07 Bolted, Sleeve Type Couplings. If a bolted coupling is used to join two different diameters of pipe, the payment item will be based on the larger size.

663-5.08 Iron Water Main Fittings. Payment for a full body (AWWA C110) fitting provided but not required will be the weight of a similar compact (AWWA C153) fitting. The payment item for a fitting with different size connections will be based on the largest diameter size on that fitting (i.e. a 12 x 4 inch diameter Tee will be in the 10 - 16 inch diameter range).

663-5.09 Water Service Connections. Payment for a water service connection will include the cost of all labor, materials and equipment necessary to complete the installation of everything required to provide a connection from a main to a customer at the highway boundary, including corporation stop, curb stop, curb box, tapping sleeve or saddle, if required, and all necessary fittings, except the service pipe, which will be paid for separately.

663-5.10 Water Meter Pits. The unit price bid shall include the cost of all labor, materials, including meter pit lids, covers and steps, and equipment necessary to complete the work.

663-5.11 Relocate Existing Hydrant. The unit price bid for each hydrant relocation shall include a length of lateral pipe up to 6 1/2 feet long, installed at any point between the main and the hydrant and hydrant drainage material at no additional cost to the State.

663-5.12 Adjust Existing Valve Box Elevation and Adjust Existing Curb Box Elevation. If the Contractor elects to reset the existing valve box, the costs of the work involved in the removal and

replacement of existing disturbed pavement shall be included in the bid price for adjustment of the valve box.

663-5.13 Adjust Existing Hydrant Elevation. The unit price bid for each hydrant elevation adjustment shall include the cost of any barrel extensions required to complete the work at no additional cost to the State.

663-5.14 Disconnect and Cap Existing Water Main. Any fittings required to complete the work will be paid for separately.

Payment will be made under:

Item No.	Item	Pay Unit
663.01xx	Ductile Iron Cement Lined Water Pipe	Foot
663.02xx	Steel Water Pipe	Foot

SECTION 664 - SANITARY SEWER UTILITIES

664-1 DESCRIPTION. The work in this section shall include special construction required for sanitary sewer utilities that are publicly, privately or cooperatively owned. The extent of work and construction specifications will be covered by special provisions in the contract documents.

664-2 MATERIALS. Materials shall meet the requirements specified by the respective utility company.

664-3 CONSTRUCTION DETAILS

664-3.01 General. The installation and testing procedures shall conform to the requirements specified by the utility company.

664-3.02 Schedule of Work. Work shall be scheduled for minimum interruption of service and must meet the approval of the utility company and the Engineer. A specified advance notice period must be given to the utility company and Engineer prior to interruption of services for construction.

664-3.03 Excavation. The requirements specified in Section 206, Trench, Culvert and Structure Excavation, shall apply.

664-3.04 Backfill. The requirements specified in Section 203, *Select Granular Fill* ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes and Conduits and Direct Burial Cables~~, shall apply.

Comment [c114]:
E109024

664-4 METHOD OF MEASUREMENT. As specified in the special specifications.

664-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTION 665 - WATERWAYS

665-1 DESCRIPTION. The work in this section shall include special construction required for the New York State Canal Corporation.

The extent of work, material required, construction details, method of measurement and basis of payment will be covered by special provisions in the contract documents.

SECTION 666 (VACANT)

SECTION 667 - LOCAL ROAD GRAVEL SURFACE, BASE, AND SUBBASE COURSES

667-1 DESCRIPTION.

667-1.01 General. The work consists of furnishing, placing and compacting gravel surface, base and subbase courses in conformity with the lines, grades, thicknesses and typical sections shown on the plans, or as determined by field conditions and ordered in writing by the municipality.

667-1.02 Material Types. Provide materials as specified by the following options.

Type A. Surface quality material with a maximum particle size of 1 inch.

Type B. Base quality material with a maximum particle size of 2 inches.

Type C. Subbase quality material with a maximum particle size of 3 inches.

667-2 MATERIALS.

667-2.01 Test and Control Methods. All tests shall be performed by laboratories accredited under the AASHTO accreditation program. Materials tests and quality control methods pertaining to the work of this section will be performed in conformance with the procedures contained in the appropriate New York State Department of Transportation (NYSDOT) and/or American Association of State Highway and Transportation Officials (AASHTO) publications which are current on the date of advertisement of bids.

667-2.02 Materials Requirements. Provide materials for road gravel surface, base, and subbase courses that consist of Sand and Gravel, approved Blast Furnace Slag or Stone that meet the requirements contained herein. Provide materials well graded from coarse to fine, and free from organic or other deleterious materials. Any gravel material will be rejected if it is determined to contain any unsound or deleterious materials.

A. Gradation. Perform sieve analysis in accordance with the AASHTO procedures T 27, T 88 or T 311. Report the following sieves for all tests: # 200, # 40, 1/4 inch, 1/2 inch, 3/4 inch, 1 inch, 1 1/2 inch, 2 inch, 3 inch.

Provide material meeting the gradation limits from Table 667-1.

B. Soundness. Material for local road gravel surface, base, and subbase courses will be accepted on the basis of Magnesium sulfate Soundness Loss after four (4) cycles performed according to NYSDOT procedures and Table 667-2.

C. Plasticity. Determine plasticity using either of the following methods:

1. Plasticity Index. The Plasticity Index of the material passing the #40 mesh sieve shall meet the values in Table 667-2. Determine plasticity using AASHTO tests T 89 and T 90.

2. Sand Equivalent. The sand equivalence of the granular material shall meet the values in Table 667-2. Determine sand equivalence using AASHTO test T 176.

TABLE 667-1 PERCENT PASSING BY WEIGHT OF GRAVEL MATERIALS			
Sieve (U.S. sieve)	Option Type		
	A(Surface)	B (Base)	C (Subbase)
3"			100
2"		100	-
1.5"		85-100	70-100
1"	100	-	-
3/4"	85-100	-	-
1/4"	50-75	30-50	30-55
#40	15-35	5-20	5-25
#200	8-15	0-5	0-8

TABLE 667-2 TEST AND CONTROL LIMITS OF GRAVEL MATERIALS

Material Properties	Material Type		
	A (Surface)	B (Base)	C (Subbase)
Maximum Soundness loss (%)	20	20	25
Plasticity Index	2-9	0-5	0-8
Sand Equivalent	>25	>40	>35

D. Elongated Particles. Not more than 30 percent, by weight, of the particles retained on a 1/2 inch sieve shall consist of flat or elongated particles. A flat or elongated particle is defined herein as one which has its greatest dimension more than 3 times its least dimension. Acceptance for this requirement will normally be based on a visual inspection. When the municipality elects to test for this requirement, material with a percentage greater than 30 will be rejected.

E. Fractured Faces. When the municipality elects to test for this requirement, Type A material shall have at least two fractured faces on 50 percent of the stone particles larger than 1/2 inch or at least one fractured face on 75 percent of the particles larger than 1/2 inch. Type B material shall have at least one fractured face on 50 percent of the stone particles larger than 1/2 inch.

667-2.03 Stockpiling. Stockpile all material, except that material furnished under Type C will not be required to be stockpiled if the total project quantity is more than 500 tons, unless otherwise stated in the contract documents. Follow stockpile construction requirements, sampling, testing and acceptance/rejection procedures as stipulated by applicable NYSDOT procedures.

667-3 CONSTRUCTION DETAILS.

667-3.01 General. Use uniform gravel types and materials between the roadbed limits.

667-3.02 Placement.

- A. Place the upper course material on the grade in a manner to minimize segregation, using equipment and procedures approved by the Municipality. Do not perform uncontrolled spreading from piles dumped on the grade.
- B. The maximum compacted layer thickness is 15 inches, or as shown on the plans. In confined areas as defined by the Municipality the maximum compacted layer thickness is 6 inches. The minimum loose lift thickness is 1.5 times the maximum particle size.

667-3.03 Compaction. When the moisture content is within the limits for proper compaction, compact the material in accordance with the requirements of Section 203, ~~Compaction §203-3.12, Compaction~~. Density tests are not required for the acceptance of these courses. If a subbase course has been disturbed by frost action prior to paving, recompact the layer.

Comment [c115]: EI09024

667-3.04 Traffic and Contamination. The movement of highway traffic over the final surface of the base or subbase may be permitted at locations designated by, and under such restrictions as directed by the Municipality, provided such movements take place prior to the final finishing of this course to the specified tolerance. The movement of construction equipment on this course may be permitted at locations designated by and under such restrictions as directed by the Municipality.

No payment will be made for furnishing, placing, maintaining, removing and disposing any protective layer. Include the cost thereof in the price bid.

If a layer is damaged or mixed with the subgrade or any other material due to the Contractor’s operation, remove such material and replace it with the appropriate material at no additional cost to the Municipality.

667-3.05 Tolerance.

A. Surface and Base Course. Place material so that after compaction the top surface of the course does not extend more than 1/4 inch above nor more than 1/4 inch below true grade for the course at any location.

B. Subbase Course. Place material so that after compaction the top surface of the course does not extend more than 1/2 inch above nor more than 1/2 inch below true grade for the course at any location.

667-4 METHOD OF MEASUREMENT. The quantity is the number of cubic yards of material, computed from payment lines shown on the plans or, where changes has been ordered, from payment lines established by the Municipality.

667-5 BASIS OF PAYMENT. The unit price bid for this work includes the cost of furnishing all labor, material and equipment necessary to complete the work. Include the cost of adding water in the price bid unless the items for furnishing and applying water are included in the contract. No direct payment will be made for losses of material resulting from compaction, foundation settlement, erosion, or any other cause. Include the cost of such losses in the price bid for this item. No deductions will be made for the volumes occupied by manholes, catch basins and other such objects.

Progress payments will be made after each Type course has been properly placed and compacted. Payment will be made at the unit price bid for seventy-five (75) percent of the quantity. The balance of the quantity will be paid for after the final finishing to the required tolerance and just prior to the placing of the next course or Type.

Payment will be made under:

Item No.	Item	Pay Unit
667.01	Local Road Gravel Surface Course, Type A	Cubic Yard
667.02	Local Road Gravel Base Course, Type B	Cubic Yard
667.03	Local Road Gravel Subbase Course, Type C	Cubic Yard

SECTIONS 668 AND 669 (VACANT)

SECTION 670 - HIGHWAY LIGHTING SYSTEM

670-1 DESCRIPTION. This work shall consist of furnishing and installing an operating highway lighting system in accordance with the plans, standard sheets, and specifications or as directed by the Engineer.

Where not specifically covered on the plans, specifications, or special provisions, all equipment shall be installed according to the manufacturer's published recommendations.

Included in this work is the furnishing and installing of metal light standards, breakaway transformer bases, arms, luminaires, lamps, electrical conductors, fittings, minor miscellaneous components (pole line hardware, insulators, etc.), concrete foundations, pull boxes and all other materials necessary for operating and controlling the highway lighting system. Also included is the removal, relocation, storage, and/or disposal of the above materials.

670-2 MATERIALS. All electrical equipment shall conform to the EEI, NEMA, ANSI and ASTM Standards. All material shall conform to the latest requirements of the "National Electrical Code", herein referred to as the "Code"; the rules of the New York State Public Service Commission; local power company requirements and any local ordinances which may apply. Differences in standards or code requirements shall be resolved as determined by the Engineer.

The materials used in the construction of lighting systems shall meet the requirements of the following subsections of Section 700- Materials and Manufacturing:

Aluminum Light Standards and Arms	723-01
High Mast Pole, Head Frame Assembly with Luminaire Ring and Lowering Device	723-02

§670

Portable Power Drive for High Mast Luminaire	
Lowering System	723-03
Anchor Base (Aluminum)	723-10
Breakaway Transformer Base (Aluminum)	723-15
Rigid Plastic Conduit	723-19
Metal Steel Conduit, Zinc Coated	723-20
P.V.C. Coated Galvanized Steel Conduit	723-23
Flexible Liquid-Tight Steel Conduit	723-24
High Pressure Sodium Vapor Luminaires (Standard Mount)	723-27
Low Pressure Sodium Vapor Luminaires (Underbridge Mount)	723-28
High Pressure Sodium Vapor Luminaires (Underbridge Mount)	723-29
Mercury Vapor Luminaires (Standard Mount)	723-30
Mercury Vapor Luminaires (Underbridge Mount)	723-31
Cast Iron Junction Box	723-40
Precast Reinforced Concrete Foundations and Pullboxes	723-45
Photoelectric Control	723-50
Anchor Bolts	723-60
Single Conductor Cable	723-70
Single Conductor Direct Burial Cable	723-71
Ground Wire	723-75
Rubber Impregnated Woven Cotton-Polyester Fabric	728-01
Rubber Impregnated Random Fiber Pad	728-02

All cast-in-place concrete base, foundations and pullboxes shall conform to the requirements of Section 501, Portland Cement Concrete - General, except that the requirements for inspection facilities, automated batching control and recordation do not apply. The concrete shall be Class A concrete for structures unless otherwise specified. The batching, mixing and curing methods, and the inspection facilities shall meet the approval of the Department or its representative. The Contractor may submit for approval by Director, Materials Bureau, a mix at least equivalent to the specified Class A Concrete.

All precast concrete bases and foundations shall meet the requirements of §723-45 Precast Reinforced Concrete Foundations and Pullboxes. Anchor bolts encased in concrete foundations shall meet the requirements of §723-60, and shall be set by template.

All concrete bases, foundations and pullboxes shall conform to the dimensions and details shown on the plans, standard sheets and specifications.

Materials will be subject to inspection at any time during the contract. Failure of the Engineer to note faulty material or faulty installation during construction will not relieve the Contractor of responsibility for removing or replacing such materials or redoing work which may fail to pass any of the Engineer's inspections of this work.

670-2.01 Conduit. Couplings, condulets, adaptors and bends shall be made from the same material as the conduit, unless otherwise indicated on the plans or directed by the Engineer.

670-2.02 Pullboxes. Pullboxes shall be cast-in-place or precast concrete units. Precast concrete units shown on the contract drawings for rectangular or circular pullboxes will be acceptable if they are of sufficient interior volume required under the pay item. If no drawings are given, the details shown on the Standard Sheet "Pullbox, Conduit and Ground Rod Installation Details" shall apply.

670-2.03 Luminaires. Luminaires shall be suitable for severe vibrations up to 3 G's, and lamp supports shall be provided if the lamp is horizontally mounted.

670-3 CONSTRUCTION DETAILS

670-3.01 Plans. The Contractor shall study the plans and details and use them as a guide in determining the location of the highway lighting equipment. Any discrepancies in the contract documents shall be resolved with the Engineer before any materials are ordered. Additionally, the manufacturer or

supplier of the lighting equipment shall also use the plans to clearly label what each component part is or where it is to be installed.

All installation shall conform to the latest EEI, NEMA, ANSI and ASTM standards. In addition workmanship shall conform to the latest requirements of the Code; the rules of the New York State Public Service Commission; local power company requirements and any local ordinances which may apply.

Any work performed within the boundaries of New York City shall also be in accordance with the "General Specifications for Street Lighting Facilities" contained in the latest publication of "City of New York SPECIFICATIONS For Use With State of New York Department of Transportation Construction Contracts." Differences in standards or code requirements shall be resolved as determined by the Engineer.

670-3.02 Shop Drawings. The Contractor shall submit six copies of the Manufacturer's Shop Drawings to the Engineer for approval. These drawings shall cover the following items and be submitted at least ten working days prior to the date the Contractor orders the light standards, breakaway transformer base, arms, precast concrete foundations and high mast poles, head assemblies and lowering devices. These items shall not be shipped to the job site until the shop drawings are approved. The shop drawings shall be neatly drawn and clearly legible.

For luminaires and photoelectric controls catalog cuts may be submitted instead of shop drawings.

670-3.03 Excavation and Miscellaneous Work. All excavation shall be performed in accordance with Section 206 *Trench, Culvert and Structure Excavation*, including the protection of workers and the public. Cuts in roadways, sidewalk surfaces and driveways shall be done in a neat manner, so as to cause the least possible damage. Sawcutting will be required unless otherwise shown on the plans or directed by the Engineer.

Excavation shall not be performed until immediately before installation of the conduit, direct burial cable or any other appurtenances.

The excavated material will be placed in a location or locations approved by the Engineer. These locations shall be selected by the Contractor so as to cause the least inconvenience to vehicular and pedestrian traffic and to cause the minimum interference with the surface drainage.

All surplus excavated material shall be removed and disposed of by the Contractor as specified in Section 203, *Disposal of Surplus Excavated Material* ~~§203-3.08, Disposal of Surplus Excavated Materials~~. Excavations shall be backfilled as specified in Section 203, *Select Granular Fill* ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables~~. After backfilling, the location shall be maintained to the satisfaction of the Engineer until permanent repairs are made.

Comment [c116]:
EI09024

Pavement or structure courses shall be replaced as specified in §206-3.02, Replacement of Pavement Structure Courses, except that in concrete sidewalks, the complete sidewalk panel shall be removed and replaced.

670-3.04 Foundations. Locations of concrete foundations for light standards shown on the plans are approximate only and the exact location will be determined in the field. The Contractor has the option to use precast foundations in place of cast-in-place foundations for light standards. However, precast foundations shall not be allowed for high mast systems.

All excavation necessary for constructing or installing a lamppost foundation shall be performed in conformance to §670-3.03.

When cast-in-place concrete foundations can be constructed in undisturbed soil, as determined by the Engineer, the concrete shall be poured in direct contact with the earth. Forms shall not be used unless the excavation is oversize or where neat limits must be maintained. The top 12 to 20 inches shall be formed as specified on the plans or as directed by the Engineer. Care shall be taken to construct the tops of all foundations so they are level and true to line and grade. Anchor bolts shall be set by template, as ordered by the Engineer.

When cast-in-place concrete foundations are to be constructed in soil that will not support a vertical cut, the foundations shall be formed. When forms are used, the foundations shall be backfilled and compacted allowing sufficient room for the compaction equipment selected.

Where unstable soil is encountered, permanent support shall be used. This can include driving sheeting, augering in a pipe section, or any other method acceptable to the engineer.

§670

When precast foundations are used, the size of the precast foundation shall not be less than that shown on the plans or standard sheet for cast-in-place foundations. They are only to be used in conjunction with one of the following special excavation and backfill methods to insure foundation stability:

Method A. The excavation shall allow a minimum clearance of 6 inches around the precast foundation to be backfilled with concrete meeting the requirements of §501-2.02, Class A. For backfill purposes, small construction mixers will be permitted.

Method B. The excavation shall allow a minimum clearance around the precast unit compatible with the compaction equipment used. ~~The clear area shall be backfilled with Select Granular Fill in accordance with §203-2.06 Select Granular Fill, and compacted in accordance with §203-3.06 Select Granular Fill. The clear area shall be backfilled with Select Granular Fill in accordance with §203-2.02 of the Standard Specifications, and compacted in accordance with §203-3.15.~~

Comment [c117]:
EI09024

Method A or Method B can be used in undisturbed areas. Only Method B is to be used in disturbed areas.

670-3.05 Grounding. A 10 foot by 5/8 inch diameter, copperclad ground rod shall be driven near each foundation, maintaining at least 2 inch of cover, or through selected pullboxes where metal conduit is used. The ground rod shall be electrically connected to the base of the pole with a No. 6 soft drawn bare stranded copper ground wire. A copperclad groundwire clamp shall be used to attach the ground wire to the ground rod.

Where a 10 foot ground rod cannot be driven, or is insufficient to provide adequate grounding (see §670-3.16), alternate methods shall be used as shown on the plans or ordered by the Engineer. Such alternate methods can include changing the ground rod length or location, or connecting the ground wire to some other grounded object.

670-3.06 Light Standards, Breakaway Transformer Bases and Arms. Each metal light standard shall be set vertically (within 1° of plumb) on a foundation or anchorage, employing approved shims when necessary, either with or without a transformer base as shown on the plans or in the proposal. The transformer base, or the anchor base when a transformer base is not used, shall be securely bolted to the anchorage by the anchor bolts previously set.

The individual light standards shall be identified as required by the responsible maintenance agency and as shown on the plans.

Each arm shall be mounted on the shaft so the luminaire will be at the proper mounting height as shown on the plans. The mounting height shall be measured from the center of the light source to the pavement. The arms shall be in a plane perpendicular to the roadway. The Contractor, in conjunction with the Engineer, shall determine the necessary elevation data for fabricating the light standard with the correct mounting height.

A Number 8 Gauge galvanized steel or 1/4 inch nylon rope drag line shall be furnished and installed running from the terminal strip area in the luminaire to the anchor base or box where the power distribution cable is or will be installed. This drag line shall be securely anchored at each end, and removed only after the cables are installed.

The protective wrapping shall not be removed from any of the shafts or arms until the Engineer instructs the Contractor to do so.

670-3.07 Conduit. Underground conduit shall be either zinc coated metal steel conduit, PVC coated galvanized steel, rigid plastic, or flexible liquid-tight steel conduit, as indicated on the plans, and shall be carefully laid in trenches prepared to receive them. Unless indicated otherwise, conduits in exposed areas, when attached to the outside of structures, such as underdeck installations, shall be PVC coated galvanized steel conduit installed as shown on the plans or in a manner approved by the Engineer. Hot dipped, galvanized or non-rusting alloy steel clamps shall be provided to support the conduit at intervals not exceeding 4 feet or as directed by the Engineer.

Underground conduit installations shall have a minimum cover of 18 inches except under roadways, where the minimum cover shall be 24 inches. The conduit shall be laid on a uniform grade to allow any condensation to drain to pull boxes or “T” drains, as detailed on the Standard Sheet “Pullbox, Conduit and Ground Rod Installation Details”. Where uniform grades cannot be maintained, “T” drains shall be installed where directed by the Engineer. Conduit shall be backfilled in accordance with [Section 203, Select Granular Fill](#) ~~§203-3.15 Fill and Backfill at Structures, Culverts, Pipes, Conduits, and Direct Burial Cables~~. However, in rock excavations, a bedding of selected backfill must be placed and tamped before laying the conduit.

Comment [c118]:
EI09024

All bends in the conduit shall be made without kinking, flattening or appreciably reducing the internal diameter of the conduit. A hydraulic or power pipe bender shall be employed, unless a template is used, for all bends in steel conduit. No bends will be accepted for exposed conduit which shows any evidence of destruction of the protective coating.

Where conduits terminate at pullboxes, the Contractor shall break into the pullbox and seal, usually with mortar, the remainder of the hole(s) in a manner acceptable to the Engineer. Sealed bonding bushings shall be provided at each conduit outlet in boxes. Bushing caps, to prevent entry of dirt and refuse prior to pulling cables, shall be placed on all conduit ends. Outlet boxes with conduits properly connected shall be accurately located according to the plans and securely fastened.

All conduits installed shall be tested for clear bore and correct installation by the Contractor using a ball mandrel, brush and snake before the installation will be accepted. Two short wire brushes shall be included in the mandrel assembly. Snaking of conduits shall be done by the Contractor in the presence of the Engineer. Any conduit which rejects the mandrel shall be cleared and the Contractor shall bear all costs to replace defective conduit and restore surface to original condition.

Numbers or letters shall be assigned to the various conduit runs, and as they test clear, they shall be identified by a brass tag, no less than 1 1/4 inch in diameter, attached by means of No. 20 AWG brass wire. All conduit terminations in pole bases or pull boxes shall be tagged.

As the conduit runs test clear, a record shall be kept under the heading of “Empty Conduits Tested, Left Clear, Tagged and Capped,” showing conduit designation, diameter, location, date tested and by whom. When completed, this record shall be signed by the Electrical Inspector and submitted in triplicate for approval. This record shall be entered on the Record Drawings.

All empty conduit and duct openings after test, shall be capped or plugged by the Contractor as directed. After a conduit is properly installed and cleaned, the Contractor shall furnish and install in each conduit run a No. 10 AWG galvanized steel drag line or nylon or polypropylene rope, with a tensile strength of at least 500 pounds, leaving at least 3 feet of extra line in each pull box, transformer base, or other terminus. If cable is not pulled through the conduit within thirty days, the steel drag shall be grounded to a suitable grounding device at each end of the circuit.

All metallic connections shall be tight to assure continuity of ground bondings.

Conduit shall be placed under existing pavement by approved jacking or boring methods and as directed by the Engineer. The jacking or boring pit shall be located beyond the outside shoulder keeping at least 2 feet clear of the edge of shoulder. Jacking pits will not be permitted in the median, but receiving pits may be dug in grass medians after the jacking is completed if permitted on the plans or by the Engineer.

670-3.08 Pullboxes. Cast-in-place or precast concrete pullboxes shall be constructed at the locations and to the dimensions shown in the plans, standard sheets, specifications, or proposal.

Excavations for pullboxes shall be performed in accordance with the requirements of §206-3, Construction Details for Trench, Culvert and Structure Excavation, and included in this item.

Frames and covers shall be furnished and placed on each pullbox. They shall be placed true to line and grade and make full and even bearing on the pullbox.

The frames and covers shall be of the design and detail shown in the plans, standard sheets, specifications or proposal. Frames and covers which do not fit together properly, are warped or rock, will be rejected by the Engineer. Any material rejected by the Engineer, will be removed from the site by the Contractor.

No pullbox shall be backfilled until all cement concrete has sufficiently hardened and forms, if any, have been removed.

The requirements of Section 203, *Select Granular Fill*, ~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables~~, shall apply.

Comment [c119]:
E109024

670-3.09 Junction Boxes. Cast iron junction boxes shall be installed at the locations shown on the plans. For surface mounting, the boxes shall be securely bolted to brackets as detailed on the plans. For installation where boxes are embedded in cement concrete, the boxes shall be set with the covers flush with the surface.

All hardware used in conjunction with mounting of these boxes shall be rust and corrosion resistant.

670-3.10 Luminaires. Luminaires of the type and wattage specified, complete with all components shall be installed where shown on the plans standard sheets, or proposal or where directed by the Engineer. All necessary field adjustments required to achieve the specified light distribution shall be performed as directed by the Engineer.

A. Standard Mounting. Luminaires shall be installed on light standard mast arms with the vertical axis perpendicular to the roadway and the longitudinal axis parallel to the roadway centerline. The luminaires shall be installed, though not necessarily powered, immediately after the mast arms are connected to the shaft. Otherwise, vibration dampeners shall be used until the luminaires are installed.

B. Underbridge Mounting. Luminaires of the type and wattage specified shall be installed on wall mounts or outlet box studs.

Self-contained underbridge luminaires complete with all specified ballasts, and any other appurtenances necessary shall be installed according to manufacturers written instructions, as shown on the plans, as specified in the proposal or as directed by the Engineer.

670-3.11 Photoelectric Control. Photoelectric controls shall be installed at the locations shown on the plans, preferably facing north, and properly adjusted to energize the luminaires at the specified illumination levels.

670-3.12 Single Conductor Cable and Single Conductor Direct Burial Cable. Wire installation shall not start until raceways and boxes have been cleared of all foreign matter and all other operations of the work which are likely to damage the conductors have been completed. The National Electric Code Rules shall be observed regarding installation of wire and cable.

Unless otherwise specified, splices will be permitted only in pullboxes, junction boxes, utility manholes, luminaires, transformer bases, and lamppost hand holes. All conductor runs between units of equipment shall be without splices. Conductors in control cabinets shall not be spliced.

All splices shall be capable of satisfactory operation under continuous submersion in water. Multiple conductors shall be spliced and insulated to provide a watertight joint and to prevent absorption of moisture by the conductors.

Moisture shall be excluded from the joint during the splicing operation and the work shall be done in dry weather or under shelter. Perspiration from the splicer's hand should be wiped off with dry material. All materials and tools involved in the splicing process shall be kept dry.

One of the following methods shall be used for making a watertight and electrically insulated splice:

Method No. 1. The outer covering and insulation shall be removed from each conductor for a minimum length necessary for the use of a pressure release crimping tool. The conductor ends shall be bared and jointed with a seamless, solderless type sleeve connector of the same AWG size as the conductor being spliced, using a pressure release crimping tool designed for the size connector being used. After crimping the sleeve connector shall maintain proper contact with both conductors around the circumferences of the splice and along the length of the sleeve.

The portion of each conductor where insulation has been removed, and the sleeve connector, shall be reinsulated using a coat of fast drying sealing agent of electrical grade, wrapped tightly with overlapping layers of rubber tape, a second coat of the sealing agent applied, and then wrapped tightly with overlapping layers of polyvinylchloride tape.

The sealing agent and tape shall extend at least 1 inch onto the undisturbed insulation of each conductor. Sufficient layers of tape shall be applied to equal 1.5 times the thickness of the original insulation.

Rejacketing the cable shall be accomplished in a similar manner as described above except that the sealing agent and tape shall extend at least 4 inches onto the undisturbed outer covering of each cable.

Individual splices in each conductor shall be staggered to minimize the outside diameter of the splice.

Method No. 2. All of the requirements for splicing, specified in Method No. 1, shall apply, except that the completed splice including sleeve connector and the portion of each conductor where the insulation has been removed, shall be reinsulated and the conductor rejacketed by using an acceptable mold poured full with a two component dielectric epoxy resin. The resin shall not require external heating to produce satisfactory pouring consistency.

670-3.13 Ground Cable. Ground cable shall be installed where and as detailed on the plans or as directed by the Engineer.

670-3.14 Regulations. All work shall be done in accordance with latest edition of the national electrical safety codes, rules and regulations of the State authorities having jurisdiction over such work, and regulations of the utility companies where the work is being installed. Where differences or discrepancies occur, the most stringent requirements shall apply.

670-3.15 Prosecution of Work. All work shall be done by qualified and experienced mechanics of each labor class, as determined by the Engineer. All work shall be inspected and approved by the Engineer before concealment.

670-3.16 Tests. The Contractor shall conduct all tests, in the presence of the Engineer. The equipment required for each test shall be supplied by the Contractor, along with the equipment manufacturer's written instructions describing how to perform the test. The following tests shall be performed by the Contractor, at the time directed by the Engineer, prior to acceptance of the work:

A. Insulation Test. Each circuit with associated ballasts and protective devices shall be insulation tested using an insulation tester connected according to manufacturers instructions. A polarization index shall be computed by dividing a ten minute reading by a one minute reading. The polarization index shall be greater than four (4) for acceptance of new circuits, and greater than two (2) for acceptance of existing circuits. The lighting system shall be properly grounded and disconnected while this test is taking place.

B. Ground Test. A ground test shall be performed by the Contractor using an earth tester with resolution to at least a tenth of an ohm. The test shall be performed, and the results interpreted, according to manufacturer's instructions. Readings of five ohms or less will be required for acceptance. Additional grounding methods satisfactory to the Engineer may be necessary until the installation can pass the ground test.

C. Functional Test. After satisfactory completion of all other tests, a functional test shall be performed consisting of not less than ten consecutive days of satisfactory operation. If unsatisfactory performance of any component of the lighting system is discovered during this time, the condition shall be corrected and the Engineer may require the test repeated until ten days of continuous satisfactory operation is obtained.

Temporary shut downs caused by power interruption or vehicle impact shall not constitute discontinuity of the functional test.

670-3.17 Coordination with Utility Company. The Contractor shall be responsible for all coordination with and between the utility company.

The Contractor shall make all necessary arrangements with the utility company for the required electrical services necessary for the energizing of a temporary lighting installation and barricade lighting.

The Contractor shall comply with the utility company regulations. The utility company will connect and disconnect the power as required. When an entry into a service manhole or attachment to any utility company pole is required, the Contractor shall notify the utility company sufficiently in advance, and under no condition shall the Contractor enter any utility company owned manhole or place an attachment to a utility company owned pole without an agreement with the utility company.

The service points shown on the plans are approximate only and the Contractor shall determine the exact location from the serving utility company.

When called for in the contract documents the Contractor shall make arrangements with the local utility company to complete the service connections.

670-3.18 Removal and Disposal, or Storage, of Lighting Equipment. Existing lighting equipment designated for storage shall be carefully removed from their present locations by disconnecting the conductors, unbolting the mast arm(s) and luminaire(s) and detaching the shaft (and transformer base) from the anchor bolts. The work shall be performed in a manner acceptable to the Engineer. Component parts designated for storage shall be neatly stored and protected during storage at locations and in a manner as approved by the Engineer. Standards designated for removal and disposal shall be disposed of by the contractor in a manner approved by the Engineer within the directed time period after removal from their original location. The concrete lamppost foundations shall be cut free of the attached trenched conduits and shall be removed by the Contractor from the job site. The hole resulting from removing the foundation shall be filled with an approved material and compacted as directed by the Engineer.

670-3.19 Relocation of Lighting Equipment. Lighting equipment designated for relocation shall be detached and stored as per §670-3.18, reinstalled and successfully retested at the new location. The complete relocation shall take place in one work shift unless otherwise shown on the plans or ordered by the Engineer.

Where bracket arms and luminaires are to be relocated onto other utility poles, the down leads shall also be relocated, or replaced in kind if necessary, AOBE. (Down leads include small sections of conduit or wood molding, wires and fuses connecting the secondary power supply line to the luminaire.) The bracket arm shall be attached to the pole with hardware similar to existing. The Contractor shall also relocate the epoxied strap used where the bracket arm is located above telephone lines.

Any part of the bracket arm, luminaire, or down lead damaged during removal or reinstallation shall be replaced or repaired to the satisfaction of the Engineer.

670-3.20 High Mast Pole, Head Frame Assembly and Lowering System. The high mast steel pole, head frame assembly and lowering system shall be installed in accordance with the manufacturer's recommendations, or as directed by the Engineer. With each installation a Manufacturer's instructional manual shall be furnished in each pole base. This manual shall include, but not be limited to the following details:

1. Raise and lower assembly instructions
2. Operating instructions
3. Maintenance instructions
4. Attachments

Additionally, the luminaire ring with all luminaires installed shall be lowered and raised five (5) times, at least twice in the coldest part of the winter and twice in the hottest part of the summer, if possible, to test functionality. These test dates shall be determined by the Engineer. Failure to lower or rise properly will be means for rejection of the assembly.

670-3.21 Portable Power Drive for High Mast Luminaire Lowering System. The portable power drive shall be used to raise and lower the luminaire ring as described above, and be delivered in good condition to the location shown on the plans upon acceptance of the high mast system.

670-4 METHOD OF MEASUREMENT

670-4.01 Foundations. Lighting standard foundations will be measured as the number of complete units installed in accordance with the plans, specifications or as directed by the Engineer.

670-4.02 Light Standards. Light standards will be measured as each standard of the type specified, complete, in place, in accordance with plans, specifications or as directed by the Engineer.

670-4.03 Arms. Arms of the type and length specified will be measured by the number of units furnished and installed on the respective light standards (or wood poles) according to the plans, specifications or as directed by the Engineer.

670-4.04 Breakaway Transformer Base. Breakaway transformer bases will be measured as the number furnished and installed in accordance with the plans, specifications or as directed by the Engineer.

670-4.05 Conduit. Conduit will be measured by the linear foot along the axis of the conduit, of the type and size specified, installed according to the plans, proposal, or as directed by the Engineer. Measurement shall include all couplings, condulets, adaptors and bends.

670-4.06 Pullboxes. Pullboxes, including frames and covers, will be measured as the number furnished and installed in accordance with the plans, specifications or as directed by the Engineer.

670-4.07 Junction Box. Cast iron junction boxes will be measured as the number of each size furnished and installed in accordance with the plans, specifications or as directed by the Engineer.

670-4.08 Luminaires. Luminaires of the type and wattage specified will be measured by the number of units furnished and installed according to the plans, specifications or as directed by the Engineer.

670-4.09 Photoelectric Controls. Photoelectric controls will be measured as each control furnished and installed in accordance with the plans, specifications or as directed by the Engineer.

670-4.10 Single Conductor Cable and Direct Burial Cable. Single Conductor Cable wire will be measured for payment by the number of linear feet of single conductor of each size actually installed in accordance with the plans and specifications or as directed by the Engineer.

670-4.11 Ground Wire. Ground wire will be measured for payment by the number of linear foot of ground wire installed in accordance with the plans and specifications or as directed by the Engineer.

670-4.12 Removal of Lighting Equipment. The removal of lighting equipment will be measured by the number of light standards (including bracket arms and luminaires), or foundations, removed from the site and stored or disposed of as ordered by the Engineer.

670-4.13 Relocation of Lighting Equipment. The relocation of lighting equipment will be measured by the number of specified units removed and reinstalled at the new location.

670-4.14 High Mast Pole, Head Frame and Lowering Assembly. High mast steel pole, head frame assembly and lowering system will be measured by the number of complete units furnished and installed in accordance with the contract documents.

670-4.15 Portable Power Drive for High Mast Luminaire Lowering System. The portable power drive for high mast luminaire lowering system will be measured by the number of complete units delivered.

670-5 BASIS OF PAYMENT

§670

670-5.01 General. The Contractor shall pay all fees and expenses for testing, service connections, licenses, electrical energy and any other cost he may incur in constructing the highway illumination system, except that the cost of electrical energy used for public benefit prior to the completion of the contract will be borne by the State, when such operation is directed by the Engineer in writing. The cost of all minor miscellaneous components shall be included in the price bid for the various lighting items.

670-5.02 Foundations. The unit price for each lighting standard foundation shall include the cost of all labor and materials necessary to complete the work, including conduit elbows, grounding system, anchor bolts, all appurtenances, excavation, special fill, and any protective system(s) required to ensure the safety of the workers and the public.

670-5.03 Light Standards. The unit bid for each light standard shall include the cost of all labor and other materials necessary to complete the work.

670-5.04 Arms. The unit price bid for each arm of the type and length specified shall include the cost of the arm, appropriate down leads and all labor and other materials necessary to install it on the designated light standard or wood pole shown on the plans.

670-5.05 Breakaway Transformer Bases. The unit price bid for each breakaway transformer base shall include the cost of the breakaway transformer base and all labor and other materials necessary to install it where shown on the plans.

670-5.06 Conduit. The unit price bid per linear foot shall include the conduit and all labor and other materials necessary to complete the work, including couplings, condulets, adaptors or bends. Excavation and backfill for conduit shall be paid for separately under the item for Conduit Excavation and Backfill or as indicated.

670-5.07 Pullbox. The unit price bid for each pullbox shall include the cost of all excavation, backfill, frames, covers, labor, equipment, and other materials necessary to complete the work.

670-5.08 Junction Box. The unit price bid per each junction box shall include the cost of furnishing and installing cast iron junction boxes, and all labor, equipment and any other material necessary to complete the work.

670-5.09 Luminaires

A. Standard Mount. The unit price bid for each standard mount luminaire shall include the cost of the luminaire of the type specified, labor and other material necessary to complete the work.

B. Underbridge Mount. The unit price bid for each underbridge luminaire shall include the cost of the underbridge luminaire of the type specified, complete with mounting hardware, and all labor and other materials necessary to complete the work.

670-5.10 Photoelectric Controls. The unit price bid for each control shall include the cost of all labor, equipment and any materials necessary to complete the work.

670-5.11 Single Conductor Cable and Direct Burial Cable. The unit price bid per linear foot shall include the cost of furnishing all labor, materials, and equipment to satisfactorily complete the work. Cable from the pole base to the luminaire, or from the overhead power source to the luminaire, will be included in the light standard item or bracket arm item.

670-5.12 Ground Wire. The unit price bid per linear foot shall include the cost of furnishing all labor, materials, and equipment to satisfactorily complete the work.

670-5.13 Remove and Store Lighting Equipment. The unit price bid for removing and storing lighting equipment shall include the cost of all labor, materials and equipment necessary to complete the work. Removing concrete foundations will be paid for under its appropriate item.

670-5.14 Remove and Dispose of Lighting Equipment. The unit price bid for removing and disposing lighting equipment shall include the cost of all labor, materials and equipment necessary to complete the work. Removing concrete foundations will be paid for under its appropriate item.

670-5.15 Relocate Lighting Equipment. The unit price bid for relocating the lighting equipment shall include the cost of all labor, materials and equipment necessary to complete the work. Installing new concrete foundations will be paid for under their appropriate items. New conductors and conduit, where necessary, will also be paid for separately.

670-5.16 High Mast Pole, Head Frame Assembly, and Lowering System. The price bid shall include the furnishing of all labor, materials, and equipment necessary to complete the work. The luminaires will be paid for separately.

670-5.17 Portable Power Drive for High Mast Luminaire Lowering System. The price bid shall include the entire power drive assembly, and winch if necessary, delivered to the location indicated on the plans or directed by the Engineer.

Payment will be made under:

SECTIONS 671 THRU 679 (VACANT)

SECTION 680 - TRAFFIC SIGNALS

680-1 DESCRIPTION

680-1.01 Work. This work shall consist of furnishing and installing new traffic signal equipment, in accordance with the plans, specifications, standard sheets, or directions of the Engineer.

680-1.02 Definitions. The following definitions shall apply to all work, equipment, and materials included under this section:

1. Actuation - The operation of any type of detector.
2. Controller - That part of a controller assembly which performs the basic timing and logic functions.
3. Controller Assembly - The complete assembly for controlling the operation of a traffic signal, consisting of a controller together with all auxiliary equipment, housed in a weatherproof cabinet or cabinets.
4. Cycle Length - The time in seconds required for one complete signal cycle.
5. Detector - A device for indicating the passage or presence of vehicles or pedestrians.

- 6. Inductance Loop Detector - A detector consisting of a wire loop embedded in the roadway surface connected to an electronic device that is capable of sensing the passage or presence of either moving or stationary vehicles by a change in the electrical inductance characteristics of the wire loop.
- 7. Interval - That part or parts of a signal cycle during which signal indications do not change.
- 8. Phase - That part of a signal cycle allocated to any traffic movement receiving the right of way or to any combination of traffic movement receiving the right of way simultaneously during one or more intervals. Each phase shall consist of at least one green interval and one yellow clearance interval.
- 9. Signal Cycle - A complete sequence of signal indications.
- 10. Signal Face - That part of a signal head provided for controlling traffic in a single direction and consisting of one or more signal sections. Turning indications may be included in a signal face.
- 11. Signal Head - An assembly containing one or more signal faces which may be designated accordingly as one-way, two-way, etc.
- 12. Signal Indication - The illumination of a traffic signal lens or equivalent device, or a combination of several lenses or equivalent devices at the same time.
- 13. Signal Section - A complete unit for illuminating a lens consisting of a housing, lens, reflector, lamp receptacle, and lamp.
- 14. Type I Traffic Signal Section. A Type I Traffic Signal Section is a standard or polycarbonate traffic signal section without reflector, reflector ring, lens, and lamp receptacle.
- 15. Type I Pedestrian Signal Section. A Type I Pedestrian Signal Section is a standard or polycarbonate pedestrian signal section without reflector, lens, and lamp receptacle.

680-2 MATERIALS

680-2.01 Traffic Signal Equipment. The specific components used in the construction of new traffic signal systems shall meet the requirements of the following subsections included under Section 700- Materials and Manufacturing:

Bar Reinforcement, Grade 60	709-01
Iron Castings	715-05
Breakaway Transformer Base	723-15
Rigid Plastic Conduit	723-19
Metal Steel Conduit, Zinc Coated	723-20
P.V.C. Coated Galvanized Steel Conduit	723-23
Flexible Liquid-Tight Steel Conduit	723-24
Cast Iron Junction Boxes	723-40
Precast Reinforced Concrete Pullboxes	723-45
Signal Cable	724-01
Span Wire	724-02
Traffic Signal Poles	724-03
Traffic Signal Heads	724-04
Shielded Communication Cable	724-08
Signal Cable with Integral Messenger	724-09
Shielded Communication Cable with Integral Messenger	724-10
Fire Pre-emption Tell Tale Light	724-15
Inductance Loop Wire	724-20
Shielded Lead-in Cable	724-21
Roadway Loop Embedding Sealer	724-22
Pedestrian Push Button and Sign	724-23
Fiberoptic Pedestrian Signal Heads	724-04
Fiberoptic Dual Indication Arrow	724-04
Strobing Signal Indication	724-04
LED Traffic Signal Modules	724-04
LED Pedestrian Signal Modules	724-04

§680

680-2.02 Concrete. All cast-in-place pullboxes, signal pole foundations and controller cabinet bases shall meet the requirements of Class A concrete in section 501, Portland Cement Concrete General, except that the requirements for inspection facilities, automated batching controls and recordation do not apply. The batching, mixing and curing methods and the inspection facilities shall meet the approval of the Department or its representative. The Contractor may submit, for approval by Director, Materials Bureau, a mix at least equivalent to the specified Class A Concrete.

All precast concrete pullboxes, signal pole foundations and controller cabinet bases shall meet the requirements of §723-45 Precast Reinforced Concrete Pullboxes.

680-2.03 Messenger Wire. Messenger wire shall meet the requirements of §724-02 Span Wire.

680-2.04 Guy Wire. Guy wire shall meet the requirements of §724-02 Span Wire.

680-2.05 Pullbox Frames and Covers. Frames and covers shall meet the requirements of §715-05 Iron Castings.

680-3 CONSTRUCTION DETAILS

680-3.01 Equipment List and Drawings. Unless otherwise waived, the Contractor shall submit to the Regional Director within 30 days following the award of contract, detailed specifications, catalog cuts, parts list, instruction sheets, and shop drawings of equipment and materials which he proposes to install.

680-3.02 (Vacant)

680-3.03 Negotiations with Utility Company. The Contractor shall be responsible for all negotiations involving utility companies.

The Contractor shall comply with utility company regulations.

When an entry into a service manhole or attachment to any utility company pole is required, the Contractor shall notify the utility company sufficiently in advance. Entry into a service manhole or attachment to any pole shall not be made without the presence of a utility company representative if the utility company so requires. The service points shown on the plans are approximate only and the Contractor shall determine the exact location from the serving utility company.

The Contractor shall make arrangements with the local utility company to complete the service connection.

680-3.04 Underground Facilities. The Contractor shall locate all existing underground facilities in accordance with the provisions of Industrial Code Rule 753. It shall be the Contractor's responsibility to satisfy himself as to existing conditions and to protect and support in a suitable manner all underground facilities encountered during the trenching and excavating operations. The Contractor shall repair any damage to these lines caused by his operations, and if the nature of the damage is such as to endanger the operations of these services and utilities and the necessary repairs are not immediately made by the Contractor, the work may be performed by the State or other Contractor and the cost thereof charged against the Contractor.

680-3.05 Test Holes. Prior to excavating for pole placement and after locating all existing underground facilities, the Contractor shall dig a test hole or holes at the proposed location of each pole. If obstructions are encountered the Contractor shall properly backfill the test hole and move to a new location as directed by the Engineer.

680-3.06 Work Sites. The Contractor shall perform all work within the work site in a workmanlike manner and in accordance with U.S. Department of Labor's Occupational Safety and Health Standards.

The sites of the work and adjacent premises shall be kept as free from material, debris and rubbish as is practicable. All such material or debris that accumulates during the work shall be removed by the Contractor as the work progresses.

Neither the materials excavated, nor the materials used, shall be placed so as to prevent access to any fire hydrants, water valves, manholes, police call boxes or fire alarm boxes.

680-3.07 Schedule of Work. The Contractor shall notify the local power company at least 72 hours (or as required by the company) in advance of the time that the individual installation is complete and ready for operation in order that taps may be made by the power company to distribution lines.

Upon completion of a signal installation the signal may be placed in service prior to the completion of other installations or the signal head may be covered. The Contractor shall place the signal in operation or cover the head as directed by the Engineer.

When the traffic signal is placed in operation, it shall be operated in accordance with timing schedules to be supplied by the Department.

680-3.08 Contractor Responsibility with Utilities. All attachments to utility company poles shall be made in accordance with the specifications and subject to the inspection of the utility companies owning the poles. The height of all proposed attachments above the ground and their locations on the poles shall be in accordance with the plans, standard sheets or as directed by the Engineer and shall meet the approval of the utility companies owning the poles.

The Contractor shall protect all property and materials of the utility companies and shall be responsible for the repair or replacement of any damaged material or property. In the event that the point of attachment or location of the risers is such that the risers interfere with or do not provide proper clearance with existing utility company attachments, the Engineer, in consultation with the utility companies owning the poles, shall make the necessary adjustments in heights and location to eliminate such interference.

680-3.09 Excavation. All excavation shall be performed in accordance with Section 206 Trench, Culvert and Structure Excavation, including the protection of workers and the public.

Excavation shall not be performed until immediately before installation of the conduit, direct burial cable, footings, pullboxes or any other appurtenances. The excavated material shall be placed in a location or locations approved by the Engineer. These locations shall be selected by the Contractor so as to cause the least inconvenience to vehicular and pedestrian traffic and to cause the minimum interference with the surface drainage. All surplus excavated material shall be removed and disposed of by the Contractor as specified in [Section 203, Disposal of Surplus Excavated Material](#)~~§203-3.08 Disposal of Surplus Excavated Materials.~~

Excavation shall be backfilled as specified in [Section 203, Select Granular Fill](#)~~§203-3.15, Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.~~ After backfilling, the excavation shall be kept well filled and maintained in a smooth and well drained condition until permanent repairs are made.

The outline of all areas to be removed in sidewalks, driveways, and pavement shall be saw cut to a depth of at least 3 inches prior to removing the sidewalk, driveway or pavement. Cuts shall be neat and true along score lines with no shatter outside the removal area. Damaged saw cut areas shall be recut.

Pavement, shoulder, sidewalks, curbs, driveways, lawns, plants and other such features shall be replaced in kind with material of equal quality or as shown on the plans, standard sheets or as directed by the Engineer.

Whenever a part of a square or slab of existing concrete sidewalk, curb, gutter or driveway is broken or damaged, the entire square, section or slab shall be removed and replaced with the same kind and quality of material.

For transverse sidewalk, curb or gutter cuts in concrete the entire square or section shall be removed and replaced with the same kind and quality of material. For longitudinal cuts in concrete sidewalks only the area removed between sawcuts shall be replaced unless specified otherwise on the plans.

680-3.10 Pole Excavation and Concrete Foundation. Foundations shall be constructed as shown in the contract documents or as directed by the Engineer. However, the Contractor has the option to use either Cast-in-Place or Precast Concrete foundations for the signal poles.

If the Contractor elects to install a cast-in-place foundation, the signal pole may be installed on the foundation three (3) days after concrete placement. However, the span wire and signal heads may not be

Comment [c120]:
EI09024

installed until the concrete cylinder strength reaches at least 2200 psi. Therefore, the Contractor shall assist the Engineer in making a sufficient number of test cylinders of the foundation concrete, store these cylinders at the location directed by the Engineer, and transport these cylinders to the State testing facility in order to install the traffic signal as soon as possible.

If the Engineer requests the submittal of design computations for one or more signal poles, the Contractor shall not start construction of the foundations for those signal poles until the Engineer's review of the submittal is completed. The Engineer will have twenty (20) working days to review the design computation for one signal pole, and an additional two (2) working days for each additional signal pole.

For those poles on which a traffic signal cabinet will be mounted, the Contractor shall orient the pole foundation to align the signal cabinet and cabinet wiring access hole as specified on the plans. If no orientation is specified on the plans, the Contractor shall orient the signal cabinet and cabinet wiring access hole 180° from the span wire or load attachment to the pole, unless otherwise directed by the Engineer. The Contractor shall notify the Engineer three (3) working days in advance of doing any pole foundation work and provide the intended pole orientation.

680-3.11 Poles. Poles shall be erected as specified on the plans, standard sheets and as directed by the Engineer.

Pole and signal locations shown on the contract plans shall be field checked for any condition that may affect their placement, where changes are necessary the exact location will be determined by the Engineer.

When field conditions require a change in pole position from that shown in the contract plans, the pole length requirements may vary. It shall be the Contractor's responsibility to verify pole length before ordering poles.

Pole erection shall include installation of mast arms and lighting arms and attachment of fittings as specified on the plans and standard sheets as follows:

1. Anchor bolt covers if specified.
2. Weatherheads and couplings as required.
3. Service bracket.
4. Pole cap and mast arm end caps.
5. Cabinet mounting fittings, plates, brackets as needed for the cabinet being installed.
6. Reinforced couplings for wire entrances to cabinets.
7. Galvanized eyebolt, nuts and washers for attaching span wire assembly.
8. Galvanized pole clamps with eyes for attaching tether wires.

In addition, the Engineer may require the contractor to submit, at any time, design computations for any or all of the traffic signal poles in the contract. The design computations must be approved, stamped and signed by a professional engineer licensed in New York State. The Engineer shall have twenty (20) working days to review the design computations for one traffic signal pole, and an additional two (2) days for each additional signal pole.

If the Engineer's review of a pole's design indicates a problem(s) exists, the Contractor will be notified within the time allotted for the review. In these cases a meeting will be held between the Engineer and the Contractor to resolve the Engineer's concerns.

680-3.12 Grounding. A copper clad ground rod, ground wire and fittings shall be installed as shown on the plans, standard sheets or as directed by the Engineer. The ground system shall be electrically connected to the grounding terminal on the pole or controller cabinet.

The ground system when completed shall be tested in accordance with §680-3.32. If the requirements of this test are not met, additional ground rods, ground rod extensions, electrical bonding of metallic conduit or other grounding measures may be required as directed by the Engineer.

680-3.13 Conduit and Direct Burial Cable. Conduit and direct burial cable shall be installed as specified on the plans, standard sheets or as directed by the Engineer. Underground conduit and direct burial cable installations shall have a minimum cover of 18 inches except under roadways, where the minimum cover shall be 24 inches unless specified otherwise on the plans, or standard sheets. The conduit

shall be laid on a uniform grade to allow any condensation to drain to pull boxes or “T” drains. Conduit shall be backfilled in accordance with ~~Section 203, Select Granular Fill~~ ~~Structures, Culverts, Pipes, Conduits and Direct Burial Cables.~~ ~~§203-3.15 Fill and Backfill at~~ In rock excavations a bedding of select backfill must be placed and tamped before laying the conduit.

Comment [c121]:
EI09024

Conduit may be placed under pavement by jacking or boring methods approved by the Engineer. Pavement may not be disturbed without permission of the Engineer. In the event obstructions are encountered, small test holes may be cut in the pavement upon approval of the Engineer. Jacking or boring pits shall be kept 2 feet clear of the edge of pavement and shoulder whenever possible. Excavation for jacking or boring pits shall be in accordance with §680-3.09 Excavation.

Conduit or direct burial cable may be placed by machine methods approved by the Engineer.

All bends in conduit shall be made without kinking, flattening or appreciably reducing the internal diameter of the conduit. A hydraulic or power pipe bender shall be employed for all bends in steel conduit. Any evidence of destruction of the protective coating will be cause for rejection. All connections in metallic conduit shall be tight. Ends of conduit shall be reamed to remove burrs and rough edges.

Conduit ends in pullboxes, junction boxes, cabinet, etc. shall be equipped with insulating bushings.

All conduits installed shall be tested for clear bore and correct installation by the Contractor in the presence of the Engineer.

All empty conduit after testing shall be immediately sealed by the Contractor.

After a conduit is properly installed, the Contractor shall furnish and install in each conduit run a No. 10AWG galvanized steel drag wire or nylon or polypropylene rope with a tensile strength of at least 500 lb. At least 3 feet of extra wire or rope shall be left at each end.

680-3.14 Pullboxes. Pullboxes shall be constructed and installed in accordance with the details specified on the standard sheets or as directed by the Engineer.

Cast iron frames and covers shall be furnished and placed on each pullbox. They shall be set in mortar and placed true to line and grade and make full and even bearing on the underlying construction surface. The frame and cover shall be as shown on the standard sheet. Frames and covers which do not fit together properly, will be rejected by the Engineer and shall be removed from the site.

680-3.15 Signal Control Cable and Shielded Communication Cable. Cable shall be installed to form a continuous circuit between the proper equipment terminals. All terminal connections shall be made with approved solderless lugs of the proper size using a crimping tool that is self-releasing when proper compression has been applied. Only connectors that provide continuity and physical contact around the circumference of the connector and conductor shall be used.

During installation of the cable, the Contractor shall take care not to damage conductors, insulation, or outer covering. The length of cable installed shall not cause excessive stress on the conductors or any part of the cable.

An insert lubricant approved by the Engineer shall be used in placing cable in conduit. Cable shall be pulled into conduit by hand and the use of winches or other power actuated pulling equipment will not be permitted.

At least 3 feet but not more than 5 feet of slack shall be left for each cable at each pullbox or junction box. Short bends of cable shall be avoided inside pullboxes. Cable in pullboxes or junction boxes shall not cross over any other cables already in place nor block any conduit. All cable shall be identified as to function in each pullbox, junction box or cabinet by the use of aluminum or brass cable markers. If a wire numbering system is used for identification, the key to the system shall be placed along with the wiring diagram in the controller cabinet.

Conductors in controller cabinets shall be dressed neatly with tie wraps. Spare conductors shall be taped and coiled neatly in the bottom of the cabinet. Ends of spare conductors shall be taped. Field wiring entering controller cabinets shall be identified as to function.

Splices in shielded communication cable will not be allowed between equipment terminals. Where cable is installed on span wire, or messengers, it shall be supported at intervals not greater than 15 inches by messenger rings, stainless steel cable straps or other non-corrosive metal lashing approved by the Engineer. Taping and plastic cable ties will not be permitted.

Integral messenger cable shall be installed in accordance with the details specified on the standard sheets or as directed by the Engineer.

When integral messenger cable is installed on utility company poles, the Contractor shall make all arrangements with the utility company for the installation. The Contractor shall observe all utility company requirements for attachments to poles and clearances with utility wires. The Contractor shall notify the utility company prior to start of the work and observe the utility company requirements for accomplishment of the work.

All necessary hardware used with integral messenger cable shall develop the full breaking strength of the integral messenger wire. Poles at each end and at each change of direction shall be guyed as specified on the plans or directed by the Engineer. When installed on utility company poles, guys shall be installed as directed by the utility company.

680-3.16 Cable Splices. Unless otherwise specified, cable splices will be permitted only in pullboxes, junction boxes, utility manholes, and at traffic signal heads. All cable runs between units of equipment shall be without splices unless shown on the plans or authorized by the Engineer. Conductors in controller cabinets shall not be spliced. Splices in overhead cable, when necessary, shall be made with the approval of, and as specified by the Engineer.

All splices shall be capable of satisfactory operation under continuous submersion in water. Multi-conductor cables shall be spliced and insulated to provide a watertight joint and to prevent absorption of moisture by the cable.

Moisture shall be excluded from the joint during the splicing operation and the work shall be done in dry weather or under shelter. Perspiration from the splicer's hand should be wiped off with dry material. All materials and tools involved in the splicing process shall be kept dry.

One of the following methods shall be used for making a watertight and electrically insulated splice:

Method No. 1. The outer covering and insulation shall be removed from each conductor for a minimum length necessary for the use of a pressure release crimping tool. The conductor ends shall be bared and joined with a seamless, solderless type sleeve connector of the same AWG size as the conductor being spliced, using a pressure release crimping tool designed for the size connector being used. After crimping the sleeve connector shall maintain proper contact with both conductors around the circumference of the splice and along the length of the sleeve.

The portion of each conductor where insulation has been removed, and the sleeve connector, shall be reinsulated using a coat of fast drying sealing agent of electrical grade, wrapped tightly with overlapping layers of rubber tape, a second coat of the sealing agent applied, and then wrapped tightly with overlapping layers of polyvinylchloride tape.

The sealing agent and tape shall extend at least 1 inch onto the undisturbed insulation of each conductor. Sufficient layers of tape shall be applied to equal 1.5 times the thickness of the original insulation.

Rejacketing the cable shall be accomplished in a similar manner as described above except that the sealing agent and tape shall extend at least 4 inches onto the undisturbed outer covering of each cable.

Individual splices in each conductor shall be staggered to minimize the outside diameter of the spliced cable.

Method No. 2. All of the requirements for splicing, specified in Method No. 1, shall apply, except that the completed splice including sleeve connector and the portion of each conductor where the insulation has been removed, shall be reinsulated and the cable rejacketed by using an acceptable mold poured full with a two component electrical insulating resin approved by the Engineer. The resin shall not require external heating to produce satisfactory pouring consistency.

680-3.17 Span Wire Assembly. Span wire assemblies including necessary hardware shall be installed and constructed in accordance with the details on the standard sheets or as directed by the Engineer.

Span wire assemblies shall be either single span wire, dual span wire with upper tether or dual span wire with lower tether as specified on the plans.

The Contractor shall determine the span and tether wire diameter based upon pole design load using the table on the standard sheets. All necessary hardware for attaching span and tether wires to the poles

shall develop the full breaking strength of the span or tether wire with which it is used, except that breakaway links for lower tether wires shall develop the strength specified on the standard sheets.

Sag shall be adjusted so that it is a minimum of 5 percent of the span when the traffic signal system, including overhead signs, is complete.

The Contractor shall determine the length of suspension and tether wire required to span the distance between poles, allow sufficient length for fastening and sag and after adjustments, make the whole assembly consistent with the plans, standard sheets or as directed by the Engineer.

680-3.18 Messenger Assembly. The messenger shall be installed in accordance with the details on the standard sheets or as directed by the Engineer.

When a messenger is installed on utility company poles the Contractor shall make all arrangements with the utility company for the installation. The Contractor shall observe all utility company requirements for attachments to poles and clearance with utility wires. The Contractor shall notify the utility company prior to the start of the work and observe the utility company requirements for accomplishment of the work.

All necessary hardware used with the messenger assembly shall develop the full breaking strength of the messenger strand. Poles at each end and at each change of direction along the run of messenger shall be guyed as specified on the plans or directed by the Engineer. When installed on utility company poles, guys shall be installed where required by the utility company. The signal control cable shall be fastened to the messenger at intervals not greater than 16 inches by messenger rings, stainless steel cable straps or other non-corrosive metal lashings approved by the Engineer. Taping and plastic cable bands will not be permitted.

680-3.19 Guy Assembly. Guys shall be installed and constructed in accordance with the details on the standard sheets or as directed by the Engineer. Guys on utility company poles shall meet the utility company requirements.

Excavation for the anchor shall be of the minimum width possible to accept the unexpanded anchor. All backfill shall be compacted.

680-3.20 Riser Assembly. Risers and weatherheads shall be installed and constructed in accordance with the details on the standard sheets or as directed by the Engineer. Risers on utility company poles shall meet the utility company requirements.

680-3.21 Signal Heads. Signal heads shall be installed as specified on the plans, standard sheets or as directed by the Engineer. Each signal head shall be assembled from signal sections and brackets in the configuration specified on the plans. Signal heads shall be properly aligned to the satisfaction of the Engineer. All mounting hardware shall be securely tightened to prevent loosening by the wind.

Until signal heads are placed in operation they shall be bagged with opaque or other material, as approved by the Engineer, that is adequately secured in a neat and orderly manner.

Optically programmed signal heads shall be installed, directed and veiled in accordance with the manufacturer's instructions, plans, standard sheets and the Engineer's visibility requirements. Each section of the signal shall be masked with prescribed materials in an acceptable and skillful manner.

LED Traffic or Pedestrian Signal Modules, which are supplied by the State, shall be installed in new or existing traffic or pedestrian signal heads as shown on the plans or as ordered by the Engineer. When the Contractor is required to furnish the LED module, unless otherwise waived, the Contractor shall submit to the Regional Director within 30 days following the award of contract, detailed specifications and catalog cuts of the equipment he/she proposes to install. In either case, the Contractor shall first remove any existing components necessary to install the LED modules, and the removed components shall remain the property of the State.

680-3.22 Wiring Color Code. The following wire color code system, unless otherwise shown on the plans, shall be used for wiring signal heads:

A. Through C. (Vacant)

D. 1 Through 8 Phases

1. Priority of assigning signal phases, overlaps and double clearances to Groupings of Color - Coded Wire for Signal Heads:

PRIORITY	FUNCTION	PRIORITY	FUNCTION
1	Phase 5	8	Phase 4
2	Phase 1	9	Overlap No. 1
3	Phase 6	10	Overlap No. 2
4	Phase 2	11	Overlap No. 3
5	Phase 7	12	Overlap No. 4
6	Phase 3	13	Double Clearance No. 1
7	Phase 8	14	Double Clearance No. 2

2. Groupings of color coded wire for signal heads:

GROUP NUMBER	INDICATION	WIRE COLOR CODE*	GROUP NUMBER	INDICATION	WIRE COLOR CODE*
1	Red	14/19C-1-R	4	Red	14/19C-1-B/R
	Yellow	14/19C-1-O		Yellow	14/19C-1-O/R
	Green	14/19C-1-G		Green	14/19C-1-BL/R
	Ground Wire	14/19C-1-W		Ground Wire	14/19C-1-W/R
2	Red	14/19C-1-R/B	5	Red	14/19C-2-R
	Yellow	14/19C-1-O/B		Yellow	14/19C-2-O
	Green	14/19C-1-G/B		Green	14/19C-2-G
	Ground Wire	14/19C-1-W/B		Ground Wire	14/19C-2-W
3	Red	14/19C-1-R/W	6	Red	14/19C-2-R/B
	Yellow	14/19C-1-BL/W		Yellow	14/19C-2-O/B
	Green	14/19C-1-G/W		Green	14/19C-2-G/B
	Ground Wire	14/19C-1-B/W		Ground Wire	14/19C-2-W/B
GROUP NUMBER	INDICATION	WIRE COLOR CODE*	GROUP NUMBER	INDICATION	WIRE COLOR CODE*
7	Red	14/19C-2-R/W	11	Red	14/19C-3-R/W
	Yellow	14/19C-2-BL/W		Yellow	14/19C-3-BL/W
	Green	14/19C-2-G/W		Green	14/19C-3-G/W
	Ground Wire	14/19C-2-B/W		Ground Wire	14/19C-3-B/W
8	Red	14/19C-2-B/R	12	Red	14/19C-3-B/R
	Yellow	14/19C-2-O/R		Yellow	14/19C-3-O/R
	Green	14/19C-2-BL/R		Green	14/19C-3-BL/R
	Ground Wire	14/19C-2-W/R		Ground Wire	14/19C-3-W/R
9	Red	14/19C-3-R	13	Red	14/10C-1-R
	Yellow	14/19C-3-O		Yellow	14/10C-1-O
	Green	14/19C-3-G		Green	14/10C-1-G
	Ground Wire	14/19C-3-W		Ground Wire	14/10C-1-W
10	Red	14/19C-3-R/B	14	Red	14/10C-1-R/B
	Yellow	14/19C-3-O/B		Yellow	14/10C-1-O/B

	Green	14/19C-3-G/B		Green	14/10C-1-G/B
	Ground Wire	14/19C-3-W/B		Ground Wire	14/10C-1-W/B

E. Groupings of Color Coded Wire for Preempts (Blue Light) and Pedestrian Signals:

1. Preempts (Blue Light).

WIRE COLOR CODE	INDICATION
14/2C-1-B	Blue Light
14/2C-1-W	Ground Wire

2. Pedestrians Signals.

PED NUMBER	WIRE COLOR CODE*	INDICATION	PED NUMBER	WIRE COLOR CODE*	INDICATION
1	14/5C-1-P/R	DONT WALK	3	14/5C-3-P/R	DONT WALK
	14/5C-1-P/G	WALK		14/5C-3-P/G	WALK
	14/5C-1-P/B	Switch Wire		14/5C-3-P/B	Switch Wire
	14/5C-1-P/O	Switch Wire		14/5C-3-P/O	Switch Wire
	14/5C-1-P/W	Ground Wire		14/5C-3-P/W	Ground Wire
2	14/5C-2-P/R	DONT WALK	4	14/5C-4-P/R	DONT WALK
	14/5C-2-P/G	WALK		14/5C-4-P/G	WALK
	14/5C-2-P/B	Switch Wire		14/5C-4-P/B	Switch Wire
	14/5C-2-P/O	Switch Wire		14/5C-4-P/O	Switch Wire
	14/5C-2-P/W	Ground Wire		14/5C-4-P/W	Ground Wire

*** Key for Wire Color Code:**

XX	/	XXC	-	X	-	X	/	X
AWG		No. of		Cable No.		Color		Tracer
		Conductors		For the Given		of Wire		Color
				Conductor Size				

Colors: R-Red, O-Orange, G-Green, BL-Blue, W-White, B-Black.

F. Notes:

The following steps should be used to determine the appropriate color coded wiring for a given signal installation:

1. Determine which functions are used in the signal operation.
2. Assign the color coded wire to the functions used in numerical order according to the priority given to the function .
3. Use the minimum number of conductors required to maintain the color code.

EXAMPLE: Signal X is a four phase signal
 Step No.1-- Phase 1, 5, 6, 4, and an overlap of Phase 6 + 4 is used in the Signal operation.

Step No. 2--	Priority	Function	Color Coded Group No.
	1	5	1
	2	1	2
	3	6	3
	8	4	4

Step No.3-- Use one 19 conductor cable and one five conductor cable

680-3.23 Pedestrian Push Button and Sign. The push button and sign shall be installed and constructed in accordance with the details specified on the standard sheets. Push button and sign shall be installed on either an existing pole, a newly installed signal pole or on its own post and footing as specified on the plans.

The orientation shall be convenient to pedestrians intending to cross the street controlled by the push button at the marked or obvious crosswalk.

680-3.24 Fire Pre-Emption Tell Tale Light. The Tell Tale Light shall be installed in accordance with details on the standard sheets or as directed by the Engineer.

The light shall be wired in such a manner as to simultaneously display a blue light during the emergency pre-emption interval and at other times remain unlighted. It shall be oriented in the position which provides the best view to the emergency equipment approach roadway.

680-3.25 Flashing Beacon Sign Assembly. The flashing beacon sign assembly shall be constructed as shown on the plans, and standard sheets. It shall be installed on either an existing sign and post or a new pole as specified on the plans.

The sign panel shall be constructed in accordance with the appropriate subsections of Section 645, Signs. The flashing beacon signal heads and solid state flasher and cabinet shall be installed as shown on the standard sheets.

When not mounted behind guiderail, the pole shall be equipped with an approved breakaway base or transformer base fabricated in accordance with §723-15.01--Breakaway Transformer Base (Aluminum).

680-3.26 Inductance Loop Installation. Loops shall be installed in accordance with the details specified on the plans, Standard Sheets or as directed by the Engineer. Loop dimensions shall be as specified on the plans.

Pullboxes, conduits and curb cuts shall be completed before beginning the loop installation.

The loop shall be outlined on the pavement to conform to the specified configuration. A power saw and wet cutting techniques shall be used to cut a slot in the pavement. Dry cutting techniques shall be used if directed by the Engineer and with appropriate measures to safeguard nearby vehicle and pedestrian traffic. The cut shall be 3/8 inch in width and the depth specified on the standard sheets. The corners shall be cored, drilled or chipped out as shown on the standard sheets. Sharp edges in the corners shall be smoothed. All saw cuts and corners shall be of the same depth.

Immediately after sawing by either wet or dry methods, the slot and pavement shall be flushed with pressurized clean water to remove the saw slurry, dust or other cutting debris. Filtered compressed air shall be used to remove all dust and moisture from the slot. If the slot is damp, do not proceed with the installation until it is dry. Hot air may be used to dry the saw slot.

At the edge of pavement or curb a 1 inch minimum diameter, Metal Steel Conduit, Zinc Coated, Flexible Liquid-Tight Steel Conduit or Rigid Plastic Conduit shall be installed between the pavement and pullbox in accordance with details specified on the standard sheets. The curb or pavement shall be cut or scored to leave a permanent mark to show where the conduit runs under the curb or pavement.

The loop wire shall be installed starting at the roadside pullbox, passed around the loop for the specified number of turns and brought back to the pullbox. Splices shall not be permitted outside the pullbox. The wire shall be depressed in the slot without the use of sharp objects which might damage the wire insulation.

The loop shall be held in place every 2 feet with 1 inch (approximate) strips of rubber, neoprene, flexible tubing or foam backer rod as approved by the Engineer. These hold down strips shall be left in place when the slot is filled with Roadway Loop Embedding Sealer.

The pair of loop wires between the edge of pavement and the splice to the shielded lead-in cable in the pullbox shall be twisted together with at least five turns per 1 foot.

The splice between the loop wires (twisted pair) and the shielded lead-in cable shall be moisture proof and shall have a dielectric strength at least equal to that of the original insulation.

The bared conductor ends shall be either twisted and soldered or joined using an uninsulated, size coded solderless type connector of the correct size using an appropriate crimping tool. The splice shall be reinsulated in accordance with §680-3.16 Cable Splices, Method No. I except that heat shrinkage polyolefin tubing may be used as an alternate to the rubber tape; also, the first layer of PVC tape and sealing agent shall be extended as needed to cover a minimum of 1 inch of the inductance loop wire tube. The polyolefin tubing shall be at least as thick as the original insulation. Upon completion of the reinsulating, a final waterproof coating shall be applied over the entire splice.

The loop wires (twisted pair) and the splice to the shielded lead-in cable with the pullbox shall be held by wire hangers as near as possible to the top of the box in order to prevent their immersion in water. The shielded lead-in cable shall be continuous (no splices) from the splice to the loop wires to the controller cabinet terminals. The drain or ground wire in the shielded cable shall be grounded at the controller cabinet terminals only.

The completed loop installation including the shielded lead-in to the controller cabinet shall have a minimum of 50 megohms leakage resistance to ground. This resistance shall be tested before the loop is sealed in the pavement and after the splice is made between the loop wires (twisted pair) and shielded lead-in. Resistance to ground shall be tested in accordance with the Insulation Resistance Test in §680-3.32.

When it is determined that the resistance to ground requirements are met, the slot shall be filled with Roadway Loop Embedding Sealer. The pavement temperature shall be at least 40°F and rising before the sealer is placed. All work involving the sealer shall be done in compliance with the manufacturer's specifications. When the loop embedding sealer has set sufficiently to open the loop to traffic, but the surface remains tacky, the loop may be dusted with cement dust to facilitate opening the loop to traffic.

680-3.27 Concrete Base for Controller Cabinet. Bases shall be installed and constructed in accordance with the details specified on the standard sheets. Bases shall be either pre-cast or cast-in-place. Anchor bolts shall be placed in the footing at the proper location. Conduits shall be installed in the footing as required by the plans.

Where the base is installed in unpaved areas a work pad shall be constructed in front of the cabinet door.

Excavation shall be in accordance with §680-3.09, Excavation.

680-3.28 Power Meter Base. At each power source, the Contractor shall provide 6 feet of slack in the traffic signal cable used for power supply and neatly coil this slack within the controller cabinet.

The Contractor shall install a meter base as shown on the standard sheets or as ordered by the Engineer. The meter base will be furnished by the utility company. The additional length of power cable in the controller cabinet shall be extended through the cabinet wall into the meter base and back to the controller circuit breaker. All meter base fittings shall be weather tight.

680-3.29 Overhead Traffic Signs. Sign and mounting brackets shall be installed as shown on the plans and standard sheets. Signs shall be aligned to the satisfaction of the Engineer.

Sign Panels shall be aluminum and constructed in accordance with the appropriate subsections of section 645-Signs.

680-3.30 Field Galvanizing. All abrasions of galvanized steel due to handling equipment, erection, etc., and all points of attachment, shall be field repaired as specified in §719-01--Galvanized Coatings and Repair Methods.

680-3.31 Cast Iron Junction Boxes. Junction boxes shall be installed at the locations and according to the details on the plans or as directed by the Engineer. Dimensions shall be as shown on the plans.

680-3.32 Tests. The Contractor shall perform all tests described herein in the presence of the Engineer or his representative. Testing equipment shall be supplied by the Contractor.

Prior to placing a signal in operation, the Contractor shall perform the following tests:

A. Continuity Test. Each circuit shall be tested for continuity.

B. Ground Test. All traffic signal grounding systems when completed in place shall have a resistance to ground of not more than that shown in the table below as determined in the following manner:

1. Temporarily connect a 10 ampere load between the AC + side of the equipment cabinet fuse and the ground system. It should be assured that the power company applied voltage is 120 volts AC at the time of the test.
2. Disconnect the power company AC neutral from the ground system.
3. Connect a voltmeter between the power company AC neutral and the ground system.

Controller Installed	Voltmeter Reading (Volts)	Equivalent Resistance (Ohms)
2 Phase	20	2.0
Model 170 Microcomputer	20	2.0
All others	10	1.0

If the voltmeter reading is higher than the appropriate voltage shown in the above table under the 10 ampere load, the grounding system has an unacceptable resistance to ground. Additional grounding, including electrical bonding of underground metallic conduit, may be necessary in order to meet the requirements of this test.

C. Insulation Resistance Test. An insulation resistance test at 500 volts DC shall be made on each circuit between the circuit and ground. The insulation resistance shall not be less than 10 megohms on each circuit except that inductive loop detector circuits shall have an insulation resistance of not less than 50 megohms.

The insulation resistance test shall not be performed on magnetometer sensing elements. Splices in the pullbox adjacent to the magnetometer sensing elements shall not be made prior to performing an insulation resistance test on the lead-in conductors between the pullbox and the controller cabinet field terminals.

D. Functional Test. After satisfactory completion of all other tests, a functional test of the traffic signal control equipment shall be performed to demonstrate that every part of the signal system operates in accordance with the plans, specifications and to the satisfaction of the Engineer. The functional test for each signal system shall consist of not less than ten days of continuous satisfactory operation. If unsatisfactory performance of the system components is discovered during this time, the condition shall be corrected and the test repeated until ten days of continuous satisfactory operation is obtained.

Functional tests shall not begin on a Friday or on the day before a legal holiday. On the day the functional test begins, initial turn-on shall be made between the hours of 9:00 am and 2:00 pm unless otherwise ordered by the Engineer. Prior to turn-on all signal control equipment required for signal system shall be installed and ready for operation including pedestrian signal indications, pedestrian signs and push buttons, and vehicle detectors. All louvers, visors, and signal heads shall be directed to provide maximum visibility.

Temporary shut downs caused by power interruption or traffic accidents shall not constitute discontinuity of the functional test.

680-3.33 Fiberoptic Pedestrian Signal Heads. Fiberoptic pedestrian signal heads shall be installed according to the requirements of §680-3.21 Signal Heads.

680-3.34 Fiberoptic Dual Indication Arrow. Fiberoptic dual indication arrows shall be installed according to the requirements of §680-3.21 Signal Heads.

680-3.35 Strobing Signal Section. Strobing Signal Sections shall be installed according to the requirements of §680-3.21 Signal Heads.

680-3.36 LED Traffic Signal Module. LED Traffic Signal Modules shall be installed in Type I Traffic Signal Sections according to the requirements of §680-3.21 Signal Heads.

680-3.37 LED Pedestrian Signal Module. LED Pedestrian Signal Modules shall be installed in Type I Pedestrian Signal Section according to the requirements of §680-3.21 Signal Heads.

680-4 METHOD OF MEASUREMENT

680-4.01 Each Unit. The following items will be measured for payment as the number of each unit furnished and installed in accordance with the contract documents or as directed by the Engineer:

Span Wire Assembly	Traffic Signal Section
Guy Assembly	Strobing Signal Indication
Pedestrian Signal Section	Traffic Signal Bracket Assembly
Pullbox	Traffic Signal Disconnect Hanger
Cast Iron Junction Box	Riser Assembly
Controller Assembly Component	Traffic Signal Pole
Fire Pre-Emption Tell Tale Light	Overhead Sign Assembly
Concrete Base for Controller Cabinet	Flashing Beacon Sign Assembly
Fiberoptic Dual Indication Arrow	Fiberoptic Pedestrian Signal Section
LED Pedestrian Signal Module	LED Traffic Signal Module
Type I Pedestrian Signal Section	Type I Traffic Signal Section
Pedestrian Push Button and Sign	

680-4.02 Linear Foot Measurements. The following items will be measured for payment as the number of feet actually installed in accordance with the contract documents or as directed by the Engineer:

Inductance Loop Wire	Shielded Communication Cable
Shielded Lead-In Cable	Signal Cable with Integral Messenger
Inductance Loop Installation	Shielded Communication Cable w/ Integral Messenger
Messenger Assembly	Conduit
Signal Cable	

Inductance loop wire shall be the actual number of feet of wire used and left in place. Measurement of inductance loop installation shall be the number of feet of pavement sawcut.

680-4.03 Pole Excavation and Concrete Foundation. The payment quantity of pole excavation and concrete foundation shall be the number of cubic yards of concrete shown in the table on the standard sheet for Traffic Signal Pole Foundations for the specified footing size. No adjustment will be made when the Contractor elects to install a square footing. When a square footing is specified on the plans, the payment quantity shown in the table will be multiplied by a factor of 1.3.

680-4.04 Conduit Jacking or Boring. The quantity of conduit jacking or boring shall be the number of linear feet as computed from the payment limits specified in the contract documents.

680-5 BASIS OF PAYMENT

680-5.01 General. The unit price bid for all items of work encompassed by this Section shall include the furnishing of all labor, materials, tools, equipment, safety requirements as determined by U.S. Department of Labor's Occupational Safety and Health Standards, and incidentals as necessary to complete the work of the item installed in place and performing all tests to the satisfaction of the Engineer. No direct payment will be made for the installation of the power service connection and meter base but the cost shall be covered in the various traffic signal items. Items with additional provisions are as follows:

680-5.02 Pedestrian Signal Section. The unit price bid for each section shall include one “WALK” and one “DONT WALK” indication, and all necessary internal wiring, visor(s) and lamp(s).

680-5.03 Pedestrian Signal Bracket Assembly. The unit price bid for each bracket assembly shall include the bracket, fittings, wiring of the head assembly and installation.

680-5.04 Pole Excavation and Concrete Foundation. The unit price bid per cubic foot shall include the excavation, any protective system(s) required to ensure the safety of the workers and the public, backfill (select granular backfill or concrete), form work, concrete, bar reinforcement for concrete, excavation and backfilling of test holes, conduit bends and fittings, restoration of surfaces in kind, and sawcutting.

Progress payments will be made at the unit price bid for 80 percent of the quantity for each foundation properly installed except for the mortar cap and restoration. The remaining 20 percent will be paid for upon satisfactory completion of each footing.

680-5.05 Pullbox. The unit price bid for each pullbox shall include all concrete, reinforcing steel, crushed stone or gravel, extensions, sawcutting, excavation, backfill, frames, covers, restoration of surfaces and incidentals as required.

680-5.06 Conduit. The unit price bid shall include all handling, cutting, bending, fitting, capping, painting, testing, furnishing and placing pull lines, condulets and concrete inserts, expansion and incidental fittings as required. Conduit bends and fittings in concrete footings will be paid for under the respective footing item. Conduit excavation and backfill and jacking or boring will be paid for under their respective items.

680-5.07 Inductance Loop Installation. The unit price bid per linear foot shall include the cost of all pavement sawing and drilling, loop embedding sealer, and pavement cut-outs. Inductance Loop Wire, pullboxes, Shielded lead-in Cable, Vehicle Detector Inductance Loop, Conduit, and Conduit Excavation and Backfill shall be paid under their respective items.

680-5.08 Controller Assembly. The unit price bid for each component of the Controller Assembly shall include all labor, material and equipment necessary to complete the work. The cost of the necessary grounding system shall be included in the unit price bid for the controller assembly components.

Progress payments will be made in the following manner:

Sixty-five percent of the bid price of each component will be paid after it is installed and ready for testing.

Twenty-five percent of the bid price will be paid after satisfactory completion of all tests required by these specifications, including the function test for ten days of continuous satisfactory operation of the traffic signal system at each signalized location.

The remaining ten percent will be paid when all the traffic signals in the contract are functioning to the satisfaction of the Engineer.

680-5.09 Fire Pre-Emption Tell Tale Light. The unit price bid shall include the light fixture, bulb, nipple, guard, and all attachments and fittings as required.

680-5.10 Concrete Base for Controller Cabinet. The unit price bid for each base shall include the cost of all sawcutting, excavation, backfill, form work, restoration of surfaces, concrete, test holes, conduit bends and fittings, and concrete work pad.

680-5.11 Pedestrian Push Button and Sign. The unit price bid shall include the push button, sign, mounting hardware, pole drilling, and necessary fittings as required. Where the push button and sign is installed on its own post the unit price shall also include the cost of the post, sawcutting, excavation, backfill, concrete, restoration of surfaces, and conduit bend and fittings.

680-5.12 Jacking or Boring. The unit price bid per foot shall include excavation, backfilling for jacking or boring pits; test holes; and restoration of surfaces in kind.

680-5.13 Signal Cable and Shielded Communication Cable. The unit price bid per foot shall include the connectors, lashing or messenger rings or plastic cable bands, splices when permitted, testing, cable markers, and incidental fittings for the cable connected in place.

680-5.14 Signal Cable with Integral Messenger and Shielded Communication Cable with Integral Messenger. The unit price bid per foot shall include connectors, splices when permitted, testing, cable markers, hardware and fittings to attach the cable to the pole and other incidentals for the cable connected in place.

680-5.15 Traffic Signal Sections. The unit price bid shall include housing, visors, lamps, lenses and incidentals to make an individual signal head section.

680-5.16 Traffic Signal Bracket Assembly. The unit price bid shall include all brackets, elbows, arms and fittings to attach the signal to span wire, pole and mast arm. It shall include all labor and materials to assemble the individual signal sections and brackets to form a complete signal head including internal wiring and installation on the span wire, pole and mast arm.

680-5.17 Traffic Signal Disconnect Hanger. The unit price bid shall include the disconnect hanger, wiring to the signal head and signal cable and installation on the signal head.

680-5.18 Traffic Signal Poles. The unit price bid for each pole shall include all the items specified in §680-3.11 and the necessary grounding system, anchor bolts, mast arms, lighting arms, pole assembly and erections, and field galvanizing as required. Breakaway transformer bases when specified shall be included in the price bid for each pole.

680-5.19 Overhead Sign Assembly. The unit price bid shall include the mounting brackets attaching the sign to signal head, span wire, pole, and mast arm, sign panel and incidental hardware and fittings.

680-5.20 Flashing Beacon Sign Assembly. The unit price bid shall include the flashing beacon signal head, two circuit flasher and cabinet, sign panel and mounting brackets and all other necessary hardware. The cost of the pole and pole excavation and concrete foundation will be paid for under their respective items. The cost of any necessary breakaway base shall be included in the cost of the pole.

680-5.21 LED Traffic Signal Module. The unit price bid shall include the LED module, the removal of existing components if necessary, and installation of the LED module on the signal head.

680-5.22 LED Pedestrian Signal Module. The unit price bid shall include the LED module, the removal of existing components if necessary, and installation of the LED module on the pedestrian signal head.

680-5.23 Type I Traffic Signal Section. The unit price bid shall include housing, door, visor and incidentals to make an individual Type I Signal Head Section.

680-5.24 Type I Pedestrian Signal Section. The unit price bid shall include housing, door, visor and incidentals to make an individual Type I Pedestrian Signal Section.

680-5.25 LED Traffic Signal Module Installation. The unit price bid shall include the cost of labor, materials, and equipment required to remove existing components if necessary, and install the State supplied Traffic Signal Modules as shown on the plans or as ordered by the Engineer.

§680

680-5.26 LED Pedestrian Signal Module Installation. The unit price bid shall include the cost of labor, materials, and equipment required to remove existing components if necessary, and install the State supplied Pedestrian Signal Modules as shown on the plans or as ordered by the Engineer.

Payment will be made under:

NOTE: SEE PAY ITEM CATALOG FOR ITEM NUMBERS CONTAINING VARIABLES.

* Mast arm mounting heights, and span wire pole length and load, are as defined on the 'Standard Traffic Signal Poles' standard sheets and in §724-03, Traffic Signal Poles. The nominal luminaire mounting height and span shall be as indicated on the plans.

** The mast arm length and mounting height indicated by the item number is for only one of the mast arms. The other mast arm length and mounting height shall be as indicated on the plans.

SECTION 681 AND 682 - (VACANT)

SECTION 683 - INTELLIGENT TRANSPORTATION SYSTEMS

683-1 DESCRIPTION. The work in this section shall include work required for intelligent transportation systems.

683-2 MATERIALS. Materials shall be as specified in the special specifications.

683-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

683-4 METHOD OF MEASUREMENT. As specified in the special specifications.

683-5 BASIS OF PAYMENT. As specified in the special specifications.

Comment [c123]:
EI09-014

SECTION 685 - EPOXY REFLECTORIZED PAVEMENT MARKINGS

685-1 DESCRIPTION. Under this work, the Contractor shall furnish and apply epoxy reflectORIZED pavement markings at the location and in accordance with patterns indicated on the plans or as ordered by the Engineer, and in conformance with the MUTCD and these specifications.

The epoxy marking material should be hot-applied by spray methods onto bituminous and portland cement concrete pavement surfaces at the thickness and width shown on the Contract Documents. Following an application of glass beads, the cured epoxy marking shall be an adherent reflectORIZED stripe.

685-2 MATERIALS. Materials shall conform to the requirements of §727-03 White and Yellow Epoxy Reflectorized Pavement Markings.

685-3 CONSTRUCTION DETAILS

685-3.01 General. All pavement markings and patterns shall be placed as shown on the Contract Documents and in accordance with the MUTCD.

Before any pavement marking work is begun, a schedule of operations shall be submitted for the approval of the Regional Director and his/her authorized representative.

At least five (5) days prior to starting striping, the Contractor shall provide the Engineer with the epoxy manufacturer's written instructions for use. These instructions shall include, but not be limited to, material mixing ratios and application temperatures.

When pavement markings are applied under traffic, the Contractor shall provide all necessary flags, markers, signs, etc. in accordance with the MUTCD to maintain and protect traffic, and to protect marking operations and the markings until thoroughly set.

The application of pavement markings shall be done in the general direction of traffic. Striping against the direction of traffic flow shall not be allowed.

The Contractor shall be responsible for removing, to the satisfaction of the Engineer, all tracking marks, spilled epoxy, and epoxy markings applied in unauthorized areas.

When necessary the Contractor shall establish marking line points at 30 feet intervals throughout the length of the pavement or as directed by the Engineer.

685-3.02 Atmospheric Conditions. Epoxy pavement markings shall only be applied during conditions of dry weather and on substantially dry pavement surfaces. At the time of installation the pavement surface temperature shall be minimum of 50°F and the ambient temperature shall be a minimum of 50°F and rising. The Engineer shall be the sole determiner as to when atmospheric conditions and pavement surface conditions are such to produce satisfactory results.

685-3.03 Surface Preparation. The Contractor shall clean the pavement and existing durable markings to the satisfaction of the Engineer.

Surface cleaning and preparation work shall be performed only in the area of the epoxy markings application.

At the time of application, all pavement surfaces and existing durable markings shall be free of oil, dirt, dust, grease and similar foreign materials. The cost of cleaning these contaminants shall be included in the bid price of this item.

In addition, concrete curing compounds on new portland cement concrete surfaces and existing painted pavement markings on both concrete and bituminous pavement surfaces shall be cleaned and paid for in accordance with Section 635, Cleaning and Preparation of Pavement Surfaces for Pavement Markings.

685-3.04 Epoxy Applying Equipment. Mobile applying equipment for the placement of epoxy reflectorized pavement markings shall be approved by the Director (Materials Bureau) prior to the start of work.

In general, a mobile applicator shall be a truck mounted, self-contained pavement marking machine, specifically designed to apply epoxy resin materials and reflective glass spheres in continuous and skip-line patterns. The applying equipment shall be maneuverable to the extent that straight lines can be followed and normal curves can be made in true arc. In addition, the truck mounted unit shall be provided with accessories to allow for the marking of legends, symbols, crosswalks, and other special patterns.

At any time throughout the duration of the project, the Contractor shall provide free access to his epoxy applying equipment for inspection by the Engineer or his authorized representative.

The Engineer may approve the use of a portable applicator in lieu of mobile truck mounted accessories for use in applying special markings only, provided such equipment can demonstrate satisfactory application of reflectorized epoxy markings in accordance with these specifications. The

§685

applying equipment shall be capable of installing a minimum of 100,000 feet of epoxy reflectorized pavement markings in an eight hour day and shall include the following features:

1. Individual tanks for the storage of Part A and Part B of the epoxy resin and for the storage of reflective glass spheres.
2. Heating equipment of sufficient capacity to maintain the individual epoxy resin components at the manufacturer's recommended temperature for spray application.
3. Glass bead dispensing equipment and the capacity of applying the spheres a minimum rate of 20 lb/gal of epoxy resin composition.
4. Metering devices or pressure gauges on the proportioning pumps, positioned to be readily visible to the Engineer.
5. All necessary spray equipment, mixers, compressors, and other appurtenances for the placement of epoxy reflectorized pavement markings in a simultaneous sequence of operations as described in §685-3.05 Application of Epoxy Reflectorized Pavement Markings.

685-3.05 Application of Epoxy Reflectorized Pavement Markings. Epoxy reflectorized pavement markings shall be placed at the width, thickness, and pattern designated by the Contract Documents.

Marking operations shall not begin until applicable surface preparation work is completed and approved by the Engineer, and the atmospheric conditions and pavement surface temperature are acceptable to the Engineer.

Pavement markings shall be applied by the following simultaneous operation:

1. The pavement surface is air-blasted to remove dirt and residues.
2. The epoxy resin, mixed and heated in accordance with the manufacturer's recommendations, is uniformly hot-sprayed onto the pavement surface at the minimum specified thickness.
3. Reflective glass spheres are injected into, or dropped onto, the liquid epoxy marking at a minimum rate of 20 lb/gal of epoxy resin.

685-3.06 Defective Epoxy Pavement Markings. Epoxy reflectorized pavement markings, which after application and curing are determined by the Engineer to be defective and not in conformance with this specification, shall be repaired. Repair of defective markings shall be the responsibility of the Contractor and shall be performed to the satisfaction of the Engineer as follows:

1. Insufficient film thickness and line width; insufficient glass bead coverage or inadequate glass bead retention.

Repair Method. Prepare the surface of the defective epoxy marking by grinding or blast cleaning. No other cleaning methods will be allowed. Surface preparation shall be performed to the extent that a substantial amount of the reflective glass spheres are removed and a roughened epoxy marking surface remains. Immediately after surface preparation remove loose particles and foreign debris by brooming or blasting with compressed air. Repair shall be made by restriping over the cleaned surface in accordance with the requirements of this specification and at the full thickness indicated on the Contract Documents.

2. Uncured or discolored epoxy*; insufficient bond (to pavement surface or existing durable marking).

Repair Method. The defective epoxy marking shall be completely removed and cleaned to the underlying pavement surface in accordance with the requirements of Section 635 - Cleaning and Preparation of Pavement Surfaces, at the Contractor's expense. The extent of removal shall be the defective area plus any adjacent epoxy pavement marking material extending three feet in any direction. After surface preparation work is complete, repair shall be made by reapplying epoxy over the cleaned pavement surface in accordance with the requirements of this specification.

*Uncured epoxy shall be defined as applied material that fails to cure (dry) in accordance with requirements of §727-03 MATERIAL REQUIREMENTS, A., 2.0 paragraph d. Drying Time (Field); or applied material that fails to cure (dry) within a reasonable time period under actual field conditions, as defined by the Engineer.

†Discoloration shall be defined as localized areas or patches of brown, grayish or black colored epoxy marking material. These areas often occur in a cyclic pattern and often are not visible until several days or weeks after markings are applied.

Other defects not noted above, but determined by the Engineer to need repair, shall be repaired or replaced as directed by and to the satisfaction of the Engineer.

All work in conjunction with the repair or replacement of defective epoxy reflectorized pavement markings shall be performed by the Contractor at no additional cost to the State.

685-4 METHOD OF MEASUREMENT. Pavement striping will be measured in feet along the centerline of the pavement stripe and will be based on a 4 inch wide stripe. Measurement for striping with a plan width greater or less than the basic 4 inches as shown on the plans or directed by the Engineer, will be made by the following method:

$$\frac{\text{Plan Width of Striping (inches)} \times \text{Feet}}{4 \text{ inches}}$$

Letters and symbols will be measured by each unit applied. A unit will consist of one letter or one symbol. Example: "SCHOOL" would be paid as six units. Double and triple headed arrows will be measured as a single unit, but the "X" in railroad grade crossing markings (MUTCD Figure 8B-6) will be measured by feet of 4 inch stripe.

685-5 BASIS OF PAYMENT. The accepted quantities of markings will be paid for at the contract unit price, which shall include the cost of furnishing labor, materials and equipment to satisfactorily complete the work. The cost for maintaining and protecting traffic during the marking operations shall be included in the price bid. The cost of removal of concrete curing compounds and existing pavement markings will be paid under separate items and are not included in this item.

No payment will be made for the repair or replacement of defective epoxy reflectorized pavement markings.

No payment will be made for the number of feet of skips in the dashed line.

Payment will be made under:

Item No.	Item	Pay Unit
685.01	White Epoxy Reflectorized Pavement Stripes – 15 mils	Feet
685.02	Yellow Epoxy Reflectorized Pavement Stripes – 15 mils	Feet
685.03	White Epoxy Reflectorized Pavement Letters – 15 mils	Each
685.04	White Epoxy Reflectorized Pavement Symbols – 15 mils	Each
685.11	White Epoxy Reflectorized Pavement Stripes – 20 mils	Feet
685.12	Yellow Epoxy Reflectorized Pavement Stripes – 20 mils	Feet
685.13	White Epoxy Reflectorized Pavement Letters – 20 mils	Each
685.14	White Epoxy Reflectorized Pavement Symbols – 20 mils	Each

SECTION 686 (VACANT)

SECTION 687 - THERMOPLASTIC REFLECTORIZED PAVEMENT MARKINGS

687-1 DESCRIPTION. Under this work, the Contractor shall furnish and apply thermoplastic reflectorized pavement markings at the location and in accordance with patterns indicated on the plans or as ordered by the Engineer, and in conformance with the MUTCD and these specifications.

The thermoplastic pavement marking compound shall be extruded in a molten state onto the pavement surface. Following surface application of glass beads and upon cooling to normal pavement temperatures, the resultant marking shall be an adherent reflectorized stripe of the specified thickness and width that is capable of resisting deformation by traffic.

687-2 MATERIALS. Materials shall conform to the requirements of §727-01 White and Yellow Thermoplastic Reflectorized Pavement Markings.

687-3 CONSTRUCTION DETAILS

687-3.01 Equipment General. Thermoplastic applying equipment shall be approved by the Engineer prior to the start of work.

Unless otherwise approved by the D.C.E.C., all projects specifying quantities greater than 65,000 feet of longitudinal pavement marking lines will be striped using only mobile applying equipment for the longitudinal lines. Longitudinal pavement marking lines are Broken Lines (skipline), Edge Lines, Barrier Lines, and Solid Lines as defined by the MUTCD. Portable applying equipment will be acceptable for placing all other markings on these projects.

Thermoplastic material shall be applied to the pavement surface by the extrusion method, wherein one side of the shaping die is the pavement and the other three sides are contained by, or are part of, suitable equipment for maintaining the temperature and controlling the flow of material (Note 1.)

Note 1. Alternate types of extrusion devices may be considered acceptable for use upon prior approval by the Materials Bureau. Requests for approval of alternate extrusion applying equipment shall be made to the Materials Bureau by the Contractor/Manufacturer at least 90 days prior to its date of intended use. Detailed requirements and procedures for the acceptance of alternate equipment are available from the Materials Bureau.

For heating the thermoplastic composition, the application equipment shall include a melting kettle(s) of such capacity as to allow for continuous marking operations. The melting kettle(s) may be mounted on a separate "supply" vehicle or included as part of the mobile applying equipment. The kettle(s) shall be capable of heating the thermoplastic composition temperatures greater than 400°F. The heating mechanism shall be by means of a thermostatically controlled heat transfer medium. Heating of the composition by direct flame will not be allowed. Material temperature gauges shall be visible at both ends of the kettle(s).

Application equipment shall be constructed to provide continuous mixing and agitation of the material. Conveying parts of the equipment between the main material reservoir and the extrusion shoe(s) shall be so constructed as to prevent accumulation and clogging. All parts of the equipment which come into contact with the material shall be so constructed so as to be easily accessible and exposable for cleaning and maintenance. The equipment shall be constructed so that all mixing and conveying parts up to and including the extrusion shoe(s), maintain the material at the required plastic temperature.

The applying equipment shall be so constructed as to insure continuous uniformity in the dimensions of the stripe. The applicator shall provide a means for cleanly cutting off stripe ends squarely and shall provide a method of applying "skip" lines. The equipment shall be capable of applying varying widths of traffic markings.

The applicator shall be equipped with a drop-on type bead dispenser capable of uniformly dispensing reflective glass spheres at controlled rates of flow.

The bead dispenser shall be automatically operated in such a manner that it will only dispense beads while the composition is being applied.

Applying equipment shall be mobile and maneuverable to the extent that straight lines can be followed and normal curves can be made in a true arc.

Applicators shall be equipped and constructed in such a manner as to satisfy the requirements of the National Board of Fire Underwriters and the appropriate agencies of the State of New York.

The equipment used for the placement of thermoplastic pavement markings shall be two general types: mobile applicator and portable applicator.

687-3.02 Mobile Applying Equipment. The mobile applicator shall be defined as a truck mounted, self-contained pavement marking machine that is capable of hot applying thermoplastic by the extrusion method. The unit shall be equipped to apply the thermoplastic material at temperatures exceeding 400°F, and at the widths and thicknesses specified herein. The mobile unit shall be capable of operating continuously and of installing a minimum of 20,000 feet of longitudinal markings in an 8-hour day.

The mobile unit shall be equipped with a melting kettle(s) or materials storage reservoir(s) of such capacity as to allow for continuous marking operations. The kettle(s) or reservoirs shall be capable of heating or holding the thermoplastic composition at temperatures greater than 400°F.

The mobile unit shall be equipped with an extrusion shoe(s), and shall be capable of marking edgeline and centerline stripes. The extrusion shoe(s) shall be closed, heat jacketed or suitably insulated unit; shall hold the molten thermoplastic at a temperature greater than 400°F; and shall be capable of extruding a line between 3 to 8 inches in width; and at a thickness of not less than 1/8 inch nor more than 3/16 inch, and of generally uniform cross section. Material temperature gauges shall be affixed or incorporated in the extrusion shoe in such a manner as to be visible, and capable of monitoring the composition temperature throughout the marking operation.

The mobile unit shall be equipped with an electronic and programmable line pattern control system, or mechanical control system, so as to be capable of applying skip or solid lines in any sequence, and through any extrusion shoe in any cycle length.

687-3.03 Portable Applying Equipment. The portable applicator shall be defined as hand operated equipment, specifically designed for placing thermoplastic installations such as crosswalks; stop bars; legends; arrows; and short lengths of lane, edge, and centerlines. The portable applicator shall be capable of applying thermoplastic pavement markings by the extrusion method. It is intended that the portable applicator will be loaded with hot thermoplastic composition from the melting kettle(s). The portable applicator shall be equipped with all the necessary components, including a materials storage reservoir, bead dispenser, extrusion shoe, and heating accessories, so as to be capable of holding the molten thermoplastic at temperatures greater than 400°F, of extruding a line of from 3 to 8 inches in width, and in thickness of not less than 1/8 inch nor more than 3/16 inch and of generally uniform cross-section. Material temperature gauges shall be affixed or incorporated in the extrusion shoe in such a manner as to be visible, and capable of monitoring the composition temperature throughout the marking operation.

687-3.04 Application General. All pavement markings shall be placed as shown on the plans and in accordance with the MUTCD.

Before any pavement marking work is begun, a schedule of operations shall be submitted for the approval of the Regional Director or his authorized representative.

When pavement markings are applied under traffic the Contractor shall provide all necessary flags, markers, signs, etc. to maintain and protect traffic; and to protect marking operations and the markings until thoroughly set.

The application of pavement markings shall be done in the general direction of traffic. Striping against the direction of traffic flow shall not be allowed.

The Contractor shall be responsible for removing, to the satisfaction of the Engineer, tracking marks, spilled thermoplastic or thermoplastic applied in unauthorized areas.

When necessary, the Contractor shall establish marking line points at 30 feet intervals throughout the length of pavement or as directed by the Engineer.

687-3.05 Atmospheric Conditions. Thermoplastic pavement markings shall be placed upon dry pavement surfaces. At the time of installation the pavement surface temperature shall be a minimum of 55°F and the ambient temperatures shall be a minimum of 50°F and rising. The Engineer will determine when atmospheric conditions are such to produce satisfactory results (Note 2).

Note 2. To comply with the 55°F pavement surface temperature requirement, it will benefit the Contractor to schedule striping work for seasons of warm weather when possible. In cooler conditions, striping operations may be coordinated with bituminous paving work to take advantage of residual heat, providing that the ambient temperature requirements of §687-3.05 are still met.

687-3.06 Materials Application Requirements

A. Thermoplastic Primer. All pavement surfaces shall be primed except that on new bituminous pavements, when the thermoplastic pavement markings are applied within the same calendar year as the completion of paving operations, primer shall not be required.

The primer shall be either a one-component or a two-component, cold or hot applied material of the type recommended by the manufacturer of the thermoplastic pavement marking material. At least

five working days prior to the start of thermoplastic application, the Contractor shall provide the Engineer with the manufacturer's written instructions for primer application. The application of the primer shall be performed in accordance with the manufacturer's written recommendations which shall include the method of application, the application rate, and the drying time.

B. Thermoplastic Composition.

1. Application Temperature - thermoplastic composition shall be applied at temperatures no lower than 400°F at the point of deposition. For purposes of these specifications, the point of deposition shall be defined as within the extrusion shoe.

2. Extruded Markings - all extruded markings shall be applied at the specified width, and at a thickness of not less than 1/8 inch nor more than 3/16 inch.

C. Reflective Glass Spheres (for Drop-On). Immediately following application, reflective glass spheres shall be dropped onto the molten thermoplastic marking at the rate of 1 lb per 20 square feet of composition.

687-3.07 Surface Cleaning and Preparation of Pavement. The Contractor shall be responsible for cleaning the pavement surface to the satisfaction of the Engineer.

Surface cleaning and preparation work shall be performed only in the area of the thermoplastic markings application.

At the time of application all pavement surfaces shall be free of oil dirt, dust, grease and similar foreign materials. The cost of cleaning these contaminants shall be included in the bid price of this item.

In addition, concrete curing compounds on new Portland Cement concrete surfaces; and existing pavement markings on both concrete and bituminous pavement surfaces shall be cleaned and paid for under separate items.

687-3.08 Application of Thermoplastic Pavement Markings. All special markings, cross walks, stop bars, legends, arrows, and similar patterns shall be placed with a portable applicator. Unless otherwise specified in the contract documents all center line, skip line, edge line and other longitudinal type markings may be applied with either a portable or a mobile applicator.

When the surface preparation work has been completed, if applicable, the bituminous and/or concrete pavement surface shall be primed according to the manufacturer's written instructions. Primer shall not be required on new bituminous pavement surfaces that are completed within the same calendar year as the thermoplastic marking application. The primer shall be spray applied onto the pavement surface and allowed to dry according to the manufacturer's written instructions. Pavement surfaces that are primed and not striped with thermoplastic within the required drying time or within the same work day shall be re-primed.

After the primer has dried, the thermoplastic shall be applied at composition temperatures no lower than 400°F at the point of deposition. Immediately after installation of the thermoplastic, drop-on reflective glass spheres shall be mechanically applied such that the spheres are held by and embedded in the surface of the molten composition.

687-4 METHOD OF MEASUREMENT. Pavement striping will be measured by linear foot along the centerline of the pavement stripe, and will be based on a 4 inch wide stripe. Measurement for striping with a plan width greater or less than the basic 4 inch as shown on the plans or as directed by the Engineer, will be made by the following method:

$$\frac{\text{Plan Width of Striping (inches)} \times \text{Feet}}{4 \text{ inches}}$$

No payment will be made for the number of feet of skips in the dashed line.

Letters and symbols will be measured by each unit applied. A unit will consist of one letter or symbol. Example: "SCHOOL" would be measured as six units. Double and triple headed arrows will be

measured as a single unit, but the “X” in railroad grade crossing markings (MUTCD Figure 8B-6) will be measured by feet of 4 inch stripe.

687-5 BASIS OF PAYMENT. The accepted quantities of markings will be paid for at the contract unit price, which shall include the cost of furnishing all labor, materials and equipment to satisfactorily complete the work. The cost for maintaining and protecting traffic during the marking operations shall be included in the price bid. The cost of removal of concrete curing compounds and existing pavement markings will be paid under separate items and are not included in this item.

Payment will be made under:

Item No.	Item	Pay Unit
687.0101	White Thermoplastic Reflectorized Pavement Stripes	Feet
687.0201	Yellow Thermoplastic Reflectorized Pavement Stripes	Feet
687.0301	White Thermoplastic Reflectorized Pavement Letters	Each
687.0401	White Thermoplastic Reflectorized Pavement Symbols	Each

SECTION 688 - PREFORMED REFLECTORIZED PAVEMENT MARKINGS

688-1 DESCRIPTION. Under this work, the Contractor shall furnish and apply preformed reflectorized pavement markings at the location and in accordance with patterns indicated on the plans or as ordered by the Engineer, and in conformance with the MUTCD and these specifications.

The preformed reflectorized pavement marking shall be applied on new and existing bituminous and portland cement concrete surfaces by hand and mechanical methods. The resultant marking shall be an adherent reflectorized stripe that is capable of molding itself to the contours of the pavement surface and of resisting deformation by traffic.

688-2 MATERIALS. Materials shall conform to the requirements of §727-04 White and Yellow Reflectorized Pavement Markings.

688-3 CONSTRUCTION DETAILS

688-3.01 General. All pavement markings and patterns shall be placed as shown on the plans and in accordance with the MUTCD.

Before any pavement marking work is begun, a schedule of operations shall be submitted for the approval of the Regional Director or his authorized representative.

At least five (5) days prior to the start of work, the Contractor shall provide the Engineer with the manufacturer's written instructions for the application of preformed marking and primer materials.

When pavement markings are applied under traffic, the Contractor shall supply all necessary flags, markers, signs, and other devices, to maintain traffic and to protect the markings until set.

The application of pavement markings shall be done in the general direction of traffic. Striping against the direction of traffic flow will not be allowed without prior approval of the Engineer.

The Contractor shall be responsible for removing, to the satisfaction of the Engineer, preformed markings applied in unauthorized areas.

When required by the Engineer, the Contractor shall establish marking line points at 30 feet intervals throughout the length of the pavement or as directed by the Engineer.

688-3.02 Application Methods. Preformed pavement markings shall be applied by the following methods. The installation of markings on the project may be performed simultaneously by more than one method.

A. During Bituminous Paving Operations. Preformed markings shall be applied on newly paved bituminous surfaces after finish rolling is complete.

B. On Completed Pavements. Preformed markings shall be applied on new and existing bituminous and portland cement concrete pavement surfaces as prescribed in §688–3.03 Weather and Seasonal Limitations.

688-3.03 Weather and Seasonal Limitations. The Engineer shall determine as to when temperature and pavement surface conditions are such as to produce satisfactory results.

Preformed pavement markings shall be placed upon dry pavement surfaces; pavements exposed to rain or wet conditions shall be allowed to thoroughly dry before marking application.

Preformed markings applied in conjunction with §688–3.02A, *During Bituminous Paving Operations*, shall only be placed within the seasonal limitations of Standard Specification §402-3.01. The bituminous pavement surface temperature shall, at all times, be the controlling temperature at which preformed markings are placed, and shall be between 100°F and 170°F.

Preformed markings applied in conjunction with §688–3.02B, *on completed pavements*, shall be applied within the seasonal limitations of Table 688-1, Temperature and Seasonal Requirements. The pavement surface and ambient air temperatures in Table 688-1 shall, in all cases, be the controlling temperatures at which preformed markings are placed. Marking application work shall be discontinued when temperatures fall below the specified requirements.

TABLE 688-1 TEMPERATURE AND SEASONAL REQUIREMENTS (§688–3.02b. ON COMPLETED PAVEMENTS)			
Geographic Location	Pavement Surface Temperature	Ambient Air Temperature	Allowable Installation Dates
Regions 1, 2, 3, 4, 5, 6, 7 & 9 (All Counties) Region 8 (Ulster County only)	70°F, Min.	60°F, Min.	May 15 to September 1
Regions 8 & 10 (except Ulster County)	70°F, Min.	60°F, Min.	May 15 to September 15
Region 11	70°F, Min.	60°F, Min.	May 1 to September 30

NOTES:

1. Surface temperatures shall be measured on the pavement surface where the preformed markings are to be placed. The controlling temperature shall be the average of three temperature readings taken at locations 100± feet apart.
2. Ambient air temperatures shall be measured in the shade.

688-3.04 Mechanical Applying Equipment. Mechanical applying equipment for the placement of preformed pavement marking stripes shall be of the type recommended by the manufacturer of the preformed material. All applying equipment shall be approved by the Engineer prior to the start of work.

688-3.05 Rollers. Preformed markings applied in conjunction with §688-3.02a, during bituminous paving operations, shall be rolled into place with compaction equipment meeting the requirements of Standard Specification §402-3.04. Vibratory roller models shall operate in a 'static' mode.

Preformed markings applied in conjunction with §688-3.02B., *On Completed Pavements*, shall be rolled into place using steel shell or pneumatic rubber-tired roller equipment approved by the Engineer. Steel wheel rollers shall weigh a minimum of 200 lbs on each axle. Pneumatic rubber-tired rollers shall exert a minimum tire compression on the pavement of 28 psi. Hand rollers or rubber tired vehicles (e.g. pick-up truck) meeting the above requirements may be suitable for use.

688-3.06 Primer Requirements. When required, primer or adhesive shall be used for marking applications in accordance with the written recommendations of the manufacturer of the preformed marking material.

Primer materials shall be placed at the application rate and by the application methods recommended by the manufacturer.

When primer is applied, the area of application shall be at least the width or dimension, of the new preformed marking, plus one inch on each side.

688-3.07 Surface Cleaning and Preparation of Pavement Surfaces. The Contractor shall be responsible for cleaning the pavement surface to the satisfaction of the Engineer.

Surface cleaning and preparation work shall be performed only in the area of the preformed markings application.

At the time of application, all pavement surfaces shall be free of oil, dirt, dust, grease and similar foreign materials. The cost of cleaning these contaminants shall be included in the bid price of this item.

In addition, concrete curing compounds on new portland cement concrete surfaces and existing pavement markings on both concrete and bituminous pavement surfaces shall be removed and paid for under separate items.

688-3.08 Application of Preformed ReflectORIZED Pavement Markings. Unless otherwise approved by the Engineer, all longitudinal lines shall be applied using mechanical applying equipment. Transverse and special marking patterns may be applied by hand or mechanical methods.

Preformed marking operations shall not begin until after the pavement surface has been cleaned and prepared.

Preformed stripes shall not be applied over longitudinal paving joints or over the point of transition between the pavement surface and adjoining shoulder. The placement of stripes in the area of transition shall be either on the pavement or on the shoulder, as directed by the Engineer.

No roller shall operate in excess of 3.0 mph. One roller pass shall be defined as one movement of the roller over any point of the preformed marking, in the direction of the marking application.

A. Application During Bituminous Paving Operations. The application of preformed markings shall not begin until finish rolling of the new bituminous pavement is complete.

At the time of marking application, the surface temperature of the new bituminous pavement shall be between 100°F and 170°F. The Contractor shall coordinate paving and preformed marking operations to conform with surface temperature requirements.

Immediately after finish rolling is complete, the preformed marking shall be applied on the new bituminous surface. Traces of water or other residue from finish rolling operations shall first be removed. Immediately after its placement, the preformed marking shall be adhered to the warm pavement surface by rolling. Rollers shall make a minimum one pass, and operate in the same direction that the marking was applied. Diagonal, reverse or crosswise rolling will not be allowed. The minimum one pass may be increased by the Engineer if, in his opinion, the desired adherence is not obtained.

B. Application on Completed Pavements. The application of preformed markings shall only be performed within the limitations of §688-3.03 Weather and Seasonal Limitations.

If required by the manufacturer, primer and adhesive activators shall be applied and allowed to dry in accordance with the instructions of the manufacturer of the preformed material.

The preformed marking shall be placed on the pavement surface and adhered by rolling. Rollers shall make a minimum of one pass, and operate in the same direction that the marking was applied. Diagonal, reverse or crosswise rolling will not be allowed. The minimum one pass may be increased by the Engineer if, in his opinion, the desired adherence is not obtained.

688-4 METHOD OF MEASUREMENT. Pavement striping will be measured by feet along the centerline of the pavement stripe and will be based on a 4 inch wide stripe.

The preformed pavement markings will be inspected during and following installation to determine conformance with this specification. In addition, they will be inspected following a performance period that will extend for 180 calendar days following both their installation and opening of the roadway to traffic.

Within 15 consecutive calendar days after the end of the 180 day performance period, a final performance inspection will be made by the Engineer. If this inspection discloses any work, in whole or in part, as not being visibly intact and serviceable to the following extent, the Contractor shall completely repair or replace such work:

§688

A. Broken Line. 90 percent measured longitudinally of the total length of all broken lines in any 500 feet long pavement section.

B. Dotted Line. 50 percent measured longitudinally of the total length of all dotted lines in any 100 feet long pavement section.

C. Solid Line and Edge Line. 90 percent measured longitudinally of the total length of solid line or edge line in any 500 feet long pavement section.

D. Channelizing Line, Stop Line, Crosswalk Lines, Clearance Line and Crossbars, Hatch Lines, Letters and Symbols. 90 percent by area of any individual line, letter or symbol.

When required all repair or replacement work shall be performed in accordance with this specification and completed within 60 calendar days of the earliest allowable installation date as specified in Table 1, for that location. The Engineer shall determine the limits or quantity of preformed to be repaired or replaced.

Upon completion of the final performance inspection, or after satisfactory completion of any necessary corrections, the Engineer will, within 10 calendar days, notify the Contractor in writing, of the date of such final performance inspection and release the Contractor from further performance responsibility.

Pavement striping on-going projects will be measured as the total of the striping applied, if after the final 180 day performance period, damage to the striping is not in excess of that specified (e.g. If 95% of the edgeline striping is intact in a 500 feet pavement section, the edgeline will be measured as the full 500 feet of applied marking. No deduction will be made for the damaged 5% (25 feet) of striping).

Measurement for striping with a plan width greater or less than the basic 4 inches as shown on the plans or as directed by the Engineer, will be made by the following method:

$$\frac{\text{Plan Width of Striping (inches)} \times \text{Feet}}{4 \text{ inches}}$$

No payment will be made for the number of feet of gaps between broken or dotted line segments.

Letters and symbols will be measured by each unit applied. A unit will consist of one letter or one symbol. Example: "SCHOOL" would be measured as six units.

Double and triple headed arrows will be measured as a single unit, but the "X" in railroad grade crossing markings (MUTCD Figure 8B-6) will be measured by feet of 4 inch stripe.

688-5 BASIS OF PAYMENT. The accepted quantities of markings will be paid for at the contract unit price, which shall include the cost of furnishing all labor, materials and equipment to satisfactorily complete the work. The cost of cleaning pavement surfaces of oil, dirt, dust, grease and similar foreign materials shall be included in the price bid. The cost of removal of concrete curing compounds and existing pavement markings will be paid under separate items and are not included in this item.

Payment will be made under:

Item No.	Item	Pay Unit
688.01	White Preformed Reflectorized Pavement Stripes	Feet
688.02	Yellow Preformed Reflectorized Pavement Stripes	Feet
688.03	White Preformed Reflectorized Pavement Letters	Each
688.04	White Preformed Reflectorized Pavement Symbols	Each

SECTIONS 689 THRU 696 (VACANT)

SECTIONS 689 THRU 695 (VACANT)

SECTION 696 CONTRACTOR CHARGES

696-1 DESCRIPTION. This section will provide for the accounting of charges assessed against the Contractor in accordance with the contract documents.

696-2 MATERIALS. None specified.

696-3 CONSTRUCTION DETAILS. The Department may assess the Contractor charges for Engineering Charges and/or Liquidated Damages against monies due the Contractor in accordance with §108-03 *Failure to Complete Work On Time*, or may make other charges in accordance with the contract. These charges will be assessed using the contract pay items in this section.

696-4 METHOD OF MEASUREMENT. These contract pay items will not be shown in the itemized proposal. Contractor charges will be measured on a Dollars-Cents basis.

696-5 BASIS OF PAYMENT. Should the Contractor be assessed charges, the amounts will be accounted for using the contract pay items in this section. Assessed charges will be deducted from a contract payment processed after the determination that charges will be made, or, if the Contractor is not due monies sufficient to recover the assessed charges, the State may utilize other methods of recovery.

Payment will be made under:

Item No.	Item	Pay Unit
696.01	Engineering Charges	Dollars Cents
696.02	Liquidated Damages	Dollars Cents
696.03	Contractor Charges – Other	Dollars Cents

Comment [cjt124]:
EI08022

SECTION 697 - FIELD CHANGE PAYMENT

697-1 DESCRIPTION

697-1.01 General. The Field Change Payment (FCP) provides a contract contingency allowance for the timely payment of authorized extra work that was completed to fulfill the intent of the contract documents.

697-1.02 Eligible Work. Only the following extra work will be eligible for FCP item payments:

1. Work within the scope of the contract.
2. Completed additional quantities of existing contract items of work processed as unit bid prices:
 - Up to 200% of original contract quantity for Minor Items of work.
 - More than 200% of a Minor Item original contract quantity that results in an increase less than \$1,000.00 from the original contract amount.
 - Up to 125% of original contract quantity for Major Items of work.
3. Completed additional quantities of existing contract items that have exceeded the threshold quantities, but have unit bid prices that are acceptable by comparison to the Weighted Average Awarded Prices or the Average of the Three Lowest Bidders.
4. Completed additional quantities of existing contract items that have exceeded the threshold quantities, which requires the use of new item numbers, and renegotiated prices that are acceptable by comparison to the Weighted Average Awarded Prices or the Average of the Three Lowest Bidders.
5. Completed quantities of new contract items of work with Agreed Prices that are acceptable by comparison to the Weighted Average Awarded Prices.
6. Fuel, Asphalt, or Steel Adjustment items calculated for eligible work completed.

697-2 MATERIALS. None specified.

697-3 CONSTRUCTION DETAILS. None specified.

697-4 METHOD OF MEASUREMENT. The unit price shown in the proposal for this item will be considered as the unit price bid and shall not be altered in any manner. Should the amount shown be

§698

altered, the figure entered will be disregarded and the original unit price will be used to determine the total amount bid for the contract.

697-5 BASIS OF PAYMENT. All work to be paid under the FCP item must receive prior authorization in conformance with §104-02 Changes, Contingencies, Extra Work and Deductions. Disputed work, force account work, work associated with §104-10 Value Engineering Change Proposals, or payments for time-related provisions are not eligible for FCP item payment.

FCP item payments will be determined from the quantities and unit prices of eligible work that have been completed. Work for which FCP item payments are processed will be paid in accordance with the specifications governing the work.

Prior to processing the final agreement, the FCP item payments will be reconciled through an Order-on-Contract, such that the amount of FCP item payments is converted to the corresponding quantities of the pertinent contract pay items. When the amount of FCP item payments is transferred to the appropriate items, the remaining amount of FCP funds will be deleted.

Payment will be made under:

Item No.	Item	Pay Unit
697.03	Field Change Payment (FCP)	Dollars-Cents

SECTION 698 - PRICE ADJUSTMENTS

698-1 DESCRIPTION. This section will provide for additional compensation to the Contractor for increases, or repayment by the Contractor for decreases, in the price of asphalt, fuel, or steel/iron products.

No adjustment will be provided for any new or additional work paid for by force account. Additional quantities of existing contract pay items at original bid prices will be considered eligible work. Additional work added by agreed price will be considered eligible work. Work performed by the Contractor at its own expense will not be eligible for price adjustment.

698-1.01 Asphalt Price Adjustment. This item will enable the Department to make price adjustments to account for changes in asphalt prices. Price adjustments will be made for eligible work listed in the proposal.

698-1.02 Fuel Price Adjustment. This item will enable the Department to make price adjustments to account for changes in fuel prices. Price adjustments will be made for eligible work listed in the proposal.

698-1.03 Steel/Iron Price Adjustment. This item will enable the Department to make price adjustments to account for changes in steel/iron product prices for materials which will be permanently incorporated into the work.

698-2 MATERIALS. None specified.

698-3 CONSTRUCTION DETAILS.

698-3.01 Asphalt Price Adjustment. The asphalt price adjustment will be based solely on the price changes for asphalt as determined by the formulas below. No consideration will be given to the situation where an individual supplier's price exceeds the monthly average posted price, nor will any adjustment be made if the monthly average posted price is within \$10.00 of the Performance Graded Binder (PGB) index price.

A. Quantity. The quantity of asphalt (tons) considered for adjustment will be determined by multiplying the quantity of eligible work completed by the conversion factors which are listed in the proposal note entitled *Asphalt Price Adjustment*.

B. Prices. The PGB index price and the monthly average posted price are defined as follows:

1. Asphalt Index Price. A fixed price per ton of PGB used solely as a basis from which to compute asphalt price adjustments. The PGB index price will be the monthly average posted price for the month of the bid letting, as listed in the Engineering Bulletin entitled *Fuel, Asphalt and Steel Price Adjustments*. The PGB index price for extra work at the original contract bid price will be the monthly average posted price for the month of the bid letting. The PGB index price for extra work at agreed price will be the monthly average posted price for the month the agreed price was submitted to the Engineer.

2. Monthly Average Posted Price. The average FOB terminal price for unmodified PG 64-22 binder, without anti stripping agent, will be determined by the Department, based on prices from approved primary sources of PGB. Prices will be posted in a monthly Engineering Bulletin entitled *Fuel, Asphalt and Steel Price Adjustments*.

C. Adjustment. Asphalt price adjustment will be based on the following formulas:

1. When price increases:

Price Adjustment = (Quantity of Asphalt) x (Average Posted Price - PGB Index Price - \$10.00)

2. When price decreases:

Price Adjustment = (Quantity of Asphalt) x (Average Posted Price - PGB Index Price + \$10.00)

698-3.02 Fuel Price Adjustment. The fuel price adjustment will be based solely on the price changes for fuel as determined by the formulas below. No consideration will be given to the situation where an individual supplier's price exceeds the monthly average posted price, nor shall any adjustment be made if the monthly average posted price is within \$0.10 of the fuel index price.

A. Quantity. The quantity of fuel (gallons) considered for adjustment will be determined by multiplying the quantity of eligible work completed by the fuel usage factor which are listed on the proposal note entitled *Fuel Price Adjustment*.

B. Prices. The Fuel Index Price and the monthly average posted price are defined as follows:

1. Fuel Index Price. A fixed price per gallon of fuel used solely as a basis from which to compute fuel price adjustments. The fuel index price will be the monthly average posted price for the month of the bid letting, as listed in the Engineering Bulletin entitled *Fuel, Asphalt and Steel Price Adjustments*. The fuel index price for extra work at the original contract bid price will be the monthly average posted price for the month of the bid letting. The fuel index price for extra work at agreed price will be the monthly average posted price for the month the agreed price was submitted to the Engineer.

2. Monthly Average Posted Price. The rack average FOB terminal price per gallon determined by the Department based on prices from approved primary sources of diesel fuel and unleaded gasoline. Prices will be posted in a monthly Engineering Bulletin entitled *Fuel, Asphalt and Steel Price Adjustments*.

C. Adjustment. Fuel price adjustment will be based on the following formulas:

1. When price increases:

Price Adjustment = (Quantity of Fuel) x (Average Posted Price - Fuel Index Price - \$0.10)

2. When price decreases:

Price Adjustment = (Quantity of Fuel) x (Average Posted Price - Fuel Index Price + \$0.10)

698-3.03 Steel/Iron Price Adjustment. If the percentage change does not exceed 5%, no adjustments will be made for materials invoiced that month. For lump sum or each items, such as overhead sign structures, that are assembled from numerous components, the percentage change will be determined for the assembled contract pay item using the month that the largest value of materials were invoiced. To allow for multiple adjustments of various quantities at different times, for unit price items such as guiderail that are assembled from numerous components, the percentage change will be determined for a given quantity of the contract pay item using the month that the largest value of component materials for that quantity of the contract pay item were invoiced.

The weight of the steel and/or iron shall be determined from manufacturer's/supplier's data or shipping weights, and exclude minor appurtenances individually weighing less than 5 lbs. (i.e., nuts, bolts, washers, etc.). Eligible precast or prestressed concrete items shall have total reinforcing steel weight listed on the approved shop drawings. The following sources shall be used, in declining order of precedence, to determine the weight of steel/iron: approved shop drawings, contract documents, Department Standard Sheets, industry standards (i.e., AISC Manual of Steel Construction, AWWA Standards, etc.) and manufacturer's data. Materials will be considered invoiced when invoiced from a Manufacturer or Material Supplier to the Contractor, to a Subcontractor or to a Fabricator.

A. Quantity. The quantity of steel and/or iron considered for adjustment for each core (3-digit) contract pay item number (e.g., 564 – *Structural Steel*) will be measured to the nearest 0.1 Tons.

1. Percent Change Greater Than 5%. If the percentage change calculated by the Engineer is greater than 5%, Price Adjustments will be made for materials invoiced that month. The Contractor shall provide the Engineer a detailed list of the weight of eligible materials, including: the contract pay item, the weight of steel/iron, the month(s) of invoice, the source used to determine the weight, and if requested by the Engineer, copies of invoices to verify the month of invoice.

2. Percent Change -5% to +5%. If the percentage change calculated by the Engineer is 5% or less, no adjustments will be made for materials invoiced that month. The Contractor shall provide the Engineer with a list of the materials invoiced that month, including the contract pay item, the quantity invoiced, and if requested by the Engineer, copies of invoices to verify the month of invoice. The list shall be provided not later than the 15th of the following month.

3. Percent Change -5% and Lower. If the percentage change calculated by the Engineer is -5% or lower, a Price Rebate will be charged to the Contractor for materials invoiced that month. The Contractor shall provide the Engineer a detailed list of the weight of eligible materials, including: the contract pay item, the weight of steel/iron, the month(s) of invoice, the source used to determine the weight, and if requested by the Engineer, copies of invoices to verify the month of invoice. If the Contractor fails to provide the information required to determine the Price Rebate within 60 calendar days after the end of the month, the percentage change will be applied to the entire unit price, until such time as the Contractor provides the required information.

B. Prices. The Benchmark Steel Index and the Monthly Index are defined as follows:

1. Producer Price Index (PPI). Producer Price Index (PPI) values are published by the US Department of Labor (USDOL), Bureau of Labor Statistics (BLS). Recent PPI values are posted on the [Office of Construction Division](http://www.nysdot.gov) website at www.nysdot.gov. A complete listing of PPI values can be found on the BLS website at <http://data.bls.gov/PDQ/outside.jsp?survey=wp>.

2. Benchmark Steel Index (BI). Value of the PPI for *Semifinished Steel Mill Products* (WPU 101702) for the month of contract bid letting. The benchmark steel index for additional work at the original contract bid price will be the value of the PPI for the month of the bid letting. The benchmark steel index for additional work at agreed price will be the value of the PPI for the month the agreed price was submitted to the Engineer.

3. Monthly Steel Index (MI). Value of the PPI for *Semifinished Steel Mill Products* (WPU 101702) for the month the material is invoiced.

4. Cost Basis (CB). Cost Basis defined in dollars per ton listed in the monthly Engineering Bulletin *Fuel, Asphalt and Steel Price Adjustments* for the month of bid letting. The cost basis for additional work at the original contract bid price will be the cost basis listed for the month of the bid letting. The cost basis for additional work at agreed price will be the value of the cost basis for the month the agreed price was submitted to the Engineer.

C. Adjustment. Steel/Iron price adjustment will be based on the following formulas:

1. The percent change in any given month will be determined as follows:

$$\text{Percentage Change} = \left(\frac{MI - BI}{BI} \right) \times 100$$

2. When price increases:

$$\text{Price Adjustment} = \left[\left(\frac{MI - BI}{BI} \right) - 0.05 \right] (CB) Qty$$

3. When price decreases:

$$\text{Price Rebate} = \left[\left(\frac{MI - BI}{BI} \right) + 0.05 \right] (CB) Qty$$

698-4 METHOD OF MEASUREMENT. The unit price shown in the itemized proposal will be considered the unit price bid, although actual payment will be calculated based on changes in posted material prices. Should the amount shown be altered, the altered figures will be disregarded and the original price will be used to determine the total contract bid amount.

698-4.01 Asphalt Price Adjustment. Asphalt price adjustments will be measured on a Dollar Cents basis.

698-4.02 Fuel Price Adjustment. Fuel price adjustments will be measured on a Dollar Cents basis.

698-4.03 Steel/Iron Price Adjustment. Steel/Iron price adjustments will be measured on a Dollar Cents basis.

698-5 BASIS OF PAYMENT. Price adjustments will be based on the computations described above. Adjustments, either positive or negative, will be made when the accumulated amount for a price adjustment contract pay item exceeds \$5,000, or at such additional times as the Engineer deems appropriate. Asphalt price adjustments and fuel price adjustments not meeting this criteria will be made in the final contract payment.

If price adjustments are based on estimated material quantities for that time, and a revision to the total material quantity is made in a subsequent or final estimate, an appropriate addition or deduction will be made to the price adjustment previously calculated. The addition or deduction will be based on the same adjustment factors used to calculate the price adjustment which is being revised. If the installation dates of the revised material quantity cannot be determined, the addition or deduction will be based on the adjustment factors in effect during the last month in which any portion of the material quantity was installed.

If eligible items are installed after the original contract completion date and during which time an extension of time without the assessment of engineering charges is approved, the monthly average posted price or monthly index value used to compute price adjustments will be the appropriate monthly average posted price or monthly index value.

§698

If eligible items are installed after the scheduled contract completion date and during which time there are assessed engineering charges and/or liquidated damages, the monthly average posted price or monthly index value used to compute price adjustments will not exceed, but may be less than the monthly average posted price or monthly index value in effect on the last contract completion date without assessed engineering charges.

698-5.01 Asphalt Price Adjustment. The adjustment will be based on the monthly average posted price in effect at the time the work is completed. The monthly average posted price will be updated about the twentieth of each month and will apply to eligible work performed during the following month.

698-5.02 Fuel Price Adjustment. The adjustment will be based on the monthly average posted price in effect at the time the work is completed. The monthly average posted price will be updated about the twentieth of each month and will apply to eligible work performed during the following month.

698-5.03 Steel/Iron Price Adjustment. The minimum price adjustment for a contract is \$5,000. The minimum price adjustment for any group of contract pay items sharing the same core (3-digit) contract pay item number (e.g., 564 – *Structural Steel*) is \$1,000. The adjustment will be based on the index in effect at the time of purchase or invoice.

The monthly index is listed as preliminary for 4 months after initial publication. At contract final acceptance, the Engineer will make final revisions to the adjustment based on revised data. If all contract work is complete, preliminary index values as posted by the BLS may be used in place of final values. If a preliminary value is not posted for a given month or months, the preliminary value will be the average of the preceding and following months that are posted. If a final value is not posted for a given month or months, the final value will be determined from the average annual value, if possible, or will be the average of the preceding and following months that are posted.

Payment will be made under:

Item No.	Item	Pay Unit
698.04	Asphalt Price Adjustment	Dollars Cents
698.05	Fuel Price Adjustment	Dollars Cents
698.06	Steel/Iron Price Adjustment	Dollars Cents

SECTION 699 - MOBILIZATION

699-1 DESCRIPTION. Under this work the Contractor shall provide necessary bonds, insurance, and prefinancing and shall set up his necessary general plant, including shops, storage areas, office and such sanitary and other facilities as are required by local or state law or regulation.

699-2 MATERIALS. Such materials as required for mobilization and that are not to be part of the completed contract shall be as determined by the Contractor, except that they shall conform to any pertinent local or State Law, regulation or code.

699-3 CONSTRUCTION DETAILS. The work required to provide the above facilities and service for mobilization shall be done in a safe and workmanlike manner and shall conform with any pertinent local or State Law, regulation or code. Good housekeeping consistent with safety shall be maintained.

699-4 METHOD OF MEASUREMENT. Payment for mobilization will be made on a lump sum basis.

699-5 BASIS OF PAYMENT. The amount bid for mobilization shall not exceed four percent (4%) of the total contract bid price excluding the bid price for mobilization. Should the bidder exceed the foregoing four percent (4%), the Department will make the necessary adjustment to determine the total amount bid based on the arithmetically correct proposal.

The amount bid shall include the furnishing and maintaining of services and facilities noted under §699-1 DESCRIPTION, to the extent and at the time the Contractor deems them necessary for his operations, consistent with the requirements of this work and the respective contract.

§699

The amount bid shall be payable to the Contractor with the first contract payment made for other contract work.

Payment will be made under:

Item No.	Item	Pay Unit
699.040001	Mobilization	Lump Sum

Section 700

MATERIALS and MANUFACTURING

SECTION 701 - HYDRAULIC CEMENTS

701-01 PORTLAND CEMENT

SCOPE. This Specification covers five types of portland cement as follows:

Type 1. For use in general concrete construction where low heat of hydration is not required and where no sulfate action is anticipated.

Type 2. For use in general concrete construction.

Type 3. For use when high early strength is required.

Type 5. For use when high sulfate resistance is required.

Type 6. For use in white concrete or white mortar.

For uniformity with recognized industry terminology, Types 1, 2, 3 and 5 may also be designated as Types I, II, III and V respectively. Type I/II is defined as a cement that meets the requirements of both Types I and II cement.

Type of cement to be used will be as shown in the plans or specifications for each contract.

MATERIAL REQUIREMENTS. Portland cement, Types 1, 2, 3 and 5 shall conform to the chemical and physical requirements of those respective types as contained in AASHTO M 85 with the following:

Type 6 cement shall meet the requirements for Type 1 cement except the color shall be white. Any cement with an alkali content in excess of 0.70% is restricted for use as per the requirements of §501.

The Department reserves the right to impose the "Optional Chemical and Physical Requirements" of AASHTO M 85 when, in the Department's opinion, a cement contains undesirable constituents. The temperature of the cement, measured immediately prior to entering the mixing unit at a batching facility, shall not exceed 170°F.

Manufacturer. The gypsum shall be added to the clinker by means of an approved automatic mechanical device. At the option of the manufacturer, additions of those commercial products known as "grinding aids" will be permitted as provided for by AASHTO M 85. The manufacturer shall declare the commercial name of the product used and the amount thereof in writing to the Materials Bureau.

Storage. The cement shall be stored at its source of supply in approved weather-tight silos. Facilities shall be provided for maintaining such silos under Department seal control when and as directed by the Materials Bureau.

All silos shall be completely empty and clean before cement is deposited therein unless the silo contains Department specification cement of the same type.

Cement remaining in bulk storage at the mill and/or distribution terminal for a period greater than one year after completion of tests shall be resampled and retested before shipment. However, cement which has been in bulk storage at mills and/or distribution terminals more than two years from the time of original manufacture shall not be used. No cement stored by the Contractor over the winter shall be used until retested by the Materials Bureau.

Bagged cement shall not be stored at mill or terminal locations for a period longer than that time considered reasonable by the Department for preparing an order for shipment.

§701

Shipment. All shipments of cement shall be made in accordance with procedural directives issued by the Materials Bureau. Conveyances for bulk cement shipment shall be of a type approved by the Department. The compartments of all such conveyances shall be completely empty and clean before any cement is loaded therein. Cement may be shipped in paper bags which conform to industry standards and which have the brand name, type of cement, and the name of the manufacturer plainly marked thereon.

Inspection and Testing. All inspection and testing shall be in accordance with procedural directives issued by the Materials Bureau. When required by the Materials Bureau, cement shall be sampled by means of an automatic sampling device constructed so as to obtain continuous samples across the full stream of cement and deliver such samples into a sealed container approved by the Materials Bureau. Tests for chemical and physical properties shall be in accordance with test methods stipulated by AASHTO M 85.

BASIS OF ACCEPTANCE. Portland cement will be considered for acceptance at mill or terminal locations in accordance with procedural directives issued by the Materials Bureau.

701-02 MASONRY AND MORTAR CEMENT

SCOPE. Masonry and mortar cement, used to make masonry mortar.

MATERIALS

Masonry Cement	ASTM C91
Mortar Cement	ASTM C1329

BASIS OF ACCEPTANCE. The Engineer will base acceptance on each package being labeled to show ASTM conformance and its contents being in good condition.

701-03 BLENDED PORTLAND CEMENT

SCOPE. This specification covers blended portland cement, for use in portland cement concrete, using Class F fly ash, microsilica, ground granulated blast furnace slag or a combination of fly ash and microsilica. The cement, and percent of each material in the blended cement, shall be at an appropriate quantity to achieve the desired percentage in the concrete mix as shown in the plans or specifications without further addition of any cementitious component.

GENERAL. Blended portland cements, as described in AASHTO M 240 shall conform to the chemical and physical requirements described herein, or as modified in the concrete mix as shown in the plans or specifications of each contract. Acceptable blended portland cements are defined as follows:

Portland/ fly ash cement (IP). A product consisting of portland cement and fly ash in which the fly ash content does not exceed 22 percent by weight.

Portland/ microsilica cement (SF). A product consisting of portland cement and microsilica in which the microsilica content does not exceed 10 percent by weight.

Portland/ ground granulated slag cement (SM). A product consisting of portland cement and finely ground, granulated blast furnace slag in which the slag content does not exceed 22 percent by weight.

Ternary blend cement. A product consisting of portland cement, fly ash, and microsilica in which the total supplementary cementitious content does not exceed 30 percent by weight. The fly ash portion shall range from 15 -20 percent of the total weight. The microsilica portion shall range from 6-10 percent of the total weight.

Blending may be completed by means of intergrinding or by mechanical means. The blended cement shall remain homogeneous from the point of blending to the point of use at a portland cement concrete batching facility. The ability and means of maintaining homogeneity shall be demonstrated to the satisfaction of the Department.

MATERIAL REQUIREMENTS. The individual components, before blending, shall meet the following requirements:

Portland Cement	701-01 Type I, II or I/II only
Fly ash	711-10
Microsilica	711-11
Ground, Granulated Blast Furnace Slag	711-12

Blended portland cements shall meet the chemical requirements specified in Table 701-1 and the physical requirements specified in Table 701-2.

STORAGE. The blended cement shall be stored at its source of supply in approved weather-tight silos. Facilities must be provided for maintaining such silos under Department seal control when and as directed by the Materials Bureau.

	Portland/flyash (IP)	Portland/microsilica (SF)	Ternary Blend	Portland /slag (SM)
Loss on Ignition	5.0 % max. ¹	3.4 % max.	3.6 % max.	3.0 % max. ²
SiO ₂	--- ¹	22.0 % min.	31.5 % min.	---
MgO	6.0 % max. ¹	6.0 % max.	6.0 % max.	---
SO ₃	4.0 % max. ^{1,3}	3.1 % max. ³	3.5 % max. ³	3.0 % max. ^{2,3}
Total Alkalinity	0.85 % max. ⁴	0.80 % max. ⁴	0.95 % max. ⁴	0.75 % max. ⁴

Note 1- As per chemical requirements of AASHTO M 240 for Type IP blended cement.

Note 2- As per chemical requirements of AASHTO M 240 for Type I(SM) blended cement.

Note 3- There are cases where the optimum SO₃ (using ASTM test method C563) for a particular cement is close to or in excess of the limit in this specification. In such cases where the properties of a cement can be improved by exceeding the SO₃ limits stated in this table, it is permissible to exceed the values in the table, provided it has been demonstrated by ASTM test method C1038 that the cement with the increased SO₃ will not develop expansion under water exceeding 0.020 % at 14 days. When the manufacturer supplies cement under this provision, the supporting data will be supplied, on request, to the Materials Bureau.

Note 4- Any blended cement where the portland cement portion contains an alkali content in excess of 0.70% may be either rejected, accepted, or have use limitations imposed as directed by the Materials Bureau.

Passing 45µm (ASTM C430)	70% minimum
Time of setting, Vicat test (ASTM C191) (minutes)	45 minimum, 420 maximum
Autoclave contraction (ASTM C151)	0.2% maximum
Autoclave expansion	0.8% maximum
Compressive strength (AASHTO T 106) (psi)	
3 days	1500 minimum
7 days	2900 minimum
28 days	3600 minimum

All silos shall be completely empty and clean before blended cement is deposited therein unless the silo contains Department specification blended cement of the same type.

Blended cement remaining in bulk storage at the mill and/or distribution terminal for a period greater than one year after completion of tests must be resampled and retested before shipment. However,

§701

blended cement which has been in bulk storage at mills and/or distribution terminals more than two years from the time of original manufacture shall not be used. No blended cement stored by the Supplier over the winter may be used until retested by the Materials Bureau.

Bagged blended cement shall not be stored at mill or terminal locations for a period longer than that time considered reasonable by the Department for preparing an order for shipment.

SHIPMENT. All shipments of blended cement shall be in accordance with procedural directives issued by the Materials Bureau. Conveyances for bulk shipment must be of a type approved by the Department.

The compartments of all such conveyances must be completely empty and clean before any blended cement is loaded therein. Blended cement may be shipped in paper bags which conform to industry standards and which have the brand name, type of blended cement, and the name of the manufacturer plainly marked thereon.

INSPECTION AND TESTING. All inspection and testing shall be in accordance with procedural directives issued by the Materials Bureau. When required by the Materials Bureau, blended cement shall be sampled by means of an automatic sampling device constructed so as to obtain continuous samples across the full stream of blended cement and deliver such samples into a sealed container approved by the Materials Bureau. Tests for chemical and physical properties will be in accordance with test methods stipulated herein.

BASIS OF ACCEPTANCE. Blended portland cement will be considered for acceptance at mill or terminal locations in accordance with procedural directives issued by the Materials Bureau.

701-04 CONCRETE REPAIR MATERIAL

SCOPE. This specification covers a portland cement based concrete mix generally used in the repair of precast concrete products such as pipe, cribbing, manholes, etc.

MATERIAL REQUIREMENTS. This material shall have a maximum initial setting time of 1 hour. Compressive strength shall be a minimum of 2000 psi after 1 day and 5000 psi after 28 days. The material shall be able to withstand 25 cycles of freeze-thaw (10% NaCl) with a maximum loss of 4%, in accordance with NY Test Method 502-3P. The material may exhibit expansion at no more than 0.40% and shrinkage of no more than 0.05% such that no cracks are produced. The bond strength shall be a minimum of 200 psi after 5 days air cure without the use of a special bonding agent. The material shall exhibit no appreciable heat of hydration. The color of the repair after it cures will be of substantially the same color as the item being repaired.

BASIS OF ACCEPTANCE. Application for approval of concrete repair material shall be submitted to the Materials Bureau accompanied by a labeled 50 lb standard production sample. Upon approval, the name of the product will be placed on an approved list. Such product will then be accepted on the basis of the brand name labeled on the containers. The manufacturer is required to print the date of manufacture on the container in the following format "month, year." Inclusion of the day of manufacture in the date is optional. The expiration date of acceptance for this material shall be one calendar year from the date of manufacture or as stated in the Approved List, whichever is less. If in the opinion of the Engineer the material is determined to be unsuitable for Department work, the material will be rejected.

701-05 CONCRETE GROUTING MATERIAL

SCOPE. This specification covers a grouting material for use in grouting anchor bolts, dowels and other miscellaneous items in concrete.

GENERAL. The material shall be a non-metallic, non-shrink grout which, when mixed with water, will harden rapidly to produce a permanent anchoring bond. It shall contain no metals nor rust or corrosion promoting agents. The color shall be light gray matching approximately the color of hardened concrete.

MATERIAL REQUIREMENTS. The material when prepared in accordance with the manufacturers instructions, shall be of a trowelable consistency. It shall also have the following properties.

A. Shrinkage. The material shall exhibit no shrinkage on setting but may exhibit slight expansion of no more than 0.40%.

B. Compressive Strength. Cubes cast in accordance with AASHTO T 106 shall be cured as shown and have a minimum three cube compressive strength average as follows:

Cure	Strength
24 hour air cure @ 75°F	4000 psi Min.
7 day air cure @ 75°F	6000 psi Min.
7 day air, 10-day water submersion	6000 psi Min.
7 day air, 24 hour, 10% NaCl solution submersion, 25 cycles freeze-thaw	6000 psi Min.

C. Initial Set. The material shall have a minimum initial set of 30 minutes.

D. Pull-out Strength. A No. 5 reinforcement bar grouted 6 inches deep in a 7/8 inch diameter hole in saturated, surface-dried concrete shall have a pull-out strength of 10,000 pounds.

E. Impurities. The material shall contain not more than 0.05% chlorides or 5% sulfates.

F. Durability. The material shall withstand 25 cycles of freeze-thaw (10% NaCl) with a maximum loss of 4%.

BASIS OF ACCEPTANCE. Application for approval of a Concrete Grouting Material by the producer shall be submitted to the Materials Bureau accompanied by a labeled 50 lb standard production sample of the product. Upon approval by the Materials Bureau, the name of the product will be placed on an approved list. Such product shall then be accepted on the basis of the brand name labeled on the container. The manufacturer is required to print the date of manufacture on the container in the following format "month, year." Inclusion of the day of manufacture in the date is optional. The expiration date of acceptance for this material shall be one calendar year from the date of manufacture or as stated in the Approved List, whichever is less. If in the opinion of the Engineer the material is determined to be unsuitable for Department work, the material will be rejected.

701-06 CEMENT BASED GROUT MATERIALS FOR SHEAR KEYS

SCOPE. This specification covers the requirements for cement based grouts for placement in shear keys between prestressed concrete box beam and hollow slab units.

GENERAL. The material shall be cement-based, non-metallic, non-shrink and pre-packaged which when mixed with water will become a grout that hardens and develops strength rapidly. The material shall contain no rust, or corrosion promoting agents and shall require only the addition of water in the field. No additional aggregate will be allowed when field mixing. The Department's approved products list titled: Cement Based Grout Materials for Shear Keys will state the precise water-cement (w/c) ratio by weight. This ratio shall not be altered.

MATERIAL REQUIREMENTS. Following the manufacturer's instructions, the Department will test all cement based grout materials to ensure that the following properties are attainable. If the material attains these properties, the Department will place the material on its approved list together with the precise water cement ratio (by weight) required to attain the properties. The properties are:

A. Compressive Strength. Three cubes shall be cast and cured in accordance with AASHTO T 106. The average strength of the 3 cubes at 7 days age shall be a minimum of 6000 psi.

B. Freeze-Thaw (FT) Resistance. Three cubes shall be molded and cured for 7 days in accordance with AASHTO T 106. Upon completion of cure, they will be subjected to 25 FT cycles in accordance with test method NY 502-3P. Material shall not exhibit a weight loss greater than 3.0%, based on the average loss of the 3 cubes.

C. Expansion-Contraction. The grout shall be tested in accordance with CRD C621. Measurements shall be made at 4 hours, 1, 2, 3 and 4 days age after molding. The tolerance for the measurement ages shall be ±15 minutes. The material shall exhibit a 4-day expansion between 0 - 5% inclusive, with no subsequent contraction.

D. Pourability. The grout shall be thoroughly mixed and immediately poured into a container with the approximate shape of a standard shear key. To be considered pourable, the grout shall completely fill the container without excess air entrapment.

BASIS OF ACCEPTANCE. Application for material approval shall be submitted to the Materials Bureau by the manufacturer. The application shall be accompanied by a labeled 50 lb standard production sample of the product. Upon approval, the name, and manufacturer, of the product will be placed on the Department's approved list. Products so listed will be accepted at the work site on the basis of the brand name labeled on the container. The manufacturer is required to print the date of manufacture on the container in the following format "month, year." Inclusion of the day of manufacture in the date is optional. The expiration date of acceptance for this material shall be one calendar year from the date of manufacture or as stated in the Approved List, whichever is less. If in the opinion of the Engineer the material is determined to be unsuitable for Department work, the material will be rejected.

701-07 ANCHORING MATERIALS - CHEMICALLY CURING

SCOPE. This specification covers polymer anchoring materials for installing anchor bolts and other miscellaneous items in concrete.

GENERAL. The material shall be a non-metallic, non-shrink polymer resin supplied in prepackaged and/or premeasured containers. It shall contain no rust or corrosion promoting agents and shall be moisture insensitive. Packaged stability of each component in original unopened containers stored in temperatures between 40°F and 90°F shall be a minimum of six months. The mixing instructions, setting time and expiration date of the material shall appear on each container.

CHEMICAL RESISTANCE. Cured sealer shall be resistant to most chemicals and solvents. The manufacturer shall certify that the sealant meets the following chemical resistances when tested in accordance with ASTM D471 (70°F for 24 hours):

Gasoline	Slight Swell
Hydraulic Brake Fluid	No Effect
Motor Oil	No Effect
Sodium Chloride (5%)	No Effect
Calcium Chloride (5%)	No Effect

MATERIAL REQUIREMENTS. Manufacturers must supply test results performed in accordance with the procedural directives of the Materials Bureau, using 1 inch diameter fully threaded rods embedded 10 inches deep in unreinforced concrete. Results from testing using lesser embedment depths will be accepted provided they achieve the pullout strength required for the 10 inch embedment. Testing must be performed by an independent testing agency and approved by the Materials Bureau. A minimum of three tests shall be performed and each test result must meet the minimum required pullout value. Concrete

with a compressive strength greater than 4000 psi is recommended. The minimum required pullout values for various concrete strengths are shown below:

Concrete Strength (psi)	≤ 4000	4500	5000	5500
Minimum Pullout Load (lb)	51,120	54,225	57,150	59,940

The Materials Bureau will inform the Manufacturer when the test results are accepted. The Manufacturer shall then supply six 5/8 inch diameter fully threaded rods, a minimum of 7 inches long, and sufficient material for testing by the Materials Bureau. Tensile pullout testing will be performed on the 5/8 inch diameter rods embedded 4 inches deep in unreinforced concrete. Two sets of three tests shall be performed and each test shall meet the minimum required load. The minimum required pullout values for various concrete strengths are shown below:

Concrete Strength (psi)	4000	4500	5000	5500
Minimum Pullout Load (lb)	8,593	9,113	9,630	10,080

Copies of Procedural Directives may be obtained from the Materials Bureau upon request.

BASIS OF ACCEPTANCE. Application for approval of Anchoring Materials - Chemically Curing shall be made by the manufacturer or supplier to the Materials Bureau and shall include the material safety data sheets and independent test data. The manufacturer or supplier shall prepare and submit the appropriate material in accordance with the procedural directives of the Materials Bureau and the requirements of this specification. Upon approval by the Materials Bureau, the name of the product will be placed on the Approved List. Such product will then be accepted on the basis of the brand name labeled on the container.

701-08 VERTICAL AND OVERHEAD PATCHING MATERIAL

SCOPE. This specification covers the requirements for Vertical and Overhead Patching Material for placement in structural concrete repairs.

GENERAL. The material shall consist of a cementitious material to which water or an emulsified component is added. The material shall be pre-packaged with the product name, manufacturer and mixing instructions printed clearly on the package.

MATERIAL REQUIREMENTS. Following the manufacturer's instructions, the Department will test the patching materials to ensure that the following properties are attainable. If the material attains these properties, the Department will place the material on its Approved List. The properties are:

A. Compressive Strength. The material shall exhibit a minimum 7 day compressive strength of 2000 psi and a minimum 28 day strength of 3000 psi when tested under NYSDOT Test Method 701-13F.

B. Flexural Bond Strength. The material shall exhibit a minimum bond strength of 200 psi when tested under NYSDOT Test Method 701-13F.

C. Freeze-Thaw Resistance. Three cubes shall be molded of the material and cured for 7 days in accordance with AASHTO T 106. Upon completion of cure, they shall be subject to 50 Freeze-Thaw cycles in accordance with NYSDOT Test Method 502-3P. Materials shall not exhibit a weight loss greater than 3.0% based on the average loss of the 3 cubes.

D. Expansion-Contraction. The material may exhibit expansion of no more than 0.40% and shrinkage of no more than 0.01% when tested in accordance with NYSDOT Test Method 701-13F.

E. Material Consistency. The material shall be placeable in layers of at least 1 inch on overhead applications without the use of formwork or anchoring devices.

F. Color. The material shall produce a finished patch, concrete grey in color.

BASIS OF ACCEPTANCE. Application for material approval shall be submitted to the Materials Bureau by the manufacturer. The application shall be accompanied by a labeled 50 lb standard production sample of the product. Upon approval, the product name and manufacturer will be placed on the Department's Approved List. Products so listed will be accepted at the worksite on the basis of the brand name labeled on the container. The manufacturer is required to print the date of manufacture on the container in the following format "month, year." Inclusion of the day of manufacture in the date is optional. The expiration date of acceptance for this material shall be one calendar year from the date of manufacture or as stated in the Approved List, whichever is less. If in the opinion of the Engineer the material is determined to be unsuitable for Department work, the material will be rejected.

701-09 RAPID HARDENING CONCRETE REPAIR MATERIAL (Normal Weather)

SCOPE. This specification covers a rapid hardening concrete mix, consisting of a dry component made up of the cementing medium and fine aggregate to which water or an emulsified component is added. The resulting mixture is generally used in the repair of portland cement concrete pavements.

GENERAL. The rapid hardening concrete shall be of a high strength, have rapid strength gain characteristics in normal weather (above 50°F ambient temperature), bond to the existing concrete, and be durable. The rapid hardening concrete shall be able to accept coarse aggregate to extend the yield and result in a workable mixture.

MATERIAL REQUIREMENTS. The material, as delivered without additional coarse aggregate, and mixed in accordance with the manufacturer's instructions, shall have the following properties when tested under NYSDOT Test Method 701-13F:

- A minimum one hour compressive strength of 2500 psi, a 24 hour strength of 3500 psi and a 28 day strength of 5000 psi.
- A minimum bond strength of 200 psi after 24 hours.
- A minimum initial setting time of 5 minutes at 75 ± 2°F.
- The ability to withstand 50 cycles of freeze-thaw (10% NaCl solution) with a maximum loss of 6%.
- Expansion of no more than 0.40% and contraction of no more than 0.05%.
- A workable mixture when extended with a minimum 60% CA1 coarse aggregate by weight of dry R.S.C. component.

The material delivered from the manufacturer in moisture proof bags shall weigh within ±3% of the labeled bag weight, the manufacturer's name, address, mixing instructions, and manufacturing date shall be printed on each bag.

BASIS OF ACCEPTANCE. Application for material approval shall be submitted to the Materials Bureau by the manufacturer. The application shall be accompanied by a labeled 100 lb standard production sample of the product. Upon approval, the name and manufacturer of the product will be placed on the Department's Approved List. Products so listed will be accepted at the work site on the basis of the brand name labeled on the container. The manufacturer is required to print the date of manufacture on the container in the following format "month, year." Inclusion of the day of manufacture is optional. The expiration date of acceptance for this material shall be one calendar year from the date of manufacture or as stated in the Approved List, whichever is less. If in the opinion of the Engineer the material is determined to be unsuitable for Department work, the material will be rejected.

701-10 (VACANT)

701-11 ELASTOMERIC CONCRETE

SCOPE. This specification covers the material requirements for elastomeric concrete.

GENERAL. Supply elastomeric concrete components and primer materials in prepackaged and/or premeasured containers with the product name, manufacturer, VOC content, and mixing instructions clearly marked on each container.

MATERIAL REQUIREMENTS.

Physical Test Requirements. Elastomeric concrete will conform to the following physical test requirements:

TESTS	PROCEDURE	MINIMUM REQUIREMENTS
Resilience	ASTM C579-01	70%
5-Hr. Compressive Strength	ASTM C579-01 (modified)	500 psi
24-Hr. Compressive Strength	ASTM C579-01 (modified)	2000 psi
7-Day Tensile	ASTM D638	150 psi
7- Day Tear	ASTM D624	40 lb _f /in
Pot Life	Gardco GT-S Gel Timer	5 minutes

Materials Details. The manufacturer will submit Material Detail Sheets to the Materials Bureau for approval. Upon approval, the manufacturer, product name, and the Material Detail Number will be placed on the Department's Approved List.

Field Evaluation. To maintain Approved List status, the elastomeric concrete will be evaluated by the Materials Bureau or a designated representative at six-month intervals for a period of two years from the date of installation. If the material is performing as designed at the end of the two-year evaluation approved status will continue.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Department's Approved List for Materials and Equipment. The supplier shall provide two copies of the Approved Material Detail Sheets and Material Safety Data Sheets through the Contractor to the Engineer as part of the evidence of acceptability for the material at least 14 days prior to shipment of the product to the job site.

SECTION 702 - BITUMINOUS MATERIALS

SCOPE. These specifications cover the material requirements and methods of testing bituminous materials classified into the following groups:

1. Performance-Graded (PG) Binders for Paving.
2. Miscellaneous Asphalt Cements.
3. Rapid and Medium Curing Liquid Asphalts.
4. Anionic, Cationic, and Polymer-Modified Asphalt Emulsions.
5. Synthetic Resins.
6. Asphalt Emulsion Tack Coat.

GENERAL. The bituminous material volume shall be measured at 60°F. The specific gravity at 60°F shall be included with each shipment of bituminous material to a plant or project site.

MATERIAL REQUIREMENTS. Bituminous materials shall meet the following requirements.

1. Performance-Graded (PG) Binders for Paving. PG binder, designated PG XX-YY, is defined as the range of pavement temperatures expressed in degrees Celsius, maximum to minimum, over which the PG binder can be expected to provide acceptable performance. The PG binder shall be prepared from refining crude petroleum by suitable methods with the addition of a modifier, if necessary, to meet the required performance-grade. PG binders shall meet the requirements of AASHTO M 320 *Standard Specification for Performance-Graded Asphalt Binder* and Table 702-1 *Performance-Graded Binders for Paving*. The PG binder supplier shall certify that the PG binder meets NYSDOT quality requirements for a Primary Source appearing on the Department's Approved List of Performance-Graded Binders for Paving. If the PG binder is modified, the supplier shall include type of modification and any special handling instructions in the certification. The PG binder supplier shall provide the design mixing and compaction temperatures on a Form BR 320, *SUPERPAVE Performance Graded Binder Temperature Viscosity Data*. Also, the supplier shall provide AASHTO M 320 test data and all necessary shipping documents in accordance with the Department's Materials Method (MM) 8.1 *Quality Assurance Procedure for Performance-Graded (PG) Asphalt Binders*.

TABLE 702-1 PERFORMANCE-GRADED BINDERS FOR PAVING						
MATERIAL DESIGNATION	702-5828	702-5834	702-6422	702-6428	702-7022	702-7622
PERFORMANCE-GRADE	PG 58		PG 64		PG 70	PG 76
	28	34	22	28	22	22
Test Requirements	AASHTO M 320					

Silicone additives will be permitted in paving binders. Silicone may be introduced into the PG binder in accordance with the manufacturer's recommendations either at the refinery, terminal, or at a mixing plant storage tank. PG binder treated with silicone shall conform to the specifications for untreated PG binder.

Any PG binder previously approved that has been stored in the mixing plant tank over the winter shall be re-sampled and accepted by the Department before it is used.

2. Miscellaneous Asphalt Cements. Asphalt cements shall meet the requirements in Table 702-2 *Miscellaneous Asphalt Cements*. The asphalt cement shall be homogenous, free from water, and shall not foam when heated to 350°F. The supplier shall maintain the identity of the asphalts in accordance with the Department's written instructions from the point of refining to the point where the asphalt is incorporated into the work. Test data and shipping documents shall be provided by the supplier in accordance with the Department's Materials Method (MM) 8.3 *Liquid Asphalts (Rapid and Medium Curing), Miscellaneous Asphalt Cements (Fillers), and Synthetic Resins – Quality Assurance*.

TABLE 702-2 MISCELLANEOUS ASPHALT CEMENTS		
MATERIAL DESIGNATION	702-0700	
GRADES	18 - 60	
Test Requirements	Minimum	Maximum
Penetration, 77°F (25°C), 100 g, 5 second (AASHTO T 49)	18	60
Flash Point, COC, °F (AASHTO T 48)	393	-
Solubility in trichloroethylene, % (AASHTO T 44)	99.5	-
Softening Point, °F (AASHTO T 53)	130	167

Ductility, 77°F (25°C), 5 cm/minute, cm (AASHTO T 51)	5	-
Typical Uses	Joint and Crack Filler	

3. Rapid and Medium Curing Liquid Asphalts. Rapid and Medium Curing liquid asphalts shall meet the requirements in Table 702-3 *Rapid Curing Liquid Asphalts* and Table 702-4 *Medium Curing Liquid Asphalts*, respectively.

TABLE 702-3 RAPID CURING LIQUID ASPHALTS				
MATERIAL DESIGNATION	702-1100	702-1200 and 702-1300 ⁽¹⁾	702-1400 and 702-1500 ⁽¹⁾	702-1600
GRADE	RC-70	RC-250	RC-800	RC-3000
Test Requirements	ASTM D 2028 or AASHTO M 81			

1. Material Designations 702-1300 and 702-1500 shall contain an anti-stripping additive and meet the stone coating requirements.

TABLE 702-4 MEDIUM CURING LIQUID ASPHALTS					
MATERIAL DESIGNATION	702-2000	702-2100	702-2200 and 702-2300 ⁽¹⁾	702-2400	702-2500
GRADE	MC-30	MC-70	MC-250	MC-800	MC-3000
Test Requirements	ASTM D 2027 or AASHTO M 82				

1. Material Designation 702-2300 shall contain an anti-stripping additive and meet the stone coating requirements.

The liquid asphalts shall show no separation or curdling prior to use and shall not foam when heated to the application temperature.

When required, an anti-stripping additive shall be added to the bituminous material to cause it to coat and adhere more effectively to wet and unheated aggregates. The additive shall have no deleterious effect upon the bituminous material and shall be completely miscible and thoroughly blended throughout the bituminous materials. The anti-stripping additive shall be added to the bituminous material only during the process when the asphalt cement and the solvent materials are

blended to make the liquid asphalt. Material containing an anti-stripping additive shall conform to the specifications for untreated material.

4. Anionic, Cationic, and Polymer-Modified Asphalt Emulsions. The emulsion shall be homogeneous and show no separation of asphalt, after thoroughly mixing, within 30 days after delivery, provided separation has not been caused by freezing. Emulsified asphalts held in storage tanks, drums, or distributors for long periods are subject to settlement. The asphalt emulsion shall be agitated or circulated amply to ensure a homogenous emulsion prior to sampling or application of material. Material that has separated due to freezing is unacceptable at anytime. During production of polymer-modified emulsions, the polymer modifier shall be milled or blended into the base asphalt or emulsifying agent prior to the emulsification process.

Asphalt emulsions shall meet the requirements shown in Table 702-5 *Anionic Asphalt Emulsions*, Table 702-6 *Cationic Asphalt Emulsions*, or Table 702-7 *Polymer-Modified Emulsions*. Test data and shipping documents shall be provided by the supplier in accordance with the Department's Materials Method (MM) 8.2 *Asphalt Emulsion – Quality Assurance*.

Typical Applications:⁽⁴⁾										
	Surface Treatment				Paver-Placed Surface Treatment		Surface Treatment		Micro-Surfacing	

Notes:

- Elastic recovery procedure: Use ASTM D 6084 Testing Procedure "A." Samples will be tested at 50°F (10°C).
- Float test AASHTO T 50, except that the residue from distillation shall be poured immediately into the float collar at 500°F (260°C).
- If the Particle Charge Test result is inconclusive, material having a maximum pH value of 6.7 will be acceptable.
- These typical applications are intended only as a guide for selecting the proper emulsion grade.
- According to ASTM D 6997 except as modified, when the lower temperature reaches approximately 275°F (135°C) move the ring burner approximately level with the bottom of the still. Increase the temperature to a maximum 350°F ±10°F (177°C ±5.5°C) maintaining this temperature for 15 minutes.
- Test results within the range of 35 and 40 will be further evaluated by the Materials Bureau for substantial conformance to the specification.
- According to AASHTO T 53.

5. Synthetic Resins. The synthetic resins covered under these specifications are two types: synthetic resin binder and rapid curing synthetic resin liquid. The synthetic resin binder is a light insensitive liquid used in the colored synthetic resin binder concrete. The rapid curing synthetic resin liquid is a tack coat for the resin binder concrete and shall be light colored and compatible with the resin binder concrete placed over it.

The synthetic resin shall be homogeneous and shall meet the requirements in Table 702-8 *Synthetic Resins*.

TABLE 702-8 SYNTHETIC RESINS				
TYPE	Resin Binder		Rapid Curing Resin Liquid	
MATERIAL DESIGNATION	702-7000		702-7100

6. Asphalt Emulsion Tack Coat. Tack coat emulsions held in storage tanks, drums, or distributors for long periods are subject to settlement. The tack coat emulsion shall be agitated or circulated amply to ensure a homogenous emulsion prior to sampling or application of material. Material that has separated due to freezing is unacceptable at anytime. The consistency of the tack coat shall be appropriate for pumping, sampling, and give uniform spray coverage.

Only the grades of emulsions detailed in Table 702-9 *Grades of Asphalt Emulsions Used for Tack Coats* shall be allowed in tack coat applications. Use of any other tack coat material requires prior approval by the Director, Materials Bureau on a project by project basis. Tack coat shall meet the requirements in Table 702-10 *Tack Coat*. These tack coats shall be produced by diluting these asphalt emulsion grades with an emulsifier and/or water and thoroughly mixing into a homogeneous liquid.

BASIS OF APPROVAL. The procedural directives for sampling, testing, and certifying the bituminous material, and for achieving and maintaining Approved List status, are available from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of the bituminous material is based on the name of the primary source appearing on the Approved List for the specific group of bituminous material and satisfactory test results from samples taken at the location where the material is incorporated into the work. A primary source is defined as a firm that samples, tests, and certifies that the bituminous material is in conformance with the specifications.

SECTION 703 - AGGREGATES

703-01 FINE AGGREGATE

SCOPE. The specification covers the material details, quality requirements and methods for sampling and testing fine aggregate generally used in portland cement concrete and bituminous concrete.

SAMPLING. Samples of fine aggregates shall be obtained by and submitted to the Materials Bureau by a representative of the Department under the following conditions:

A. Sampling Approved Operating Sources. All approved operating sources shall be sampled when:

- The latest test for a source is two (2) years old.
- A change in the character of processed fine aggregate occurs.
- The location of the course of raw material is shifted, or a change in the character of raw material occurs.
- Considered necessary by the Department.

B. Sampling Non-approved or Rejected Operating Sources. Non-approved or rejected operating sources, equipped with adequate processing facilities, may be sampled upon favorable recommendation by a Regional Director and approved by the Director, Materials Bureau. Approval action on such sources may be conditioned on the results obtained by periodic sampling and testing as prescribed by the Materials Bureau.

C. Sampling Proposed Unopened Sources of Material. Proposed unopened sources of material may be sampled upon the favorable recommendation of a Regional Director and approved by the Director, Materials Bureau. The results of tests on such samples shall be for information only and shall be indicative of the potential quality of the source. Action in regard to acceptance or rejection of a source will be taken only after processing facilities have been installed and approved.

Stripping. All sources of fine aggregate shall be thoroughly stripped of all inferior and objectionable material before processing operations are started and shall be kept stripped far enough from the working face to insure against undesirable material becoming mixed with the output. If undesirable material is furnished from accepted sources through faulty operations or any other cause whatsoever, the source and any objectionable material therefrom may be rejected by the Regional Director.

Annual Reports. As part of the acceptance requirements, the following information shall be submitted to the Department annually for each operating source:

A. Geologic Source Report. A geologic source report that describes the characteristics of the material to be processed during the coming year.

B. Plant Flow Information. Plant flow information describing the processing equipment and the products to be furnished for Departmental use.

The details of these requirements may be obtained from the Materials Bureau. These annual reports shall be received and approved by the Department before the start of the year's operations. Approval of the reports by the Department does not relieve the supplier of its responsibility to provide a uniform and acceptable product.

MATERIAL REQUIREMENTS. Fine aggregate shall consist of natural sand or manufactured sand, conforming to the requirements of these specifications. All fine aggregate shall consist of hard, strong, durable particles which are free from a coating or any injurious material and injurious amounts of clay, loam, or other deleterious substances. In addition, the fine aggregate shall not contain substances, which, when mixed in portland cement concrete, produce an unacceptable level of chloride ions in the final product. Substances that produce chloride ions shall be considered deleterious material. Any fine aggregate may be rejected if it is determined by the Department to contain sufficient amounts of unsound or deleterious material to be harmful.

Fine aggregates from more than one source or of more than one type of material may be blended. Blending procedures shall be approved by the Department.

Fine aggregates meeting the requirements of Table 703-1, "Fine Aggregate Requirements (Testing)" shall be accepted unless service records indicate that it is unsound, or that the material is otherwise determined to be unsatisfactory by the Director, Materials Bureau.

TABLE 703-1 FINE AGGREGATE REQUIREMENTS (TESTING)		
Test Method	Portland Cement Concrete	Bituminous Concrete
Magnesium Sulfates (NYSDOT 207) Max. percent loss by weight at 5 cycles	30	45
Organic Impurities (NYSDOT 202, AASHTO T-21) Organic Plate, Lighter Than	3	-
Gardner Color, Lighter Than	11	-

Fine aggregate not meeting the requirement of Table 703-1 may be further evaluated by additional testing, petrographic examination, geologic studies, review of performance history and plant flow information. If the results of the evaluation indicate that the aggregate should perform satisfactorily, the source may be accepted by the Director, Materials Bureau.

If fine aggregate is found unsatisfactory when examined for organic impurities, it shall be rejected unless it passes the mortar strength test for compression. Fine aggregates so tested shall achieve a compressive strength of at least one hundred percent when tested according to methods prescribed by the Material Bureau (NYSDOT 204).

TESTS. The details of all test methods for fine aggregates may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of the source is determined on the basis of tests performed by the Materials Bureau on samples representing the sources; review of Geologic Source Reports and Plant Flow Information; petrographic examination and other geologic studies; and performance histories where applicable. The material is incorporated into the work on the basis that it is from an approved source conforming to procedural directives of the Department and the aggregate shall meet the gradation requirement at the point of use.

Aggregate for use in the manufacture of precast concrete units may be accepted on the basis of stockpile approval at a location acceptable to the Department on a per job basis. Requests for stockpile approval shall be made in writing to the Materials Bureau. The manufacturer shall allow at least ninety (90) days for the testing and evaluation of the aggregate.

703-02 COARSE AGGREGATE

SCOPE. This specification covers the material details, requirements and methods for sampling and testing coarse aggregate generally used in portland cement concrete, bituminous concrete and surface treatments.

SAMPLING. Samples of coarse aggregates shall be obtained by and submitted to the Materials Bureau by a representative of the Department under the following conditions:

A. Sampling Approved Operating Sources. All approved operating sources shall be sampled when:

- The latest test for a source is two (2) years old.
- A change in the character of processed coarse aggregate occurs.
- The location of the source of raw material is shifted or a change in the character of raw material occurs.
- Considered necessary by the Department.

B. Sampling Non-approved or Rejected Operating Sources. Non-approved or rejected operating sources, equipped with adequate processing facilities, may be sampled upon favorable recommendation by a Regional Director and approval by the Director, Materials Bureau. Approval action on such sources may be conditioned on the results obtained by periodic sampling and testing as prescribed by the Materials Bureau.

C. Sampling Proposed Unopened Sources of Material. Proposed unopened sources of material may be sampled upon the favorable recommendation of a Regional Director and approval by the Director, Materials Bureau. The results of tests on such samples shall be for information only and shall be interpreted as indicative of the potential quality of the source. Action in regard to acceptance or rejection of a source will be taken only after processing facilities have been installed and approved.

Stripping. All sources of coarse aggregate shall be thoroughly stripped of all inferior and objectionable material before processing operations are started and shall be kept stripped far enough from the working face to insure against undesirable material becoming mixed with the output. If undesirable material is furnished from accepted sources through faulty operation or any other cause whatsoever, the source and any objectionable material therefrom may be rejected by the Regional Director.

Annual Reports. As part of the acceptance requirements, the following information shall be submitted to the Department annually for each operating source:

A. Gravel Operations

1. A Geologic Source Report that describes the characteristics of the material to be processed during the coming year.
2. Plant Flow Information describing the processing equipment and the products to be furnished for Departmental use.

B. Quarry Operations. A Quarry Report describing the characteristics and uniformity of rock to be quarried during the coming year.

All details of these report requirements may be obtained from the Materials Bureau. The annual reports shall be received and approved by the Department before the start of the year's operations. The approval of a report does not relieve the supplier of its responsibility to provide a uniform and acceptable product.

MATERIAL REQUIREMENTS. Coarse aggregates shall consist of crushed stone, crushed gravel, screened gravel or crushed air-cooled blast furnace slag, conforming to the requirements of these specifications. All coarse aggregates shall meet the requirements for these materials as outlined in Tables 703-2, "Physical Requirements (Testing)," 703-3, "Physical Requirements (Deleterious Materials)," and 703-4, "Size of Stone, Gravel and Slag."

A coarse aggregate meeting the requirements of Tables 703-2, and 703-3 shall be accepted unless service records indicate that it is unsound or that the material is otherwise determined to be unsatisfactory by the Director, Materials Bureau. Coarse aggregate not meeting the requirements of these tables may be further evaluated by additional testing, petrographic examination, geologic studies, review of Plant Flow Information and performance history. If the results of the evaluation indicate that the aggregate should perform satisfactorily, the source may be accepted by the Director, Materials Bureau.

TABLE 703-2 PHYSICAL REQUIREMENTS (TESTING)⁽¹⁾

Magnesium Sulfate Test (703-07 P,G) ⁽²⁾ Max. percent loss by weight at 10 cycles	18	18	18	6
Freezing and Thawing Test (703-08 P,G) ⁽³⁾ Max. percent loss by weight at 25 cycles	20	20	20	-
Los Angeles Abrasion Test (703-11 P,G) Max. percent loss by weight (Grading A or B)	35 ⁽⁴⁾ 45 ⁽⁵⁾	35	35	40
Flat Particles, Elongated Particles, or Flat and Elongated Particles (ASTM D4791) Maximum percent by weight Flat and Elongated to the Degree of 5:1	10 ⁽⁶⁾	10 ⁽⁶⁾	-	-
Crushed Particles in any primary size (ASTM D5821) Minimum percent by weight				
Larger than 1/2 inch 12.5mm (1 fractured face)	-	75 ⁽⁷⁾	-	-
Smaller than 1/2 inch 12.5mm (2 fractured faces)	-	85 ⁽⁷⁾	-	-
Minimum unit weight (703-10 P,G) lbs/cu. ft.	-	-	-	70

1. To determine its conformance to specification limits, processed coarse aggregate may be tested at any point after completion of processing. The manufactured material shall be separated into the primary sizes indicated in Table 703-5, "Primary Size." Each size fraction shall conform to the requirements of §703-02 Coarse Aggregate.

2. Loss applies to No. 2 size fraction.

3. The freeze-thaw requirement applies only to aggregate used in Portland cement concrete. The loss applies to the No. 2 size fraction.

4. Loss applies to all materials excepting marble, granite, and other similar materials.

5. Loss applies to marble, granite, and other similar materials.

6. Requirement applies to coarse aggregate for use in hot mix asphalt with design ESALs of 0.3 million or greater.

7. Gravel which has not been processed through a crusher shall not be combined with crushed gravel.

A. Crushed Stone. Crushed stone shall be Material Designation 703-0201 and shall consist of clean, durable, sharp-angled fragments of rock of uniform quality. The crushed stone used as coarse

aggregate for all items shall be obtained from sources conforming to the requirements of the Department as to sampling, testing methods, Quarry Reports and any other required procedures.

B. Crushed Gravel. Crushed Gravel shall be Material Designation 703-0202 and shall consist of clean, durable, sharp-angled fragments of gravel free from coatings. A crushed particle shall be defined as one in which the total area of face fracture exceeds 25% of the maximum cross-sectional area of the particle. When two fractured faces are designated, the total area of each fractured face shall exceed 25% of the maximum cross-sectional area of the particle.

A naturally fractured face shall be acceptable providing that the sharp angular portion of the particle consists of sound material and is free from unsound or injurious coatings.

TABLE 703-3 PHYSICAL REQUIREMENTS - DELETERIOUS MATERIALS				
Maximum percent by weight in any primary size ⁽¹⁾				
Material Designation	Crushed Stone 703-0201	Crushed Gravel 703-0202	Screened Gravel 703-0203	Crushed Slag 703-0204
Shale and shale-like materials ⁽²⁾	3.0	3.0	3.0	-
Coal/Lignite/Sulfides ⁽³⁾	1.0	1.0	1.0	-
Clay lumps or Wood	0.2	0.2	0.2	-
Metal Ore ⁽⁴⁾	3.0	3.0	3.0	3.0
Other Deleterious Materials ⁽⁵⁾	3.0	3.0	3.0	3.0
Total Deleterious Materials	5.0	5.0	5.0	5.0

- (1) Coarse aggregates containing more than the specified maximum amounts of deleterious materials may be washed or otherwise processed until such specifications are satisfied.
- (2) Shale, slate, phyllite, argillite, schist, and similar shale-like fissile rocks that have been identified by performance or by test to be unsound and deleterious. Such shale-like fissile rocks may be tested separately from the rest of the aggregate by freezing and thawing according to NYSDOT Test Method 703-08 P,G. If the loss is 20% or greater, that material will be designated as deleterious shale or shale-like material.
- (3) Pyrite, marcasite, pyrrhotite, bog iron, and similar material.
- (4) Magnetite, illmenite, etc. Percentages above 3.0% may be accepted by the Director, Materials Bureau, when appropriate adjustments to yield have been made.
- (5) Cemented clusters, weathered particles, and similar material.

TABLE 703-4⁽¹⁾ SIZES OF STONE, GRAVEL AND SLAG											
Size Designation	Screen Sizes										
	4 in	3 in	2 1/2 in	2 in	1 1/2 in	1 in	1/2 in	1/4 in	1/8 in	# 80	#200⁽³⁾

4A	-	100	90-100	-	0-20	-	-	-	-	-	0-0.7
4	100	90-100	-	0-15 0-15	-	-	-	-	-	-	0-0.7
5	90-100	0-15	-	-	-	-	-	-	-	-	0-0.7

- (1) Percentage by weight passing the following square openings.
- (2) Screenings shall include all of the fine material passing a 1/4 in. screen.

(3)The minus No. 200 material requirements apply only to aggregate for use in portland cement concrete, surface treatment, cold mix bituminous pavements and underdrain filter material.. The test (NYSDOT 201) will be performed on the entire sample of the designated size aggregate. Primary size does not apply in the determination of the minus No. 200 material.

TABLE 703-5 ⁽¹⁾ SIZES OF CRUSHED GRAVEL, STONE, AND SLAG FOR SLURRY								
Size Designation	Screen Sizes							
	3/8 in	No. 4	No. 8	No. 16	No. 30	No. 50	No. 100	No. 200 ⁽²⁾
2MS	100	90-100	65-90	45-70	30-50	18-30	10-21	5-20.0
3MS	100	70-90	45-70	28-50	19-34	12-25	7-20	5-20.0

(1)Percentage by weight passing the following square openings.

(2)Determine percent passing No. 200 sieve according to AASHTO T 11, Materials Finer than No. 200 Sieve in Mineral Aggregates by Washing.

The crushed gravel used as coarse aggregate for all items shall be obtained from sources conforming to the requirements of the Department as to sampling, testing methods, Geologic Source Reports, Plant Flow Information, and any other required procedures.

C. Screened Gravel. Screened gravel shall be Material Designation 703-0203 and shall consist of clean, durable gravel free from coatings.

Screened gravel may consist of all uncrushed particles and shall be obtained from sources conforming to the requirements for crushed gravel.

TABLE 703-6 PRIMARY SIZES					
Size Designation	Primary Screen Sizes		Size Designation	Primary Screen Sizes	
	Passing	Retained		Passing	Retained
1B	1/8 in	No. 80	3A	1 1/2 in	1 in
1A	1/4 in	1/8 in	3	2 in	1 in
1ST	1/2 in	1/4 in	4A	2 1/2 in	1 1/2 in
1	1/2 in	1/4 in	4	3 in	2 in
2	1 in	1/2 in	5	4 in	3 in

D. Crushed Slag. Crushed slag particles shall be Material Designation 703-0204 and shall consist of hard, durable, angular fragments which are reasonably uniform in density and quality; free from injurious amounts of sulphur; and reasonably free from thin, elongated pieces, dirt, or other objectional matter. All crushed slag shall be obtained from approved sources conforming to the requirements of the Department as to sampling, test methods and any other required procedures.

Gradation. The sizes of all stone, gravel or slag used under these specifications shall conform to the gradation requirements for the various sizes tabulated in Table 703-4.

All crushing plants shall be fitted with tailing chutes so that no aggregate will reach the bins other than that which passes through the proper screens.

Primary Size. For the purposes of this specification, the term “Primary Size” shall be defined for each size designation as all of the material passing and retained on the screens specified in Table 703-5 “Primary Sizes.”

TESTS. The details of test methods for coarse aggregate may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of the source is determined on the basis of tests performed by the Materials Bureau on samples representing the source; review of Quarry Reports; Geologic Source Reports and Plant Flow Information; petrographic examination and other geologic studies; and performance history where applicable. The material is incorporated into the work on the basis that it is

from an approved source conforming to procedural requirements of Department and that the aggregate shall meet gradation at the point of use.

Aggregate for use in the manufacture of precast concrete units may be accepted on the basis of stockpile approval at a location acceptable to the Department on a per job basis. Requests for stockpile approval shall be made in writing to the Materials Bureau. The manufacturer shall allow at least ninety (90) days for the testing and evaluation of the aggregate.

703-03 MORTAR SAND

SCOPE. This specification contains the requirements for sand used in mortar.

GENERAL. §703-01, Fine Aggregate shall apply except as modified herein.

MATERIAL REQUIREMENTS. When dry, mortar sand shall meet the following gradation requirements:

Sieve Size		No. 4	No. 8	No. 50	No. 100
Percent Passing by Weight	100	95-100	10-40	0-15	

Concrete sand, §703-07, will be permitted as an alternative to mortar sand.

TEST. Test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The provisions of §703-01, Fine Aggregate, shall apply.

703-04 GROUT SAND

SCOPE. This specification contains the requirements for sand used in grout.

GENERAL. §703-01, Fine Aggregate, shall apply except as modified herein.

MATERIAL REQUIREMENTS. When dry, the grout sand shall meet the following gradation requirements:

Sieve Size	Percent Passing by Weight
No. 16	100
No. 100	0-10

The sand may be determined to be unacceptable for grout sand if it contains more than 6 percent by volume of loam and silt.

TEST. Test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The provisions of §703-01, Fine Aggregate, shall apply.

703-05 FINE AGGREGATE FOR WHITE PORTLAND CEMENT CONCRETE

SCOPE. This specification contains the requirements for white fine aggregate used in the white portland cement concrete.

MATERIALS REQUIREMENT. Material Specification 703-01, Fine Aggregate, shall apply except as modified herein. The aggregate shall be white, having a Munsell color with a value of 8 or greater and a chroma saturation of 2 or less, when compared to a set of standard color chips. Gradation shall conform to the specification requirement under § 703-07, Concrete Sand.

§703

TEST. The details of the test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The provisions of §703-01 Fine Aggregate, shall apply except that the color will be accepted on a per stockpile basis by the Director, Materials Bureau.

703-06 CUSHION SAND

SCOPE. This specification contains the requirements for cushion sand used for concrete block slope paving.

GENERAL. Material for cushion sand shall meet the requirements specified herein.

MATERIAL REQUIREMENTS. Cushion sand shall consist of clean, hard, durable, uncoated particles, free from lumps of clay and all deleterious substances.

When dry, the cushion sand shall meet the following gradation requirements:

Sieve Size	1/4 in	No. 50	No. 100	
Percent Passing by Weight		100	0-35	0-10

The sand may be determined to be unacceptable for cushion sand if it contains more than 10 percent by volume of loam or silt.

TEST. Test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The cushion sand is accepted on the basis of gradation tests and visual inspection, unless otherwise specified, at the point of use.

703-07 CONCRETE SAND

SCOPE. This specification contains the requirements for sand used in portland cement concrete.

GENERAL. §703-01, Fine Aggregate, shall apply except as modified herein.

MATERIAL REQUIREMENTS. When dry, the fine aggregate for portland cement concrete shall conform to the following gradation requirements:

Sieve Size	Percent Passing By Weight	
	Minimum	Maximum
3/8 in	100	
No. 4	90	100
No. 8	75	100
No. 16	50	85
No. 30	25	60
No. 50	10	30
No. 100	1	10
No. 200 (Wet)	0	3

TEST. Test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The provision of §703-01, Fine Aggregates, shall apply.

703-08 MINERAL FILLER

SCOPE. This specification contains the requirements for mineral filler used in bituminous concrete mixtures.

MATERIAL REQUIREMENTS. Mineral filler shall conform to the requirements of the standard specification for Mineral Filler for Bituminous Paving Mixture, ASTM D242.

When dry, the mineral filler shall meet the following gradation requirements:

Sieve Size	No. 30	No. 50	No. 200		
Percent Passing by Weight			100	95-100	70-100

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the producer's certification of compliance with these specification requirements.

703-09 RECLAIMED ASPHALT PAVEMENT (RAP)

SCOPE. This specification covers the material requirements for reclaimed asphalt pavement (RAP) for use in asphalt pavement recycling.

The provisions of Section 403 - Hot Mix Asphalt Concrete Pavement shall apply except that the Contractor has the option of recycling reclaimed asphalt pavement (RAP). RAP may be recycled in any of the following mixes or applications:

- Asphalt Concrete - Type 1 Base
- Asphalt Concrete - Type 3 Binder
- Asphalt Concrete - Type 6 Top (for shoulders)
- Asphalt Concrete - Truing and Leveling

If the contractor chooses the recycling option, the following modifications to the specification requirements shall apply:

MATERIAL REQUIREMENTS. RAP shall consist of asphalt pavement recovered from an asbestos free pavement by cold milling or other removal techniques approved by the Regional Director or his/her representative.

The aggregate component of the RAP shall meet the requirements of Section 703, Aggregates. The bitumen component of the RAP shall be asphalt cement and shall be free of significant contents of solvents, tars or other contaminating substances that will make the RAP unacceptable for recycling as determined by the Department. The RAP shall be separated according to specific pavement source by the Contractor unless otherwise permitted by the Regional Director or his/her representative.

The Department will use one of the following procedures to approve the RAP quality:

A. RAP obtained from an asbestos-free pavement which was constructed with asphalt cement, and with aggregates that meet the current requirements of Section 703, Aggregates, will be approved by the Regional Director or his/her representative.

B. If the source of the RAP or its quality is not known, the Contractor shall submit the following to the Department at least 30 calendar days prior to the start of paving:

1. Designated use of the RAP and approximate proportions.
 2. A 5 pound (minimum) sample representing the RAP to be incorporated into the recycled mixture.
 3. A 5 pound (minimum) sample of the aggregate extracted from the RAP for petrographic examination.
 4. The penetration test result (77°F, 100 g, 5 s) of the bituminous material recovered from the RAP.
- The Department will determine the acceptability of the RAP for the designated use. Details for sampling and testing the RAP are available from the Materials Bureau.

Composition of Mixtures. The blend percentage of RAP shall be selected within the limits shown in Table 703-09A:

TABLE 703-09A	
Plant Type	% Reclaimed Material, Maximum
Drum Mixer	70
Batch	50

The recycled mixture of RAP, new aggregate and added asphalt cement shall meet the requirements specified in Table 401-1, Composition of Bituminous Plant Mixtures for aggregate gradation, asphalt cement content and temperature range.

Mix Design for bituminous mixtures containing RAP shall be submitted in accordance with the procedures outlined by Department written instructions. The mix design shall be submitted to the Regional Director or his/her representative a minimum of fourteen (14) calendar days prior to the scheduled start of work.

Bituminous Materials. The added asphalt cement may be AC 20, AC 15, AC 10, AC 5, AC 2.5 or other asphalt cement grades approved by the Director, Materials Bureau. The resultant penetration of the combined asphalt cement (reclaimed bitumen and added asphalt cement) prior to plant mixing shall be between 70 and 105. The grade of asphalt cement selected by the Contractor shall be in accordance with Department written instructions.

Stockpile Materials. RAP from each pavement source shall be stockpiled on a free draining base separately from other aggregate or RAP sources. Department accepted RAP stockpiles shall be positively identified. The RAP shall be reclaimed from the stockpiles without contamination by foreign materials. Prior to entry into the RAP feed bin, the RAP shall have a reasonably uniform gradation from coarse to fine with 100 percent passing the 2 inch sieve.

The maximum allowable RAP blend percentages for given RAP stockpile moisture contents are given in Table 703-9B. These limits shall apply to all plants as indicated.

Plant Equipment. RAP shall be fed into the plant by equipment specifically designed for recycling and shall be approved by the Director of the Materials Bureau. Scalping screens, grizzlies or similar devices shall be installed on the RAP feed bin(s) to remove any debris or other foreign material in excess of 4 inches.

TABLE 703-9B ALLOWABLE RAP BLENDING PERCENTAGES		
RAP MOISTURE CONTENT (%)	MAXIMUM RAP (%)	
	(Batch Plant)	(Drum Mixer)
0.0 - 0.9	50	70
1.0 - 1.9	45	50
2.0 - 2.9	40	45
3.0 - 3.9	35	40
4.0 - 4.9	30	35
5.0 - 5.9	25	30
6.0 and over	20	25

Batch Plants. RAP shall be last in the aggregate weighing sequence. RAP draw weight(s) shall be increased to compensate for the moisture content. Total mix time shall be 60 seconds minimum. In addition, all requirements pertaining to aggregates shall apply to RAP including the equipment requirements for automatic proportioning and recordation stipulated for aggregates in §401-3.02.

Drum Mix Plants. The RAP shall be fed into the drum so that it will not come in direct contact with the burner flame. Mixing of RAP with new aggregate shall occur before the bituminous material introduction

point. All requirements pertaining to aggregates shall apply to RAP. The equipment for automatic proportioning and recordation of RAP shall meet the requirements for aggregates in §401-3.02. In addition, RAP shall be added with a maximum variation of 0.5 percent of the total weight of bituminous mixture per interval of time. The recordation shall also record accumulated dry RAP weights separately from aggregates.

Retained Moisture in Mixture. The moisture content of the mixture upon discharge from the mixer shall not exceed 0.5 percent when tested in accordance with Department written instructions.

METHOD OF MEASUREMENT. The provisions of subsection 401-4, Method of Measurement shall apply except that recorded batch weights will not be permitted for determination of the ~~tons~~ ~~metric tons~~ of mixture being delivered to the work site.

BASIS OF ACCEPTANCE. The RAP will be accepted on the basis of one of the following:

1. Certification from the Contractor that the RAP from a specific pavement which was constructed with asphalt cement and aggregates that meet current specification requirements.
2. Analysis of RAP and its components by the Department.

703-10 LIGHTWEIGHT AGGREGATES

SCOPE. This specification covers the material details and quality requirements for lightweight aggregates generally used in structural portland cement concrete.

GENERAL. The provisions of Sampling, Stripping and Annual Reports under §703-02 Coarse Aggregate shall apply, except that in addition under 2. Quarry Operations, plant flow information describing the processing equipment shall be provided.

MATERIAL REQUIREMENTS. The lightweight aggregates shall be prepared by expanding or sintering materials such as shale, slate, clay, fly ash or blast furnace slag. The requirements of ASTM C330 shall apply except as modified in these specifications. In addition to ASTM C330, the lightweight aggregates shall meet the requirements given in Table 703-10, Lightweight Aggregate Requirements (Testing). The Durability Factor of concrete made from lightweight aggregates shall not be less than 80 percent.

A lightweight aggregate meeting the requirements of this specification shall be accepted unless service records indicate that the aggregate is unsound or that the material is otherwise determined to be unsatisfactory by the Director, Materials Bureau. Lightweight aggregates not meeting these requirements may be further evaluated by additional testing, petrographic examination, geologic studies, a review of the lightweight aggregate processing and the performance history. If the results of the evaluation indicate that the lightweight aggregate should perform satisfactorily, the material may be accepted by the Director, Materials Bureau.

Test. Sampling procedure instructions and test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of lightweight aggregates is determined by the Director, Materials Bureau on the basis of tests performed by the Materials Bureau on representative samples of the materials; review of Quarry Reports and Plant Flow Information; petrographic examination and other geologic studies; and performance histories where applicable. The material is incorporated into the work on the basis that it is accepted and conforms to procedural directives of the Department and the aggregate shall meet the gradation requirement at the point of use.

TABLE 703-10 LIGHTWEIGHT AGGREGATE REQUIREMENTS (TESTING)		
Test Method	Fine Aggregate	Coarse Aggregate

SECTION 704 - MASONRY UNITS

704-01 COMMON BRICK

SCOPE. This specification covers the material and quality requirements for common brick, made from clay or shale, used in the construction of drainage structures and manholes.

MATERIAL REQUIREMENTS. Brick shall conform to the requirements of ASTM C32, Grade MS, including the requirement for saturation coefficient. Common brick may be furnished in any of the designated standard sizes that will produce the required dimensions in the completed structure, and the bricks shall be solid.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A minimum of 10 full-size bricks of the same size and style will be required. Samples will be tested for the physical properties identified in ASTM C32. Tests will be performed in accordance with ASTM 67.

BASIS OF ACCEPTANCE. Common brick will be accepted on the basis of a material certification that specifies the product conforms to this specification.

704-02 CONCRETE BRICK

SCOPE. This specification covers the material and quality requirements for concrete brick used in brick masonry construction.

MATERIAL REQUIREMENTS. Concrete brick shall conform to the requirements of ASTM C55 Grade N, except as noted herein. Materials used in the manufacture of concrete brick shall meet the requirements of the following subsections:

- Portland Cement 701-01
- Coarse Aggregate 703-02
- Mortar Sand 703-03
- Grout Sand 703-04
- Concrete Sand 703-07
- Fly Ash 711-10
- Ground, Granulated Blast-Furnace Slag 711-12
- Water 712-01

Fly ash or ground, granulated blast-furnace slag may be substituted up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

The nominal dimensions of the brick shall be 8 inches long, 4 inches wide, and 2 2/3 inches in height.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A total of 10 full-size bricks of the same size and style will be required.

Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140.

The manufacturer shall be responsible for having brick tested for linear drying shrinkage in accordance with ASTM C55. A copy of the test report shall be included with the samples submitted to the Department for compression and absorption testing.

BASIS OF ACCEPTANCE. Concrete brick will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

704-03 PRECAST CONCRETE - GENERAL

SCOPE. This specification covers the general material and quality requirements for precast concrete items produced in accordance with the current Materials Procedure for precast concrete QC/QA titled "Procedures For Achieving And Maintaining Precast Concrete Manufacturer's Approved List Status". It is intended for use in conjunction with the individual item specifications.

MATERIAL REQUIREMENTS. The Portland Cement Concrete shall meet the requirements in §501, Portland Cement Concrete - General; §501-2.02, §501-2.03 and §501-3.02 except as noted herein.

Type 1, 2 or 3 cement may be used. The manufacturer may substitute pozzolans up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Certain aggregates appear in the Approved List of Sources of Fine & Coarse Aggregates that have use limitations with a high alkali portland cement. When requested, the Materials Bureau may approve this combination when 15-20% by weight of the cement in the mix is replaced with fly ash.

The concrete shall have an air content of 5.0 to 9.0%. Unless noted otherwise in the contract documents, approved fabrication drawings or item specification, the minimum compressive strength of concrete used in precast units shall be 3000 psi @ 28 days.

Threaded inserts used to connect reinforcing steel to precast concrete shall be non-corrosive and shall have a tensile capacity of at least 50% of the yield strength of the reinforcing steel.

The use of galvanized reinforcing in place of specified epoxy coated reinforcing is allowed. If galvanized reinforcing is used, all reinforcing in the unit must be galvanized. The use of galvanized dowels to attach secondary pours, requires all reinforcing in secondary pours to be galvanized. When galvanized wire fabric for concrete reinforcement is used, it shall be galvanized in accordance with ASTM A123. Fabrication, including bending of fabric, shall be performed prior to galvanizing.

Additional materials, listed below, shall meet the requirements of the following subsections:

Concrete Repair Material	701-04
Bar Reinforcement, Grade 60	709-01
Wire Fabric For Concrete Reinforcement	709-02
Epoxy Coated Bar Reinforcement, Grade 60	709-04
Epoxy Coated Wire Fabric Reinforcement	709-08
Cold-Drawn Wire For Concrete Reinforcement	709-09
Mechanical Connectors for Reinforcing Bar Splices (Epoxy Coated)	709-10
Galvanized Bar Reinforcement	709-11
Quilted Covers (for curing)	711-02
Plastic Coated Fiber Blankets (for curing)	711-03
Polyethylene Curing Covers (White Opaque)	711-04
Membrane Curing Compound (Clear w/Fugitive Dye)	711-05
Burlap	711-06
Corrosion Inhibitor	711-13

DRAWINGS. Precast concrete units shall be fabricated to conform to the details contained in the plans and contract documents. Fabrication Drawings shall be one of the following:

A. Contract Plan Sheets. When the contract plans contain enough detail to properly fabricate and inspect the precast element they may be used as the fabrication drawings. The Materials Bureau will determine whether or not the contract plans contain enough detail.

B. Department Standard Sheets. When Department Standard Sheets are referenced in, and are in compliance with the contract plans, the Standard Sheet shall be used as the fabrication drawing.

C. Fabricator Working Drawings. When the contract plans do not contain enough detail to be used as fabrication drawings and there is no Department Standard Sheet for the precast element or the Standard Sheet is not in compliance with the contract plans, Fabricator Working Drawings shall be used as the fabrication drawings.

D. Fabricator Standard Drawing. Fabricator Standard Drawings, previously approved by the Director, Materials Bureau, which meet the requirements of the contract plans, may be used as the fabrication drawings in place of Contract Plan Sheets, Department Standard Sheets or Fabricator Working Drawings.

Fabrication Drawings shall be prepared and processed in accordance with the current Materials Procedure for Preparing And Processing Fabrication Drawings For Precast Concrete Products.

FABRICATION. The manufacturer shall produce precast units that conform to the details of the approved fabrication drawings. The precast units shall be uniform in appearance. All concrete surfaces which will be exposed to view after installation shall be flat and smooth, free from irregularities and uniform in color and texture. The Department, and its representatives, shall have free access to the manufacturing facility and all products produced for the Department.

Formwork. Concrete shall be cast in rigidly constructed forms which will maintain the units within specified tolerances to the shapes, lines and dimensions shown on the approved fabrication drawings. Forms shall be constructed from flat, smooth, non-absorbent material and shall be sufficiently tight to prevent the leakage of mortar. When wood forms are used all faces in contact with the concrete shall be laminated with a non-absorbent material. All worn or damaged forms which cause irregularities on the concrete surface or damage to the concrete during form removal shall be repaired or replaced before being reused. Form coatings, appearing on the Department's Approved List, shall be applied to all forms.

Lifting Devices. Lifting devices shall be a recessed type designed for use in precast concrete. The precast manufacturer shall ensure that the lifting devices selected for use have an adequate capacity to safely handle the precast product. Reinforcing steel shall not be used as a lifting device. Lifting devices that are used for turning or rotating a unit at the precast facility but are not necessary for further handling or installation shall be filled with concrete repair material before the unit is shipped. All other lifting devices shall be filled with concrete repair material after the unit is installed.

Reinforcing. Shall meet the requirements in §556, Reinforcing Steel for Concrete Structures; §556-3.01B and C, §556-3.02A and §556-3.03A through §556-3.03C. Unless noted otherwise in approved fabrication drawings or item specification, the minimum concrete cover over reinforcing steel shall be 1 1/2 inch. Reinforcing steel shall be tied and supported to keep it in position during the concrete placement. The ends of chairs or spacers, used to support or locate reinforcing steel, that bear on the faces of forms, shall be made of, or coated with, non-corrosive material so that no discoloration will show on the face of the units. Chairs, tie wires and other devices used to support, position or fasten epoxy coated or galvanized reinforcement shall be made of or coated with a dielectric material. Tack welding or any other welding of specified steel reinforcement will not be allowed. Welding for cage stability will be permitted provided that redundant steel is added in each direction and tied to the cage. The redundant steel shall be thirty (30) bar diameters, minimum, in length and shall be positioned so that the midpoint is located at the weld.

Corrosion Inhibitor. When allowed by the individual item specification, corrosion inhibitor may be used in lieu of epoxy coated reinforcing. When corrosion inhibitor is selected for use it shall be clearly

noted on the fabricator working drawing or in the fabrication request when standard sheets, contract plan sheets, etc are used as the fabrication drawings. When selected for use, corrosion inhibitor shall be used in all units produced to the referenced fabrication drawings. The corrosion inhibitor shall be added to the concrete as an aqueous solution at a dosage rate of 4 gal/cy.

The calcium nitrite, which acts as an accelerator, may be used in conjunction with compatible retarding admixtures to control setting time and workability of the concrete, however the use of a formulation of calcium nitrite solution which includes a set control ingredient may be used if setting times and increased water demands are of concern, consult the manufacturer of the product. The corrosion inhibitor must be added to the mix immediately after air entraining and retarding admixtures have been introduced into the batch.

When a batching problem exists or is perceived the Department reserves the right to test the hardened concrete at any time to verify the quantity of calcium nitrite present. Units with less than the specified amount of calcium nitrite shall be subject to rejection. If hardened concrete is tested, 4 inches diameter cores shall be drilled by the manufacturer under the supervision of a Department representative. Cores shall be a minimum of 4 inches in length unless otherwise approved by the Materials Bureau. Core holes shall be plugged and repaired in accordance with the requirements of repair indicated below.

Concrete Placement And Consolidation. Suitable means shall be used for placing concrete to prevent segregation. The concrete shall be thoroughly consolidated by external or internal vibrators or a combination of both, unless otherwise approved by the Materials Bureau. Vibrators shall not be used to move concrete within the forms. Concrete shall be placed and consolidated in a way that minimizes the presence of surface voids or bug holes on the formed surfaces.

Cold Weather. When concrete is cast in ambient temperatures less than 50°F the following requirements shall apply:

- A. Immediately before concrete placement the minimum temperature inside the forms shall be 40°F.
- B. Immediately following completion of the placement the requirements of the chosen curing method shall be followed.
- C. Concrete temperatures required by the chosen curing method shall be maintained by means of an external indirect heat supply or by utilizing the heat of hydration. Curing temperatures shall not exceed 85°F unless units are steam cured in accordance with this specification. When an external heat supply is used the enclosure shall be properly vented to prevent surface disintegration of the fresh concrete due to an accumulation of carbon dioxide gas.
- D. The plastic concrete shall not be exposed to freezing temperatures after it has been placed into the forms or during the curing period.

Dimensional Tolerances. The following tolerances shall apply, unless noted otherwise in the contract documents, approved fabrication drawings or item specification:

- Unit dimensions ±1/2 inch
- Variations in required spacing of reinforcing steel, not cumulative. ±2 inches
- Concrete cover over reinforcing steel +5/8 inch
-1/4 inch
- All reinforcing steel fabrication tolerances shall conform to ACI 117 sec 2.1.
- All reinforcing steel embedded and lap length tolerances shall conform to ACI 117 sec 2.2.8.

The application of fabrication tolerances shall not impact the proper fit, alignment or function of the assembled precast item, nor shall it negatively impact the appearance of precast items which are exposed to view after installation.

Architectural Treatments

A. Architectural Patterned And Textured Precast Concrete. The architectural pattern or textured effect called for in the contract plans shall be obtained by using form liners, stamping equipment or other texturing tools recommended by the manufacturer. Details of the architectural

pattern or texture and the fabrication method used shall be shown on the fabrication drawings for the precast item. Concrete surfaces treated with form liners or by stamping shall have a repeatable, seamless pattern such that when installed the units will form a continuous, natural looking, matching and repeatable pattern. Surfaces treated with texturing tools shall be uniform in appearance. When form liners are used, a high quality release agent compatible with the form liner material shall be used. Form liners which are worn or damaged resulting in a non-uniform appearance or damage to the concrete during form removal shall be replaced. Fabrication drawings shall clearly show the design thickness of the precast element and the thickness being added by the architectural pattern or texturing. The architectural pattern or texturing shall not penetrate into the required concrete cover over the reinforcing steel at any point.

B. Exposed Aggregate Precast Concrete. Coarse aggregate shall meet the color and size requirements in the plans. When no size is specified a Type CA1 gradation, or equal approved by the Director, Materials Bureau, shall be used. A set retarder designed for use in exposed aggregate applications shall be used. Surfaces requiring an exposed aggregate finish shall be uniform in appearance with the surface completely covered with exposed aggregate. A set retarder shall be applied, in accordance with the manufacturers recommendations, to the surfaces receiving the exposed aggregate finish. Alternate methods of obtaining the exposed aggregate finish require prior approval of the Director, Materials Bureau. Unless otherwise shown in the contract plans, the depth of exposure shall be 30% of the primary size of the coarse aggregate. The depth of exposure shall be measured by laying a straight edge across the plane of the concrete face and measuring back to the concrete matrix.

C. Integral Coloring. Integrally colored concrete shall be produced by use of a pigment coloring system meeting the requirements of ASTM C979. For each color used the pigment shall be from the same batch or lot unless otherwise approved by the Director, Materials Bureau. Pigment will be approved based on a manufacturers certification of compliance with these requirements. Type 6 white cement, meeting the requirements of §701-01, may be used to achieve the desired color. Coloring pigment shall be added to the concrete mix per manufacturer's recommendations, at a dosage rate to achieve the desired color as specified in the contract documents. The manufacturer's recommended maximum dosage rate shall not be exceeded.

D. Visual Standards. The Contractor shall construct visual samples that are the same general size and shape as the production units they represent. The samples must be submitted to the Regional Landscape Architect for written approval. Each of the patterns, textures and colors identified in the plans shall be represented by the samples. Only one pattern or texture shall be used per sample face. When multiple patterns or textures are called for, additional samples will be required. Materials and fabrication techniques used in the samples, including curing, concrete pigment and sealers, shall be the actual materials and techniques to be used in the construction of the final product. If the samples are rejected by the Landscape Architect, the Contractor shall construct additional samples as required to obtain the Landscape Architect's approval. The approved samples shall be made available at the precast plant, for use by the inspector as visual standards, throughout production of the units. When surface coatings are to be field applied additional samples, without the surface coatings, shall be prepared and retained at the precast plant for use as visual standards. The fabrication of precast concrete units shall not begin until written approval of the visual standards has been received from the Department.

E. Visual Evaluation. When comparing production units against the visual standards there shall be minimal color and texture variations, from the standard, when viewed in good typical lighting at a 20 foot distance. When viewed alone, production units shall show no obvious imperfections or evidence of repairs other than minimal color and texture variations when viewed in good typical lighting at a 20 foot distance.

Curing. All precast concrete units shall be subjected to curing by any one of the methods described in the following paragraphs. The manufacturer shall provide minimum/maximum temperature

thermometers to monitor curing temperatures unless otherwise specified. If, at any time, curing temperatures fall below the specified minimum for the chosen curing procedure, the curing period shall be increased accordingly.

Except as noted under D. Moisture Retention Curing, no unit shall be subjected to freezing temperatures until the following two conditions are met:

- The chosen curing cycle has been completed.
- The specified 28 day compressive strength or 3000 psi, whichever is less, has been reached.

Cylinders shall be cured in the same manner and maintained in the same temperature and environmental conditions as the units they represent until being tested.

A. Steam Curing. The units shall be cured in a suitable enclosure. The enclosure shall be designed to minimize the loss of heat and moisture while allowing for the uniform circulation of steam around the entire unit. The interior surfaces of the enclosure and the surface of the unit shall be moist at all times. Steps shall be taken to prevent localized "hot spots" caused by the steam lines. The enclosure shall be free from outside drafts.

Steam curing shall not begin until a preset period has been completed. The preset period begins when the last concrete has been placed and continues until the concrete obtains initial set. Prior written approval from the Director, Materials Bureau is required when preset periods of less than two hours are to be used. During the preset period, moderate heat may be applied to the enclosure to maintain the initial temperature of the concrete. The maximum temperature inside the enclosure during the preset period shall be the initial temperature of the concrete +10°F.

After the preset period is complete, steam shall be injected into the curing enclosure. The temperature inside the enclosure shall not be increased at a rate greater than 40°F per hour. A moist atmosphere shall be maintained at a temperature between 105°F and 185°F for a period of not less than 12 hours. The temperature inside the enclosure shall then be decreased at a rate not exceeding 40°F per hour until the ambient temperature outside the enclosure is reached. The manufacturer shall provide automatic temperature recorders to continuously record the curing temperature inside the enclosure.

B. Water Spray Curing. Curing shall begin as soon as the concrete has hardened sufficiently to prevent surface damage from the water spray but not more than 2 hours after the completion of finishing. All exposed surfaces of the precast unit shall be kept wet with a continuous fine spray of water in an enclosure maintained at a temperature of not less than 70°F for a period of not less than 72 hours. Additional curing time may be necessary to meet the 28 day strength requirements.

C. Saturated Cover Curing. The saturated covers used under this method shall be burlap. Curing shall begin as soon as the concrete has hardened sufficiently to prevent surface damage from the saturated burlap but not more than 2 hours after the completion of finishing. All exposed concrete surfaces on the precast unit shall be covered with burlap, saturated with water before applying. The burlap shall be kept saturated and the units kept at a temperature of not less than 70°F for a period of not less than 72 hours. Additional curing time may be necessary to meet the 28 day strength requirements.

D. Moisture Retention Curing. Units cured in accordance with these methods shall be maintained at a temperature of not less than 45°F for a period of not less than 7 days except as noted below. Additional curing time may be necessary to meet the 28 day strength requirements. When the specified 28 day compressive strength or 3000 psi, whichever is less, has been reached the unit may be exposed to freezing temperatures however the membrane curing compound or curing covers must still be maintained for a minimum of 7 days.

1. Membrane Curing Compound. The membrane curing compounds used under this method must appear on the Department's current Approved List of Membrane Curing Compounds under B. Clear (with fugitive dye). The compound shall be properly agitated

immediately before each use. A minimum coverage rate of one gallon per 150 square feet shall be used.

The membrane curing compound shall be applied to the concrete surface after finishing as soon as the free water on the surface has disappeared and no water sheen is visible, but not so late that the liquid curing compound will be absorbed into the concrete. When curing compound cannot be applied within the above requirements, the manufacturer shall instead immediately begin curing the unit in accordance with one of the other curing methods contained in this specification, until curing compound can be applied.

If the forms are left on for a minimum of 7 days, curing compound is not required on any formed surfaces. When the forms are removed prior to 7 days, the exposed concrete surfaces shall be wet with water within one half hour of form removal and shall be kept moist until the curing compound is applied. Before application, the concrete shall be allowed to reach a uniformly damp appearance with no free water on the surface and then the compound shall be applied immediately.

This method of curing shall not be used on any concrete surface which is to have plastic concrete, grout or mortar bonded to it or on any concrete surface that will have a penetrating or coating type treatment such as a sealer or stain applied to it. Another approved method of curing shall be used when this condition exists.

2. Curing Covers. The curing covers used under this method shall be either Plastic Coated Fiber Blankets, §711-03, appearing on the Department's Approved List or Polyethylene Curing Covers meeting the requirements of §711-04. Curing covers shall be placed immediately following the finishing operation or form removal, whichever is applicable. Care shall be taken not to damage any exposed concrete surfaces during cover placement. Curing covers shall be placed and secured and be of such condition as to minimize the loss of moisture and temperature. When it is necessary to use more than one curing cover the edges shall be lapped a minimum of 12 inches.

E. Other Methods. Other Methods of curing are subject to approval by the Director, Materials Bureau.

Repair. Precast concrete units that contain minor defects caused by manufacture or mishandling shall be repaired at the manufacturing site. In addition, units that contain minor defects caused by mishandling during shipment or installation shall be repaired at the project site. When repairs are made to a unit that has been sprayed with curing compound, the compound must be removed from the repair area before making the repair as it will act as a bond breaker between the precast concrete and the repair material. Major defects and non repairable defects in a unit will be cause for rejection of the unit. Defects are defined as follows:

A. Surface Defects. Surface voids or bugholes which are less than 5/8 inch in diameter and less than 1/4 inch deep are acceptable, except as noted under D. of this section. Surface defects need not be repaired.

B. Minor Defects. Minor defects are defined as: spalls, honeycombing and surface voids which have no dimension greater than 12 inches, when measured along a straight line, and do not expose the reinforcing steel. Minor defects shall be repaired by removing all unsound concrete from the defect, square cutting the edges of the defect to prevent feather edging of the repair and then filling the void with concrete repair material meeting the requirements of §701-04. Concrete repair material shall have a color similar to that of the precast unit. The repair shall be finished to the proper shape and cured in accordance with the repair material manufacturer's recommendations. It shall withstand a moderate blow with a 16 oz hammer. The blow shall produce a sharp ring indicating proper bonding of the repair.

C. Major Defects. Major defects are defined as: spalls, honeycombing and surface voids which have any dimension greater than 12 inches, when measured along a straight line, or expose the

reinforcing steel. Cracks which go through the section or are greater than 0.01 inch in width are also major defects.

No major defect shall be repaired without prior approval of the Department. Requests to repair major defects shall be made in accordance with the requirements contained in the current Materials Procedure for precast concrete.

D. Non Repairable Defects. Non repairable defects are defined as: cracks in a concrete surface, which will be exposed to view after installation, that are visible when viewed in good typical lighting with the naked eye at a 10 foot distance; minor defects which in total make up more than 5% of the surface area of the unit and excessive surface defects on more than 5% of the surface area which will be exposed to view after installation.

SAMPLING AND TESTING. Sampling and testing shall be done by the precast manufacturer in accordance with Materials Bureau requirements contained in the current Materials Procedure for precast concrete.

MARKING. All precast units shall be clearly marked with permanent waterproof paint. Unless noted otherwise in the item specification, units shall be marked on an inside or back surface which will not be exposed to view after installation. The following information shall be included:

- Name or trademark of the manufacturer.
- Date of manufacture.
- Unique piece identification number.
- NYSDOT Contract number.

FINAL PRODUCTION INSPECTION. A final production inspection shall be performed by the precast manufacturer on every precast unit produced for the Department. An inspection will be considered satisfactory when it verifies that the precast unit is in compliance with the appropriate Department specifications. The specific requirements and procedures for the inspection are contained in the precast manufacturer’s Department approved Quality Control Plan.

SHIPPING. Upon completion of a satisfactory final production inspection the precast unit may be shipped from the manufacturing location except that units produced between the dates of October 31st and April 1st shall not be shipped for a minimum of 72 hours following the completion of casting.

BASIS OF ACCEPTANCE. Precast units will be accepted at the job site based on the following:
 The manufacturer’s name must appear on the Department’s Approved List for the item being supplied.
 A manufacturer’s certification.
 An acceptable product evaluation made by the Engineer.

704-04 CONCRETE BLOCK (SLOPE PAVING)

SCOPE. This specification covers the material and quality requirements for solid concrete block for use in concrete block slope paving.

MATERIAL REQUIREMENTS. Materials used in the manufacture of concrete block shall meet the requirements of the following subsections:

Portland Cement	701-01
Coarse Aggregate	703-02
Mortar Sand	703-03
Grout Sand	703-04
Concrete Sand	703-07
Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12

Fly ash or ground granulated blast furnace slag may be substituted for up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

Physical Properties. The average compressive strength of five full-size blocks shall be not less than 2500 psi, with no individual block less than 2000 psi. The average freeze/thaw loss of five block samples, subjected to 42 freeze/thaw cycles in a 3% NaCl solution, shall not exceed 1.0%, with no individual sample exceeding 1.5%.

Block dimensions shall be as required in the contract documents. Dimensions shall not vary by more than 1/4 inch from those specified. Blocks shall be sound and free from cracks or other defects that would interfere with their proper placement or performance.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A minimum of 5 full-size blocks of the same size and style will be required for compression testing. A minimum of five samples, prepared by the manufacturer in accordance with ASTM C1262, will be required for freeze/thaw testing.

Samples will be tested for compressive strength in accordance with ASTM C140. Samples will be tested for freeze/thaw durability in accordance with ASTM C1262.

BASIS OF ACCEPTANCE. Concrete block will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

704-05 PRECAST CONCRETE BARRIER

SCOPE. This specification covers the material and quality requirements for precast concrete barrier used in highway applications, precast concrete barrier for structures, and precast temporary concrete barrier.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 Precast Concrete - General shall apply except as noted herein.

Concrete mixtures used under this specification shall have a maximum cement content of 750 lbs per cubic yard. Unless noted otherwise in the contract documents or approved fabrication drawings, the compressive strength of concrete used in precast concrete barrier shall be as follows:

Concrete Barrier	3,000 psi (minimum) @ 28 days
Concrete Barrier for Structures	5,000 psi (minimum) @ 28 days
Temporary Concrete Barrier	3,000 psi (minimum) @ 28 days

All reinforcing steel for Concrete Barrier and Concrete Barrier For Structures shall be epoxy coated meeting the requirements of §709-04 Epoxy Coated Bar Reinforcement, Grade 60. All reinforcing steel for Temporary Concrete Barrier shall meet the requirements of §709-01 Bar Reinforcement, Grade 60.

DRAWINGS. The drawing requirements contained in §704-03 Precast Concrete - General shall apply except as noted herein.

Concrete Barrier and Temporary Concrete Barrier shall use dimensions as shown on the Standard Sheets. Concrete Barrier for Structures shall use dimensions as shown on the Bridge Design (BD) Sheets.

FABRICATION. The fabrication requirements contained in §704-03 Precast Concrete - General, as well as the following shall apply.

- Cross-sectional dimensions shall not vary from the dimensions shown by more than 1/4 inch.
- Barrier shall not be out of plumb by more than 1/4 inch.

- Longitudinal dimensions shall not vary from the dimensions shown by more than 1/4 inch per 10 feet of barrier.
- When checked with a 10 foot straight edge, irregularities shall not exceed 1/4 inch.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 Precast Concrete - General shall apply.

MARKING. The Marking requirements contained in §704-03 Precast Concrete - General shall apply except as noted herein.

Concrete Barrier and Concrete Barrier For Structures shall be marked on one end of each barrier segment such that they will not be exposed to view after installation.

Temporary Concrete Barrier shall be marked with "NYSDOT" in place of a Department contract number. In addition, each Temporary Concrete Barrier segment shall be permanently marked with a manufacturer's identification and a date of manufacture in a manner that will remain legible throughout its service life. The date, at a minimum, shall contain the month and year. Permanent markings shall be placed in a consistent location on the top, bottom, or one end of each segment. Imprinting the required information a minimum of 1/4 inch into the concrete surface will be considered an acceptable permanent marking. Paint will not be considered a permanent marking. If permanent markings are located on the bottom of the segment, paint markings matching the permanent markings shall be placed on one end of each segment to facilitate field inspection.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 Precast Concrete - General shall apply.

SHIPPING. The Shipping requirements in §704-03 Precast Concrete - General shall apply.

BASIS OF APPROVAL. Concrete Barrier designs other than those shown on the Standard Sheets will not be approved.

Concrete Barrier For Structures designs may be proposed, and if found acceptable, they will be placed on the approved list. Evidence shall be provided that the proposed anchorage system has been successfully tested in accordance with the procedural directives issued by the DCES.

Temporary Concrete Barrier designs other than those shown on the Standard Sheets may be proposed, and if found acceptable, they will be placed on the approved list. Evidence shall be provided that the temporary concrete barrier, with the proposed joint system, is NCHRP 350 approved.

BASIS OF ACCEPTANCE. The Basis of Acceptance requirements contained in §704-03 Precast Concrete - General shall apply.

704-06 PRECAST CONCRETE CRIBBING

~~**SCOPE.** This specification covers the material and fabrication requirements for precast concrete cribbing.~~

704-06 PRECAST MODULAR WALLS AND PRECAST CONCRETE CRIBBING

SCOPE. This specification covers the material and fabrication requirements for precast modular walls and precast concrete cribbing.

Comment [cjt125]:
E108020

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03 shall apply.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply.

704-07 SEGMENTAL RETAINING WALL BLOCKS

SCOPE. This specification covers the material details and quality requirements for segmental retaining wall blocks.

MATERIAL REQUIREMENTS. Provide segmental retaining wall block meeting the style and color requirements in the contract documents. Use materials, meeting the following requirements, in the manufacture of segmental retaining wall blocks:

Portland Cement	701-01
Coarse Aggregate	703-02
Mortar Sand	703-03
Grout Sand	703-04
Concrete Sand	703-07
Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12
Water	712-01

Fly ash or ground, granulated blast-furnace slag may be substituted for up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Use integral coloring pigments, when required, meeting the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

Physical Properties. The minimum acceptable average compressive strength of five-block samples is 4000 psi, with no individual block sample less than 3500 psi. The maximum acceptable average freeze/thaw loss of five-block samples, subjected to 42 freeze/thaw cycles in a 3% NaCl solution, is 1.0%, with no individual sample exceeding 1.5%.

The formed dimensions of concrete retaining wall block units will not differ more than 1/4 inch from the nominal dimensions shown on the approved Materials Detail Drawing. Provide sound blocks, free from cracks or other defects that would interfere with the proper placing, performance, or appearance of the blocks.

Materials Details. At the time of application to the Approved List, submit Materials Details Drawings to the Director, Materials Bureau for approval. Prepare and submit drawings in accordance with Departmental procedural directives. Submit a unique drawing(s) for each block style under consideration.

SAMPLING AND TESTING. When samples are requested by the Department, randomly select them from production-run material. A minimum of 5 samples, prepared by the manufacturer in accordance with ASTM C140, will be required for compression testing. A minimum of five samples, prepared by the manufacturer in accordance with ASTM C1262, will be required for freeze/thaw testing.

Samples will be tested for compressive strength in accordance with ASTM C140. Samples will be tested for freeze/thaw durability in accordance with ASTM C1262.

BASIS OF ACCEPTANCE. Segmental retaining wall blocks will be accepted on the basis of the manufacturer's name and block style appearing on the Department's Approved List, a material

certification that specifies the product conforms to this specification, and conformance to the approved materials detail drawing(s).

704-08 BRICK SIDEWALK AND DRIVEWAY PAVERS

SCOPE. This specification covers the material and quality requirements for brick pavers made from extruded fire clay or shale for use in brick paving.

MATERIAL REQUIREMENTS. Brick pavers shall conform to the requirements of ASTM C902, Class SX, Type I. Brick pavers shall be the shape, size, and color shown in the contract documents.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A minimum of 10 full-size bricks of the same size and style will be required. Samples will be tested for the physical properties identified in ASTM C902. Tests will be performed in accordance with ASTM C67.

BASIS OF ACCEPTANCE. Brick sidewalk and driveway pavers will be accepted on the basis of a material certification that specifies the product conforms to this specification.

704-09 STONE BLOCKS

SCOPE. This specification covers the material and quality requirements for stone blocks for use in Grouted Stone Block Paved Sidewalks and Driveways.

MATERIAL REQUIREMENTS. Stone blocks shall be new or used granite or other stone as specified.

The blocks shall be sound and durable, reasonably uniform in quality and texture throughout, free from shale, excess mica, seams, scaling or evidence of disintegration. Color shall be as specified.

Samples of stone blocks shall be submitted to and be approved by the Engineer prior to beginning of work.

The blocks shall be rectangular in shape, with the following approximate dimensions: 8 - 12 inches in length, 3 - 5 inches in depth, unless otherwise specified or approved, and so dressed that they may be laid with a maximum of 1 1/4 inch joints or as specified. All blocks shall have one reasonably smooth split face with no projections or depressions over 1/4 inch. Cutting of blocks to meet the pattern requirements will be permitted subject to the approval of the Engineer.

BASIS OF ACCEPTANCE. Stone blocks shall be inspected, by the Engineer, for dimensional and color compliance upon arrival at the project location. Blocks not in compliance with the contract documents may be rejected by the Engineer.

704-10 SPLIT-FACED CONCRETE BRICK

SCOPE. This specification covers the material and quality requirements for split-faced concrete brick for use in facing structural walls.

MATERIAL REQUIREMENTS. Split-faced concrete brick shall conform to the requirements of ASTM C55, Grade N, except as noted herein. The shape, size, and color of split-faced concrete brick shall be as shown in the contract documents. The splitting operation shall leave relatively sharp, straight, and parallel edges. Materials used in the manufacture of split-faced concrete brick shall meet the requirements of the following subsections:

Portland Cement	701-01
Coarse Aggregate	703-02
Mortar Sand	703-03
Grout Sand	703-04
Concrete Sand	703-07

§704

Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12
Water	712-01

Fly ash or ground, granulated blast-furnace slag may be substituted for up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A minimum of 10 full-size, split-faced bricks of the same size and style will be required. Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140.

The manufacturer shall be responsible for having brick tested for linear drying shrinkage in accordance with ASTM C55. A copy of the test report shall be included with the samples submitted to the Department for compression and absorption testing.

BASIS OF ACCEPTANCE. Split-faced concrete brick will be accepted on the basis of a material certification that specifies the product conforms to this specification.

704-11 PRECAST CONCRETE COPING

SCOPE. This specification covers the material and quality requirements for precast concrete coping.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03 shall apply except as noted herein.

Coping shall be produced with a dense, smooth, uniform finished surface without rubbing or additional treatment. Corners shall have a maximum radius of 1/8 inch and grinding will not be allowed. Coping shall be removed from the forms and handled in a manner that will prevent chipping of the edges and faces of the concrete.

Repair. Surface defects, regardless of size, shall be repaired by wetting the surface to achieve a damp condition with no standing water in the holes and then filling the holes with a mortar composed of an appropriate proportion of sand and cement having the same color and physical characteristics of the original mix. The mortar shall be allowed to partially harden and then be rubbed until a clean, uniform appearance, with no visible coating of mortar on the concrete, is obtained. The mortar repair shall be cured in the same manner as the coping unit.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein. Markings shall be placed on one end of each unit such that they won't be exposed to view after installation.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply.

704-12 DECORATIVE CONCRETE BLOCK

SCOPE. This specification covers the material and quality requirements for decorative concrete block for use in facing structural walls.

MATERIAL REQUIREMENTS. Decorative concrete block shall conform to the requirements of ASTM C90 except as noted herein. The shape, size, and color of decorative concrete block shall be as shown in the contract documents. Materials used in the manufacture of decorative concrete block shall meet the requirements of the following subsections:

Portland Cement	701-01
Coarse Aggregate	703-02
Mortar Sand	703-03
Grout Sand	703-04
Concrete Sand	703-07
Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12
Water	712-01

Fly ash or ground, granulated blast-furnace slag may be substituted for up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A minimum of 10 full-size decorative concrete blocks of the same size and style will be required. Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140.

The manufacturer shall be responsible for having block tested for linear drying shrinkage in accordance with ASTM C90. A copy of the test report shall be included with the samples submitted to the Department for compression and absorption testing.

BASIS OF ACCEPTANCE. Decorative concrete block will be accepted on the basis of a material certification that specifies the product conforms to this specification.

704-13 PRECAST CONCRETE DRIVEWAY AND SIDEWALK PAVERS

SCOPE. This specification covers the material and quality requirements for precast concrete pavers used for driveway and sidewalk paving.

MATERIAL REQUIREMENTS. Precast concrete pavers shall meet the requirements of ASTM C936 except as noted herein. The shape, size, and color of precast concrete pavers shall be as shown in the contract documents. Materials used in the manufacture of precast concrete pavers shall meet the requirements of the following subsections:

Portland Cement	701-01
Coarse Aggregate	703-02
Mortar Sand	703-03
Grout Sand	703-04
Concrete Sand	703-07
Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12
Water	712-01

§704

Fly ash or ground, granulated blast-furnace slag may be substituted for up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

Physical Properties. Precast concrete pavers shall meet the compressive strength and absorption requirements in ASTM C936. In addition, the maximum acceptable average freeze/thaw loss of five paver samples, subjected to 25 freeze/thaw cycles in a 10% NaCl solution, is 1.0%, with no individual sample exceeding 1.5%.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A total of 15 precast concrete pavers of the same size and style will be required. Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140. Five samples will be tested for freeze/thaw durability in accordance with NYSDOT test methods.

BASIS OF ACCEPTANCE. Precast concrete driveway and sidewalk pavers will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

704-14 PRECAST CONCRETE PANEL UNITS (Mechanically Stabilized Earth System)

SCOPE. This specification covers the material and quality requirements for precast concrete panel units used to construct a mechanically stabilized earth system.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply except as noted herein.

Unless noted otherwise in the contract documents or approved fabrication drawings the concrete used to fabricate panel units shall have a minimum compressive strength of 5000 psi @ 28 days.

Reinforcing steel shall be epoxy coated meeting the requirements of §709-04 or §709-08.

Embedded items shall be as detailed on the fabrication drawings. Acceptance of embedded items will be based on manufacturer's certification, unless otherwise directed by the Materials Bureau. When steel embedments are required, they shall be galvanized to §719-01.

DRAWINGS. The drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following, shall apply.

A. Corrosion Inhibitor. When required in the contract plans the concrete used shall contain a corrosion inhibitor. The use of corrosion inhibitor does not replace the requirement for epoxy coated reinforcing.

B. Dimensional Tolerances

- Panel dimensions (edge-to-edge of concrete). ±1/4 inch
- Panel thickness. ±1/4 inch
- Length difference between two diagonals (squareness). ±3/8 inch
- Distance between the centerline of dowel and dowel sleeve. ±1/4 inch
- Dimension from the face of panel to centerline of dowel and dowel sleeve, and to centerline of reinforcing steel. ±1/4 inch
- Warping of the exposed panel face 1/4 inch in 5 feet
- Location of tie strips. ±1 inch
- Location of coil embeds. ±1/4 inch

- Location of connection slots. ± 1 inch
- Contact surfaces of each fabricated embedment assembly. $\pm 1/8$ inch from a straight line.
- Miscellaneous tolerances. as detailed on the fabrication drawings.

C. Coating of Concrete Units. When required in the contract plans, panel units shall be coated on all surfaces with a penetrating sealer meeting the requirements of §717-03 Penetrating Type Protective Sealers. Surfaces to be coated must be prepared by blast cleaning, removing all laitance, loose particles, etc. The surface shall be allowed to dry for 24 hours after wetting for any reason. All surface preparation work shall be completed before sealer application can commence. The coating of units shall take place prior to shipping unless otherwise approved by the Engineer.

Sealer materials shall not be applied during wet weather conditions. Any unit exposed to wetting within 12 hours of being sealed shall be recoated. Ambient and surface temperatures shall be a minimum of 40°F during application and until the sealed concrete is dry to the touch. Application by spray methods shall not be used during windy conditions.

The sealer shall be used as supplied by the manufacturer without thinning or alterations, unless specifically required in the manufacturer's instructions. Thorough mixing of the sealer before and during use shall be accomplished as recommended by the manufacturer. Equipment for sealer application shall be clean of foreign materials. A minimum of two coats of sealer shall be applied. The total quantity of sealer applied by each coat shall be equal to the quantity required at the application rate specified in the Approved List. Each coat shall be allowed to dry before the next coat is applied. On sloping and vertical surfaces, sealer application shall progress from the bottom to the top. Care shall be taken to ensure that the entire surface of the concrete is covered and all pores filled.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply.

704-15 PRECAST CONCRETE PAVEMENT SLAB SYSTEMS

SCOPE. This specification covers material and fabrication requirements for precast concrete pavement slab systems. Approved systems can be supplied by any manufacturer appearing on the Department's Approved List entitled "Precast Concrete Manufacturers Approved for QC/QA Production – Groups 1 & 6," provided they obtain approval from the system designer.

SYSTEM APPROVAL. For Approved List consideration, the system designer must submit the following information to the Materials Bureau. After the Materials Bureau reviews the submitted information, the system designer will be required to perform a trial installation as detailed herein.

A. Fabricator Standard Drawings. Apply §704-03, Precast Concrete – General. Include the following details:

- Transverse joint support type, locations, spacing, and the mechanism used to transfer loads across transverse joints after slabs are placed.
- Longitudinal joint tie type, locations, spacing and the mechanism used to tie adjacent slabs together.
- Lifting insert type, location, positioning, and capping or backfill method.
- Grout port type, location, positioning, and capping or backfill method.

B. Installation Instructions. Provide installation instructions, including any special equipment, to address the following.

1. Subbase Preparation. Instructions for any recommended subbase preparation.
2. Slab Installation. Instructions for lifting, moving, protecting, lowering, and adjusting the slabs into position.
3. Bed and Level Slabs. Instructions to ensure slabs are fully supported by underlying layers at the correct line, grade, and cross slope while meeting contract smoothness requirements. Slabs may be either:
 - Placed on a precisely graded bedding layer and grouted in-place to fill any small, isolated voids between the slabs and bedding layer (grade-supported).
 - Placed or held near final position and jacked into place (grout-supported).
 - Placed by other methods approved by the Director, Materials Bureau.

For grade-supported slabs, include all pertinent bedding and leveling instructions, including:

- Bedding material composition and gradation.
- Bedding grout mix design and anticipated strength gain. Bedding grouts must develop a minimum compressive strength of 600 psi in 12 hours.
- Method used to place the bedding material and grout beneath the slab.
- Method used to ensure complete bedding when placed.

For grout-supported slabs, include all pertinent bedding and leveling instructions, including:

- Material properties, composition, mix design, and anticipated strength gain of any slab-jacking material.
- Method used to place the slab-jacking material beneath the slab.
- Method used to ensure complete slab contact with jacking material when placed.

4. Backfilling Pavement Hardware. Instructions to completely encase load transfer devices, longitudinal joint ties, lifting inserts, and grout ports. Include all pertinent information, including:
 - Material properties, composition, mix design, and anticipated strength gain of any backfill material that is not named in Backfill Material for Pavement Hardware, or, revised instructions for those materials if the manufacturer's instructions are not followed.
 - Method used to place backfill material.
 - Method used to ensure complete hardware encasement.

Subsequent to system approval, any change to approved installation instructions must be submitted to, and approved by, the Director, Materials Bureau, to maintain Approved List status. The Department reserves the right to require additional trial installations if the changes are deemed significant.

C. Trial Installation. Perform a trial installation at a facility agreeable to the Regional Materials Engineer that is within a 1-hour drive of a Regional Materials Laboratory. Ensure Materials Bureau and Regional Materials personnel are present. Place 4 (minimum) 12 x 12 foot slabs simulating 2 lanes of traffic. Provide a drill rig, with operator, capable of retrieving 4 inch diameter cores through any portion of the slab, and a technician capable of fabricating test specimens in accordance with Test Method NY 701-13P, C, Concrete Repair Material. As a minimum, the following will be evaluated:

1. Bedding Grout Properties and Completeness of Placement. Fabricate 24 cubes meeting Test Method NY 701-13P, C, Concrete Repair Material.
2. Leveling Material Properties and Completeness of Placement. Fabricate 24 cubes meeting Test Method NY 701-13P, C, Concrete Repair Material.
3. Backfill Material Properties and Completeness of Placement. If a material identified in this specification as Backfill Material for Pavement Hardware (under Material Requirements) is used in accordance with the manufacturer's written instructions, no further material testing is required. If a different material is used (or if a material is not used in accordance with the manufacturer's instructions), fabricate a sufficient amount of test specimens to determine the properties identified in

Table 704-15-1, Backfill Material Requirements, when tested in accordance with Test Method NY 701-13P, C, Concrete Repair Material.

4. Dimensions and Tolerances. Slabs must conform to the Fabricator Standard Drawings and be capable of being placed in an essentially true plane.
5. Instruction Completeness. Manufacturer’s instructions must accurately reflect the processes used in the trial installation.
6. Load Transfer Efficiency (LTE). The Department reserves the right to conduct falling weight deflectometer testing to determine LTE at the joints. Poor LTE ($\leq 70\%$) is cause for rejection.

MATERIAL REQUIREMENTS. Apply §704-03, Precast Concrete – General, except as noted herein.

A. Concrete. Use concrete having a minimum 28-day compressive strength of 4500 psi unless noted otherwise in the contract documents or approved fabrication drawings. Use aggregate meeting the friction requirements of Sections 501, Portland Cement Concrete – General, and 502, Portland Cement Concrete Pavement, for precast slabs that will remain concrete surfaced. Friction aggregate type is identified in the contract documents by pay item.

B. Reinforcement. Use bars meeting §709-04, Epoxy-Coated Bar Reinforcement, Grade 60. As a minimum, fabricate slabs with single-mat reinforcement located in the bottom third of the slab.

Provide 2 inch (minimum) concrete cover between the mat and the slab bottom. Fabricate mats using a size and spacing of steel (in both directions) that results in a steel area to cross-sectional area ratio of 0.0018 (minimum). Maximum bar spacing is 18 inches.

The manufacturer may provide additional reinforcement based on jobsite loading conditions. (A typical example is when slabs must be loaded before a bedding grout is placed.)

C. Backfill Material for Pavement Hardware. If the precast slab system requires a backfill material around pavement hardware, use DBR Retrofit Mortar, HD-50, Five Star Highway Patch, or an alternate prepackaged material submitted as an approved equal. If the brands named above are mixed in accordance with their manufacturer’s written instruction, no further testing is required. If the manufacturer’s written instructions are not followed, or if an alternate material is proposed for use, the material must meet Table 704-15-1, Backfill Material Requirements, when tested in accordance with Test Method NY 701-13P,C, Concrete Repair Material. Material submission instructions can be found at the Department’s web site, www.nysdot.gov, under Approved List of Materials and Equipment Submission Instructions.

TABLE 704-15-1 BACKFILL MATERIAL REQUIREMENTS		
Property	Minimum	Maximum
Compressive Strength, Opening to Traffic	2500 psi	-
Compressive Strength, 28 Day	4000 psi	-
Expansion	-	0.40 %
Contraction	-	0.05 %
Freeze - Thaw Loss (25 cycles at 10% NaCl)	-	1.0 %
Bond Strength (to dry PCC)	300 psi	-
Initial Set Time	15 minutes	-
Chloride Content	-	0.05 %
Sulfate Content	-	5.0 %

DRAWINGS. Apply §704-03 Precast Concrete – General, except as noted herein. Provide job-specific Fabricator Working Drawings, from the system designer, for each contract. Use these drawings, in conjunction with approved Fabricator Standard Drawings, to manufacture the pavement slabs. Copies of approved working drawings will be returned to the system designer. If the manufacturer is not the system designer, include the manufacturer’s name, address, and telephone number on the drawings.

§704

FABRICATION. Apply §704-03, Precast Concrete – General, except as noted herein.

Texture. Apply §502-3.10, Texturing, to the top surface of the slab.

Curing. When membrane curing compound is the selected curing method and the slabs are exposed to sunlight while curing, use a white pigmented membrane curing compound from the Department’s Approved List instead of a clear compound with fugitive dye.

SAMPLING AND TESTING. Apply §704-03, Precast Concrete - General.

MARKING. Apply §704-03, Precast Concrete - General.

FINAL PRODUCTION INSPECTION. Apply §704-03, Precast Concrete - General.

SHIPPING. Apply §704-03, Precast Concrete - General.

BASIS OF ACCEPTANCE. Apply §704-03, Precast Concrete – General, and the following:

- The system must appear on the Department’s Approved List entitled “Precast Concrete Pavement Slabs Systems (§704-15).”
- Written approval from the system designer to use the approved system if the manufacturer is not the system designer.

704-16 THRU 704-22 (VACANT)

704-23 PRECAST CONCRETE STREET PAVERS

~~**SCOPE.** This specification covers the material and quality requirements for precast concrete pavers used for street paving.~~

~~**MATERIAL REQUIREMENTS.** Precast concrete pavers shall meet the requirements of ASTM C936 except as noted herein. The shape, size, and color of precast concrete pavers shall be as shown in the contract documents. Materials used in the manufacture of precast concrete pavers shall meet the requirements of the following subsections:~~

Portland Cement	701-01
Coarse Aggregate*	703-02
Mortar Sand*	703-03
Grout Sand*	703-04
Concrete Sand*	703-07
Fly Ash	711-10
Ground, Granulated Blast Furnace Slag	711-12
Water	712-01

~~*Aggregates used in precast concrete street pavers shall meet the friction requirements of §501-2.02-B-2.~~

~~— Fly ash or ground, granulated blast furnace slag may be substituted up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.~~

~~**Physical Properties.** Precast concrete pavers shall meet the compressive strength and absorption requirements in ASTM C936. In addition, the maximum acceptable average freeze/thaw loss of five paver samples, subjected to 25 freeze/thaw cycles in a 10% NaCl solution, is 1.0%, with no individual sample exceeding 1.5%.~~

~~**SAMPLING AND TESTING.** Samples, when requested by the Department, shall be randomly selected from production-run material. A total of 15 precast concrete pavers of the same size and style will be required. Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140. Five samples will be tested for freeze/thaw durability in accordance with NYSDOT test methods.~~

~~**BASIS OF ACCEPTANCE.** Precast Concrete Street pavers will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.~~

704-23 PRECAST CONCRETE STREET PAVERS

SCOPE. This specification covers the material and quality requirements for precast pavers used for street paving.

MATERIAL REQUIREMENTS. Precast concrete pavers shall meet the requirements of ASTM C936 except as noted herein. The shape, size, and color of the precast pavers shall be as shown in the contract documents. Minimum thickness for precast concrete pavers shall be 3 1/8 inches. Materials used in the manufacture of precast concrete pavers shall meet the requirements of the following subsections:

Portland Cement	701-01
Coarse Aggregate*	703-02
Mortar Sand*	703-03
Grout Sand*	703-04
Concrete Sand*	703-07
Fly Ash	711-10
Ground, Granulated Blast-Furnace Slag	711-12
Water	712-01

*Aggregates used in precast concrete street pavers shall meet the friction requirements of §501-2.02 B. 2.

Fly ash or ground, granulated blast-furnace slag may be substituted up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix. Pigments used for integral coloring shall meet the requirements of ASTM C979. Other materials may be used in the manufacture as approved by the Director, Materials Bureau.

Physical Properties. Precast concrete pavers shall meet the compressive strength and absorption requirements in ASTM C936. In addition, the maximum acceptable average freeze/thaw loss of five paver samples, subjected to 25 freeze/thaw cycles in a 10% NaCl solution, is 1.0%, with no individual sample exceeding 1.5%.

SAMPLING AND TESTING. Samples, when requested by the Department, shall be randomly selected from production-run material. A total of 15 precast concrete pavers of the same size and style will be required. Five samples will be tested for compressive strength and five for absorption, in accordance with ASTM C140. Five samples will be tested for freeze/thaw durability in accordance with NYSDOT test methods.

BASIS OF ACCEPTANCE. Precast Concrete Street pavers will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

Comment [cjt126]:
EI08032

SECTION 705 - JOINT MATERIALS**705-01 PREFORMED CORK JOINT FILLER**

SCOPE. This specification contains the material requirements pertaining to preformed cork joint filler.

GENERAL. The Joint Filler shall be of the dimensions shown on the plans or listed in the specifications. Each piece shall be plainly marked with the manufacturer's name.

MATERIAL REQUIREMENTS. Preformed Cork Joint Filler shall conform to the requirements of ASTM D1752, Type III (Self-expanding Cork).

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification of compliance with these specification requirements.

705-02 HIGHWAY JOINT SEALANTS

SCOPE. Material requirements for hot-applied joint and crack sealants.

MATERIAL REQUIREMENTS. ASTM D6690, Types II and/or IV, except the bond, non-immersed requirement for Type IV is 3 cycles at 100% extension at -20°F.

SAMPLING AND TESTING. Deliver sealant sampled, packaged, and marked in accordance with ASTM D6690, to:

The New York State DOT Laboratories
1220 Washington Avenue
Albany, NY, 12206

Include the following information along with the sample:

- Manufacturer's address, telephone number, fax number, and e-mail address.
- Type (II or IV) for which testing is requested.

BASIS OF ACCEPTANCE. Highway joint sealants will be accepted at the contract based on the product name appearing on the appropriate Approved List entitled "Highway Joint Sealants (ASTM D6690, Type II)" or "Highway Joint Sealants (ASTM D6690, Type IV)" under "Joint Materials, Pavements."

705-03 PREFORMED RUBBER JOINT FILLER

SCOPE. This specification contains the material requirements pertaining to preformed rubber joint filler.

GENERAL. The joint filler shall be of the dimensions shown on the plans or in the specifications.

MATERIAL REQUIREMENTS. Preformed Rubber Joint Filler shall conform to the requirements of the Standard Specifications for ASTM D1752, Type (Sponge Rubber), except that the use of reclaimed rubber or factice will be permitted.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification of compliance with these specification requirements.

705-04 ARMORLESS BRIDGE JOINTS

SCOPE. This specification covers the material requirements for armorless bridge joint systems.

MATERIAL REQUIREMENTS. The materials used to construct the armorless bridge joint system will appear as approved materials on the Department's Approved List for Materials and Equipment for use on NYSDOT Projects.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name and system appearing on the Department's Approved List and a Manufacturer's certification of conformance of the system to the approved Materials Detail Sheet (MDS.) The supplier will provide two copies of the approved Materials Details through the Contractor to the Engineer as part of the evidence of acceptability for the material at least 10 days prior to shipment of the product to the job site.

705-05 SILICONE JOINT SEALANTS FOR PAVEMENTS

SCOPE. This specification covers the material requirements for silicone joint sealants for pavements.

GENERAL. Use equipment meeting §502-2.04 J, Joint Sealing (Silicone). Install the sealant in accordance with the manufacturer's written instructions.

MATERIAL REQUIREMENTS. Silicone Joint Sealant shall conform to the following requirements:

Property	Test Method	Specification ASTM D5893
Tack-Free Time, min.	ASTM C679	5 hrs. ± 10 min.
Accelerated Weathering	ASTM C793	Satisfactory
Flow	ASTM C639	No Flow
Modulus of Elongation	ASTM D412	600% (Minimum)
Bond, Non-Immersed	ASTM D5329	Satisfactory

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Approved List for Joint Materials, Pavement for Silicone Joint Sealants (705-05).

705-06 CAULKING COMPOUND FOR STRUCTURES

SCOPE. This specification covers the material requirements for caulking compound for structures.

GENERAL. Caulking compound shall be applied with either a pneumatic or ratchet hand gun.

MATERIAL REQUIREMENTS. Caulking compound shall be a material which complies with Federal Specification TT-S-230 Sealing Compound, Synthetic-Rubber Base, Single Component, Chemically Curing. The color of the compound shall be cement mortar grey when tested in the manner described in TT-S-230 and compared against a color standard in possession of the Materials Bureau. This standard will be made available upon written request.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification of compliance with these specification requirements.

705-07 PREMOULDED RESILIENT JOINT FILLER

SCOPE. This specification contains the material requirements for premoulded resilient joint filler.

GENERAL. The joint filler shall be of the dimensions shown on the plans or listed in the specifications. When the material is delivered cut to dimension, it shall be banded in bundles of convenient size.

§705

MATERIAL REQUIREMENTS. The premoulded resilient joint filler shall conform to the requirements of ASTM D1751. The asphalt content requirement may be waived if the material meets other requirements of D1751 based on supplementary testing performed by the Materials Bureau.

BASIS OF ACCEPTANCE. Application for approval of premoulded resilient joint filler shall be submitted to the Director, Materials Bureau. Upon approval, the product name and its manufacturer will be placed on the Department's Approved List. Each lift or bundle of joint filler shall be tagged by the manufacturer; the product will be accepted at the work site on the basis of the name and manufacturer of the product appearing on the tag and the Approved List.

The Department reserves the right to sample and test the material after delivery at the project site.

705-08 PREFORMED, CLOSED-CELL FOAM MATERIAL

SCOPE. This specification covers the requirements for preformed, closed-cell foam material.

MATERIAL REQUIREMENTS

General. Closed-cell foam material is used primarily as the joint seal in structural expansion joint systems. The joint material shall remain unaffected by road salts and petroleum products. The material shall also be capable of maintaining a waterproof joint within the range of 50% compression and 25% tension. The joint material shall have grooves along the entire length of the bond surfaces for enhanced bonding performance. The grooves shall be 1/8 inch deep × 1/8 inch wide and spaced from 1/4 inch to 1/2 inch apart.

Installation. Install the preformed, closed-cell foam material according to the manufacturer's recommended procedure. If a bonding agent is required, it shall be one which is recommended by the manufacturer.

Physical Properties. The joint material shall be a closed-cell, cross linked, expanded polyethylene. Material will meet the properties of Table 705-1.

TABLE 705-1			
Property	Test Method	Specification	
		Minimum	Maximum
Extrusion	ASTM D545 @ 50% Compression 3 Sides Restrained	--	1/4 inch
Compression Deflection	ASTM D3575, Suffix D 50% Deflection @ 80°F	10 psi	60 psi
Density	ASTM D3575, Suffix W, Method A	2 pcf	3 pcf
Water Absorption	ASTM D545	--	3 %
Compression Set	ASTM D1056, 50% Deflection for 22 hrs. @ 70 ± 5°F	--	15%@168hrs.

DIMENSIONS. The joint material shall be of the thickness and width described in the contract documents within a tolerance of +10% and -2%. Joint material shall be heat welded to the proper dimensions by the manufacturer. No glue or chemical agents shall be used to join pieces together. No laminations in width shall be allowed.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the product name appearing on the Department's Approved List for Preformed Closed-Cell Foam Material.

705-09 PREFORMED ELASTIC BRIDGE JOINT SEALER

SCOPE. This specification covers the material requirements for preformed elastic bridge joint sealer for use in bridge joints.

MATERIAL REQUIREMENTS. The preformed elastic joint sealer material shall be vulcanized elastomeric compound using polymerized chloroprene as the only basic elastomer.

Flexibility. The sealer shape shall be capable of withstanding compression, rotation, or other joint movements without change in the position of the point of foldability, misalignment, or other conditions felt detrimental by the Director, Materials Bureau. The sealer shall exhibit sufficient sealing pressures throughout its expected compression range to assure that no deleterious materials enter the joint.

The joint sealer material shall be tested in accordance with AASHTO M297 except that Compression Deflection properties shall be determined in accordance with Department written instructions. Compression Deflection Properties, LC min and LC max, shall comply to that specified in Table 705-2. Test specimens shall be cut and/or buffed from joint seal samples.

Nominal Seal Size (in.)	LC Min. %	LC Max. %
3 or less	85	55
3 1/2	85	50
4	85	48
5	85	45
6	90	45

DIMENSIONS. The measured width and depth of joint seal material shall meet the minimum and maximum allowable dimensions as determined from the original drawings and the applied tolerances.

Dimensional Tolerances. The nominal height of the uncompressed sealer shall be greater than or equal to the nominal uncompressed width.

The measured width and height of joint material shall satisfy the minimum and maximum allowable dimensions as determined from the nominal dimensions shown on the approved drawings and the following dimensional tolerances.

A dimensional tolerance of ±5% of the nominal dimensions shall be applied to seals less than 4 inches in width. A dimensional tolerance of ±1/4 inch shall be applied to the nominal dimensions for seals greater than or equal to 4 inches in width.

SERVICEABILITY

Installation and Performance Requirements. Each lot of joint sealer submitted for Department approval shall demonstrate that it possesses the properties necessary for satisfactory field installation.

The sealer shall not exhibit any twisting, rolling, misalignment of opposite top edges, tendencies to trap incompressibles or any other qualities which shall be deemed detrimental by the Department to the sealer's proper installation and performance.

Joint Wall Contact with Sealer. The top edges of the vertical walls shall remain in contact with the joint sealer faces throughout the compression range to which the sealer will be subjected in use.

Lubricant. The lubricant used to install the sealer shall conform to the requirements of §705-13, Lubricant for Preformed Elastic Joint Sealer, unless otherwise specified in the proposal.

BASIS OF ACCEPTANCE. Preformed elastic bridge joint sealer will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

705-10 PREFORMED ELASTIC LONGITUDINAL JOINT SEAL

SCOPE. This specification covers the material requirements for preformed elastic joint seal for use in longitudinal concrete pavement joints.

GENERAL. The preformed elastic material shall be a vulcanized elastomeric compound using polymerized chloroprene as the only basic elastomer. The shape of any joint seal shall be approved by the Director of the Materials Bureau prior to the submission of any individual production lot for approval.

Such approval shall be requested in writing and be accompanied by a detailed drawing of the shape and a 1.5 foot length of the proposed seal. The lubricant used to install the joint seal shall conform to §705-13, Lubricant for Preformed Elastic Joint Sealer, unless otherwise specified.

MATERIAL REQUIREMENTS

Physical Requirements. The joint seal material shall be tested in accordance with AASHTO M220 and meet the physical requirements therein. The requirements for compression-deflection, ozone resistance, and low-temperature recovery @ 14⁰F are waived.

The minimum percentage requirements for low-temperature recovery at -20⁰F, and for high temperature recovery at 212⁰F, shall be modified to 75%. Measurements for recovery may be made using an electronic caliper in addition to methods specified. The following exceptions shall be made to the recovery test when the seal shape has lips (a small protrusion on the top longitudinal edge). The seal shall be compressed to 50% of the nominal width of the seal. The denominator for the percent recovery calculation, however, shall be the width between the outer edges of the lips provided on the manufacturer's drawing. The numerator or recovered width shall be measured between the outer edges of the lips.

BASIS OF ACCEPTANCE. Preformed elastic longitudinal joint sealer will be accepted on the basis of a material certification that specifies the product conforms to this specification.

705-11 POLYVINYL CHLORIDE EXTRUDED SHAPES AND SHEET MATERIAL

SCOPE. This specification covers the quality requirements for polyvinyl chloride extruded shapes and sheet material for use in expansion, contraction, construction joints and drainage troughs.

GENERAL. The PVC material from which the shapes shall be extruded shall not contain any reclaimed, reground or reworked material whatsoever, but shall be compounded from virgin PVC resins, plasticizers, stabilizers and such materials that when compounded it shall meet the physical requirements contained in this specification.

Material shall be extruded in such a manner that all cross sections shall be dense, homogeneous and free from porosity or other imperfections.

The dimensional tolerances shall be as shown on the plans.

All splices shall be heat welded as approved by the Engineer.

Each extrusion shall be plainly marked at 5 foot intervals with the manufacturer's name, lot number, and type.

MATERIAL REQUIREMENTS. The material for the extruded shapes shall meet the following performance requirements:

Property	ASTM Test Method	Requirement
Tensile strength, psi	D412, Die C	1400 min.
Ultimate elongation, percent	D412, Die C	250 min.
Hardness, Type A durometer	D2240 *	65-88
Resistance to alkali	D543 **	-
Weight change, percent	-	-0.10 to +0.25
Hardness, Type A durometer points change	-	+5

Tensile strength, percent change	-	-15 max.
Water absorption, 48 hours percent	D570	0.5 max.
Specify gravity	D792	1.42 max

* The hardness test shall be performed in accordance with D2240 except that the material is pressed to the durometer by thumb.
 ** Resistance to alkali. A specimen, weighing about 2.65 oz, will be cut from the sample. The specimen will be washed in tap water, rinsed with distilled water, wiped with a clean cloth, and allowed to dry in laboratory air for approximately 1 hour. The weight of each specimen, to the nearest 0.000035 oz, will be recorded. The durometer reading will be taken as noted above. The specimens will be completely immersed in a freshly made solution containing 0.18 oz of chemically pure potassium hydroxide and 0.18 oz of chemically pure sodium hydroxide in one quart of distilled water, kept at 21E to 24EC. At the end of seven days the specimens will be removed, rinsed with distilled water, the surfaces wiped with a clean cloth, and allowed to dry in laboratory air for approximately 1 hour. The weight and durometer hardness will be measured and recorded. Tensile strength shall be determined as noted above. The weight and tensile strength change shall be reported as a percentage of the original readings. The hardness change will be reported as the change relative to the original reading.

Cold Bend Test. A cold bend test shall be made by subjecting a 1/2 inch by 6 inch by 1/8 inch strip of extrusion material to a temperature of -20°F for 2 hours. The strip shall immediately thereafter be bent 180 degrees around a rod of 1/4 inch diameter by applying sufficient force to hold the sample in intimate contact with the rod. The sample shall then be examined for evidence of cracking. There shall be no cracking of the samples.

BASIS OF ACCEPTANCE. Polyvinyl chloride extruded shapes and sheet material will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

705-12 PREFORMED ELASTIC TRANSVERSE CONTRACTION AND EXPANSION JOINT SEAL

SCOPE. This specification covers the material requirements for preformed elastic joint seal for use in transverse contraction joints and transverse expansion joints in concrete pavement.

GENERAL. The preformed elastic material shall be a vulcanized elastomeric compound using polymerized chloroprene as the only basic elastomer. The shape of any joint seal, from any manufacturer, shall be approved by the Director of the Materials Bureau prior to the submission of any individual production lot for approval. Such approval shall be requested in writing and be accompanied by a detailed drawing of the shape and a 15 foot length of the proposed seal. The lubricant used to install the joint seal shall conform to §705-13, Lubricant for Preformed Elastic Joint Sealer, unless otherwise specified.

MATERIALS REQUIREMENTS

Geometric Requirements. Joint seals shall meet the geometric requirements in the following table:

PROPERTY OR REQ. AT SPECIFIED WIDTH	TYPE OF SEAL			
	21/32 inch Transverse Contraction	25/32 inch Transverse Contraction	1 1/4 inch Transverse Contraction	1 5/8 inch Transverse Expansion
Overall width, min.	21/32 in.	25/32 in.	1 1/4 in.	1 5/8 in.
Contact Dimension, min.	21/32 in. @ 5/8 in. width	25/32 in. @ 5/8 in. width	7/8 in. @ 1 in. width	7/8 in. @ 1 1/4 in. width
Overall depth, max.	2 in. @ 1/2 in. width	2 in. @ 1/2 in. width	2 in. @ 5/8 in. width	2 in. @ 7/8 in. width

Physical Requirements. For all properties except compression-deflection, low-temperature recovery @ 14°F, and ozone resistance, the joint seal material shall be tested in accordance with AASHTO M220 and meet the physical requirements therein. The requirements for compression-deflection, low-temperature recovery @ 14°F and ozone resistance are waived. Measurements for recovery may be made using an electronic caliper in addition to methods specified.

The following exceptions shall be made to the recovery test when the seal shape has a lip (a small protrusion at the top longitudinal edge). The seal shall be compressed to 50% of the nominal width of the seal. The denominator for the percent recovery calculation, however, shall be the width between the outer edges of the lips on the manufacturer's drawing. The numerator or recovered width shall be measured between the outer edges of the lips.

Force-Deflection Requirements. Force-Deflection properties shall be determined in accordance with the force-deflection test established by the Materials Bureau. A description of this test is available on request from the Materials Bureau.

The preformed elastic transverse joint seal shall conform to the following force-deflection requirements:

PROPERTY OR REQ. AT SPECIFIED WIDTH	TYPE OF SEAL			
	21/32 inch Transverse Contraction	25/32 inch Transverse Contraction	1 1/4 inch Transverse Contraction	1 5/8 inch Transverse Expansion
Min. Resisting Force (lb/in)	2.85 @ 5/8 in. width	2.85 @ 5/8 in. width	2.85 @ 1 in. width	2.85 @ 1 1/4 in. width
Max. Resisting Force (lb/in)	10.9 @ 1/2 in. width	9.14 @ 1/2 in. width	12.0 @ 5/8 in. width	20.0 @ 7/8 in. width

The seal shall not creep more than 1/4 inch horizontally during force-deflection testing, nor shall there be any loss of contact between the top edges of the seal and the compression plates.

All test sections used in the above procedures shall be cut and/or buffed from the joint seal specimens.

BASIS OF ACCEPTANCE. Preformed elastic transverse contraction expansion joint sealers will be accepted on the basis of a material certification that specifies the product conforms to this specification.

705-13 LUBRICANT FOR PREFORMED ELASTIC JOINT SEALER

SCOPE. This specification covers the lubricant used for the installation of preformed elastic joint sealers.

GENERAL. The lubricant shall be a one-component polychloroprene compound containing only soluble phenolic resins blended together with anti-oxidants and acid acceptors in an aromatic hydrocarbon solvent mixture.

MATERIAL REQUIREMENTS. The lubricant shall meet the following physical requirements: For use with concrete pavement sealers the lubricant shall conform to the requirements of ASTM D2835. For use with bridge sealers the lubricant shall conform to the requirements of ASTM D4070.

PACKAGING. Each lot of the lubricant shall be delivered in containers plainly marked with the manufacturer's name or trademark, lot number and date of manufacture.

BASIS OF ACCEPTANCE. The basis of acceptance for the lubricant shall be the manufacturer's certification as to compliance with this specification which shall accompany the material delivered to the job site. Any lubricant not used within 270 days of its manufacture shall be unacceptable.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

705-14 LONGITUDINAL JOINT TIES

SCOPE. This specification details the requirements for longitudinal joint ties (LJTs) and their support assemblies used at longitudinal joints in portland cement concrete (PCC) pavement.

GENERAL. LJTs are either one-piece deformed bar reinforcement or multiple-piece systems consisting of deformed bar reinforcement with 1 or 2 threaded ends and a coupler. For longitudinal joints between lanes placed simultaneously, one-piece LJTs must be supported by an assembly that secures them in position when the assembly is affixed to the underlying pavement layer. For longitudinal joints between lanes placed separately, the LJTs are either:

- Loose, one-piece, deformed bars drilled and anchored into the vertical placement edge.
- Loose, multiple-piece systems.

In the latter case, the first piece is bolted to the paving forms in the initial concrete placement and the second piece threaded into the first piece after form removal from the initial placement. Refer to Section 502, PCC Pavement, to identify which method is used.

All LJTs not referenced on the Department's Approved List entitled "Longitudinal Joint Ties (705-14)," under "Joint Materials, Pavement," will be subject to approval testing before their use is allowed on Department contracts. Submit approval applications to the Director, Materials Bureau, at least 120 days before their intended use. Approved LJTs and their support assemblies will be placed on the Approved List and referenced by the drawing number and approval date. Any change to a previously approved LJT requires approval by the Director, Materials Bureau, before its use.

In case of conflict between the requirements of this specification and specifications referenced herein, the requirements of this specification or the instructions of the Director, Materials Bureau, will apply.

The Department may perform supplementary sampling and testing of the LJTs that arrive at Department contracts.

MATERIAL REQUIREMENTS

A. Deformed Bar Reinforcement. Obtain deformed bar reinforcement from a manufacturer appearing on the Department's Approved List entitled "Reinforcing Bars (709-01)," under "Reinforcing, Steel." Use number 6 deformed bars made of Grade 60 steel. Materials other than steel may be proposed, but their use is subject to the approval of the Director, Materials Bureau.

Use one-piece LJTs having lengths as required by Section 502, PCC Pavement, and the associated 502 Standard Sheets for PCC Pavement, i.e.:

- 36 inches between travel lanes placed simultaneously (in support assemblies).
- 28 inches between travel lanes placed separately (drill and anchor method).
- 20 inches between a travel lane and PCC shoulder placed simultaneously (in support assemblies).
- 18 inches between a travel lane and PCC shoulder placed separately (drill and anchor method).

Use multiple-piece LJTs having lengths of 36 inches between travel lanes placed separately and 20 inches between a travel lane and a PCC shoulder placed separately. The length of a multiple-piece LJT includes only the deformed bar segment lengths, not the thread lengths nor the coupling length. When assembled, the coupler must cover all threads in the threaded ends.

B. Coatings. All LJT components must be epoxy-coated steel except for threaded connections. Coatings other than epoxy (and their applicators) may be proposed, but their use is subject to the approval of the Director, Materials Bureau. Use an epoxy coating appearing on one of the following Approved Lists under, "Reinforcing, Epoxy and Coating:"

§705

- Epoxy Coatings for Steel Reinforcing Bars (709-04).
- Epoxy Coatings for Longitudinal Joint Ties (705-14).

Apply the epoxy coating in accordance with “Coating Application” in §709-04, Epoxy Coated Bar Reinforcement, by an epoxy coating applicator appearing on one of the following Approved Lists under “Reinforcing, Epoxy and Coating:”

- Applicators for Steel Reinforcing Bars (709-04).
- Epoxy Coatings for Longitudinal Joint Ties (705-14).

Coatings must be continuous over the bar length, including couplers for multiple-piece ties, and 8 - 12 mils thick. Coatings must be within 1/4 inch of threaded ends in multiple-piece ties. The cross-sectional ends of the bars may be uncoated.

Damaged coatings may be repaired at the epoxy coating applicator’s facility or at the fabricator’s facility in accordance with “Repair of Coated Bars” in §709-04, Epoxy Coated Bar Reinforcement. Field repair of damaged coating is allowed, provided the damage is less than 1 inch long in any direction and more than 4 inches from the center of the bar or the threaded ends. Use a patching material supplied by the epoxy coating manufacturer that is compatible with the epoxy coating and inert in concrete.

Follow the manufacturer’s written recommendations regarding surface preparation and application. Provide those recommendations to the Engineer before field repairs are made. Apply the patching material to the damaged area only. Dipping the bar into the patching material, or liberally coating undamaged areas, is not allowed. Epoxy-coated bars with perforations, cracks, other damage, or improperly applied coatings will be rejected.

C. LJT Support Assemblies. Support one-piece LJTs in longitudinal joints between lanes placed simultaneously in assemblies or “baskets” that securely hold more than 1 LJT in position as detailed in Geometric Requirements below. Fabricate the assemblies using steel wire as depicted in the approved Materials Details. Affix 1 or both ends of each LTD to the assembly by welding or mechanical fixation within 2 inches of the end of the LJT.

D. Corrosion Inhibitors for Threaded Connections (Multiple-piece LJTs Only). Use one of the following:

- Medium setting asphalt emulsion meeting Table 702-5, Asphalt Emulsions.
- Thread-sealing compound approved by the Materials Bureau.

Apply the corrosion inhibitor to all threaded connections before the LJTs are assembled such that all surfaces of the assembled LJT are covered with an unbroken seal of epoxy coating or corrosion inhibitor. Do not apply corrosion inhibitors to bolts that hold multiple-piece LJTs to forms.

GEOMETRIC REQUIREMENTS. Unless otherwise indicated in the contract documents, fabricate the support assemblies or bolt multiple-piece LJTs to forms such that the:

- Assembly holds at least 2 LJTs.
- Entire longitudinal axis of each bar is located at the middepth of the pavement slab.(1 inch).
- Longitudinal axes of the bars are aligned perpendicular to the pavement centerline and parallel with the pavement surface such that the maximum misalignment of 1 bar end relative to the other is 1 inch.
- Midpoint of the longitudinal axis of each bar is at the center of the joint.(1 inch).
- Longitudinal axes of adjacent bars do not exceed the maximum spacing identified in the contract documents.
- Bars are 3 inches (minimum) away from other LJTs or transverse joint supports.

TESTS

A. Materials Details – LJT Support Assemblies. The LJT manufacturer must submit 3 Materials Details (shop drawings) to the Director, Materials Bureau, for review and approval before any other testing begins. The Materials Details must depict the following minimum information:

- Manufacturer's name, address, telephone number, fax number, and e-mail address.
- Drawing number.
- Support assembly dimensions and tolerances.
- LJT positioning within the joint support assembly.
- LJT ASTM steel grade designation.
- A cross section showing the relative positioning of LJTs to their support legs.
- Method used to affix LJTs to the support assembly and the locations of points of fixation.
- Methods used to affix wires together in the support assembly and the locations of points of fixation.
- Diameter of wires used in joint support assembly fabrication including wires used as assembly frames, LJT support legs, stakes, and spacer wires, if any.
- A detail of wire legs that hold LJTs to the support assembly.
- A detail of the stakes used to hold the supports to the underlying pavement layers during construction.
- The positioning and number of stakes required to hold the supports to the underlying pavement layers during construction. The minimum number of stakes must equal the number of LJTs in the assembly.

B. Materials Details – Multiple-Piece LJTs. The LJT manufacturer must submit 3 Materials Details (shop drawings) to the Director, Materials Bureau, for review and approval before any other testing begins. The Materials Details must depict the following minimum information:

- Manufacturer's name, address, telephone number, fax number, and e-mail address.
- Drawing number.
- Length of threaded ends.
- Thread size designations.
- LJT ASTM steel grade designation.
- Coupler dimensions and tolerances.
- Method used to affix LJTs to forms.

C. Joint Support Assemblies. Submit 2 complete LJT support assemblies and 6 loose, epoxy-coated LJTs to the Director, Materials Bureau, for conformance verification with the submitted Materials Details and this specification.

D. One-Piece LJTs. In addition to meeting Grade 60 yield strength requirements of the ASTM designation indicated on the Materials Details, epoxy-coated deformed bars must meet the Chemical Resistance, Cathodic Disbondment, Salt Spray Resistance, Coating Flexibility, Relative Bond Strength in Concrete, and Impact Test requirements of AASHTO M284 (ASTM A775), Epoxy Coated Steel Reinforcing Bars.

E. Multiple-Piece LJTs. Submit 12 multiple-piece LJTs to the Director, Materials Bureau, for conformance verification with the submitted Materials Details and this specification. When assembled, the multiple-piece ties shall have minimum yield strengths of 60 ksi. Also, multiple-piece LJTs must meet the Chemical Resistance, Cathodic Disbondment, Salt Spray Resistance, Coating Flexibility, Relative Bond Strength in Concrete, and Impact Test requirements of AASHTO M284 (ASTM A775), Epoxy Coated Steel Reinforcing Bars.

BASIS OF ACCEPTANCE. Longitudinal Joint Ties will be accepted at the contract based on the Manufacturer's appearance on the Department's Approved List entitled "Longitudinal Joint Ties (705-14)," under "Joint Materials, Pavement." The contractor shall provide 2 copies of each of the following to the Engineer:

- Approved Materials Details identified by drawing number and approval date as shown on the Approved List.
- Manufacturer's certification that the LJTs were manufactured in accordance with this specification and the submitted Materials Details.

§705

- The name, address, telephone number, and e-mail address of the rolling mill that manufactured the LJT's and the mill's certification as to the type, grade, and ASTM designation of steel used in the LJT's.
- The brand name of the epoxy coating used on the LJT's and the name, address, telephone number, and e-mail address of the manufacturer.
- The name, address, telephone number, and e-mail address of the epoxy coating applicator and the applicator's certification that the coatings were applied in conformance to this specification.
- The brand name of the corrosion inhibitor for threaded coatings used on multiple-piece LJT's and the name, address, telephone number, and e-mail address of the manufacturer.

705-15 TRANSVERSE JOINT SUPPORTS

SCOPE. This specification details the requirements for load transfer devices (LTDs) and their support assemblies used at transverse joints in portland cement concrete (PCC) pavement.

GENERAL. All Transverse Joint Supports not referenced on the Department's Approved List entitled "Transverse Joint Supports (705-15)," under "Joint Materials, Pavement," will be subject to approval testing before their use is allowed on Department contracts. Submit approval applications to the Director, Materials Bureau, at least 120 days before their intended use. Approved supports will be placed on the Approved List and referenced by the drawing number and approval date. Any change to a previously approved transverse joint support requires approval by the Director, Materials Bureau before its use.

In case of conflict between the requirements of this specification and specifications referenced herein, the requirements of this specification or the instructions of the Director, Materials Bureau, will apply.

The Department may perform supplementary sampling and testing of the joint supports assemblies that arrive at Department contracts.

MATERIAL REQUIREMENTS

A. Dowels. Dowels are the LTD component of transverse contraction and expansion joint support assemblies. They are also used at transverse construction joints. Obtain dowels from a manufacturer appearing on the Department's Approved List entitled "Reinforcing Bars (709-01)," under "Reinforcing, Steel."

Use 18 inch long dowels made of plain, Grade 60 steel bar reinforcement having uniform circular cross sections for their entire lengths. Saw cut dowel ends such that they are free of burrs or projections. Materials other than steel may be proposed, but their use is subject to the approval of the Director, Materials Bureau. Dowel diameters vary with pavement thickness as detailed in the Section 502 Standard Sheets. Coating thickness is not included in the dowel diameter.

B. Deformed Bar Reinforcement. Deformed bar reinforcement is the LTD component of transverse hinge joint support assemblies. Obtain bars from a manufacturer appearing on the Department's Approved List entitled "Reinforcing Bars (709-01)," under "Reinforcing, Steel." Use number 6 deformed bars, 24 inches long, made of Grade 60 steel. Materials other than steel may be proposed, but their use is subject to the approval of the Director, Materials Bureau.

C. Coatings. Steel LTDs (dowels and deformed bars) must be epoxy coated. Coatings other than epoxy (and their applicators) may be proposed, but their use is subject to the approval of the Director, Materials Bureau. Use an epoxy coating appearing on one of the following Approved Lists under, "Reinforcing, Epoxy and Coating:"

- Epoxy Coatings for Steel Reinforcing Bars (709-04).
- Epoxy Coatings for Longitudinal Joint Ties (705-14).

Apply the epoxy coating in accordance with “Coating Application” in §709-04, Epoxy Coated Bar Reinforcement, by an epoxy coating applicator appearing on one of the following Approved Lists under “Reinforcing, Epoxy and Coating:”

- Applicators for Steel Reinforcing Bars (709-04).
- Epoxy Coatings for Longitudinal Joint Ties (705-14).
- Epoxy Coatings for Dowel Bars for Transverse Joint Supports (705-15).

Coatings must be continuous over the length of the LTD and 10 - 18 mils thick, except for the cross-sectional ends, which may be uncoated. Field repair of damaged coatings is not allowed. Plant or facility repairs are not allowed unless the damage results from welding or mechanical fixation to the support assembly and is within 1 inch of the weld or fixation point. Such damage must be repaired before visible rust occurs. Use a patching material supplied by the epoxy coating manufacturer that is compatible with the epoxy coating and inert in concrete. Apply the patching material to the damaged area only. Dipping the LTD into the patching material, or liberally coating undamaged areas, is not allowed. Supports containing LTDs with perforated, cracked, otherwise damaged, or improperly applied coatings will be rejected.

Completely coat each dowel with a bond breaker applied at the epoxy coating applicator facility or the joint support assembly facility. The bond breaker is subject to approval by the Materials Bureau. Do not apply a bond breaker to deformed bar reinforcement.

D. Premoulded Resilient Joint Filler (§705-07). Use 3/8 - 5/8 inch thick filler in transverse expansion joint assemblies only.

E. Joint Support Assemblies. Support LTDs in assemblies or “baskets” that securely hold them in position as detailed in Geometric Requirements below. Fabricate the assemblies using steel wire as depicted in the approved Materials Details. Affix 1 end of each LTD to the assembly by welding or mechanical fixation. Affix alternating ends of adjacent LTDs to the assembly such that the point of fixation is within 2 inches of the end of the LTD.

GEOMETRIC REQUIREMENTS

A. Transverse Contraction Joints. Unless otherwise indicated in the contract documents, fabricate the support assemblies such that the:

- Entire longitudinal axis of each dowel is located at the middepth of the pavement ($\pm 1/4$ inch).
- Longitudinal axes of the dowels are aligned parallel with the pavement centerline and pavement surface such that the maximum misalignment of one dowel end relative to the other is 1/8 inch.
- Midpoint of the longitudinal axis of each dowel is at the center of the joint (± 1 inch).
- Longitudinal axes of the two end dowels are 4 - 8 inches from the longitudinal joints.
- Longitudinal axes of the dowels are spaced 4 - 12 inches apart.

B. Transverse Expansion Joints. Fabricate the support assemblies such that the dowels are positioned in accordance with paragraph A, Transverse Contraction Joints. Include a one-piece premoulded resilient joint filler in the assembly that extends completely across the slab width. The joint filler must either equal the full depth of the slab, or extend from the bottom of the slab to within 1 1/2 - 2 inches of the top of the slab with a finishing cap that extends to the top of the slab.

Vertically support the filler at the longitudinal midpoints of the dowels and perpendicular to the longitudinal axes of the dowels. Depict support mechanisms in the Materials Details. Do not weld the dowels to filler supports.

Place plastic expansion caps on the free ends of the dowels (the ends opposite the fixed ends). Use expansion caps with essentially the same inner diameter as the outer diameter of the dowel plus coating thickness (+ 40 mils).

C. Transverse Hinge Joints. Unless otherwise indicated in the contract documents, fabricate the support assemblies such that the:

- Entire longitudinal axis of each deformed bar is located at the middepth of the pavement slab (± 1 inch).
- Longitudinal axes of the deformed bars are aligned parallel with the pavement centerline and pavement surface such that the maximum misalignment of one bar end relative to the other is 1 inch.
- Midpoint of the longitudinal axis of each bar is at the center of the joint (± 1 inch).
- Longitudinal axes of the two end bars are 4 - 12 inches from the longitudinal joints.
- Longitudinal axes of the bars are spaced 4 - 18 inches apart.

TESTS

A. Materials Details. The transverse joint support manufacturer must submit 3 Materials Details (shop drawings) to the Director, Materials Bureau, for review and approval before any other testing begins. Depict only one type of joint on each detail submitted for approval. The Materials Details must depict the following minimum information:

- Manufacturer's name, address, telephone number, fax number, and e-mail address.
- Type of support (contraction, expansion, or hinge joint).
- Drawing number.
- Joint support assembly dimensions and tolerances.
- LTD length, spacing, and positioning within the joint support assembly.
- LTD ASTM steel grade designation.
- Bond breaker brand name and manufacturer.
- A cross section showing the relative positioning of LTDs to their support legs.
- Method used to affix LTDs to the support assembly and the locations of points of fixation.
- Methods used to affix wires together in the joint support assembly and the locations of points of fixation.
- Diameter of wires used in joint support assembly fabrication including wires used as assembly frames, LTD support legs, premoulded resilient joint filler supports (expansion joints only), stakes, and spacer wires that hold cages in place during transport.
- A detail of wire legs that hold LTDs to the support assembly.
- A detail of the stakes used to hold the supports to the underlying pavement layers during construction.
- The positioning and number of stakes required to hold the supports to the underlying pavement layers during construction.
- Methods used to support premoulded resilient joint fillers (expansion joints only).
- Expansion cap material and dimensions (expansion joints only).

B. Joint Support Assemblies. Submit 2 complete joint support assemblies and 6 loose, epoxy-coated LTDs to the Director, Materials Bureau, for conformance verification with the submitted Materials Details and this specification.

C. Epoxy-Coated Dowels. In addition to meeting the Grade 60 yield strength requirements of the ASTM designation indicated on the Materials Details, epoxy-coated dowels must meet the Load-Deflection, Pull-out, Abrasion, Corrosion, Chemical Resistance, Cathodic Disbonding, Coating Hardness, and Coating Impact Resistance requirements of AASHTO M254, Corrosion-Resistant Coated Dowel Bars, when tested in accordance with AASHTO T253, Coated Dowel Bars.

D. Epoxy-Coated Deformed Bar Reinforcement. In addition to meeting Grade 60 yield strength requirements of the ASTM designation indicated on the Materials Details, epoxy-coated deformed bars must meet the Chemical Resistance, Cathodic Disbondment, Salt Spray Resistance, Coating Flexibility, Relative Bond Strength in Concrete, and Impact Test requirements of AASHTO M284 (ASTM A775), Epoxy Coated Steel Reinforcing Bars.

E. Field Test. Only joint support assemblies meeting the above test requirements will be considered for trial installation in a field test. The supplier or manufacturer is responsible for coordinating the field test. The field test location may be:

- Part of a Department contract.
- Part of a contract under the jurisdiction of an agency other than the Department.
- A test site arranged by the supplier or manufacturer.

If the field test is outside New York State, the location must meet the approval of the Director, Materials Bureau.

If the field test is part of a Department contract, the Contractor must obtain the Engineer's approval before any support assemblies are installed. If the field test is at a test site arranged by the supplier/manufacturer, install the joint support assemblies in a 150 foot long (minimum) pavement constructed in accordance with Section 502, Portland Cement Concrete Pavement. In any case, a minimum of 10 joints must be constructed using the joint supports.

Conduct field tests in the presence of Materials Bureau personnel. Specific attention will be given to handling, coating integrity, damage, alignment before and after paving, fixation failure, securing to underlying layers, contraction joint formation, and general specification conformance. Failing assemblies, and the pavement they are constructed into if part of a Department contract, will be rejected and removed and replaced at no cost to the State.

The Director, Materials Bureau, may waive field tests for hinge and expansion joint assemblies or from manufacturers who have an established history of successful contraction joint assembly installations with the Department.

BASIS OF ACCEPTANCE. Transverse joint supports will be accepted at the contract based on the Manufacturer's appearance on the Department's Approved List entitled "Transverse Joint Supports (705-15)," under "Joint Materials, Pavement." The contractor shall provide 2 copies of each of the following to the Engineer:

- Approved Materials Details identified by drawing number and approval date as shown on the Approved List.
- Manufacturer's certification that the joint supports were manufactured in accordance with this specification and the submitted Materials Details.
- The name, address, telephone number, and e-mail address of the rolling mill that manufactured the LTDs and the mill's certification as to the type, grade, and ASTM designation of steel used in the LTD.
- The brand name of the epoxy coating used on the LTDs and the name, address, telephone number, and e-mail address of the manufacturer.
- The name, address, telephone number, and e-mail address of the epoxy coating applicator and the applicator's certification that the coatings were applied in conformance to this specification.
- The brand name of the bond breaker used on the dowels and the name, address, telephone number, and e-mail address of the manufacturer.

705-16 CONCRETE PIPE JOINT SEALING COMPOUND

SCOPE. This specification covers a flexible/rubber sealer used for joints in elliptical pipe, cattle pass and drainage units.

MATERIAL REQUIREMENTS. Concrete pipe joint sealing compound shall conform to the requirements of either AASHTO M198 Type B or ASTM C990.

BASIS OF ACCEPTANCE. Label stating conformance to either AASHTO M198 Type B or ASTM C990. Labels shall be either attached directly to the sealing compound or to the packaging in which the compound arrives at the project site.

705-17 CONCRETE PIPE JOINT ELASTOMERIC GASKETS

SCOPE. This specification covers elastomeric gaskets used for joints in round pipe.

MATERIAL REQUIREMENTS. Concrete pipe joint elastomeric gaskets shall conform to the requirements of either ASTM C443 or ASTM C361.

BASIS OF ACCEPTANCE. Label stating conformance to either ASTM C443 or ASTM C361. Label shall be either stenciled on the elastomeric gaskets, attached directly to the gaskets or attached to the packaging in which the gaskets arrive at the project site.

705-18 THRU 705-20 (VACANT)

705-21 MASONRY MORTAR

SCOPE. Requirements for the 3 common types of masonry mortar (N, S and M - increasing in strength, respectively). Use these mortars to bind masonry units together to construct masonry structures, repair masonry structures (tuck pointing), or bed and bond masonry or concrete units together. For historic masonry structures made with soft hydrated lime mortars, use a specially designed lime mortar as shown in the Contract Documents or as approved by the Engineer.

- Type N Masonry Mortar- for tuck pointing repair of structures made with fired clay bricks
- Type S Masonry Mortar- for new structures made with all types of masonry, including brick
- Type S Masonry Mortar- for tuck pointing repair of structures made with masonry other than clay brick
- Type M Masonry Mortar- for new and tuck pointing repair of rigid masonry riding surfaces, such as bridge decks, pavements, sidewalks, and other roadway areas subject to severe weathering and abrasion conditions

MATERIAL REQUIREMENTS

Portland Cement, Type II or VI	701-01
Masonry or Mortar Cement, Type N, S or M	701-02
Blended Portland Cement	701-03
Mortar Sand	703-03
Concrete Sand	703-07
Water	712-01

Proportion the N, S or M mortar type by loose volume parts as follows:

PORTLAND OR BLENDED PORTLAND CEMENT	MASONRY OR MORTAR CEMENT	SAND
Type N Mortar (make with Type N Masonry or Mortar Cement)		
0	1 (Type N)	2 1/4 to 3
Type S Mortar (make with Type S or N Masonry or Mortar Cement)		
0	1 (Type S)	2 1/4 to 3
1/2	1 (Type N)	3 3/8 to 4 1/2
Type M Mortar (make with Type M or N Masonry or Mortar Cement)		
0	1 (Type M)	2 1/4 to 3
1	1 (Type N)	4 1/2 to 6

After adding all ingredients (including water) to a mechanical mixer, mix for 3 to 5 minutes to entrain air and produce a workable and uniform consistency. Discard all unused mortar 2 1/2 hours after initial mixing. Mortar that has stiffened may be re-tempered up to 2 1/2 hours after initial mixing by adding water to restore the original workable consistency.

Use a uniform layer of mortar, 1/4 to 3/4 inch thick, for joints between uniform masonry units. For a tuck pointing (raking out and repointing) mortar, add the minimum water to the dry ingredients to produce a mortar that retains its form when hand squeezed and released. Allow this mortar to stand

covered (prehydrate) for 1 to 1 1/2 hours to greatly reduce shrinkage. Then mix with sufficient water to produce a stiff, but workable consistency, and use within 2 1/2 hours of initial mixing.

Avoid re-tempering the mortar when tuck pointing, matching a color, or to avoid color variations between batches (mix smaller quantities, if needed).

No admixtures, except for mortar coloring agents made from light-fast, durable, alkali-resistant minerals, will be permitted without written permission of the Director, Materials Bureau. If colored mortar is specified, submit samples of hardened mortar to the Engineer. Upon approval, use the same, uniform, mortar color throughout the work.

BASIS OF ACCEPTANCE. Inspection and approval by the Engineer.

705-22 PORTLAND CEMENT MORTAR BONDING GROUT

SCOPE. This specification covers the material requirements for portland cement mortar grout used for bonding fresh concrete to hardened concrete in both vertical and horizontal planes.

MATERIAL REQUIREMENTS. The ingredients for the portland cement mortar grout shall comply with the following:

Portland Cement, Type 1 or Type 2	701-01	
Mortar Sand		703-03
Concrete Sand		703-07
Water		712-01

Proportioning. The mortar grout shall have the cement and mortar or concrete sand proportioned 1:1 in separate volumetric containers. The sand shall be deposited into an approved mechanical grout mixer prior to the cement. Both the sand and cement shall be dry mixed for one (1) minute. After dry mixing, water shall be added in sufficient quantity to result in a workable consistency. An additional three (3) minutes of mixing is required after adding desired water. Workable consistency is defined as a grout that will not run on vertical faces or puddle in low spots. Any grout that has dried or become unworkable, as determined by the Engineer, shall not be incorporated in the work. Hand mixing of the mortar may be permitted only for small quantities as approved by the Engineer.

BASIS OF ACCEPTANCE. The mortar grout shall be accepted on the basis of inspection and approval by the Engineer.

SECTION 706 - CONCRETE, CLAY AND PLASTIC PIPE

706-01 NON-REINFORCED CONCRETE PIPE

SCOPE. This specification covers the material and quality requirements for non-reinforced concrete pipe 24 inches and smaller used for culverts.

GENERAL. The provisions of §706-02, Reinforced Concrete Pipe, shall apply except that all references to reinforcing steel shall be deleted. In addition, physical and dimensional requirements of concrete pipe under 12 inches in diameter shall be as stated in Table 1, Class 1, of ASTM C14. Plain concrete pipe 12 to 24 inches in diameter shall conform to Table 1, Class 2, of ASTM C14.

MATERIAL REQUIREMENTS. The Material Requirements contained in §706-02 shall apply except that all references to reinforcing steel shall be deleted.

FABRICATION REQUIREMENTS. The Fabrication Requirements contained in §706-02 shall apply except as noted herein.

Marking. No pipe class or wall designation shall be marked on the pipe.

§706

PHYSICAL REQUIREMENTS. The Physical Requirements contained in §706-02 shall apply except as noted herein.

Strength. The strength requirements for the respective diameter pipe sizes shall be as stated in Table 1 of ASTM C14. Details of the three-edge bearing test shall comply with ASTM C14.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §706-02 shall apply.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §706-02 shall apply.

SHIPPING. The Shipping requirements contained in §706-02 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §706-02 shall apply.

706-02 REINFORCED CONCRETE PIPE CLASSES II, III, IV, V

SCOPE. This specification covers the material, fabrication, and physical requirements of reinforced concrete pipe and cattle pass.

GENERAL. Apply the requirements of AASHTO M 170, Reinforced Concrete Culvert, Storm Drain and Sewer Pipe, Classes II, III, IV, and V, except as modified by this specification. Produce reinforced concrete pipe by either machine made or wet cast methods in accordance with working drawings approved by the Department and in full compliance with the details of this specification. Pipe manufactured for a specific class will be acceptable for any class having a lower design strength.

Methods of manufacture include the following:

A. Wet Cast Pipe And Cattle Pass. Wet cast units are those made from concrete placed and consolidated by conventional equipment. These units develop resistance to freeze-thaw damage through the use of entrained air in the concrete. Air content in wet cast concrete shall range between 5.0% and 9.0%.

Manufacture wet cast pipe, for Department acceptance, in accordance with this specification and the current Materials Procedure for precast concrete titled "Procedures For Achieving And Maintaining Precast Concrete Manufacturer's Approved List Status".

B. Machine Made Pipe. Machine made units use very low slump concrete and methods of consolidation which produce a dense product with low permeability and good resistance to freeze-thaw damage.

Manufacture machine made pipe, for Department acceptance, in accordance with this specification and the current Materials Method titled "Quality Assurance Procedure For Concrete Pipe Items".

MATERIAL REQUIREMENTS

A. Materials

Portland Cement (Type 1, Type 2 or Type 3)	701-01
Concrete Repair Material	701-04
Coarse Aggregate	703-02
Concrete Sand	703-07
Bar Reinforcement, Grade 60 (Reinforcement & Stirrups)	709-01
Wire Fabric for Concrete Reinforcement	709-02
Bar Reinforcement, Grade 40	709-03
Cold Drawn Wire for Concrete Reinforcement	709-09

Admixtures	711-08
Water	712-01
Concrete Pipe Joint Sealing Compound	705-16
Concrete Pipe Joint Elastomeric Gaskets	705-17
Fly Ash	711-10
Ground Granulated Blast Furnace Slag	711-12

B. Cementitious Content. Use a minimum combined cementitious content of 565 lb/cy. This includes the Portland Cement and pozzolan (fly ash and/or ground granulated blast furnace slag). The maximum allowable total chloride content in concrete shall not exceed 0.10 percent by weight of cementitious material tested in accordance with written procedural directives of the Materials Bureau.

C. Pozzolans. Fly ash and/or ground granulated blast furnace slag may, in total, be substituted for cement up to a maximum of 20% by weight of the total amount of cement plus pozzolan in the mix.

D. Admixtures. Calcium Chloride is not allowed in concrete. Admixtures, other than an approved Air Entraining agent for wet cast pipe, are not allowed unless otherwise approved by the Materials Bureau.

E. Reinforcement. Sample the reinforcement in accordance with the written directives of the Materials Bureau. Accept stirrups based on the manufacturer's certification, unless otherwise directed by the Materials Bureau.

F. Pipe Joint Materials

1. Elastomeric Gaskets. The gaskets used in the installation of round pipe shall meet the specification requirements of §705-17 and only those types and sizes designated by the pipe manufacturer on the approved drawings of the particular pipe.

2. Sealing Compounds. Concrete pipe joint sealing compound, meeting the specification requirements of §705-16, shall be used only on elliptical pipe and reinforced cattle pass.

FABRICATION REQUIREMENTS

Drawings. Submit detailed working drawings conforming to the Materials Bureau concrete pipe templates. All diameter sizes of a particular geometric shape can be included on one drawing. Separate drawings are required for cattle pass, jacking pipe and special designs.

Full approval of the working drawings is required prior to the manufacture of any concrete pipe.

Design, Reinforcement and Dimensions

A. General. Apply the Design, Reinforcement and Permissible Variations requirements of AASHTO M 170 for Class II, III, IV and V pipe, walls B & C. The AASHTO tables show minimum reinforcement. The manufacturer may submit drawings detailing alternatives to the specified reinforcement and/or wall thickness for Materials Bureau consideration. To gain full approval of alternate designs, manufacture and test pipe samples in accordance with the written procedural directives of the Materials Bureau.

B. Reinforced Concrete Cattle Pass. Apply the requirements of applicable Standard Sheet with the following modification. A minimum length of 48 inches is required for each section. The maximum allowable variation in laying lengths of two opposite sides of a cattle pass section is 1/8

inch per 12 inches of diameter, not to exceed 5/8 inch in any length of cattle pass, except where beveled or curved cattle pass lengths have been specified.

Concrete Batch Placement

A. Machine Made Pipe. Clean and properly assemble the forms prior to placing any concrete. Transport and place the concrete mixture such that no segregation of the concrete materials or displacement of the reinforcing steel occurs within the form.

B. Wet Cast Pipe And Cattle Pass. Apply the Concrete Placement And Consolidation requirements contained in §704-03.

Curing. Include the type of curing, curing time and any temperature requirements on the drawing.

A. Machine Made Pipe. Cure the pipe in accordance with AASHTO M 170. Other methods of curing are subject to approval by the Director, Materials Bureau.

B. Wet Cast Pipe And Cattle Pass. Apply the Curing requirements contained in §704-03.

Joints. Use either bell and spigot or tongue and groove design. Design the joints so as to permit effective jointing to reduce leakage and infiltration and to permit placement without irregularities.

Marking. The pipe markings must be identified on the inside barrel for pipe diameters of 1 1/2 feet and greater. If the diameter is less than 1 1/2 feet the markings may be stenciled on the outside of the pipe. Mark each piece of pipe with the following information, as applicable.

1. Name or trademark of manufacturer.
2. Date of manufacture.
3. Pipe class.
4. Wall designation.
5. Pipe diameter.
6. NYSDOT lot number (“NYSDOT ”) (Machine made pipe only.)
7. Indelibly mark the word “TOP” on the inside and outside of the barrel at the appropriate location on each pipe length with elliptical or quadrant reinforcing.

Repair

A. Machine Made Pipe. Pipe may be repaired at the plant or in the field using 701-04 Concrete Repair Material. Repairs to more than 10% of a lot will not be permitted. Repairs will be acceptable if, in the opinion of the Department, the repairs are sound, properly finished and cured, and the repaired pipe conforms to the requirements of these Specifications and the written procedural directives of the Materials Bureau.

B. Wet Cast Pipe And Cattle Pass. Apply the Repair requirements contained in §704-03.

PHYSICAL REQUIREMENTS

Strength. Apply the requirements of AASHTO M 170 except that the compressive strength requirements do not apply except for cattle pass. Conduct such number and type of three edge bearing tests as the Materials Bureau deems necessary to establish the quality of pipe.

Reinforced concrete cattle pass will not require a three-edge bearing test. The minimum 28 day compressive strength for cattle pass, as determined by concrete cylinders, is 3000 psi.

Absorption Requirements For Machine Made Pipe. The maximum average absorption for all pipe is 8.0% by weight for the last three specimens tested.

Freeze-Thaw Requirements. The Materials Bureau reserves the right to test the pipe for durability by freeze-thaw testing. The test will be run in accordance with written procedural directives of the Materials Bureau.

SAMPLING AND TESTING. It is required that each manufacturer have a testing machine, of a type approved by the Materials Bureau, to carry out three edge bearing tests. Employ a commercial testing agency to calibrate the testing machine according to ASTM E4 at a minimum of once a year. Upon request of the Materials Bureau, furnish a record of this calibration. Sample and test reinforced concrete pipe and cattle pass units, manufactured under the requirements of this specification, as follows.

A. Machine Made Pipe. Separate machine made reinforced concrete pipe into specific and identifiable production lots. Follow the written procedural directives of the Materials Bureau to determine the maximum number and type of units in a lot and the number of samples to be taken per lot. Test each lot of machine made reinforced concrete pipe as follows:

1. Three Edge Bearing Test. Follow the requirements for strength testing indicated above using the test procedure identified in the procedural directives issued by the Materials Bureau. Perform tests in the presence of a representative of the Department.

2. Absorption Test. Cores from each lot, drilled by the manufacturer in the presence of a representative of the Department, will be used for this test. The cores will be tested by the Materials Bureau in accordance with the test method specified in ASTM C497 except that under “absorption test” the drying period will be 48 hours at a temperature of 230°F.

Plug the holes when cores are taken. Ensure that plugs are sound, properly finished and cured according to the requirements of “Pipe Repair.”

In addition to the above tests, pipe will be subject to inspection at any time prior to placing, and rejection may be made through failure to comply with the criteria shown in the written procedural directives of the Materials Bureau.

B. Wet Cast Pipe And Cattle Pass. Sample and test wet cast reinforced concrete pipe and cattle pass in accordance with Materials Bureau requirements contained in the current Materials Procedure for precast concrete, titled “Procedures For Achieving And Maintaining Precast Concrete Manufacturer’s Approved List Status”.

FINAL PRODUCTION INSPECTION. For wet cast units only, follow the Final Production Inspection requirements contained in §704-03.

SHIPPING

A. Machine Made Pipe. No units will be considered for shipment unless the units are free from defects as noted under Pipe Repair in this specification and according to the written procedural directives of the Materials Bureau.

B. Wet Cast Pipe And Cattle Pass. Follow the Shipping requirements contained in §704-03.

BASIS OF ACCEPTANCE

A. Machine Made Pipe. Units will be accepted in stock lot quantities at the manufacturing location in accordance with the current version of Materials Method 1 titled “Quality Assurance Procedure For Concrete Pipe Items”.

B. Wet Cast Pipe And Cattle Pass. Follow the Basis Of Acceptance requirements contained in §704-03.

706-03 REINFORCED CONCRETE ELLIPTICAL PIPE; CLASSES HE-II, HE-III, HE-IV, VE-IV, VE-V AND VE-VI

SCOPE. This specification covers the material and quality requirements for both horizontal and vertical elliptical reinforced concrete pipe of the classes noted above for use as culvert pipe. Pipe designed for placement with the major axis horizontal is designated as horizontal elliptical pipe. Pipe designed for placement with the major axis vertical is designated as vertical elliptical pipe.

GENERAL. The provisions of §706-02, Reinforced Concrete Pipe Classes II, III, IV, V shall apply except as noted herein.

All references to AASHTO M 170, contained in §706-02, shall be replaced with AASHTO M 207. All reference to Classes II, III, IV and V, contained in §706-02, shall be deemed to include all classes of elliptical pipe.

MATERIAL REQUIREMENTS. The Material Requirements contained in §706-02 shall apply except that the pipe joint material shall be a sealing compound meeting the requirements of §705-16.

FABRICATION REQUIREMENTS. The Fabrication Requirements contained in §706-02 shall apply except as noted herein.

Design, Reinforcement and Dimensions. In the case of elliptical pipe, the working drawings indicate the equivalent round pipe diameter, rise, span and class. A tolerance of plus or minus 2% from the nominal rise and span of the pipe, as shown on the approved working drawing, will be permitted.

Variations in laying lengths of two opposite sides of a pipe section shall not be more than 1/8 inch per foot of equivalent diameter, with a maximum of 5/8 inch in any length of pipe, except where beveled or curved lengths have been specified.

Marking. No wall designation shall be marked on the pipe. An equivalent round pipe diameter shall be used for markings.

PHYSICAL REQUIREMENTS. The Physical Requirements contained in §706-02 shall apply.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §706-02 shall apply.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §706-02 shall apply.

SHIPPING. The Shipping requirements contained in §706-02 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §706-02 shall apply.

706-04 PRECAST CONCRETE DRAINAGE UNITS

SCOPE. This specification covers the material and fabrication requirements for precast concrete drainage units including transverse drainage interceptors.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply except as noted herein.

The concrete used to fabricate round precast concrete drainage units shall have a minimum compressive strength of 4000 psi @ 28 days. The concrete used to produce machine made units shall have a maximum absorption of 8.0% by weight and is not required to be air entrained.

Additional materials listed below shall meet the requirements of the following subsections:

Frames And Grates	655
Concrete Grouting Material	701-05
Concrete Pipe Joint Sealing Compound	705-16
Concrete Pipe Joint Elastomeric Gaskets	705-17
Mortar For Concrete Masonry	705-21
Steps For Manholes	725-02

DRAWINGS. The Drawing requirements contained in §704-03 along with the following shall apply.

Fabricator Working Drawings are required for all round drainage structures. Cut sheets, showing structure heights, the size and location of pipe openings and step locations are required for all drainage structures.

FABRICATION. The Fabrication requirements contained in 704-03, along with the following shall apply.

Manufacturing Process. Precast concrete drainage units shall be wet cast or machine made.

A. Wet Cast. Wet cast units are manufactured from concrete, placed and consolidated by conventional equipment, containing entrained air to develop resistance to freeze-thaw damage.

B. Machine Made. Machine made units are manufactured with very low slump concrete, consolidated to produce a dense product with low permeability and good resistance to freeze-thaw damage. Machine made units are those made by the following methods:

- Packerhead
- Roller suspension
- Centrifugal
- Machine tamped
- Machine vibrated
- Other methods as approved by the Materials Bureau

Reinforcing. Reinforcing bar splices shall be lapped a minimum of 30 bar diameters and tied securely. Wire fabric splices shall be secured by one of the following methods:

A. Tying. Under this method the ends shall lap to a length of not less than 30 diameters of the reinforcement and the lap shall contain a longitudinal member. A sufficient number of laps shall be tied to maintain continuity of the cage through the period of placement and curing of the concrete.

B. Welding. Each circular member shall be lapped a minimum of 2 inches and welded. The weld shall develop a minimum of 50 percent of the specified strength of the wire.

Round Units. Precast bases, floors, risers, conical top sections, grade rings and flat slab tops shall conform to the design, dimension and reinforcement requirements of ASTM C478. The C478 requirements for splices, laps and welds shall not apply.

Transverse Drainage Interceptors. Bar reinforcement shall be epoxy coated meeting the requirements of §709-04.

Joints. Joints between precast riser sections shall be formed with male and female ends so that when the sections are assembled they will make a continuous and uniform unit.

Joint Sealant Materials. Joints between precast sections are to be sealed with flexible watertight Elastomeric Gaskets, Pipe Joint Sealing Compounds, Mortar for Concrete Masonry, Concrete Grouting Material or Concrete Repair Material meeting the requirements of the Standard Specifications. If

§706

elastomeric Gasket Sealers are used the shape, size and placement shall be recommended by the precast manufacturer.

Steps for Drainage Units. Steps for drainage units shall conform to §725-02, Steps for Manholes. Steps in risers and conical top sections shall be aligned to form a continuous ladder with rungs equally spaced vertically in the completed unit at a maximum spacing of 16 inches. All steps in a completed drainage unit shall be the same size. Steps shall be embedded into the walls of the section a minimum of 3 inches. The rung shall project a minimum clear distance of 4 inches from the walls of the section measured from the point of embedment. If the steps are grouted, the grouting material shall conform to §701-04 Concrete Repair Materials or §701-05 Concrete Grouting Material. If plastic inserts are used for installing steps, they shall be approved by the Materials Bureau. Steps which are damaged during installation or handling shall be replaced.

Frames for Grates. Frames cast into the top slab or top of the uppermost riser shall be secured and held in place by a minimum of 4 stirrups or studs per frame, welded to the frame near the corners.

Parallel bar frames shall contain shear stud anchors, for the purpose of transferring loads, as required and detailed on the standard sheet for parallel bar grates and frames. Shear stud anchors, when required, shall replace the frame securing stirrups or studs.

Dimensional Tolerances.

A. Drainage Units (Rectangular / Square).

- Internal dimensions +5/8 inch, -1/2 inch
- Wall thickness
 - 6 inches +3/4 inch, -1/4 inch
 - ≥8 inches +3/4 inch, -1/2 inch
- Reinforcing steel cover
 - Walls (inside face) 2 inches (min), 4 inches (max)
 - Base (inside face) 2 inches (min), 3 1/4 inches (max)
 - Roof (all faces) +5/8 inch, -1/4 inch
 - Pipe openings (2 inches) ±1 inch
- Step spacing and alignment ±3/4 inch

B. Drainage Units (Round).

- Internal diameter
 - ≤60 inches ±5/8 inch,
 - >60 inches & ≤ 96 inches ±3/4 inch
 - >96 inches ±1 1/2 inches
- Wall thickness
 - Internal diameter ≤60 inches +5/8 inch, -1/4 inch
 - Internal diameter >60 inches & ≤ 96 inches +3/4 inch, -1/2 inch
 - Internal diameter >96 inches +1 inch, -5/8 inch,
 - Reinforcing steel cover
 - Base, Roof and Walls +5/8 inch, -1/4 inch
 - Pipe openings (2 inches) ±1 inch
- Step spacing and alignment ±3/4 inch

SAMPLING AND TESTING. The sampling and testing requirements contained in 704-03 shall apply except as noted herein.

A. Machine Made Units. Testing for air content is not required. Cores shall be taken from the hardened concrete and tested for absorption. A minimum of 3 cores per 5 batches of a single mix with a minimum of three cores per day per mix shall be used to measure absorption. The average absorption of the 3 cores shall not exceed the maximum absorption specified herein. Testing shall be

in accordance with ASTM C497 except that the drying period shall be 48 hours at a temperature of 230°F.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein.

Markings shall be placed on the inside face of all precast pieces. Each flat slab top that doesn't have an integral frame or a design that readily indicates the top surface shall have the words "INSTALL THIS SIDE UP" placed on its top surface.

The markings on rectangular drainage units, including base slabs, bases and risers, shall include the maximum placement depth in feet ("MPD...feet"). The maximum placement depth is based on wall thickness and reinforcement and shall be in accordance with the Department's Standard Sheets or the contract plans.

Instead of marking the contract number on each unit they may be marked with "NYSDOT".

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in 704-03 shall apply.

706-05 POROUS CONCRETE PIPE UNDERDRAIN

SCOPE. This specification covers the material and quality requirements for porous concrete pipe and extra strength concrete porous concrete pipe underdrains.

GENERAL. Porous concrete pipe and extra strength porous concrete pipe shall be manufactured in accordance with approved working drawings and in compliance with details set forth below.

MATERIAL REQUIREMENTS. All materials shall comply with the requirements of §706-02, Reinforced Concrete Pipe, except that reinforcement shall not be used.

Drawings. Drawings shall be furnished in accordance with the provisions of §706-02.

FABRICATION. Porous concrete pipe and extra strength porous concrete pipe shall conform in size and shape to the details shown on the standard sheet for porous concrete pipe underdrain and the approved working drawing.

The inside surface of the pipe shall be straight and true to dimensions with a permissible variation from the true form of not more than 1 1/2 percent. A tolerance of 5% will be permitted in the diameter of the pipe. The wall thickness of the pipe may be greater than shown on the standard sheet, but it shall not be less than 95% of the stipulated wall thickness.

High early strength cement, calcium chloride or any other additive shall not be used unless otherwise approved by the Materials Bureau.

Concrete mix proportions will be such that will produce a concrete mix of such quality that the pipe will conform to the test and design requirements of these specifications.

Each length of pipe shall be clearly marked on the outside with the name or trademark of the manufacturer. Extra strength porous concrete pipe underdrain shall be clearly marked, "Extra Strength".

Curing. All pipe shall be cured in accordance with the provisions of §706-02.

Strength Requirements. The minimum ultimate strength for the size of the pipe being tested shall be as specified on the standard sheet. Requirements of §706-02 shall apply except that no determination of a 0.01 inch crack will be required and the ultimate strength values as determined on full length specimens shall be as specified on the standard sheet.

Infiltration Requirements. Pipe shall be tested for rate of infiltration in accordance with the method of test outlined in AASHTO Designation M176. The minimum rate of infiltration shall not be less than 1 gallon per minute per inch of internal diameter per foot of pipe for all sizes.

All tests shall be performed by the manufacturer at their plant and shall be witnessed by a representative of the Department. The number of samples for test shall be as directed by the Materials Bureau.

Other Requirements. In addition to the above tests, the pipe shall be subject to inspection at all times prior to placing and rejection will be made through failure to comply with any of the following conditions:

A. Dimensions. The pipe shall not vary in any dimensions more than permitted by this specification.

B. Fractures or Cracks. The pipe shall have no fractures or cracks passing through the shell or socket of the pipe, except that a single crack not exceeding 2 inches in length at either end of a pipe shall not be considered cause for rejection unless the defect exists in more than 5% of the lot offered for sampling and testing.

C. Quality. There shall be no defects that indicate imperfect mixing and molding.

D. Strength. There shall be no cracks that are sufficient to impair the strength, durability or serviceability of the pipe.

E. Shape. The shape of the pipe shall be such that there shall be no variation in alignment of more than 1/8 inch per linear foot.

BASIS OF ACCEPTANCE. The material will be considered for acceptance in stock lot quantities at the manufacturing location in accordance with procedural directives of the Materials Bureau.

In addition, the manufacturer shall furnish the Department representative at the plant a certification for each lot manufactured certifying that all pipe in the lot was manufactured in accordance with the terms of this specification and that the pipe details conform to drawings previously approved by the Department. Pipe shall be considered ready for acceptance when a lot conforms to the indicated test requirements. The manufacturer shall be permitted to retest to determine specification compliance.

Pipe not used within two years after its original acceptance shall be retested by the Department before it can be used.

706-06 POLYESTER FORMED IN PLACE PIPE LINER

SCOPE. This specification covers the material requirements for polyester formed in place pipe liners used in rehabilitation applications of culverts and storm drains.

GENERAL. The flexible liner will be fabricated from one or more layers of polyester felt. An impermeable polyurethane or polyvinyl chloride material will be bonded to the outside of the felt liner. Once inverted, the impermeable plastic membrane will become the inside of the pipe liner.

MATERIAL REQUIREMENTS. Supply a resin system material conforming to the following:

Property	Standard	Required
Tensile Stress, psi	ASTM D638	3000
Flexural Stress, psi	ASTM D790	4500
Flexural Modulus, psi	ASTM D790	25000

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Approved List for rehabilitation of Culverts and Storm Drains.

706-07 REINFORCED CONCRETE PIPE END SECTIONS

SCOPE. This specification covers the material and fabrication requirements for reinforced concrete pipe end sections.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following, shall apply.

The barrel portion of the end section shall meet the Design, Reinforcement and Permissible Variations requirements of AASHTO M 170 for Class III Pipe, Wall Designation B.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 shall apply, unless otherwise approved by the Director, Materials Bureau.

MARKING. The Marking requirements contained in §704-03 shall apply.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply, unless otherwise approved by the Director, Materials Bureau.

SHIPPING. The Shipping requirements contained in §704-03 shall apply, unless otherwise approved by the Director, Materials Bureau.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply, unless otherwise approved by the Director, Materials Bureau.

706-08 AND 706-09 (VACANT)**706-10 POLYVINYL CHLORIDE PIPE (relining)**

SCOPE. This specification covers the material requirements for polyvinyl chloride pipe when used in rehabilitation applications of culverts and storm drains.

General. The polyvinyl material from which the pipe and fittings are extruded or molded will not contain any reclaimed, reground or reworked material and will be comprised of virgin polyvinyl resins only. The resins used will meet the requirements contained in this specification. The pipe and fittings will be manufactured in such a manner so that all cross sections will be dense, homogeneous, and free from any imperfections.

MATERIAL REQUIREMENTS. The Polyvinyl Chloride pipe materials must conform to ASTM F1803 (Profile Wall) or ASTM F949 (Corrugated). All materials supplied will be clearly marked with the appropriate ASTM as certified.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Approved List for Rehabilitation of Culverts and Storm Drains.

706-11 HIGH DENSITY POLYETHYLENE PIPE (relining)

SCOPE. This specification covers the material requirements for high density polyethylene pipe when used in rehabilitation applications of culverts and storm drains.

General. The high density polyethylene material from which the pipe and fittings are extruded will not contain any reclaimed, reground or reworked material and will be comprised of virgin high density polyethylene resins only. The resins used will meet the requirements contained in this specification.

The pipe and fittings will be manufactured in such a manner so that all cross sections will be dense, homogeneous, and free from any imperfections.

MATERIAL REQUIREMENTS. The high density polyethylene pipe material must conform to ASTM F894 (Profile Wall) or ASTM F714 (Smooth Wall). All materials supplied will be clearly marked with the appropriate ASTM as certified.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Approved List for rehabilitation of Culverts and Storm Drains.

706-12 SMOOTH INTERIOR CORRUGATED POLYETHYLENE PIPE

SCOPE. This specification covers the material and quality requirements for smooth interior corrugated polyethylene pipe and fittings.

MATERIAL REQUIREMENTS. The polyethylene material for the pipe and fittings shall meet the requirements of AASHTO M294, Type S or Type SP. In addition, when checked with a 12 inches straight edge the smoothness of the interior liner shall not deviate more than 1/4 inch.

BASIS OF ACCEPTANCE. Smooth interior, corrugated polyethylene pipe will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

The supplier shall provide two copies of the approved Materials Details through the Contractor to the Engineer as part of the evidence of acceptability for the material at least 10 days prior to shipment of the product to the job site.

706-13 PERFORATED CORRUGATED POLYETHYLENE UNDERDRAIN TUBING

SCOPE. This specification covers the material and quality requirements for corrugated polyethylene tubing and fittings.

MATERIAL REQUIREMENTS. The corrugated polyethylene tubing and fittings 4 thru 10 inches in diameter shall meet the requirements of AASHTO Designation: M252, Corrugated Polyethylene Drainage Tubing except that tubing manufactured from material meeting A.S.T.M. Designation D1248, Class B, shall also be acceptable.

Corrugated polyethylene tubing and fittings 12 inches in diameter shall meet the requirements of AASHTO M252 except the pipe stiffness requirement shall be 45 psi at 5% deflection.

BASIS OF ACCEPTANCE. Perforated corrugated polyethylene underdrain tubing will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

706-14 CORRUGATED INTERIOR POLYETHYLENE PIPE

SCOPE. This specification covers the material and quality requirements for corrugated interior polyethylene pipe and fittings.

MATERIAL REQUIREMENTS. The polyethylene material for the pipe and fittings shall meet the requirements of AASHTO M294, Type C.

BASIS OF ACCEPTANCE. Corrugated interior polyethylene pipe will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification.

706-15 PVC PLASTIC DRAIN PIPE SYSTEM

SCOPE. This specification covers the material and quality requirements for poly (vinyl chloride) plastic drain pipe, fittings and solvent cement when used as a drain pipe system.

GENERAL. The PVC material from which the pipe and fittings shall be extruded or molded shall not contain any reclaimed, reground or reworked material whatsoever, but shall be compounded from virgin PVC resins, plasticizers, stabilizers, and such materials that when compounded, it shall meet the requirements contained in this specification.

The pipe and fittings shall be extruded or molded in such a manner that all cross sections shall be dense, homogeneous, and free from porosity or other imperfections.
The solvent cement shall be a solution of unplasticized PVC tetrahydrofuran and cyclohexanone.

MATERIAL REQUIREMENTS. The PVC material for the pipe and fittings shall meet the requirements of ASTM D1784 for Rigid Poly (Vinyl Chloride) Compounds and Chlorinated Poly (Vinyl Chloride) Compounds, Class 12444-B.

The molded or extruded pipe shall conform to ASTM D1785 for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedule 80, PVC 1120.

The molded or extruded fittings shall conform to ASTM D2467 for Socket-Type Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80, PVC I.

The solvent cement shall meet the requirements of ASTM D2564 for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Pipe and Fittings.

Nominal Size	Outside Diameter (Inches)	Inside Diameter (Inches)	Wall Thickness Schedule 80 (Inches)
4	4.500	3.826	0.337
5	5.563	4.813	0.375
6	6.625	5.761	0.432
8	8.625	7.625	0.500
10	10.750	9.564	0.593

DIMENSIONS. The dimensions and tolerances of the pipe and fittings shall conform to ASTM D1785 and D2467 respectively.

MARKING. All material furnished shall be plainly marked in accordance with ASTM D1785, D2467, and D2564 for the pipe, fittings and solvent cement, respectively.

BASIS OF ACCEPTANCE. All pipe, fittings and solvent cement shall be accepted on the basis of the manufacturer's certification that the material conforms to this specification.

706-16 CELLULAR POLYSTYRENE PROTECTIVE COVER

SCOPE. This specification covers the material and quality requirements for cellular polystyrene when used as protective cover for pipes.

GENERAL. The protective cover shall be fabricated from rigid extruded cellular polystyrene such that it shall meet the requirements contained in this specification.

§706

The polystyrene shall be extruded in such manner that all cross sections shall be uniform and free from imperfections.

MATERIALS REQUIREMENTS. The fabricated cellular polystyrene protective cover shall meet the following requirements:

Property	ASTM Test Procedure	Requirement
Density, pcf	D1622	2.0 ± 0.15
Compressive Strength, psi	D1621	30 ± 5
Flammability	D1692	Self-Extinguishing

DIMENSIONS. The protective cover shall be fabricated in cylindrical half-sections of any convenient length for application to straight pipe and half-sections of suitable shape and length to protect any non-linear portions of the pipe or fittings.

The thickness of the protective cover shall be maintained within ± 1/16 inch of the thickness shown on the plans.

The protective cover shall be fabricated such that it mates with the pipe without leaving gaps at the seams. It shall have the following maximum clearance between outside diameter of nominal pipe and inside diameter of protective cover:

Nominal Pipe Size, Inches	Maximum Clearance, Inches
1/8 to 1 1/2 incl.	1/64
2 to 4 incl.	2/64
5 to 11 incl.	5/64
12 and over	6/64

BASIS OF ACCEPTANCE. All protective cover furnished shall be marked with the following information: manufacturer's name, type of material, and nominal size.

All protective cover shall be accepted on the basis of the Manufacturer's certification that the material conforms to this specification.

706-17 PRECAST CONCRETE BOX CULVERTS

SCOPE. This specification covers the material and quality requirements for precast concrete box culverts.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply except as noted herein.

The concrete used to fabricate precast concrete box culverts shall have a minimum compressive strength of 5000 psi @ 28 days. Joint gasket material shall meet the requirements of ASTM D1056, Grade # 2A1 or # 2A2.

DESIGN. When the contract plans contain complete design details for the culvert, alternate designs will not be considered. When the contract plans do not contain complete design details for the culvert the Contractor shall be responsible for providing them. Precast concrete box culvert designs shall meet the requirements of the "NYSDOT Reinforced Concrete Box Culvert Design Guidelines". Design details for bridge size culverts shall also include load rating information. Design calculations shall be stamped by a Professional Engineer licensed, and registered, to practice in New York State. The transmittal, processing and approval of box culvert designs will be in accordance with procedural directives of the Materials Bureau.

DRAWINGS. The Drawing requirements contained in §704-03, along with the following shall apply.

All fabrication drawings for Contractor provided designs shall be stamped by a Professional Engineer licensed, and registered, to practice in New York State. Fabrication drawings for bridge size culverts shall include load rating information. Reproducible drawings are required for bridge size culverts only.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following shall apply.

Reinforcing. Unless noted otherwise in the contract plans or approved fabrication drawings the concrete cover over reinforcing steel shall be 1 inch minimum on the walls, floor slab and roof slab of culverts and 1 1/2 inches minimum on wingwalls. When fill heights over the box culvert are less than 24 inches the concrete cover on the outside face of the roof slab shall be 2 inches minimum and all reinforcing steel in the top mat of the roof slab shall be epoxy coated or the concrete shall contain corrosion inhibitor. Fill heights shall be measured from the top of pavement to the top of the culvert roof slab. All reinforcing steel in the wall section of wingwalls shall be epoxy coated or the concrete shall contain corrosion inhibitor.

Joints. Precast concrete box culvert sections shall be fabricated with a female joint on the upstream end and male joint on the downstream end. Joint depth shall be a minimum of 2 inches and a maximum of 4 inches. The ends of longitudinal reinforcing steel shall have 1/2 inch minimum concrete cover at the mating surface of the joint. The circumferential reinforcing steel shall have 1 inch minimum concrete cover, as measured to the outermost bars, at the mating surface of the joint. When interferences occur which prevent this, the concrete cover shall be increased accordingly as shown on the approved fabrication drawings. Joints shall be fabricated such that when box culvert sections are fully drawn together the gap between adjacent culvert sections is 3/4 inch maximum. The outside mating surface of the joint shall have a continuous 1 x 1 inch gasket installed at the precast plant.

Corrosion Inhibitor. Corrosion inhibitor may be used in lieu of epoxy coated reinforcing.

Dimensional Tolerances

- Internal Dimensions
 - < 48 inches: ±1/2 inch
 - ≥ 48 inches & ≤ 96 inches: ±3/4 inch
 - > 96 inches: ±1 inch
- Wall & Slab Thickness
 - < 10 inches: +5/8 inch, -1/4 inch
 - ≥ 10 inches: +3/4 inch, -1/4 inch
- Design Laying Length: +1 inch, -1/2 inch
- Variation in Laying Length of Opposite Faces
 - Span / Rise ≤ 84 inches: ±5/8 inch
 - Span / Rise > 84 inches: ±3/4 inch
- Surface Irregularities on Mating Surface of Joint (when checked with a 3 foot straight edge): ±1/4 inch

Repair. Minor defects in the mating surface of the joint, that do not come in contact with the joint gasket material and are 1/4 inch or less in depth, do not require repair.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein. Markings shall be placed on the inside face of one wall of each culvert barrel section.

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis of Acceptance requirements contained in §704-03 shall apply.

706-18 PERFORATED POLYVINYL CHLORIDE UNDERDRAIN PIPE

SCOPE. This specification covers the material and quality requirements for smooth-wall perforated polyvinyl chloride (PVC) plastic pipe, couplings and fittings intended for use in underdrains.

MATERIAL REQUIREMENTS. Perforated polyvinyl chloride underdrain pipe and fittings shall conform to AASHTO M278 Class PS46.

BASIS OF ACCEPTANCE. Acceptance of the perforated polyvinyl chloride underdrain pipe will be based on the manufacturer's certification of compliance with these specifications.

SECTION 707 - METAL PIPE

707-01 (VACANT)

707-02 CORRUGATED STEEL PIPE

SCOPE. The material requirements of corrugated steel pipe with metallic, bituminous, portland cement concrete/or polymer coating intended for use in construction of culverts and drainage systems.

GENERAL. The corrugated steel pipe covered by this specification is classified as follows:

1. Type I. A full circular cross-section, with a single thickness of corrugated sheet.
2. Type IR. A full circular cross-section, with a single thickness of smooth sheet, fabricated with helical ribs projecting outwardly.
3. Type II. A Type I pipe which has been reformed into a pipe-arch, having an approximately flat bottom.
4. Type IIR. A Type IR pipe which has been reformed into a pipe-arch having an approximately flat bottom.
5. Type III. A Type I pipe which has been perforated to permit the in-flow or out-flow of water.

MATERIAL REQUIREMENTS. Apply the requirements of AASHTO M 36 Types I, IR, II, IIR, and III except as modified herein for all metallic coated corrugated steel pipe. Apply the requirements of AASHTO M 190M except as modified herein for all bituminous coated corrugated steel pipe. Apply the requirements of AASHTO M 245M Types I and II except as modified herein for all polymer coated steel pipe.

When Type IR or Type IIR corrugated steel pipe (spiral rib) is specified, the nominal dimension of the ribs shall be 3/4 x 3/4 inch at 7 1/2 inch pitch.

A. Coatings. Coat pipe with one of the following:

1. Metallic. The steel sheet will have a protective coating of zinc galvanizing (AASHTO M 218) or of Aluminum-Coated (Type 2) (AASHTO M 274).

2. Fully bituminous coated and paved invert (AASHTO M 190, Type C). In addition to one of the metallic coatings, the pipe will be fully bituminous coated and have a bituminous paved invert.

3. Fully bituminous coated and 100 percent paved (AASHTO M 190, Type D). In addition to one of the metallic coatings, the pipe will be fully bituminous coated and have a fully paved, smooth bituminous interior.

4. Polymer coated. The steel sheet will have a protective coating of zinc (galvanizing). In addition, the pipe will have a minimum interior polymer coating thickness of 0.01 inch and an optional exterior polymer coating. If an exterior polymer coating is applied, it will have a minimum thickness of 0.003 inch.

5. Polymer coated with a bituminous paved invert. In addition to the zinc and polymer coatings, the pipe will have a bituminous paved invert.

TABLE 707-2-1 SHEET GAGE NUMBERS AND THICKNESS OF UNCOATED METAL			
Manufacturer's Standard Gage #	Thickness Equivalent(*) Inches	Manufacturer's Standard Gage #	Thickness Equivalent(*) Inches
1	0.27	15	0.067
2	0.25	16	0.060
3	0.24	17	0.054
4	0.224	18	0.048
5	0.21	19	0.042
6	0.20	20	0.036
7	0.18	21	0.033
8	0.164	22	0.030
9	0.150	23	0.027
10	0.134	24	0.024
11	0.120	25	0.021
12	0.104	26	0.018
13	0.090	27	0.016
14	0.074	28	0.015

*NOTE: Minimum thickness shall conform to the appropriate AASHTO specifications.

6. Portland Cement Concrete Lined. The steel sheet will be covered with dense, homogeneous, nonsegregating concrete lining. The concrete will be a minimum thickness of 1/2 inch over the crest of the corrugations of the carrier pipe. In no case will the amount of portland cement, blended cement, or portland cement plus flyash be less than 17 pcf. Flyash in the mix may not exceed 20% by weight of the cementitious material. When type IP cement is used, no flyash will be added in batching. All concrete will have a water-cement ratio not exceeding 0.50 by weight. Cure the concrete lining prior to installation as per manufactures instructions.

The bituminous material for coating and/or paving will be homogeneous and have the following properties in addition to those specified by AASHTO M 190:

Penetration at 77°F, 100g, 5 seconds	AASHTO T49	25-50
Penetration Ratio (40°F/77°F x 100)	AASHTO T49	80-90
Softening Point °F(Ball & Ring)	AASHTO T53	88-110

Apply the requirements of AASHTO M 246 for polymer material. Polymer coating materials must appear on the Department's Approved List.

Apply the material requirements of §501-2.02 Materials for portland cement concrete liner material.

B. Gauge. The nominal metal thickness corresponding to any gauge is shown in Table 707-2-1.

C. End Finish. To facilitate field joining, reroll the ends of all helical corrugated steel pipe with diameters of 12 inches or greater to form a minimum of two annular corrugations of no less than 2 2/3 inch pitch by 1/2 inch depth. Reroll the ends of Type IR and IIR pipe to form only two corrugations.

D. Coupling Bands. Supply annular corrugated steel coupling bands for all round pipe sections (Types I, IR, and III) 12 inches or greater in diameter. The band corrugations will have the same dimensions as the pipe ends. Mesh the band with at least one full corrugation and lap it equally on each pipe end. The band width will be a minimum of 7 inches for pipe diameters up to and including 32 inches. The band width will be a minimum of 10 1/2 inches for pipe diameters greater than 32 inches. The thickness of the band cannot be less than 2 nominal sheet thicknesses thinner than the pipe and in no case thinner than 0.05 inch.

Pipe arches (Type II and IIR) may be joined by the annular corrugated bands described above or by special projection type coupling bands. The special projection bands will consist of two rows of projections at 3 inches center-to-center that will mesh with at least one full corrugation and will lap equally on each pipe end. The thickness of the special projection bands will not be less than 2 nominal sheet thicknesses thinner than the pipe and in no case thinner than 0.06 inch.

Regular projection type coupling bands (dimpled bands) will not be acceptable for 1 foot in diameter pipe and larger. Dimpled bands may be used on pipe diameters smaller than 1 foot, all sizes of perforated underdrain pipe (Type III), and for connecting pipe extensions to existing helical corrugated metal pipe without rerolled ends, unless otherwise shown on the plans.

Coupling bands may be one or two piece. Use two piece coupling bands on pipe 48 inches or greater in diameter.

Use one of the following coupling band connectors:

- Galvanized steel angles, 2 x 2 x 3/16 inches
- Lug connectors
- Bar and strap connectors

Rivet, bolt, or weld these connectors to the coupling bands. Any evidence of loose bolts or rivets, bearing failure, or weld or band tearing are cause for rejection and replacement of that coupling band. As an alternate to the coupling band connectors stated above, a corrugated angle which conforms to an approved Materials Detail may be used.

Coat the steel sheet used for coupling bands with a polymer or metallic coating. If polymer or metallic coated corrugated steel pipe is being joined, the bands must have the same coating as the pipe.

Joints for concrete lined pipe will meet the requirements of §603-3.06 Joints.

E. Coating Repair. Repair damaged metallic, bituminous, portland cement concrete and/or polymer coating.

Metallic coating field repairs will be allowed only when the total damaged area on each piece is less than 2 sf of coated surface, excluding aluminum coated rerolled ends. Any piece having damaged areas totaling more than 2 sf, excluding aluminum coated rerolled ends, will be rejected.

Repair metallic coatings as follows:

- Power disk sand or mechanically wire brush areas of damaged coating to bright metal
- Remove oil, grease, and corrosion products from repair areas
- Spray or brush a zinc-rich paint on clean, dry repair areas. The paint brand must appear on the Department's Approved List, Materials for Use in Repairing Galvanized Surfaces §719-01. The dry film paint thickness shall be at least 0.005 inch. Do not apply paint below 40°F.

Repair aluminum coatings damaged during rerolling at the manufacturing location. The rerolled ends may be either spot repaired or completely painted to repair small areas of damaged coating. Make repairs to the rerolled ends of aluminum coated pipe as referenced above. These rerolled end repairs, when properly completed, will not be counted toward the 2 sf of allowable damaged coating described above.

Repair damaged interior bituminous coatings using the original material or a Corrugated Metal Pipe Bituminous Coating Repair Material appearing in the Department's Approved List. Exterior damage to a bituminous coated pipe requires repair to the metallic coating only.

Repair damaged interior polymer coatings using Polymer Repair Materials for Steel Sheet used for Corrugated Pipe appearing in the Department's Approved List. Exterior damage to a polymer coated pipe requires repair to the metallic coating only.

Repair damaged portland cement concrete linings with Item 701-08, vertical and overhead patching material. The lining will be free of cracks exceeding 0.04 inch in width or the pipe will be rejected.

F. Marking. Mark or tag each length of corrugated steel pipe over the coating as approved by the Department to properly cross-reference the supplier's certification.

G. Additional Defects. In addition to coating damage and other criteria established in Materials Bureau procedural directives, the following additional defects along with those listed in AASHTO will be cause for rejecting the pipe when inspected at the project:

- Variation from a straight centerline of more than 3/4 inch in 20 feet.
- Any dents greater than 3 inches in diameter
- Any punctures
- Loosely formed or cracked lock seams
- Cracks through the metal
- Sharp bends in pipe arches that are less than the specified minimum corner radius for that size.

BASIS OF ACCEPTANCE. Corrugated steel pipe will be accepted on the basis of certified documentation issued by a supplier appearing on the Department's Approved List. Certification will accompany all shipments arriving at the project in accordance with Materials Bureau procedural directives. Shipments arriving without certification, or with improper certification will be rejected.

The Engineer will measure gauge and coating thicknesses at the project. The pipe will be rejected if the metal and/or coating thickness is less than required or certified. The Contractor will supply equipment required to measure metal and coating thicknesses as detailed in §603-3.02H, Thickness Measuring Equipment.

Acceptance requirements including thickness measurements, visual inspection instructions, certification format, and fabrication shop approval will be in accordance with Materials Bureau procedural directives. At the option of the Department, this material may be subjected to shop inspection. Polymer coatings, coating applicator facilities, and application methods are subject to Materials Bureau approval. Samples are required for laboratory and field testing. Field testing will be a minimum of two years duration. Upon approval, the brand of polymer coating and applicator will be placed on the Department's Approved List. Certifications for polymer coated pipe received at the project will include the brand and applicator of polymer coating, which must appear on the Department's Approved List. Corrugated connecting angles will be accepted provided an approved Materials Detail appears on the Department's Approved List from that supplier.

707-03 DUCTILE IRON PIPE (NON-PRESSURE)

SCOPE. This specification covers the material and quality requirements for 14 to 54 inches Ductile Iron Culvert Pipe.

GENERAL. Ductile Iron Pipe. (Non-Pressure) shall be a centrifugally cast iron pipe conforming to the requirements of ASTM A716, Ductile Iron Culvert Pipe.

BASIS OF ACCEPTANCE. Ductile Iron Pipe (Non-Pressure) shall be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the job site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

707-04 DUCTILE IRON PIPE (PRESSURE)

SCOPE. This specification covers the material, and quality requirements for 3 to 54 inches Ductile Iron Pipe (Pressure).

GENERAL. Ductile Iron Pipe (Pressure) shall be a centrifugally cast iron pipe conforming to the requirements of ANSI A21.51., Ductile-Iron Pipe, Centrifugally Cast In Metal Molds or Sandline Molds, for Water or Other Liquids.

BASIS OF ACCEPTANCE. Ductile Iron Pipe (Pressure) shall be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the job site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

707-05 TUNNEL LINER PLATE (relining)

SCOPE. This specification covers the material and fabrication requirements for tunnel liner plate.

MATERIAL REQUIREMENTS. Tunnel liner plate steel must conform to ASTM A569. Tunnel liner plate aluminum must conform to AASHTO M219 (ASTM B746). Before cold forming into tunnel liner plate the plates must conform to the following mechanical requirements:

	STEEL		ALUMINUM	
		(0.125-0.15 in.)	(0.173-0.25 in.)	
Tensile Strength, psi	42,000 min.	35,000 min.	34,000 min.	
Yield Point, psi	28,000 min.	24,000 min.	24,000 min.	
Elongation in 2 inch, percent	30 min.	6 min.	8 min.	

Prepare test specimens in accordance with ASTM A570 for steel sheets or ASTM A283 for steel plates and ASTM B209M for aluminum plates. Deliver the Mill test reports, for each heat and thickness to the Engineer with each shipment of liner plates.

Galvanizing. Galvanize steel plates in accordance with AASHTO M167 M. Galvanize after the plates are formed, punched and curved. Hot dip galvanize all bolts and nuts, when used with galvanized tunnel liner plate in accordance with ASTM A153.

Liner Plate. Punch all plate for bolting on both the longitudinal and circumferential seams or joints and fabricate so as to permit complete erection from the inside of the tunnel liner plate structure. The minimum edge distance from the center of a bolt hole to the edge of a plate will be in accordance with the manufacture's standard spacing. Provide a sufficient number of plates with 2 inches, or larger, grouting holes with pipe plugs, and spaced so that when the plates are installed there will be one line of holes at the crown of the pipe and one line on each side at approximately the midpoint. The holes in each line will not be more than 6 feet apart, and they will be staggered along the tunnel length.

Tunnel Liner Plate (Two-Flange). The minimum moment of inertia in inches⁴ per inch of plate width, based on the average of one ring of plates is as follows:

STEEL		ALUMINUM	
Uncoated			
Plate Thickness (in.)	Moment of Inertia (in. ⁴ /in.)	Thickness (in.)	Moment of Inertia (in. ⁴ /in.)
0.135		0.064	0.125
0.164		0.079	0.150
0.180		0.087	0.175
0.210		0.103	0.210
			0.0579
			0.071
			0.084
			0.097

0.240

0.118

0.225

0.110

The longitudinal seams will be of the lap type. The depth of the offset will be equal to the thickness of the metal for the full width of plate, including flanges. Fabricate the lap to allow the cross section of the plates to be continuous through the seam. The lapped longitudinal joints will contain at least five (5) bolts per 18 inch plate width, with bolts in ridges and valleys staggered. Circumferential bolt spacing will be in accordance with the manufacturer's standard spacing and will be a multiple of the plate length so that the plates having the same curvature are interchangeable. Bolts and nuts for liner plate assemblies will not be less than 0.63 inch in diameter. Circumferential (flange) seams will conform to ASTM A307, with chemical and mechanical requirements conforming to Grade A and dimensions conforming to Grade B. Bolts and nuts for longitudinal seams will have square heads with a square shoulder to engage the plate. Longitudinal seams of plates 0.078 to 0.177 inches thick, inclusive will conform to ASTM A307, with chemical and mechanical requirements conforming to Grade A. Bolts for longitudinal seams of plates 0.2 to 0.25 inches or thicker will conform to the chemical and mechanical requirements of ASTM A449. Nuts, for use on ASTM A449 bolts, will conform to ASTM A307, with chemical and mechanical requirements conforming to Grade A, and dimensions conforming to Grade B.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Approved List.

707-06 THRU 707-08 (VACANT)

707-09 CORRUGATED STRUCTURAL STEEL PLATE FOR PIPE, PIPE ARCHES AND UNDERPASSES

SCOPE. This specification covers corrugated structural steel plates intended for use in the construction of pipe, pipe arches and underpasses.

MATERIAL REQUIREMENTS. Structural steel plate, nuts and bolts shall conform to the requirements of AASHTO M167 except as herein specified, and shall be of the thickness and shape shown of the plans. When a gauge number is specified in the contract documents it shall conform to Table 707-2-1. Plates shall have approximately a 2 inch lip beyond each end crest, which will result in the actual length of a given structure being approximately 4 inches longer than the nominal length, except where skewed or beveled.

If directed by the Engineer, the Contractor shall, at its own expense, repair damaged spelter on plate items as directed under §719-01, Galvanized Coatings and Repair Methods. This repair method shall be allowed only when it is in the best interest of the Department. All repairs shall be made at no cost to the State.

BASIS OF ACCEPTANCE. This material will be accepted on the basis of certified documentation issued by a fabrication shop appearing on the Department's Approved List. Certification format and fabrication shop approval shall be in accordance with procedural directives issued by the Materials Bureau. At the option of the Department, this material may be subjected to shop inspection.

707-10 GALVANIZED STEEL END SECTIONS

SCOPE. This specification covers galvanized steel end sections to be attached to the inlet and outlet ends of corrugated steel pipe.

MATERIAL REQUIREMENTS. Galvanized steel end sections shall be manufactured from material meeting the requirements of AASHTO M218. The units shall conform to the shape, dimensions, and thickness shown on the applicable standard sheet and/or contract plans. The nominal metal thickness corresponding to any gauge shall be as shown in Table 707-2-1. Marking and coating repair shall meet the requirements of §707-02, Corrugated Steel Pipe.

§707

BASIS OF ACCEPTANCE. End sections will be accepted on the basis of certified documentation issued by a fabrication shop appearing on the Department's Approved List. All shipments shall arrive at the project with certification prepared in accordance with Materials Bureau procedural directives.

Shipments arriving without certification, or with improper certification, will be rejected.

Metal and coating thicknesses will be measured at the project by project inspectors. If the metal and/or coating thickness is less than required or certified, the material shall be rejected. Equipment required to measure metal and coating thickness shall be supplied by the contractor as detailed in §603-3.02G, Thickness Measuring Equipment.

Acceptance requirements including thickness measurements, visual inspection instructions, certification format, and fabrication shop approval shall be in accordance with Materials Bureau procedural directives. At the option of the Department, this material may be subjected to shop inspection.

707-11 ALUMINUM END SECTIONS

SCOPE. This specification covers aluminum end sections to be attached to the inlet and outlet ends of corrugated aluminum pipe.

MATERIAL REQUIREMENTS. Aluminum end sections shall be manufactured from material meeting the requirements of AASHTO M197M. The units shall conform to the shape, dimensions, and thickness shown on the standard sheet for galvanized steel end sections and/or contract plans. The nominal metal thickness corresponding to any gauge shall be as shown in Table 707-2-1. Marking shall meet the requirements of §707-13, Corrugated Aluminum Pipe.

BASIS OF ACCEPTANCE. End sections will be accepted on the basis of certified documentation issued by a fabrication shop appearing on the Department's Approved List. All shipments shall arrive at the project with a certification prepared in accordance with Materials Bureau procedural directives. Shipments arriving without certification, or with improper certification, will be rejected.

Metal thickness will be measured at the project by project inspectors. If the metal thickness is less than required or certified, the material shall be rejected. Equipment required to measure thickness shall be supplied by the contractor as detailed in §603-3.02H, Thickness Measuring Equipment.

Acceptance requirements including thickness measurements, visual inspection instructions, certification format, and fabrication shop approval shall be in accordance with Materials Bureau procedural directives. At the option of the Department, this material may be subjected to shop inspection.

707-12 (VACANT)

707-13 CORRUGATED ALUMINUM PIPE

SCOPE. This specification covers corrugated aluminum pipe intended for use in the construction of culverts and drainage systems. The corrugated aluminum pipe covered by this specification is classified as follows:

Type I. This pipe shall have a full circular cross-section with a single thickness of corrugated sheet fabricated with annular (circumferential) or helical corrugations.

Type IA. This pipe shall have a full circular cross-section with an outer shell of corrugated sheet fabricated with helical corrugations and an inner liner of smooth (uncorrugated) sheet attached to the shell at helical lock seams.

Type IR. This pipe shall have a full circular cross-section with a single thickness of smooth sheet fabricated with helical ribs projecting outwardly.

Type II. This pipe shall be a Type I pipe which has been reformed into a pipe-arch having an approximately flat bottom.

Type IIR. This pipe shall be a Type IR pipe which has been reformed into a pipe-arch having an approximately flat bottom.

Type III. This pipe, intended for use as underdrains or for underground disposal of water, shall be a Type I pipe which has been perforated to permit the in-flow or out-flow of water.

MATERIAL REQUIREMENTS. Corrugated aluminum pipe shall conform to the requirements of AASHTO M196M Types I, IA, IR, II, IIR, and III except as modified herein. When Type IR and Type IIR corrugated aluminum pipe (spiral rib) is specified, the nominal dimension of the ribs shall be $3/4 \times 3/4$ inch at $7 \frac{1}{2}$ inches spacing.

Gauge. The nominal metal thickness corresponding to any gauge shall be as shown in Table 707-2-1.

End Finish. To facilitate field joining, the ends of all helical corrugated aluminum pipe with 12 inches or greater diameters shall be rerolled to form a minimum of two annular corrugations of no less than $2 \frac{2}{3}$ inch pitch by $1/2$ inch depth. When the ends of Type IR or Type IIR pipe are rerolled, there shall be only two such corrugations. Rerolled pipe ends shall be uniquely and indelibly labeled so the pipe may be assembled in the field in the same order it was manufactured.

Coupling Bands. All round pipe sections (Types I, IA, IR, and III) 12 inches or greater in diameter shall be field joined with aluminum coupling bands. Helical corrugated pipe without rerolled ends may be joined with helical corrugated bands. Pipe with rerolled ends or annular corrugations shall be joined with annular corrugated coupling bands.

All bands shall have corrugations with the same dimensions as the pipe ends. Annular corrugated bands shall mesh with at least one full corrugation and shall lap equally on each pipe end. The band widths shall be a minimum of 7 inches for pipe diameters up to and including 32 inches. The band widths shall be a minimum of $10 \frac{1}{2}$ inches for pipe diameters greater than 32 inches.

The bands shall not be more than 2 nominal sheet thicknesses thinner than the pipe and in no case thinner than 0.05 inch.

Pipe arches (Type II and Type IIR) may be joined by the annular corrugated bands described above or by special projection type coupling bands. The special projection bands shall consist of two rows of projections at 3 inches center-to-center that will mesh with at least one full corrugation and will lap equally on each pipe end. The special projection bands shall not be more than 2 nominal sheet thicknesses thinner than the pipe and in no case thinner than 0.063 inch.

Regular projection type coupling bands (dimpled bands) will not be acceptable for pipe 12 inches in diameter and larger. Dimpled bands may be used on pipe smaller than 12 inches in diameter, all sizes of perforated underdrain pipe, and for connecting pipe extensions to existing helical corrugated pipe without rerolled ends, unless otherwise shown on the plans.

Coupling bands may be one or two piece. Two piece coupling bands shall be used on pipe 48 inches or greater in diameter.

Coupling band connectors shall be one of the following types:

- Aluminum angles, $2 \times 2 \times 3/16$ inches
- Aluminum lug connectors
- Aluminum bar and strap connectors.

These connectors shall be riveted, bolted, or welded to the coupling bands. Evidence of loose bolts or rivets, bearing failure, or weld or band tearing shall be cause for rejection and replacement of that coupling band. As an alternate to the coupling band connectors stated above, an aluminum corrugated angle which conforms to an approved Materials Detail may be used.

MARKING. Each length of corrugated aluminum pipe shall be marked or tagged as approved by the Department to properly cross-reference the supplier's certification.

Additional Defects. In addition to criteria established in Materials Bureau procedural directives and defects listed in AASHTO, the following defects will be cause for rejecting the pipe when inspected at the project:

- Variation from a straight centerline of more than 3/4 inch in 20 feet.
- Any dents greater than 3 inches in diameter
- Any punctures
- Loosely formed or cracked lock seams
- Cracks through the metal
- Sharp bends in pipe arches that are less than the specified minimum corner radius for that size.

BASIS OF ACCEPTANCE. Corrugated aluminum pipe will be accepted on the basis of certified documentation issued by a supplier appearing on the Department's Approved List. All shipments shall arrive at the project with certification prepared in accordance with Materials Bureau procedural directives. Shipments arriving without certification, or with improper certification, shall be rejected.

Gauge shall be measured at the project by project inspectors. If the gauge is less than required, the pipe shall be rejected. Equipment required to measure gauge shall be supplied by the contractor as detailed in §603-3.02H, Thickness Measuring Equipment.

Acceptance requirements including thickness measurements, visual inspection instructions, certification format, and fabrication shop approval shall be in accordance with Materials Bureau procedural directives. At the option of the Department, this material may be subjected to shop inspection. Corrugated connecting angles will be accepted provided an approved Materials Detail appears on the Department's Approved List from that supplier.

707-14 CORRUGATED ALUMINUM STRUCTURAL PLATE FOR PIPE AND PIPE ARCHES

SCOPE. This specification covers corrugated aluminum structural plates for use in the construction of pipe and pipe arches.

MATERIAL REQUIREMENTS. Structural plate, nuts and bolts shall conform to the requirements of AASHTO M219 except as herein specified, and shall be of the thickness and shape shown on the plans. When a gauge number is specified in the contract documents, it shall conform to Table 707-2-1.

The corrugations shall run at right angles to the longitudinal axis of the structure. Plates shall have approximately a 1 3/4 inch lip beyond each end crest, which will result in the actual length of a given structure being approximately 3 1/2 inches longer than the nominal length, except where skewed or beveled.

All sections which are damaged from any cause, including handling, or where any dimension varies from that specified, shall be replaced at the Contractor's expense in a manner approved by the Engineer.

BASIS OF ACCEPTANCE. This material will be accepted on the basis of certification by the fabricator. Each fabricator shall furnish upon request by the Materials Bureau a certified analysis and guarantee executed by the manufacturer of the base metal as described in AASHTO M219.

At the option of the Department, structural plates may be subjected to shop inspection or may be shipped to the project site accompanied by certified documentation executed in a form prescribed by the Department.

707-15 THRU 707-19 (VACANT)

707-20 ANCHOR BOLTS FOR CORRUGATED CULVERTS

SCOPE. This specification covers the material details and quality requirements for the anchorage system securing the ends of corrugated metal pipe, arch pipe, and structural plate to reinforced or plain concrete headwalls.

MATERIAL REQUIREMENTS. Anchor bolts shall be 3/4 inch diameter heavy hex bolts, ASTM A307. Grip shall be 5 1/2 inches threaded over at least the first 2 1/2 inches. The bolts shall be fitted

with two nuts, ASTM A563 heavy hex. Nuts shall be chamfered on at least one face using a 1 inch spherical radii. The nuts and bolts shall be so assembled that in the final assembly, the bolt and one of the nuts is embedded in concrete, that the chamfered faces of the nuts face each other, and secure the pipe between them. Nuts and bolts shall be galvanized as per ASTM A153 after all machining operations are completed. Following galvanization, threads shall be cleaned to produce a free running fit.

When 19 inch hook bolts are used as anchor bolts they shall be detailed on the plans and shall conform to the requirements of ASTM A36.

Anchor bolts shall be spaced around the periphery of the pipe at intervals not exceeding 18 inches. At least two anchor bolts shall be provided.

BASIS OF ACCEPTANCE. Anchor bolts and nuts for corrugated metal pipes, pipe arches, and structural plate pipe will be accepted on the Manufacturer's Certification that they conform with these specifications.

SECTION 708 - PAINTS

708-01 STRUCTURAL STEEL PAINTS CLASS 1

SCOPE: This specification defines the requirements for materials appearing on the Department's Approved List, "Structural Steel Paints, Class 1."

MATERIAL REQUIREMENTS: The system shall be able to be applied as a shop or a field-applied coating over an SSPC SP-10 cleaned surface.

The primer shall be an organic zinc-rich epoxy with pigment primarily consisting of zinc dust.

The paint shall have undergone National Transportation Product Evaluation Program (NTPEP). The coating manufacturer shall submit NTPEP results, field histories of the coating, Material Safety Data Sheets, and Technical Data Sheets to the Materials Bureau. Any formulation or technical data sheet change may affect approval status, and shall be reported to the Materials Bureau. Failure to notify the Materials Bureau shall result in the removal of the system from the Approved list.

The system's Technical Data Sheets shall contain the following information;

- Temperature Range for Storage
- Profile Range
- Temperature for Application
- Cure to Handle/Overcoat Schedule
- Humidity and Dew Point Restrictions
- Mixing Recommendations
- Thinners allowed and resulting VOC levels
- Recoat Window
- Paint Film Thickness Range, Wet and Dry-Film Values
- Surface preparation requirements
- Application Requirements

If the data sheet does not have all of the above information, the manufacturer will be required to submit a letter to the Engineer with the above information. The letter will be considered an addendum to the technical data sheet.

BASIS OF ACCEPTANCE: Contract acceptance will be based on the appearance of the product on the Approved List.

708-02 STRUCTURAL STEEL PAINTS CLASS 2

SCOPE: This specification defines the requirements for materials appearing on the Department's Approved List, "Structural Steel Paints, Class 2."

§708

MATERIAL REQUIREMENTS: The system shall be able to be applied in the field over an SSPC SP-11 cleaned surface or a previously painted surface.

The paint shall have undergone National Transportation Product Evaluation Program (NTPEP) or NYSDOT approved alternative testing. The coating manufacturers shall submit NTPEP results and field histories of the coating to the Materials Bureau.

Any formulation or technical data sheet change may affect approval status and shall be reported to the Materials Bureau. Failure to notify the Materials Bureau shall result in the removal of the system from the Approved list.

The system's Technical Data Sheets shall contain the following information:

- Temperature Range for Storage
- Profile Range
- Temperature for Application
- Cure to Handle/Overcoat Schedule
- Humidity and Dew Point Restrictions
- Mixing Recommendations
- Thinners Allowed and Resulting VOC Levels
- Recoat Window
- Paint Film Thickness Range
- Surface Preparation Requirements
- Application Requirements

If the data sheet does not have all of the above information, the manufacturer will be required to submit a letter to the Engineer with the above information. The letter will be considered an addendum to the technical data sheet.

BASIS OF ACCEPTANCE: Contract acceptance will be based on the appearance of the product on the Approved List.

708-03 (VACANT)

708-04 ZINC CHROMATE PRIMER

SCOPE. This paint is used as a prime coat on aluminum in contact with fresh concrete to reduce the effect of alkali attack.

MATERIAL REQUIREMENTS. The composition of this paint shall be as shown in the following table using ingredients conforming to the requirements of the applicable specifications indicated.

Component	Specification	Lbs. Per 100 Gal.
Zinc Yellow	(TT-P-465)	270
Titanium Dioxide, Rutile,	Chalk Resistant	75
Zinc Oxide (American Process Type)	(ASTM D79)	95
Sienna, Raw	(ASTM D765)	25
Magnesium Silicate	(ASTM D605)	75
Aluminum Stearate	(MIL-A-15206A)	6.0
Resin, alkyd Solution	(TT-R-266C, Type I)	345
Dipentene	(TT-D-376)	22.0
Petroleum Spirits	(TT-T-291, Type I, Grade A)	235
Lead Napthenate	(ASTM D600, Class B)	12.0

Cobalt Napthenate	(ASTM D600, Class B)	1.2
Magnesium Napthenate	(ASTM D600, Class B)	1.2

The quantitative requirements of zinc chromate primer shall be as follows:

	Min.	Max.
Pigment	45.0%	49.0%
Vehicle	51.0%	55.0%
Volatile by weight of paint	29.5%	33.5%
Weight (lb/gal)	11.0	11.6
Water	-	0.5%
Coarse particles & skins (total residue retained on 45 um sieve based on paint)	-	0.5%
Fineness of Grind (North Standard)	4	-
Viscosity at 25°C (Stormer-Krebs Units)	62	82
Zinc oxide (ZnO), by weight of pigment	34.0%	39.0%
Titanium Dioxide (TiO ₂), by weight of pigment	12.0%	14.5%
Chromium Trioxide (CrO ₃), by weight of pigment	20.0%	-
Phthalic Anhydride, by weight of non-volatile vehicle	23.0%	-
Flash Point	86°F	-

The percentages noted relate to mixture by weight. The paint shall dry set to touch within two hours and dry hard within 6 hours. No resin and resin derivatives shall be present in the paint. The paint shall show no evidence of cracking when subjected to a 1/8 inch "mandrel flexibility test."

708-05 STANDARD PAINT COLORS

SCOPE: This specification defines commonly used colors.

DEFINITIONS:

Color Reference Standard

Sage Green Paint	Munsell 7.5 GY 5/4
Light Gray Paint	Munsell 10B 6/1
Blue Paint	Federal Color Standard 595, # 35177
Brown Paint	Federal Color Standard 595, # 30111
Brown-Gray Paint	Federal Color Standard 595, # 36306
Dark Blue Paint	Federal Color Standard 595, # 15090
Textured Concrete Finish Paint	Federal Color Standard 595, # 36440
Weathered Brown Guide Rail Paint	Federal Color Standard 595, # 20059

Assistance in providing definitions for other colors is offered by the Materials Bureau.

BASIS OF ACCEPTANCE: The Engineer may require manufacturer's certification that the color provided meets the requirements of this specification.

708-06 PAINT FOR GALVANIZED SURFACES

SCOPE. This specification covers the materials requirements for paints to be applied over galvanized surfaces.

§708

PAINT. Paint shall be a two-coat system with an polyamide epoxy primer and an aliphatic urethane, suitable for exterior use. The paints shall have a VOC level below 340 g/L or 2.8 lb/gal, shall be produced by the same manufacturer, and the prime and top coat shall be compatible. The primer shall be specifically formulated for use over galvanized surfaces.

BASIS OF ACCEPTANCE. The material shall be accepted with the submission of the technical data sheets and the manufacturer's certification ensuring compliance with this specification.

708-07 PAINT FOR ALUMINUM SURFACES

SCOPE. This specification covers the materials requirements for paints to be applied over aluminum surfaces not in contact with concrete.

PAINT. Paint shall be a two-coat system with an epoxy primer and an aliphatic urethane, suitable for exterior use. The paints shall have a VOC level below 340 g/L or 2.8 lb/gal, shall be produced by the same manufacturer, and the prime and top coat shall be compatible. The primer shall be specifically formulated for use over aluminum surfaces.

BASIS OF ACCEPTANCE. The material shall be accepted with the submission of the technical data sheets and the manufacturer's certification ensuring compliance with this specification.

708-08 THRU 708-29 (VACANT)

708-30 WOOD PRESERVATIVE - CREOSOTE OIL

SCOPE. These specifications cover creosote used in the treatment of piles, timber and lumber.

MATERIAL REQUIREMENTS. The requirements of American Wood Preservers' Association Standards shall apply except as modified herein.

Creosote used in the treatment of piles, timber and lumber shall conform to the requirements of the following American Wood Preservers' Association Standards:

Type of Preservative	AWPA Standards
Coal-Tar Creosote	P 1 Land & Fresh Water P13 Marine (Coastal Water)
Creosote-Coal Tar Solution	P 2 Standard Creosote-Coal Tar-Grade C P12 Marine (Coastal Waters) Piles and Timber

Method of application shall be in conformance with American Wood Preservers' Association Standards C1, C2, C3, C4, C5, C14 and C18. Minimum net retention shall be as required for material in contact with soil.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

708-31 WOOD PRESERVATIVE - WATERBORNE

SCOPE. These specifications cover waterborne wood preservatives used in the treatment of piles, timber, and lumber.

MATERIAL REQUIREMENTS. Waterborne wood preservatives shall be Alkaline Copper Quarternary (ACQ), Copper Azol, Ammoniacal Copper Arsenite (ACA) or Chromated Copper Arsenate (CCA) conforming to the requirements of American Wood-Preservers' Association Standard P5.

Waterborne wood preservatives shall be applied in conformance with American Wood Preservers' Association Standards C1, C2, C3, C4, C5, C14 and C18. Minimum net retention shall be as required for material in contact with soil.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

708-32 WOOD PRESERVATIVE - OIL BORNE

SCOPE. These specifications cover oil-borne wood preservative used in the treatment of timber and lumber.

MATERIAL REQUIREMENTS. Pentachlorophenol for pressure treatment shall conform to American Wood-Preservers' Association Standard P8.

Oil-borne wood preservative shall be applied in conformance with American Wood-Preservers' Association Standards C1, C2, C5 and C14. The net retention of pentachlorophenol shall be as required for material in contact with soil.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

SECTION 709 - REINFORCING STEEL

709-01 BAR REINFORCEMENT, GRADE 60

SCOPE. This specification covers the material requirements for deformed billet steel and deformed rail steel reinforcing bars used in portland cement concrete. Plain and deformed steel for the fabrication of spirals is included.

MATERIALS REQUIREMENTS

A. Deformed Bar Reinforcement. Steel reinforcing bars shall be deformed billet steel bars meeting the requirements of ASTM A615, Grade 60, or deformed rail steel bars meeting the requirements of ASTM A996/996M, Grade 60.

B. Spirals. Spirals shall be plain wire meeting the requirements of ASTM A82, or plain or deformed bars in coils or cut lengths, meeting the requirements of ASTM A615, Grade 60.

When specified the spirals shall be epoxy coated in accordance with the applicable requirements of §709-04 or §709-08.

BASIS OF ACCEPTANCE. Bar reinforcement and spirals will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

709-02 WIRE FABRIC FOR CONCRETE REINFORCEMENT

SCOPE. This specification covers the material requirements for wire fabric reinforcement used in portland cement concrete pavement, precast concrete products and other concrete construction.

MATERIALS REQUIREMENTS. Wire fabric reinforcement shall conform to the requirements of either ASTM A185 or ASTM A497, exclusive of the portions pertaining to rejection, retests and rehearing, except as indicated on the plans, in the proposal or as modified herein.

The weld shear test will not be required for acceptance of wire fabric for concrete pipe.

BASIS OF ACCEPTANCE. Welded wire fabric for concrete reinforcement will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

709-03 (VACANT)

709-04 EPOXY-COATED BAR REINFORCEMENT

SCOPE. This specification covers bar reinforcement with protective epoxy coatings applied by the electrostatic spray method.

MATERIAL REQUIREMENTS

A. Bar Reinforcement. Steel reinforcing bars shall conform to the requirements of §709-01, Bar Reinforcement, Grade 60 or §709-14, Bar Reinforcement, Grade 75.

B. Epoxy Coating Material. The epoxy coating material shall be an organic, powdered-epoxy resin that is applied by electrostatic methods.

Epoxy coating material shall be approved by the Materials Bureau. Detailed requirements and procedures for the acceptance of epoxy coating materials are available from the Materials Bureau. Upon approval of the product, the epoxy coating will be placed on a Department "Approved List" of materials. The epoxy coating manufacturer shall supply written certification to the coating applicator that the coating material is the same as that approved by the Materials Bureau.

C. Patching Material. Patching or repair materials shall be supplied by the epoxy coating manufacturer. The patching material shall be compatible with the epoxy coating, inert in concrete, and suitable for use in making shop or field repairs.

Coating Application

A. Coating Applicator. The coating applicator's facilities shall be approved by the Materials Bureau. Applications for approval of facilities shall be made to the Materials Bureau by the coating applicator. Upon approval, the name and address of the coating applicator will be placed on the Department's list of "Approved Applicators."

B. Surface Preparation

1. The surface of bars to be coated shall be blast cleaned in accordance with the Steel Structures Painting Council - Surface Preparation Specification No. 10 (SSPC-SP10), Near White Blast Cleaning. After blasting, the cleaned surface of the bar shall be defined by SSPC-Vis 1-89, Pictorial Standards A SP 10, B SP 10, or C SP 10, as applicable.
2. A suitable anchor pattern shall be produced by the cleaning media. A target profile of approximately (1/3) the coating thickness shall be considered suitable as an anchor pattern. Measurements shall be taken using a surface profile gage, or replica tape, approved by the Materials Bureau.
3. The powdered epoxy resin coating shall be applied to the cleaned surface as soon as possible after cleaning and before visible oxidation occurs. In no case shall more than 8 hours elapse between cleaning and coating.

C. Coating Application. The powdered epoxy resin coating shall be electrostatically applied to pre-heated bars, and cured in accordance with the recommendations of the coating manufacturer. The epoxy coating may be applied before or after fabrication (bending) of the reinforcement bars.

D. Coating Thickness

1. The epoxy coating shall be applied as a uniform, smooth coat. After curing, the coating thickness shall be 10 ± 2 mils.
2. Coating thickness shall be determined by taking measurements on a minimum of five coated bars from each production lot.
Five spot measurements shall be obtained from evenly spaced locations along each side of the test bar (a minimum of 10 spot measurements per bar). A spot measurement is defined as the average of three individual readings obtained from three adjacent areas on the body, or on the deformations of the bar.
3. For acceptance purposes at least ninety (90) percent of all spot thickness measurements shall be 8 to 12 mils after cure, and no spot measurement of coating thickness shall be less than 8 mils or greater than 15 mils.
4. Coating thickness shall be measured by the method outlined in ASTM G12, except that the number and location of thickness measurements shall be in accordance with this specification. All magnetic gages shall be approved by the Materials Bureau.

E. Continuity of Coating

1. The coating shall be checked visually after cure for continuity. It shall be free from holes, voids, contamination, cracks and damaged areas.
2. The coating shall have not more than two holidays (pinholes not visible to the naked eye) in any 1 foot length of the coated bar. A 67.5 volt, 80,000 ohm, d-c holiday detector shall be used in-line to check the coating for holidays at all times during the application of epoxy protective coating. Bar reinforcement that is coated when the in-line detector is inoperable shall be automatically rejected.

F. Coating Cure. The coating applicator shall check each production lot to determine that the entire production lot of coated bars is in a fully-cured condition.

G. Adhesion of Coating

1. The adhesion of the coating shall be evaluated on a minimum of two bars from each production lot. The coated bar shall be bent 120 degrees (after rebound) around a mandrel of specified size as designated in Table 709-4. The bend shall be done at a uniformly slow rate and may take up to 45 seconds to complete. The bend test specimen shall be positioned so that the two longitudinal deformations are in a plane perpendicular to the mandrel radius. The test specimens shall be between 68°F and 86°F at the time of testing.
2. No cracking, disbondment, or other coating defect shall be visible to the naked eye on the outside, or on the inside radius of the bent bar.
3. If both test specimens show evidence of cracking or disbondment, the production lot represented by the samples shall be rejected.
If only one of the two test specimens shows evidence of cracking or disbondment of coating, two additional random samples shall be tested. If the test results from both retests show no defects, the production lot represented by the samples shall be accepted. If the test results of either retest fails, the production lot represented by the samples will be rejected.

Bar Number	3	4	5	6	7	8	9	10	11	14	18
Mandrel Diam. (in.)	3	4	5	6	7	8	9	10	11	17	23

NOTE: Bar Numbers are bar sizes marked in eighths of inches

SAMPLING AND TESTING

A. Lot Size. For test purposes a production lot is the smallest number of reinforcement bars of the same type, heat and size as determined by the following requirements:

1. A lot shall not exceed a single order.
2. A lot shall consist of the number of bars as defined by the coating applicator, except that it shall not exceed the number of reinforcement bars coated within a single working shift.

B. Quality Control. The coating applicator shall be responsible for performing quality control and test. This will include inspection for compliance with the requirements of Coating Thickness, Continuity of Coating, and Coating Cure, and the testing required under Adhesion of Coating.

C. Plant Inspection

1. The Department reserves the right to have its authorized representative observe the preparation, coating, and testing of the reinforcement bars. The representative shall have free access to the plant. Any work done when access has been denied shall be automatically rejected.
2. If the representative elects, lengths of coated bars may be taken from the production run, on a random basis, for test, evaluation and check purposes by the Materials Bureau.

Repair of Coated Bars**A. Repairs at the Coating Applicator's Facility**

1. Repairs will not be allowed on epoxy-coated reinforcement bars that do not meet the requirements for Coating Thickness, Continuity of Coating, Coating Cure, or Adhesion of Coating. Reinforcement bars exhibiting any one of these defects shall be replaced, or stripped of epoxy coating, re-cleaned, and recoated in accordance with this specification.
2. All other damage that occurs from handling, or for other reasons, at the coating applicator's facility shall be repaired with patching material. All repairs shall be performed as soon as possible and before visible rust (oxidation) appears on the steel surface. All repairs shall be performed in accordance with the recommendations of the manufacturer of the patching material.
3. The coating applicator shall be responsible for repair to the coating due to damage at the coating applicator's facility.

B. Repair at the Fabrication Facility

1. The fabricator shall be responsible for repair to the coating due to damage during fabrication and handling at the fabricator's facility.
2. All coating damage due to fabrication, or handling, or for other reasons that occurs at the fabricator's facility shall be repaired with patching material.
3. Wherever bond loss or damaged areas of coating exist, they shall be cleaned and repaired. The cleaning shall remove loose or deleterious material, or both. In cases where rust is present it shall be removed by blast cleaning prior to repairs. The requirements of Surface Preparation, part 2a., shall apply.
4. Visible cracks, including hairline cracks without bond loss that occur due to fabrication of the bars, shall be repaired with patching material.
5. When coated bars are sheared, saw-cut, or cut by other means during the fabrication process, the exposed ends shall be coated with patching material.
6. All repairs shall be performed as soon as possible and before visible rust (oxidation) appears on the steel surface.

HANDLING AND STORAGE. All systems for handling coated bars shall have padded contact areas for the bars. All bundling bands shall be padded and all bundles shall be lifted with a strong back,

multiple supports or a platform bridge so as to prevent bar to bar abrasion from sags in the bar bundle. The bars or bundles shall not be dropped or dragged.

Epoxy-coated bar reinforcement shall be stored above the ground on wooden or padded supports. Epoxy-coated bar reinforcement shall not be stored unprotected outdoors. All coated bars that are stored outdoors shall be protected from sunlight and moisture, using opaque waterproof covers. The covers shall be placed in a manner that will permit constant air circulation so as to minimize the formation of condensation on the epoxy-coated bar surface.

BASIS OF ACCEPTANCE. Epoxy-coated bar reinforcement, grade 60 or grade 75, will be accepted on the basis of the names and locations of the reinforcing bar manufacturer and the epoxy reinforcing bar applicator appearing on the Department's Approved List and a material certification from the epoxy reinforcing bar applicator that specifies the product conforms to this specification. In addition, fabricated, epoxy-coated bar reinforcement will be supplied by a fabricator appearing on the Department's Approved List, Fabricators for Epoxy-Coated Steel Reinforcing Bars. *Buy America requirements apply.*

709-05 STUD SHEAR CONNECTORS

SCOPE. This specification covers the material requirements for stud shear connectors used in bridge structures.

MATERIALS REQUIREMENTS. Steel used for the manufacture of stud shear connectors shall conform to the Specification for Steel Bars, Carbon, Cold Finished, Standard Quality, ASTM A108, UNS Designation G10100 thru G10200, either Semi-Killed, or Killed Deoxidation.

Stud shear connectors shall be furnished in the dimension shown on the Contract Plans.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification of compliance with these specification requirements.

ASTM quality control tests shall have been made not more than six months prior to the date of manufacture of the studs.

709-06 LOW-RELAXATION PRESTRESSING STEEL, GRADE 270

SCOPE. This specification covers the material requirements for low-relaxation prestressing steel used in the fabrication of prestressed concrete units.

MATERIAL REQUIREMENTS. Low-relaxation prestressing steel shall conform to the requirements of ASTM A416M, Grade 270. Low-relaxation prestressing steel shall be free of dirt, oil, paint, mill scale, corrosion, coatings, lubricants, or any other foreign material that may prevent an acceptable bond between the steel and the concrete.

BASIS OF ACCEPTANCE. Low-relaxation prestressing steel will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

709-07 STONE CURB ANCHOR BARS

SCOPE. This specification covers the material requirements for stone curb bars used in bridge construction.

MATERIAL REQUIREMENTS. Anchor bars for Types F1, G1, M, R1, R2, S and T1 curbs shall meet the requirements of ASTM A615, Grade 60 or Grade 75, deformed billet-steel bars shall be galvanized in accordance with §719-01, Galvanized Coatings and Field Repair Methods, Type I. As an alternate to galvanizing, the bars may be treated with a protective epoxy coating. This coating shall be applied by either the electrostatic spray method or the electrostatic fluidized bed method, as specified in §709-04

§709

Epoxy Coated Bar Reinforcement or in accordance with the applicable requirements of §705-14 Longitudinal Joint Ties.

BASIS OF ACCEPTANCE. The stone curb anchor bars will be accepted when on the basis of evaluation by the Engineer, the product complies with these specification requirements.

709-08 EPOXY COATED WIRE FABRIC REINFORCEMENT

SCOPE. This specification covers sheets of wire fabric reinforcement with protective epoxy coatings that are applied by the electrostatic spray method or electrostatic fluidized bed method.

MATERIAL REQUIREMENTS

A. Wire Fabric Reinforcement. Wire fabric reinforcement shall conform to the requirements of §709-02.

B. Epoxy Coating Material

1. The epoxy coating material shall be an organic, powdered epoxy resin that is applied by electrostatic methods. Epoxy coating materials shall be approved by the Materials Bureau. Detailed requirements and procedures for the acceptance of epoxy coating materials are available from the Materials Bureau. Upon approval of the product, the epoxy coating will be placed on a Department Approved List of materials.
2. The epoxy coating manufacturer shall supply written certification to the coating applicator that the coating material is the same as that approved by the Materials Bureau.

C. Patching Material. Patching or repair materials shall be supplied by the epoxy coating manufacturer. The patching material shall be compatible with the epoxy coating, inert in concrete, and shall be suitable for use in making field repairs.

Coating Application

A. Coating Applicator. The coating applicator's facilities shall be approved by the Materials Bureau. Applications for approval of facilities shall be made to the Materials Bureau by the coating applicator. Upon approval, they will be placed on the Department's list of "Approved Applicators For Epoxy Coated Wire Fabric Reinforcement."

B. Surface Preparation

1. The surface wire fabric to be coated shall be blast cleaned in accordance with the Steel Structures Paint Council - Surface Preparation Specification No. 10 (SSPC-SP10), near White Blast Cleaning. After blasting, the cleaned surface of the bar shall be defined by SSPC-Vis 1-89, Pictorial Standards A SP 10, B SP 10, or C SP 10, as applicable.
2. The powdered epoxy resin coating shall be applied to the cleaned surface as soon as possible after cleaning and before visible oxidation occurs. In no case shall more than 8 hours elapse between cleaning and coating.

C. Coating Application. The powdered epoxy resin coating shall be electrostatically applied in accordance with the recommendations of the coating manufacturer.

D. Coating Thickness. The epoxy coating shall be applied as a smooth, uniform coat. After curing, the coating thickness shall be a minimum of 4 mils. Coating thickness shall be controlled by taking measurements on a representative sample from each production lot. Coating thickness measurements shall be conducted by the method outlined in ASTM B499.

E. Continuity of Coating

1. The coating shall be checked visually after cure for continuity. It shall be free from holes, voids, contamination, cracks and damaged areas.
2. The coating shall not have more than two holidays (pinholes visible to the naked eye) in any 1 foot length of a coated single wire. A holiday detector shall be used, in accordance with the manufacturer's instructions, to check the coating for holidays. Sharp edges at the welded intersection of the wires shall not be considered to be holidays.

F. Coating Cure. The coating applicator shall check each production lot to determine that the entire production lot of coated fabric is in a fully-cured condition.

G. Flexibility of Coating

1. The flexibility of the coating shall be evaluated on two representative sections of wire fabric from each production lot or two #16, Grade 60 reinforcing bars that have been coated simultaneously with the wire fabric. A representative wire from the wire fabric shall be bent 120 degrees (after rebound) around a pin or mandrel of 10 diameters or alternately, a reinforcing bar shall be bent 120 degrees around a 6 inch diameter pin or mandrel. Bending shall be done at a minimum rate and may take up to one minute to complete. The test specimens shall be a thermal equilibrium between 68^o and 86^oF at the time of testing.
2. When examined by the naked eye, the outside radius of the bent wire or bar shall be free of cracks in the coating.

TESTING AND SAMPLING

A. Lot Size. For test purposes a production lot is the smallest number of sheets of wire fabric of the same style (gauge, spacing size) from a given manufacturer as determined by the following requirements:

1. A lot shall not exceed a single order, or delivered load of 1500 sheets, whichever is smaller.
2. A lot shall consist of the number of sheets as defined by the coating applicator except that it shall not exceed the number of sheets coated within a single working shift.
3. A lot shall consist of the number of sheets of mesh coated with the same batch or lot of epoxy.

B. Quality Control. The coating applicator shall be responsible for performing quality control and tests. This will include inspection for compliance with the requirements of Coating Thickness, Continuity of Coating and Coating Cure and the testing required under Flexibility of Coating.

C. Plant Inspection.

1. The Department reserves the right to have its authorized representative observe the preparation, coating and testing of wire fabric. The representative shall have free access to the plant. Any work done while access was denied will be rejected.
2. If the representative elects, samples of coated fabric may be taken from the production run, on a random basis, for test, evaluation and check purposes by the Materials Bureau.

REPAIR. Epoxy coated wire fabric reinforcement which does not meet the requirements of Coating Thickness, Continuity of Coating, Coating Cure or Flexibility of Coating shall not be repaired.

Reinforcement with these defects shall be replaced or stripped of epoxy coating, recleaned and recoated in accordance with the requirements of this specification.

Any damage to the coated reinforcement, occurring at the coating applicator's facility shall be cleaned and repaired with patching material. The cleaning shall remove loose or deleterious material or both. If rust is present, it shall be removed by blast cleaning prior to patching.

HANDLING. All systems for coated wire fabric shall have padded contact areas, wherever possible. All bundling bands shall be padded and all bundles shall be lifted with a strong back, multiple supports or a

§709

platform bridge so as to prevent sheet to sheet abrasion from sags in the bundle. The sheets or bundles shall not be dropped or dragged.

BASIS OF ACCEPTANCE. Epoxy-coated wire fabric will be accepted on the basis of the names and locations of the welded wire fabric manufacturer and the epoxy applicator appearing on the Department's Approved List and a material certification from the epoxy applicator that specifies the product conforms to this specification. *Buy America requirements apply.*

709-09 COLD-DRAWN WIRE FOR CONCRETE REINFORCEMENT

SCOPE. This specification covers the material requirements for cold-drawn wire for concrete reinforcement used in portland cement concrete pavement, precast concrete products and other concrete construction.

MATERIAL REQUIREMENTS. Cold-drawn wire shall conform to the requirements of either ASTM A82 or ASTM A496, exclusive of the portions pertaining to rejection, retests and reheating, except as indicated on the plans or in the proposal.

BASIS OF ACCEPTANCE. Cold-drawn wire will be considered for acceptance on the basis of the Manufacturer's name appearing on the Approved List and certification in accordance with procedural directives of the Materials Bureau.

Alternately, cold-drawn wire from a Manufacturer not appearing on the Approved List may be considered for acceptance in stock lot quantities at manufacturing locations based on sampling and testing in accordance with procedural directives of the Materials Bureau.

709-10 MECHANICAL CONNECTORS FOR REINFORCING BAR SPLICES

SCOPE. This specification covers the material requirements for mechanical connectors for splicing reinforcing bars.

GENERAL. Mechanical connectors for use on epoxy coated reinforcing bars shall be epoxy coated. Mechanical connectors coated prior to installation shall be coated in conformance with the applicable requirements for epoxy coatings contained in §709-04, Epoxy Coated Reinforcement. Mechanical connectors coated after installation shall be coated with an epoxy repair material compatible with the reinforcing bar epoxy coating. The assembled connection on epoxy coated reinforcing bars shall have no exposed uncoated steel. Any damage to the epoxy on the mechanical connector or reinforcing bars shall be repaired with a compatible epoxy repair material.

Mechanical connectors used on Galvanized Bar Reinforcement shall be galvanized in accordance with §719-01 Galvanized Coatings and Repair Methods.

Mechanical connectors for Stainless Steel Reinforcement shall be fabricated from any alloy of stainless steel that is on the Approved List for 709-13. Connectors must be made from the same alloy of stainless steel as the bars they are connecting. ~~Mechanical connectors for Stainless Clad Reinforcement and Stainless Steel Reinforcement shall be fabricated from stainless steel meeting the requirements of ASTM A959 UNS S31600.~~

Comment [c127]:
EI09032

MATERIAL REQUIREMENTS. Mechanical connectors will be tested for the following three parameters:

- The maximum slip, at 50% of the yield strength of the reinforcing bar, shall be 0.010 inch. At least 70% of the maximum slip shall have occurred on the first cycle.
- The maximum slip, at 90% of the yield strength of the reinforcing bar, shall be 0.018 inch.
- The tensile strength of the splice shall be at least 90% of the specified minimum tensile strength of the reinforcing bar.

BASIS OF ACCEPTANCE. Mechanical connectors for Reinforcing Bar Splices will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a

material certification that states the product conforms to this specification or, at the discretion of the Department, based on sampling and testing in accordance with the procedural directives of the Materials Bureau. *Buy America requirements apply.*

~~**BASIS OF ACCEPTANCE.** Application for approval of mechanical connectors shall be submitted to the Materials Bureau. Detailed requirements and procedures for approval are available from the Materials Bureau. Upon approval the name of the mechanical connector will be placed on an Approved List. Project acceptance will be based on the manufacturer's name and type of mechanical connector appearing on the Department's Approved List titled "Mechanical Connectors for Reinforcing Bar Splices."~~

Comment [c128]:
EI09032

709-11 GALVANIZED BAR REINFORCEMENT

SCOPE. This specification covers bar reinforcement with a hot dipped galvanized coating. Bar reinforcement will be coated before or after bending, as required by the payment specification.

MATERIAL REQUIREMENTS

A. Reinforcing Steel. The material for the reinforcing steel shall meet the requirements of §709-01 Bar Reinforcement, Grade 60 or §709-14, Bar Reinforcement, Grade 75.

B. Galvanizing. The bar reinforcement shall be galvanized in accordance with ASTM A767 "Standard Specification for Zinc-Coated (Galvanized) Steel Bars for Concrete Reinforcement" to a Class I Coating.

C. Embrittlement Testing. The coating applicator shall take the necessary precautions to prevent embrittlement by conforming to the requirements of STM A143 "Standard Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedures for Detecting Embrittlement". The test for embrittlement shall be conducted by the coating applicator or his representative according to the bend test described in ASTM A615 "Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement". The coating applicator shall include one reinforcing bar test specimen at least 3 feet long for each lot for this testing. The test specimen shall have the same diameter as the lot members and shall be quenched, and galvanized in the same manner and at the same time as the bars whose characteristics it is intended to represent. If the test specimen cracks or otherwise fails the bend test, the entire lot it represents shall be rejected. For test purposes, a lot is any one of the following:

- Reinforcing bars of the same diameter comprising a single order
- A number of reinforcing bars of the same diameter identified as a lot by the coating applicator, providing the bars are all been coated within a single production shift
- One thousand reinforcing bars of the same diameter. Notwithstanding the above two, no lot shall exceed one thousand bars.

D. Identification. The Contractor shall coordinate the tagging and identification requirements for the project and for lot identification and shall provide a non-destructive metal tag system for bent reinforcing bars.

E. Inspection. The materials Bureau shall be notified 30 days prior to the beginning of the coating application. The Materials Bureau representative and any other Department authorized representative shall have free access to the plant for inspection. Work done while any Department representative has been refused access shall be automatically rejected.

If the Department representative so elects, preparation of the bars, quenching and coating shall be done in his presence. On a random basis, lengths of coated bars may be taken by the representative from the production run at the point of coating application for test, evaluation and check purposes.

F. Zinc Rich Paint. Zinc rich paint used for field repairs of galvanized coatings shall meet the following requirements:

- One application of the material shall provide a dry film thickness of 2 mils

§709

- The dried fill shall have a minimum zinc dust content of 94% by mass
- The paint shall be compatible with the galvanizing and shall be inert in concrete
- The brand of material used shall be approved by the galvanizer.

BASIS OF ACCEPTANCE. The coating applicator shall furnish a Certificate of Compliance with each shipment of coated bars. The Certificate of compliance shall state the representative samples of the coated bars have been tested and that the test results conform to the requirements described herein. Test results shall be retained and made available, if requested. The Certificate of Compliance and the documentation required for uncoated reinforcement bars by §709-01 Bar Reinforcement, Grade 60 or §709-14, Bar Reinforcement, Grade 75, shall accompany each shipment to the job site.

709-12 VACANT

709-13 STAINLESS STEEL BAR REINFORCEMENT

SCOPE. This specification covers the material requirements for stainless steel reinforcing bars used in portland cement concrete.

MATERIAL REQUIREMENTS

Material Properties. The stainless steel shall meet the requirements of ASTM A955 and its designated grade, either 60 or 75. Alloys of stainless steel which meet all the testing and process requirements of ASTM A955 but are not listed in ASTM A955 Table 2 are acceptable if they meet the chemical requirements of ASTM A276, are either austenitic or austenitic-ferritic, and have a UNS designation beginning with either 'S2' or 'S3'.

- A) Deformed Bar Reinforcement - Steel reinforcement shall be deformed billet stainless steel bars or deformed billet stainless steel coils meeting the requirements of ASTM A955 and its designated grade, either 60 or 75.
- B) Plain Rounds - Reinforcement when specified for dowels, structural ties, and supports shall be plain billet stainless steel bars or coils meeting the requirements of ASTM A955 and its designated grade, either 60 or 75.
- C) Spirals – Spirals shall be plain or deformed stainless steel bars in coils or cut lengths meeting the requirements ASTM A955 and its designated grade, either 60 or 75.

BASIS OF ACCEPTANCE. Stainless steel bar reinforcement will be accepted on the basis of the manufacturer's name and location and the fabricator's name and location (where required) appearing on the Department's Approved List and a material certification that states the product conforms to this specification or, at the discretion of the Department, based on sampling and testing in accordance with the procedural directives of the Materials Bureau. *Buy America requirements apply.*

Comment [c129]:
EI09032

~~709-12 STAINLESS-CLAD BAR REINFORCEMENT~~

~~**SCOPE.** This specification covers composite bar reinforcement consisting of a mild steel core with a bonded exterior layer of stainless steel.~~

~~MATERIAL REQUIREMENTS~~

~~**Mechanical Properties.** The composite bar reinforcement shall meet the mechanical property requirements of ASTM A615, Grade 60 or ASTM A615, Grade 75.~~

1000

Stainless-Steel Cladding. ~~The stainless steel cladding shall meet the requirements of ASTM A959 UNS S31600. The completed composite bar reinforcement shall have a minimum stainless steel cladding thickness of 6.5 mils.~~

Quality Control. ~~The manufacturer shall provide a quality control plan for review and approval by the Director, Materials Bureau a minimum of thirty (30) days prior to delivery. The plan shall clearly demonstrate the ability to manufacture, test, certify, maintain, and assure the identity of bars from manufacture to placement.~~

Inspection. ~~The receipt of the manufacturer's quality control plan will serve as Department notification of the manufacturer's intention to supply reinforcing bars to Department work. The Materials Bureau will arrange for the inspection and sampling of bars by a Department representative. Department representatives shall have free access to the plant for inspection and/or sampling to verify specification compliance. Work done while any Department representative has been refused access shall be automatically rejected.~~

~~— Randomly selected lengths of clad bars will be taken by the representative from the production run for test, to assure specification compliance. The manufacturer shall allow fourteen (14) days from the receipt of the samples in the Materials Bureau's laboratory for evaluation to verify the acceptability of the bars and subsequent authorization for shipment.~~

BASIS OF ACCEPTANCE. ~~Subsequent to the review and approval of the manufacturer's Quality Control Plan, stainless clad reinforcing bars will be considered for acceptance in mill banded, stock lot quantities at manufacturing sites in accordance with procedural directives of the Materials Bureau.~~

709-13 STAINLESS STEEL BAR REINFORCEMENT

SCOPE. ~~This specification covers steel bar reinforcement consisting of stainless steel.~~

MATERIAL REQUIREMENTS

Material Properties. ~~The stainless steel shall meet the requirements of ASTM A955 M and its designated grade, either 60 or 75, and shall also meet the requirements of either ASTM A276 UNS S31653 or UNS S31803.~~

Quality Control. ~~The manufacturer shall provide a quality control plan for review and approval by the Director, Materials Bureau, a minimum of thirty (30) days prior to delivery. The plan shall clearly demonstrate the ability to manufacture, test, certify, maintain, and assure the identity of bars from manufacture to placement.~~

Inspection. ~~The receipt of the manufacturer's quality control plan will serve as Department notification of the manufacturer's intention to supply reinforcing bars to Department work. The Materials Bureau will arrange for the inspection and sampling of bars by a Department representative. Department representatives shall have free access to the plant for inspection and/or sampling to verify specification compliance. Work done while any Department representative has been refused access shall be automatically rejected.~~

~~— Randomly selected lengths of stainless bars will be taken by the representative from the production run for test, to assure specification compliance. The manufacturer shall allow fourteen (14) days from the receipt of the samples in the Materials Bureau's laboratory for evaluation to verify the acceptability of the bars and subsequent authorization for shipment.~~

BASIS OF ACCEPTANCE. ~~Subsequent to the review and approval of the manufacturer's quality control plan, stainless reinforcing bars will be considered for acceptance in mill banded, stock lot quantities at manufacturing sites in accordance with procedural directives of the Materials Bureau.~~

709-14 BAR REINFORCEMENT, GRADE 75

SCOPE. This specification covers the material requirements for deformed billet steel reinforcing bars used in portland cement concrete. Plain and deformed steel for the fabrication of spirals is included.

MATERIAL REQUIREMENTS

Deformed Bar Reinforcement. Steel reinforcing bars shall be deformed billet steel bars meeting the requirements of ASTM A615, Grade 75.

BASIS OF ACCEPTANCE. Bar Reinforcement and spirals will be accepted on the basis of the manufacturer's name and location appearing on the Department's Approved List and a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

SECTION 710 - FENCE AND GUIDE RAIL

710-01 ALUMINUM FENCE FABRIC

SCOPE. This specification covers the requirements for aluminum alloy, chain link fence fabric.

MATERIAL REQUIREMENTS. Aluminum chain link fence fabric shall conform to the requirements of AASHTO M181, Chain Link Fence, Type III, except as modified herein.

A. Wire. The aluminum alloy wire shall be 6061-T94 conforming to the applicable chemical composition limits of ASTM B211.

B. Mesh Size and Wire Diameter. The size of the mesh and the wire diameter shall be 2 inches and 9 gage (0.148 inch) respectively unless otherwise specified in the plans or proposal.

SHIPPING. Fabric shall be furnished in a clean condition free of all foreign material, including oil, dust, film, etc.

BASIS OF ACCEPTANCE. Aluminum fence fabric will be accepted on the basis of a material certification that specifies the product conforms to this specification.

710-02 GALVANIZED STEEL FENCE FABRIC

SCOPE. This specification covers the requirements for galvanized steel chain link fence fabric.

MATERIALS REQUIREMENTS. Galvanized steel chain link fence fabric shall conform to the requirements of AASHTO M181, Chain Link Fence, Type I, except as modified herein.

A. Mesh Size Coated Wire Diameter. The size of the mesh and the coated wire diameter shall be 2 inches and 9 gage (0.148 inch) respectively unless otherwise specified in the plans or proposal.

B. Zinc-Coating. The 2 inch mesh shall be galvanized with a Class D coating (2 oz/sf) by the hot-dip process after weaving. When 1 inch mesh is specified, it shall be galvanized with Class D Coating (2 oz/sf) before weaving by the electrolytic process.

SHIPPING. Fabric shall be furnished in a clean condition free of all foreign material, including oil, dust, film, etc.

BASIS OF ACCEPTANCE. Galvanized steel fence fabric will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

1002 710-03 VINYL COATED STEEL FENCE FABRIC

SCOPE. This specification covers the material requirements for Class A-Extruded Polyvinyl Chloride (PVC)-Coated Steel Fence Fabric, and Class B-Bonded Polyvinyl Chloride (PVC)-Coated Steel Fence Fabric.

MATERIAL REQUIREMENTS. Vinyl coated steel chain link fence fabric shall conform to the requirements of AASHTO M181, Chain Link Fence, Type IV, except as modified herein.

A. Mesh Size. The size of the mesh shall be 2 inches unless otherwise specified in the contract documents.

B. Wire Diameter. The wire diameter shall be as follows unless specified otherwise in the contract documents:

1. Class A- Extruded Polyvinyl Chloride (PVC)-Coated Steel shall have a 9-gage (0.148 inch) metallic coated core wire.

2. Class B- Bonded Polyvinyl Chloride (PVC)-Coated Steel shall have an 11-gage (0.12 inch) metallic coated core wire.

C. Vinyl Coating. The color of the vinyl coating shall be dark green unless shown otherwise in the contract documents. The Engineer shall have the option of approving an alternate color if the specified color is unavailable. An adhesion test is not required for coatings which are extruded or extruded and bonded.

SHIPPING. Fabric shall be furnished in a clean condition, free of all foreign material, including oil, dust, film, etc.

BASIS OF ACCEPTANCE. Vinyl-coated steel fence fabric will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

710-04 ALUMINUM COATED STEEL FENCE FABRIC

SCOPE. This specification covers the requirements for Aluminum Coated Chain Link Fence Fabric.

MATERIAL REQUIREMENTS. Aluminum coated steel fabric shall conform to the requirements of AASHTO M181, Chain Link Fence, Type II, except as modified herein.

Mesh Size and Coated Wire Diameter. The size of the mesh and the coated wire diameter shall be 2 inches and 9 gage (0.148 inch) respectively unless otherwise specified in the contract documents.

SHIPPING. Fabric shall be furnished in a clean condition free of foreign material including oil, dust, film, etc. except that a methacrylate lacquer may be used to protect it under storage conditions.

BASIS OF ACCEPTANCE. Aluminum-coated steel fence fabric will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

710-05 COATED STEEL FENCE FABRIC, (95% ZINC 5% ALUMINUM - MISCHMETAL ALLOY)

SCOPE. This specification covers the requirements for coated steel fence fabric (95% zinc 5% aluminum - mischmetal alloy).

§710

MATERIAL REQUIREMENTS. Coated steel fence fabric (95% zinc 5% aluminum - mischmetal alloy) shall conform to the dimensional and strength requirements of AASHTO M 181 Chain Link Fence Type I, except as modified herein.

A. Mesh Size. The size of the mesh shall be 2 inches unless otherwise specified in the contract documents.

B. Coated Wire Diameter. The size of the coated wire diameter shall be 9 gage (0.148 inch) unless otherwise specified in the contract documents.

C. Coating. The coating shall meet the requirements of ASTM F1345 Class 2 (1 oz/sf).

SHIPPING. Fabric shall be furnished in a clean condition, free of all foreign material including oil, dust, film, etc.

BASIS OF ACCEPTANCE. Coated steel fence fabric will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

710-06 - ROCK SLOPE NET AND WIRE MESH ASSEMBLIES

SCOPE. This specification covers the material requirements for the components for assembling a rock bolt generally used in reinforcing a rock slope or as part of a rock catchment system. The following materials are evaluated in this specification:

710.0601 – Rock Slope Net Assembly.

710.0602 – Rock Slope Wire Mesh Assembly.

710.0603 – Rock Slope Wire Mesh Drape Assembly.

MATERIAL REQUIREMENTS.

A. Rock Slope Net Assembly. Provide a fence consisting of a net fabricated from wire rope meeting the requirements of §710-27 *Rock Slope Wire Ropes, Seam Rope for Wire Rope Rock Catchment Fence*. The border rope of the net shall meet the requirements of §710-27 *Rock Slope Wire Ropes, Net Supporting Wire Rope for Wire Rope Rock Catchment Fence*.

The mesh size of the net shall be 8 in. by 8 in. The net shall be diagonally woven.

B. Rock Slope Wire Mesh. Provide 11 gauge (1/8 in. diameter), single twisted, coated steel wire mesh, with Class 1 (Zn-5Al) coating conforming to ASTM F1345. The steel wire composing the mesh shall have a minimum tensile strength conforming to ASTM A817.

C. Rock Slope Wire Mesh Drape. Provide 11 gauge (1/8 in. diameter), 8 by 10 mesh type having a nominal mesh opening of 3 ¼ in. x 4 ½ in., galvanized steel wire mesh, conforming to ASTM A975, Style 1.

BASIS OF ACCEPTANCE. The Rock Slope Net Assembly will be accepted on the basis of a material certification that the product conforms to this specification.

The Rock Slope Wire Mesh will be accepted on the basis of a material certification that the product conforms to this specification.

The Rock Slope Wire Mesh Drape will be accepted on the basis of a material certification that the product conforms to this specification.

~~710-07 THRU 710-09 (VACANT)~~

Comment [c130]:
E110003

710-10 STEEL AND IRON POSTS, RAILS, BRACES, AND FITTINGS FOR CHAIN LINK FENCE

SCOPE. This specification covers the requirements for steel and iron posts, rails, braces and fittings used in erecting chain link fence. The contractor shall have the option of supplying any one of the post sections shown on the Standard Sheets.

MATERIALS REQUIREMENTS. The following specifications cover the material requirements for each of the sections, fittings, and tension wires shown in the Post and Rail schedule on the Standard Sheets for Chain Link Fence:

A. Class A, Schedule 40 Pipe. Posts, rails and braces shall be standard weight Schedule 40 Pipe, manufactured in accordance with ASTM F1083, except that the protective coating system shall be as specified herein.

B. Class B, Steel Tubing. Posts, rails and braces shall be manufactured by one of the following methods with the steel conforming to ASTM A1011 or ASTM A1008 and A1011/A1011M with a minimum yield strength of 50,000 psi:

- Furnace butt welded, continuous welded
- Cold rolled and electric resistance welded
- Seamless

The tubing shall conform to the following dimensions:

Nominal Size (inches)	Outside Diameter, inches	Minimum Wall Thickness, inches	Weight lb/ft
1 1/4	1.660	0.111	1.836
1 1/2	1.900	0.120	2.281
2	2.375	0.130	3.117
2 1/2	2.875	0.160	4.639

C. Class C, Rolled-Formed Shapes. Posts, rails and braces shall be roll formed shapes which meet the requirements of ASTM F1043.

D. H-Posts. H Posts shall be fabricated from hot-rolled steel sections which meet the requirements of ASTM F1043.

E. Fittings. Fittings shall be manufactured of weldable steel, malleable iron, cast steel, cast iron, or aluminum alloy.

1. Weldable Steel. Weldable steel shall be commercial quality or better, produced by one of the following processes: Open-Hearth, Electric Furnace, or Basic Oxygen.

2. Malleable Iron. Malleable Iron shall conform to the requirements of §715-09.

3. Cast Iron. Cast iron shall conform to the requirements of §715-05.

4. Cast Steel. Cast steel shall conform to the requirements of §715-02.

5. Aluminum Alloy. Aluminum alloy shall meet the material requirements of §710-11.

Fittings other than aluminum fittings in contact with galvanized surfaces shall be galvanized in accordance with §719-01, Type II. Fittings in contact with aluminum surfaces shall be made of aluminum alloy or be aluminum coated in accordance with §719-03.

F. Tension Wire. Tension wire shall meet the requirements of ASTM A641M, as modified herein. The wire shall be a no. 7 gage minimum 0.177 ± 0.004 inch in diameter, having a minimum tensile

strength of 80,000 psi, with a minimum galvanized coating of 0.7 oz/sf or a minimum aluminum coating of 0.3 oz/sf.

Protective Coating Systems. Posts, rails and braces shall be coated with a protective coating system conforming to one of the following depending on structural member.

A. Class A Schedule 40 Pipe; Class B Steel Tubing

1. Galvanized Coatings. Galvanized both inside and out in accordance with ASTM F1083.

2. Combined Coatings

a. External surfaces. The external surfaces shall be coated with the following combined coating system:

(1) Hot Dip Galvanizing. The external surface shall be hot-dip galvanized with "Special High Grade" or "High Grade" slab zinc conforming to ASTM B6. The weight of the coating shall be a minimum 0.9 oz/sf.

(2) Chromate Conversion Coating. Chromate conversion coating shall be specifically designed for use as a pretreatment of galvanized surfaces. The coating shall be applied prior to the application of the thermoplastic acrylic coating at the manufacturer's recommended rate.

(3) Clear Coating. A thermoplastic acrylic or cross linked polyester coating shall be applied with a minimum dry film thickness of 0.3 mils.

b. Internal Surfaces. The internal surfaces of the pipe or tubing shall be coated with one of the following:

(1) Zinc rich coating. The zinc rich coating shall contain not less than 87% zinc dust by weight and shall be capable of providing galvanic protection. The minimum coating thickness shall be 0.3 mils.

(2) Cross linked polyester coating containing a corrosion inhibitor

(3) Hot-dip galvanized coating. The hot-dipped galvanized coating shall average not less than 0.35 oz/sf and no single specimen shall show less than 0.25 oz/sf.

B. Class C Roll Formed Shapes and H Posts. All surfaces shall be hot-dip galvanized in accordance with the requirements of §719-01, Type I.

C. Class A Schedule 40 Pipe; Class B Steel Tubing; Class C Roll Formed Shapes, H-Posts.

1. Aluminum with Chromate Coatings. All surfaces shall be given a hot-dipped 99% pure aluminum, Type II coating. The aluminum coating shall average 0.66 oz/sf and no single specimen shall show less than 0.61 oz/sf when tested in accordance with ASTM A428. The coating shall meet the adherence and quality requirements of §719-03. The aluminum coated surfaces shall be given a colorless chromate chemical treatment. The external surfaces shall be given a colorless protective resin coating to protect the material from abrasion in shipment and storage.

2. Mischmetal Alloy Coating (95% Zinc 5% Aluminum). Coating shall meet the requirements of ASTM F1043 Protective Coatings on Steel Framework for Fences Type C, except the coating weight shall be 1.0 oz/sf.

BASIS OF ACCEPTANCE. Steel and iron posts, rails, braces, and fittings for chain link fence will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

710-11 ALUMINUM POSTS, RAILS, BRACES AND FITTINGS FOR CHAIN LINK FENCE

SCOPE. This specification covers the requirements for aluminum posts, rails, braces and fittings to be used in erecting chain link fencing.

MATERIAL REQUIREMENTS. Posts, Rails, Braces and Fittings shall conform to the following materials specifications, alloy, temper and dimensional requirements in Table below.

BASIS OF ACCEPTANCE. Aluminum posts, rails, braces and fittings for chain link fence will be accepted on the basis of a material certification that specifies the product conforms to this specification.

Material	Material Spec.	Alloy & Temper	Dimensions
Fabric Ties	715-04	5052-H-38, 1100-H18 or 3003-H14	0.144 in. nom.dia.or 1/2 in. wide x 0.06 in. thick
Top & Bottom Tension Wires	715-04	6061-T94	0.192 in. nom. dia.
Hog Rings	715-04	6061-T94	0.110 in. nom. dia.
Stretcher Bars	715-04	6063-T5 or 6063-T6	1/4 x 3/4 in.
Truss Rods	715-04	6061-T6 or 6063-T6	3/8 in. nom. dia.
Cast Tumblers	715-03	356.0-T6	-
Wrought Turnbuckles	715-04	6061-T6 or 6063-T6	-
Brace & Stretcher Bands	715-04	3003-H14 or 6063-T6	1/8 x 7/8 in.
Carriage Bolts	715-04	2024-T4	-
Brace Ends & Rail Ends	715-03	356.0-T6, 360.0, D712.0, or ZG 61A-T5	-
Expansion Sleeves	715-04	6063-T6 or 6063-T832	See Note 1
Nuts	715-04	2024-T4 or 6061-T6	-
Line Posts	715-04	6063-T6	Sched. 40 pipe 2 in. diam.
End, Corner & Intermediate Posts	715-04	6063-T6	Sched. 40 pipe 2 1/2 in. diam.
Post Tops	715-03	356.0-F, 360.0, D712.0, or ZG61A-T5	-
Top Rails	715-04	6063-T6	Sched. 40 pipe 1/4 in. diam.
Brace Rails	715-04	6063-T6	Sched. 40 pipe 1/4 in. diam.

NOTE: 1. Modified Schedule 40 pipe, 1 1/2 in. nom. diam., 1.69 in. Inside Diameter, 0.078 in. Minimum Wall Thickness, 6 in. long.

710-12 PLASTIC COATED POSTS, RAILS, BRACES AND FITTINGS FOR CHAIN LINK FENCE

SCOPE. This specification covers the requirements for plastic coated posts, rails, braces and fittings used for erection of chain link fencing.

MATERIAL REQUIREMENTS. Posts, rails, braces, fittings, and accessories shall comply with the requirements of §710-10, except for the galvanized coatings. Post, rails, braces, fittings and accessories shall be resin-clad with either an epoxy modified ply (vinyl chloride), or a thermoplastic polyester resin. The coating shall have a minimum thickness of 7 mils and shall be of the same color as the fabric.

§710

Fabrication Requirements. The epoxy modified poly (vinyl chloride) coating shall be chemically bonded to heated pipe, fittings, etc., or the fitting and pipe, etc., shall be clad with a heavy molecule, saturated, linear thermoplastic polyester resin applied by electrostatic spray and fusing or equal method. Each length of pipe shall be sealed with two snug-fitting polyethylene plug-type seals to prevent condensation and eliminate internal corrosion.

BASIS OF ACCEPTANCE. Plastic-coated posts, rails, braces, and fittings for chain link fence will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

710-13 WOOD AND TIMBER POSTS AND TIMBER BLOCKOUTS

SCOPE. This specification covers wood posts used as witness posts, timber posts, and blockouts used in guiderail construction.

MATERIALS REQUIREMENTS. Wood posts, timber posts, and timber blockouts shall comply with the requirements of §712-14, Stress Graded Timber and Lumber, except that not every timber blockout in the lot need be branded, provided that approximately 10% of the blockouts are branded, and that the unbranded blockouts are visually similar, as determined by the engineer, to the branded blockouts. Using the clean wood properties of ASTM D2555, the bending stress (Modulus of Rupture) shall not be less than 4000 psi. They shall be surfaced on four sides and the dimensions shall be actual or nominal as indicated on the plans. If the dimensions are indicated to be nominal, the actual dimensions provided shall be in accordance with current trade practice. Surface dried redwood, red cedar, cypress or black locust may be used untreated. Other lumber including douglas fir, pine, oak, birch, apple, and beech may also be used but shall be pressure treated in accordance with §708-31, Wood Preservative-Water Borne after all the holes have been drilled and all other woodworking operations have been performed.

Bituminous preservative treatments will not be permitted. Before using, the Contractor shall submit to the Engineer, for approval, information as to the species of timber to be used and method of preservative treatment to be employed.

BASIS OF ACCEPTANCE. Wood and timber posts and timber blockouts will be accepted on the basis of a material certification that specifies the product conforms to this specification.

710-14 GALVANIZED STEEL BARRIER POSTS

SCOPE. This specification covers galvanized steel posts used as guiderail and median barrier posts, I-beam posts for existing guide railing and median barrier, and required soil plates, Anchor Post Base, and slip impact bases.

MATERIAL REQUIREMENTS . Galvanized steel barrier post shall conform to the following:

Galvanizing Steel	§719-01 Galvanized Coatings and Repair Methods, Type I ASTM A36
-------------------	--

Posts. Steel posts used as guiderail and median barrier posts or I-beam posts for existing guide railing and median barrier, shall be fabricated from steel conforming to the ASTM A36 shape specified on the standard sheet for the guide railing or median barrier being utilized.

Soil Plates, Slip Impact Bases, and Other Post Components. Soil plates, slip impact bases, and other post components shall be fabricated from steel conforming to the dimensions shown on the standard sheet for the guide railing or median barrier being utilized.

FABRICATION. Guiderail and median barrier posts or I-beam posts for existing guide railing and median barrier shall be fabricated with all required welding, punching, drilling, or cutting of the post or

any component of the post completed prior to galvanizing. Welding shall be done in accordance with the requirements of the *New York State Steel Construction Manual*, except that radiographic inspection of shop welds will not be required.

BASIS OF ACCEPTANCE. Galvanized steel barrier posts will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*”

710-15 THRU 710-19 (VACANT)

710-20 CORRUGATED BEAM GUIDE RAILING AND MEDIAN BARRIER

SCOPE. This specification covers corrugated beam guide railing and median barrier including corrugated beams, posts, anchorage units and accessory hardware.

MATERIAL AND FABRICATION REQUIREMENTS

Posts. Posts shall meet the requirements of §710-14 Galvanized Steel Barrier Posts

Beams, Terminal Sections and Hardware. Corrugated beams, terminal sections and all hardware shall be fabricated in accordance with the details shown on the standard sheets. Bolt holes in the beam at the post hole and elsewhere, as necessary, shall be enlarged or slotted to permit expansion and contraction, and to facilitate erection. The beams shall be of uniform section and straight, unless shop curved beams are required by the plans or specifications. The edges shall be rolled to eliminate sharp edges. When shop curving of corrugated beams is required the radius of curvature shall be stamped into the base metal of the beam. The stamping shall be on the back, at or near both ends of the beam, and in a location where it will be visible to a worker after erection.

Beams and terminal sections shall be rolled from 12 gage (nominal thickness 0.105 inches -0.009 inch tolerance) or heavier sheet or coil stock. The sheet or coil stock shall be new billet open hearth, electric furnace, or basic oxygen steel sheet. The minimum yield point and elongation of the steel used in the beam sections shall be 50,000 psi and 12% in 2 inch gage length respectively. Terminal sections, used for finishing-off or ornamental purposes, may be of mild steel, 33,000 psi yield point.

Plates and Anchorage Units. Plates and Anchorage Units shall be as detailed on the standard sheet for corrugated beam type guide railing and median barrier. They shall conform to ASTM A36.

Splices. Splices shall be made with flat, roundheaded, grippable, galvanized bolts, nuts and washers conforming to the following unless specified otherwise in the contract documents: Bolts ASTM A307 Grade A, Nuts ASTM A563 Grade A or better, and Washers ASTM F844. They shall be galvanized in accordance with the requirements of §719-01 Galvanized Coatings and Repair Methods, Type II (ASTM A153) unless another coating is specified.

Post connection bolts and the grippable splice bolts shall be as detailed on the Standard Sheets.

Fabrication Welding. Fabrication welding shall be done in accordance with the New York State Steel Construction Manual, except radiographic inspection of shop welds will not be required.

Galvanizing. The rail element shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type I (ASTM A123) or Type IV (ASTM A653/653M) of the standard specifications, except that the minimum check limits for the weight of coating as determined by the triple spot and single spot tests for §719-01, Galvanized Coatings and Repair Methods, Type IV (ASTM A653/653M), shall be 4 oz/ft² and 3 oz/ft² respectively, (total amount both sides of sheet). Posts, plates, and anchorage units shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type I (ASTM A123). Hardware shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type II (ASTM A153).

When beams are to be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type I (ASTM A123), they shall be blanked to the proper shape, fabricated and ready for

§710

assembly before galvanizing. No punching, drilling, cutting or welding will be permitted after galvanizing. When galvanizing in accordance with §719-01, Galvanized Coatings and Repair Methods, Type IV (ASTM A653/653M), the beam may be fabricated, cut, punched or drilled from galvanized sheet or coil stock. The exposed edges resulting from this process do not have to be repaired or touched up in any way.

BASIS OF ACCEPTANCE. All components of the corrugated beam type guide railing and median barrier shall be accepted in accordance with directives issued by the Department.

710-21 BOX BEAM GUIDE RAILING AND MEDIAN BARRIER

SCOPE. This specification covers box beam guide railing and median barrier including the guide rail, posts, end assembly units and accessory hardware.

MATERIAL REQUIREMENTS

Posts. Posts shall meet the requirements of §710-14 Galvanized Steel Barrier Posts.

Rails. Rails shall be cold-formed welded and seamless structural tubing. The rails shall conform to ASTM A500, Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes, Grade B, except as modified below. Splice plates and plates welded to tubes for splice assemblies shall be Charpy V-Notch tested. Splice tubes need not be tested.

All rail shall be tested in accordance with ASTM E436 "Drop-Weight Tear Tests of Ferritic Steels" except as modified below.

The tests shall be done after all galvanizing and associated operations have been performed on the rail. The testing shall be conducted at a temperature of -0.4°F , without removing the galvanizing, on 2 x 9 inch specimens supported to achieve a 7 inch span.

The percent shear area will be determined by testing nine (9) specimens, three (3) from each of three (3) sides not containing a weld. The shear areas of the three specimens from the side with the lowest average shear area shall be disregarded and the final average based on the remaining six specimens. If the average percent shear area falls below 50, the material represented by these tests shall be rejected.

To facilitate acceptance and rejection of material the manufacturer of the structural shape shall, before galvanizing, identify the product with the steel heat number, or some number which is traceable to the heat number, and its own unique identification code. The identification method shall be such that it can be read after the structural shape is galvanized. The identification information shall be placed on the structural shape at intervals not to exceed 4 feet.

When shop curving of box beams is required, the radius of curvature shall be stamped into the base metal of the beam. The stamping shall be the vertical faces, at or near both ends of the beam, and in a location where it will be visible to a worker after erection.

No mill transverse welds will be permitted on the rail sections. Longitudinal welds shall be made by the resistance, gas shielded arc, submerged arc or plasma arc welded process; shall be sound, free from defects, and shall not be repaired. The welded joint, in cold-formed welded rail, shall have a minimum tensile strength specified for the railing when tested according to the tensile strap test of ASTM Method E8. All fabrication shall be done in accordance with the requirements of the Steel Construction Manual.

Rails shall be galvanized in accordance with §719-01, Type I, Galvanized Coatings and Repair Methods. Slots and round holes may be subsequently drilled, punched, burned, or cut and regalvanized according to the paragraph below on "Regalvanizing Iron and Steel Using a Flame Sprayed Coating System." This repair procedure shall also apply to curved rail sections and splice plates as required.

Regalvanizing Iron and Steel Using a Flame Sprayed Coating System. Those areas to be regalvanizing shall be blasted with silica sand or crushed garnet of such gradation that sand shall be mesh size # 20 to # 40 U.S. Standard Sieve with a minimum of 40% retained on a # 30 U.S. Standard Sieve. Pressure of not less than 75 psi shall be maintained at the blast generator.

A sample steel plate shall be blasted until the surface cannot be further cleaned or roughened. This plate shall be used for visual comparison and any areas that do not meet this standard as to roughness or cleanliness shall be reblasted.

The wire used in spraying shall be 1/8 or 3/16 inch diameter, zinc 99.0% purity. Air pressure at the Air Control Unit shall be 60 psi and there shall be no more than 35 feet of 3/8 inch I.D. hose between the Air Control Unit and the gun.

The metal coating shall be applied at a minimum thickness of 0.0045 inches. At least one coating shall be applied within 4 hours of blasting and the surface shall be completely coated within 8 hours of blasting.

The specified thickness of coating shall be applied in multiple layers and in no case shall less than two passes be made over every part of the surface.

Fasteners. Fasteners shall be galvanized and conform to the following unless specified otherwise in the contract documents. Bolts ASTM A307 Grade A, nuts ASTM A563 Grade A or better, and washers ASTM F844.

BASIS OF ACCEPTANCE. All components of the box beam guide railing and median barrier shall be accepted in accordance with directives issued by the Department.

710-22 CABLE GUIDE RAILING

SCOPE. This specification covers cable guide railing including cable, posts, anchorage units, and accessory hardware.

MATERIAL REQUIREMENTS. Cable Guide Railing shall conform to the following:

Posts, Soil Plates	710-14 Galvanized Steel Barrier Posts
Reflectors	730-01 Aluminum Sign Panels
Reflective Sheeting	730-05 Reflective Sheeting
Cable	AASHTO M30 or ASTM A741 Type I Construction, Class A Coating
Anchor Angle, Anchor Post Base	ASTM A36
Bolts	ASTM A307 Grade A
Nuts	ASTM A563 Grade A
Washers	ASTM F844

Cable End Assemblies. Designs for a steel turnbuckle cable-end assembly or spring cable-end assembly not shown on the standard sheet or detailed in the plans shall be submitted for approval. Compensating devices must have a spring rate of 450 ± 45 lb/in and a total available "throw" of 6 inches minimum.

Hook Bolts. Hook bolts shall develop an ultimate pull open strength of from 450 lbs to 1000 lbs applied in a direction normal to the longitudinal axis of the post.

Galvanizing. The bolts, including the "J" bolt used to mount the cable, nuts, washers, anchor rods, spring compensator components, steel turnbuckle cable end assembly, and all cast steel or malleable iron hardware, except the wedge shown in "Detail X" on the standard sheet, shall be galvanized in accordance with the requirements of §719-01 Galvanized Coatings and Repair Methods, Type II, unless another coating is specified. The wedge shown in "Detail X" shall be ungalvanized (black).

The anchor angles, and Anchor Post Base shall be galvanized in accordance with the requirements of §719-01 Galvanized Coatings and Repair Methods, Type I.

Welding. Welding shall be performed in accordance with the requirements of the New York State Steel Construction Manual, except radiographic inspection of shop welds will not be required.

§710

BASIS OF ACCEPTANCE. Acceptance shall be based on the manufacturer's certification and in accordance with directives issued by the Department.

710-23 STEEL BRIDGE RAILING

SCOPE. This specification covers the material requirements for Steel Bridge Railing and its component parts.

MATERIAL REQUIREMENTS. Steel Bridge Railing materials shall conform to the following requirements:

Piece	ASTM Designation
Rail Tubes	A500 Grade B 1
Rail End Caps	A36 or A588 (A709 Grade 36 or 50W)
Base Plates ²	A588 or A572 Grade 50 (A709 Grade 50 or 50W)
Anchor Studs	A325 or A449 Grade 1
Splice Bolts,	A325 or A449 Grade 1
Round Head Bolts	A325 or A449 Grade 1
Nuts ³	A563
Washers ³	F436
Lock Washers	High carbon Heat Treated Spring Steel: ASME B18.21.1
Anchor Plates	A36 (A709 Grade 36)
Plate Shims	A36 or A588 (A709 Grade 36 or 50W)
Tube Rail Splices	A500 Grade B
Solid Rail Splices	A588 or A572 Grade 50 (A709 Grade 50 or 50W)
Angle ²	A588 or A572 Grade 50 (A709 Grade 50 or 50W)
Splice Plates	A588 or A572 Grade 50 (A709 Grade 50 or 50W)
Railing Post ²	A588 or A572 Grade 50 (A709 Grade 50 or 50W)
Tubular Posts	A500 Grade B

1 Where unpainted A588 (A709 Grade 50W) steel is used for the post, the tube shall be unpainted A500 Grade B with the chemical properties of either A588 (A709 Grade 50W) or A606, Type 4. Railing tube meeting the foregoing requirements will be acceptable if its elongation is a minimum of 21% in 2 inches.

2 All post material, including base plates, shall be furnished to minimum Charpy V-Notch Toughness requirements as required by §715-01, under Charpy V-Notch Impact test.

3 Use the following nut and washers for the given bolt class:

BOLT or STUD ASTM	NUT (A563 class & dimension style of nut)	WASHER (A563 type)
A307	5 HH	1 or 3
A325 or A449	10S HH	1 or 3
A325 Type 3	8S3 HH	3

Rail Tubes	A500 Grade B
Rail End Caps	A36 (A709 Grade 36)
Base Plates ¹	A572 Grade 50 (A709 grade 50)
Anchor Studs	A325 or A449 Grade 1
Splice Bolts	A325 or A449 Grade 1
Round Head Bolts	A325 or A449 Grade 1
Nuts ²	A563
Washers ²	F436
Lock Washers	High Carbon Heat Treated Spring Steel: ASME B18.2
Anchor Plates	A36 (A709 Grade 36)
Plate Shims	A36 (A709 Grade 36)
Tube Rail Splices	A500 Grade B
Solid Rail Splices	A572 Grade 50 (A709 grade 50)

Angle ¹	A572 Grade 50 (A709 grade 50)
Splice Plates	A572 Grade 50 (A709 grade 50)
Railing Post ¹	A572 Grade 50 (A709 grade 50)
Tubular Posts	A500 Grade B

1 All post material, including base plates, shall be furnished to minimum Charpy V-notch toughness requirements as required by §715-01, under Charpy V-Notch Impact test.

2 Use the following nut and washers for the given bolt class:

Bolt or Stud Class	NUT A563 (class & Dimension style of nut)	Washer A563 Type
4.6	5 H1	1 or 3
8.8	10S HH	1 or 3

Comment [cjt131]: EI 08-015

Beveled shims may be machined from the same type of metal as in the post base plates or may be cast from material conforming to the requirements of §715-02, Steel Castings, or §715-09, Malleable Iron Castings.

All rail, except bicycle and pedestrian rail, shall be tested in accordance with ASTM E436 - "Drop-Weight Tear Tests of Ferritic Steels", except as modified below.

The tests shall be done after all galvanizing and associated operations have been performed on the rail. The testing shall be conducted at a temperature of 0°F, without removing the galvanizing, on 2 x 9 inch specimens supported to achieve a 7 inch span.

The percent shear will be determined by testing nine (9) specimens, three (3) from each of three (3) sides not containing a weld. The shear areas of the three specimens from the side with the lowest average shear area shall be disregarded and the final average based on the remaining six specimens. If the average percent shear area falls below 50 the material represented by these tests shall be rejected.

Splice plates and plates welded to tubes for splice assemblies shall be Charpy V-notch tested. Splice tubes need not be Charpy V-notch tested.

To facilitate acceptance and rejection of material, the manufacturer of the structural shape shall, before galvanizing, identify the product with the steel heat number, or some number which is traceable to the heat number, and its own unique identification code. The identification method shall be such that it can be read after the structural shape is galvanized. The identification information shall be placed on the structural shape at intervals not to exceed 4 feet.

FABRICATION. Bridge Railing shall be fabricated to the dimensions shown in the contract plans and in compliance with the specifications.

A. Shop Drawings. Shop drawings, when required by the contract documents, shall be provided in accordance with the requirements of the S.C.M., except that: 1) the drawings shall be submitted to the Engineer for review and approval and 2) the computed weights need not be shown.

B. Welding. Shop welding shall be performed only where specifically noted on the contract documents. Transverse welds shall not be permitted unless directly called for on the contract plans. All welding shall be done in accordance with the requirements of the SCM.

C. Cutting. All exposed flame cut surfaces shall have a surface roughness not to exceed 250, as defined by the ANSI standard specification B46.1. Grind all edges of Posts and Post Base Plates so that all sharp edges are removed.

D. Bending. Rails for curved structures shall be curved in the shop prior to galvanizing. To facilitate bending, rails may be heated to a temperature not exceeding 1200°F.

E. Galvanizing. Galvanizing shall conform to the requirements of §719-01, Galvanized Coatings and Repair Methods, Type I. All components of the railing, including anchor studs, nuts and washers,

shall be galvanized. The rails, post assemblies, splices and all hardware shall be fabricated and ready or assembly prior to galvanizing.

All galvanized bolts and galvanized anchor studs shall have a Class 2A Thread. All galvanized nuts shall have a standard oversized tap to allow for the galvanizing on the bolts and nuts. Shop galvanizing repair of uncoated areas will be permitted on localized areas. Repair of localized areas is limited to a total of 2 square inches on any post or rail. A post or rail which contains galvanizing defects totaling more than 2 square inches shall be stripped and regalvanized.

Shop repair shall be made in accordance with the methods given in §719-01.

The following areas will not require galvanizing repair: One 1/8 inch maximum dimension spot of tight flux remaining in the fusion line of any 7 inch length of weld after blast cleaning pickling and galvanizing.

~~—F. Brown Rail. When brown rail is specified, when paint is used to obtain a rustic appearance,~~ all components of the railing system shall be galvanized and then the visible portions of the system shall be painted in accordance with §657 Painting Galvanized and Aluminum Surfaces. Paint color shall be ‘Weathered Brown’ as defined by 708-05 Standard Paint Colors.

Comment [cjt132]:
EI 08-015

~~F. Brown Rail. When brown rail is specified.~~

Comment [cjt133]:
EI 08-015

BASIS OF ACCEPTANCE. The manufacturer shall furnish the Department with three (3) certified copies of physical test and chemical analysis of the materials used in the manufacture of the railing. Check analysis may be made by the Department from delivered material.

Inspection will be performed in accordance with the provisions of the SCM, except that mill inspection will not be done.

Materials that do not bear the Inspector’s mark of acceptance shall not be accepted at the project site.

710-24 BOX BEAM GUIDE RAIL END ASSEMBLY, TYPE III; AND BOX BEAM MEDIAN BARRIER END ASSEMBLY, TYPE C

SCOPE. These specifications cover the material and quality requirements for Box Beam Guide Rail End Assembly Type III and Box Beam Median Barrier End Assembly, Type C. These end assemblies are manufactured articles requiring federal approval as Test Level 3 end terminals for box beam guide rail and median barrier. They function by absorbing energy either through crushing of fiberglass elements or by splitting the beam element at the corners of the box beam. When specified, these end assemblies are used to terminate the ends of box beam guide rails and box beam median barriers. Box Beam Guide Rail End Assembly Type III and Box Beam Median Barrier End Assembly, Type C are fabricated in accordance with these specifications, the manufacturer’s instructions, and the manufacturer’s drawings. They are available in two styles. These are Wyoming style and another style that uses a box beam splitting mandrel.

MATERIALS REQUIREMENTS.

A. GENERAL. Soil plates, struts, bearing plates shall meet the requirements of ASTM A36. All metal components shall be hot dip galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods.

Rustic versions of box beam bursting style Type III End Assembling shall comply with the above requirements except the metal parts exposed to view shall be painted in accordance with §740-03 Painting Galvanized Surfaces

Reflective sheeting pre-mounted on a frangible material shall be provided by the manufacturer for the free end of the end assembly. If approaching traffic will be permitted on one side only, reflectorization shall consist of alternating reflectorized 4 inch yellow and non-reflectorized 4 1/2 inch black stripes oriented at a 45 degree angle, with the lower edge of the stripes near the traveled way to be used by the approaching traffic. The reflective material shall meet the requirements of §730-05, Reflective Sheeting, Class B. If approaching traffic will be permitted on both sides of the end assembly reflectorization shall be upward pointing chevrons of the same dimensions.

B. END ASSEMBLIES USING CRUSHABLE FIBERGLASS ELEMENTS (WYOMING STYLE): Materials used in the fabrication of the Box Beam Guide Rail End Assemblies Type III and Box Beam Median Barrier End Assembly, Type C (Wyoming style) shall conform with the following requirements:

Wood and Timber Post Posts and Timber Blockouts	§710-13
Foundation Tubes, Nose Assembly, Outer Tube, Telescoping Section and Intermediate Spacer Block	§710-21
Fasteners, except shear bolts on posts 6,7, & 8	ASTM A307
Shear bolts on posts 6, 7, & 8	SAE Grade 0
Rubber Pad	Hard Rubber Division II Sect18.2
Steel Posts, Shelf Angles, and other metal parts	ASTM A36
Galvanized Coatings and Repair Methods	§719-01

The Cable Assembly shall consist of galvanized steel cable, 6 x 3/4 inch, with 3/4 inch threaded rod swaged to both ends.

The composite tube shall be MMFG Extren series 500 pulltruded fiberglass structural tubes and shall exhibit the following properties:

1. Composite tubing shall be manufactured using the pulltrusion process. Tubing shall be manufactured of glass fiber reinforced resin with a glass resin ratio of 50%. The resin shall be isophthalic polyester. Glass reinforcement shall include the following three varieties:
 - A. Surface mat shall be used on all exterior surfaces.
 - B. Continuous glass strand rovings shall be used internally.
 - C. Continuous strand mats shall be used internally.
2. The composite material shall exhibit the following minimum mechanical properties:
 - A. Ultimate Tensile Strength: Ultimate Tensile strength shall be longitudinally 30,000 psi and transversely 7000 psi measured from coupons. Bending strength of the full section shall be 20,000 psi.
 - B. Ultimate Compressive Strength shall be as given above except Transversely shall be 15,000 psi.
 - C. Ultimate Shear Strength shall be 4500 psi.
 - D. Modulus of Elasticity shall be 250,000 psi
 - E. Barcol Hardness shall be 50.
3. The energy dissipation properties of the alternate fiberglass epoxy composite tube shall be evaluated using static compressive testing. Each test specimen shall be 2.0 feet long with a 4 inch long tulip shape cut into one end of the test specimen. The test specimen shall be crushed statically at a rate of 4 inches per minute and the total crush length shall be not less than 1.0 foot. A minimum of three static compressive tests shall be conducted. The results of each test shall meet the following static energy dissipation properties:

First Stage Energy Absorber	
Average Crush Force	18,000 ± 2000 lbs
Maximum Compressive Force	26,000 lbs
Allowable Compressive Force Variation	± 2500 lbs
Second Stage Energy Absorber	
Average Crush Force	41,000 ± 3000 lbs
Maximum Compressive Force	55,000 lbs
Allowable Compressive Force Variation	± 5000 lbs

C. END ASSEMBLIES USING BOX BEAM BURSTING MANDREL :

§710

Materials used in the fabrication of the Box Beam Guide Rail End Assemblies Type III (BEAT) shall conform with the following requirements:

Mandrel Tube, Box Beam rail	§710-21
Impact Head and components, including face plate, top and bottom plates, lower and upper support boxes, Gussets	10 Ga. ASTM A36
Steel post, guide plates and mandrel support block, gusset plate, guide support, bent and front guide plates, and all metal parts	ASTM A36
Mandrel Plate shall be ASTM A514, with Brinell hardness number of 250, min.	

Ordinary box beam guide rail and ordinary box beam median barrier included within the pay limits for the bursting style Type III End Assembly for guide rail and Type C End Assembly for median barrier shall conform to the same specifications as box beam guide rail to which the Type III or Type C bursting style end assembling is attached.

BASIS OF ACCEPTANCE. Box Beam Guide Rail End Assembly Type III and Box Beam Median Barrier End Assembly, Type C will be accepted at the site of the work by the Engineer on the basis of conformance of the delivered articles with the manufacturer's drawings, and upon the manufacturer's certification of compliance with these specifications.

710-25 GUIDE RAIL AND MEDIAN BARRIER SYSTEMS (RUSTIC)

SCOPE. This specification covers the material and quality requirements for rustic barrier systems fabricated from structural and high-strength low alloy structural steel that in a reasonable time after erection in a rural environment of average atmosphere, will develop a uniform, permanent, and tightly adhering protective oxide coating.

MATERIAL REQUIREMENTS. Except as modified herein, all requirements of §710-20-Corrugated Beam Guide Railing and Median Barrier, §710-21 - Box Beam Guide Railing and Median Barrier, including Drop Weight Tear Testing, and §710-22 Cable Guide Railing shall apply.

A. Box Beam Rail. The base metal for the structural shape, plate, and bar components of box beam guide rail and median barrier shall meet the requirements of ASTM A242 or A588, and shall not be galvanized. The fabrication of structural tube shall comply with ASTM A500, Grade B. The mechanical properties of the finished tube shall conform to the requirements of ASTM A500, Grade B except that the minimum elongation in 2 inches shall be 21 percent. Splice plates shall be fabricated of ASTM A36 steel ready for assembly before galvanizing and galvanized in accordance with §719-01, Type 1 (ASTM A123).

B. Corrugated Beam Rail. The base metal for the corrugated beam rail shall meet the requirements of ASTM A606, Type 4, and shall not be galvanized.

C. Cable Guide Railing. The upper Anchor Post, including the attached upper slip impact base, shall not be galvanized.

D. Welds. All welds shall develop the strength of, and exhibit the same corrosion resistance characteristics as, the base metal used for the structural shape, plate and bar components.

E. Soil Plates. Soil plates of high strength, low alloy steel guide rail system shall be made of either; ASTM A36, ASTM A242, ASTM A588, or ASTM A606 Type 4 and shall be galvanized or epoxy coated in accordance with the applicable requirements in this specification.

F. Miscellaneous Hardware. The base metal of all accessory hardware of high strength, low alloy steel guide rail system including blockouts, backup plates, rail connecting angles, bolts, nuts and washers shall be fabricated from steel having corrosion resistance of approximately 4 times carbon

structural steel without copper. Hardware to be excepted from this requirement is listed below and shall be supplied in conformance to the requirements as detailed on the standard sheets, and galvanized in accordance with §719-01, Type 1 (ASTM A123).

- All bolts less than 1/2 inch diameter and their associated washers and nuts.
- 1 3/4 x 1 3/4 inch square washers; 3 x 1 3/4 inch washers.
- 3/4 inch diameter anchor rods, nuts and washers associated with concrete anchors.
- Other miscellaneous nuts, bolts, washers, and connectors not exposed to view.

High strength bolts, nuts, and washers specified on the standard sheets as ASTM A325 shall conform to ASTM A325, Type 3. Commercially available anti-seizing compound shall be applied to the threads of corrosion resistant bolts used in rail splices.

G. Epoxy Coating Material

1. The epoxy coating materials shall be powdered polyamide epoxy resin suitable for fusion bonding. The finish shall not be glossy. A dull or matted finish shall be supplied.
2. The color of the epoxy coating shall be a reasonable visual match to the brown color of Federal Color Standard 595 - plate numbers 10075, 10079, and 10091. Fifteen (15) days prior to commencement of coating operations, three (3) 4 x 6 inch coated metal plates shall be submitted to the Director, Materials Bureau for determination as to acceptability of the color match.

The epoxy coating shall not fade, change color or chalk appreciably when subjected to a 30 hour exposure (20 minute cycle) in the high intensity ultra violet weatherometer model DMC-RHC. Each cycle (continuously repeating) starts with 17 minutes of light followed by 3 minutes of light and waterspray.

3. Upon approval of the product and the color match, the epoxy coating will be placed on a Department Approved List of Materials.

H. Posts. Posts shall conform to any of the following requirements:

1. ASTM A36 steel with a fusion bonded polyamide epoxy coating throughout meeting the epoxy requirements of this specification.
2. ASTM A588 steel with the embedded portion of the post galvanized in accordance with §719-01, Type 1 (ASTM A123). The posts shall be prepared in accordance with standard galvanizing industry practice. The lower 32 inches of light poles and the lower 39 inches of heavy posts shall be galvanized.
3. ASTM A588 steel with the embedded portion of the post having a fusion bonded polyamide epoxy coating meeting the epoxy requirements of this specification. The lower 39 inches of the posts, regardless of rail type, shall be epoxy coated.

FABRICATION REQUIREMENTS

Epoxy Coating

A. Coating Applicator. The facilities of the coating applicator and method of application for the epoxy shall be subject to approval by the Director, Materials Bureau. Approval shall be obtained in accordance with the written procedures of the Materials Bureau. Upon approval, the complete name and address of the coating applicator will be placed on the Department's List of Approved Products titled "Fusion Bonded Coating Applicators."

Coating applicators on the "approved list" for Longitudinal Joint Ties and Steel Reinforcing Bars are approved applicators for epoxy coated posts as described in this specification.

B. Plant Inspection. The Department reserves the right to have its authorized representative observe the preparation coating and testing of the posts. The representative shall have free access to the plant Any work done while access was denied will be rejected.

If the representative elects, lengths of coated posts may be taken from the production run, on a random basis, for test, evaluation and check purposes by the Materials Bureau.

C. Quality Control. The coating applicator shall be responsible for performing quality control and tests. This will include inspection for compliance with the requirements of Coating Thickness, Continuity of Coating and Coating Cure.

D. Preparation. Posts shall be pickled according to accepted industry standards and then rinsed in a slightly basic solution to remove all traces of pickling residue. The cleaned surfaces shall be free of all residue and millscale. Only the portion of post to be coated needs to be cleaned. In lieu of the pickling process, posts may be blast cleaned in accordance with the Steel Structures Painting Council - Surface Preparation Specification No. 6 (SSPC-SP 6), Commercial Blast Cleaning. The cleaned surface shall be defined by SSPC-Vis 1-89, Pictorial Standards B SP 6 or C SP 6 as applicable.

E. Coating Thickness. Five mils minimum dry film thickness. Coating thickness measurements shall be conducted by the method outlined in ASTM G12.

F. Continuity of Coating. The coating shall be checked visually after cure for continuity. It shall be free from holes, voids, contamination and damaged areas.

G. Coating Cure. The coating applicator shall check each shipment to determine that the epoxy coating is in fully-cured condition.

Field Repair of Damaged Coatings. Posts with coating breaks, due to handling, that exceed 1/2 inch in any dimension shall not be incorporated into the work. The Contractor shall set aside such damaged units and may effect a field repair. Coating breaks may be repaired with a patching material approved by the epoxy coating manufacturer. The patching material shall be an epoxy compatible with the epoxy coating. The patching epoxy shall be a color match to the coating epoxy.

BASIS OF ACCEPTANCE. All components of the box beam or corrugated beam guide railing and median barrier shall be accepted in accordance with directives issued by the Department and in conformance with the standard sheets.

All epoxy coated posts shall be accepted by the Engineer at the contract site on the basis of the following:

- The epoxy coating manufacturer's certification that the coating material is identical to that approved by the Materials Bureau.
- The coating applicator's certification that the posts have been coated and that they conform to the requirements of this specification.
- The appearance of the name of the coating applicator and epoxy coating material on the Department's Approved List of Products.

The manufacturer's certification that the metal used conforms to the requirements of this specification. The ASTM designation and Grade shall be included.

710-26 PLASTIC AND SYNTHETIC BLOCK-OUTS FOR HEAVY POST GUIDERAIL SYSTEMS

SCOPE. This specification describes plastic and synthetic material block-outs used to provide uniform offset distance from the corrugated beam rail to the heavy post.

GENERAL. The block-out shall have the same general dimensions as detailed in the Department Standard Sheets. The block-out shall not contain excessive voids that would compromise its physical strength. The material shall be designed for outdoor exposure and shall include chemical additives to resist UV degradation. If the product contains recycled materials, they shall be environmentally friendly and non-hazardous. Blocks shall contain no materials that will negatively affect their field performance, such as materials that absorb moisture.

BASIS OF ACCEPTANCE. Manufacturers or suppliers may submit their product for evaluation to the Director of the Materials Bureau. This submission shall include copies of drawings, specifications, test reports, the quality control procedure and Federal Acceptance Letters. At the Department’s discretion, the material will be evaluated for conformance to these specifications, and product samples will be tested in accordance with procedural directives of the Materials Bureau.

The product will be accepted at the job site based on its appearance on the Approved List. In addition, the contractor shall provide manufacturer certification that the supplied product has the same chemical composition, mechanical properties as the product used in the testing accepted for Federal Approval. Modifications to this product are acceptable, provided the resulting product is an equivalent or of higher level of quality, and supporting documentation is provided.”

710-27 - ROCK SLOPE WIRE ROPES

SCOPE. This specification covers the material requirements for the components for wire ropes generally used in a rock catchment system. The following materials are evaluated in this specification:

- 710.2701 – Rock Slope Wire Ropes, Net Supporting Wire Rope for Wire Rope Rock Catchment Fence.
- 710.2702 – Rock Slope Wire Ropes, Seam Rope for Wire Rope Rock Catchment Fence.
- 710.2703 – Rock Slope Wire Ropes, Tieback Restraining Cable for Wire Rope Rock Catchment Fence.
- 710.2704 – Rock Slope Wire Ropes, Anchor Cable for Wire Rope Rock Catchment Fence.
- 710.2705 – Rock Slope Wire Ropes, Seam Rope for Wire Mesh Slope Protection

MATERIAL REQUIREMENTS. Provide material in accordance with TABLE 710-27A *Rock Slope Wire Ropes*.

TABLE 710-27A ROCK SLOPE WIRE ROPES			
Rock Slope Wire Rope	Rope/Cable	Minimum Diameter	Minimum Breaking Strength
Wire Ropes for Wire Rope Rock Catchment Fence	Net Supporting Wire Rope	5/8 in. (6x19 construction)	37 kips
	Seam Rope	5/16 in. (7x7 construction)	9 kips
	Tieback Restraining Cables	5/8 in. (6x19 construction)	37 kips
	Anchor Cables (10 ft. min. length, equipped with heavy duty type thimbles)	¾ in.	53 kips
Seam Wire for Wire Mesh Slope Protection	Seam Rope	5/16 in. (7 x 19 Galvanized Aircraft Cable)	10 kips

All wire ropes for the wire nets, supporting ropes, seam ropes and anchors shall be composed of steel wires individually galvanized before being woven into the ropes.

BASIS OF ACCEPTANCE. The Wire Ropes for Wire Rope Rock Catchment Fence will be accepted on the basis of a material certification that the product conforms to this specification.

The Seam Wire Rope for Wire Mesh Slope Protection will be accepted on the basis of a material certification that the product conforms to this specification.

Comment [c134]:
E110004

710-30 RIGHT-OF-WAY FENCING

§710

SCOPE. These specifications cover the material requirements required for the construction of right-of-way fences comprised of (a) galvanized steel or aluminum coated steel fence fabric, and (b) posts, braces and hardware designed to support and retain the fencing.

MATERIAL REQUIREMENTS

Fence Fabric. Right-of-way fencing fabric shall conform to the requirements of ASTM A116 "Zinc Coated (Galvanized) Steel Woven Wire Fence Fabric". The fabric shall be woven in accordance with Design Number 1047-6-9 or 1047-6-11 as shown in Table 1 of both ASTM A116. The weight of the coating on the Zinc-Coated (Galvanized) Fence Fabric shall conform to the coating weight requirements of Class 3 shown in Table 2 of ASTM A116.

Fence Posts and Braces. Posts and brace sizes shall be as indicated on the Standard Sheets. Steel line posts shall conform to the requirements of ASTM A702. Steel end, corner or intermediate post and braces shall conform to the requirements of Section 6.5 through Section 6.5.4 of ASTM A702; or the requirements for Class A, Schedule 40 Pipe or Class B, Steel Tubing of §710-10.03 of the Standard Specifications. Posts and braces conforming to the requirements of ASTM A702 shall be galvanized in accordance with the requirements of §719-01 Type I. Type A Schedule 40 Pipe and Type B Steel Tubing shall use one of the protective coating system specified in 7A of §710-10.03.

Wood posts and braces shall be seasoned southern yellow pine, red (Norway) pine, spruce, douglas fir, hemlock, larch, or redwood. All wood posts and braces shall be pressure treated with a water-borne wood preservative conforming to the requirements of §708-31. The wood posts shall be subject to inspection before and during treatment at the option of the Department. They shall be sound, free from loose knots or decay, and with no through checks on tops or butts. Posts shall be machine peeled to a smooth uniform appearance and free from all inner bark. The preservative pressure treatment shall be by the empty cell process in accordance with C5 of the American Wood-Preservers' Association Standards.

Fittings. Fittings shall be manufactured of weldable steel, malleable iron, cast steel, cast iron, or aluminum alloy. Fittings other than aluminum shall be galvanized in accordance with the requirements of §719-01 Type II.

Fasteners. Bolts, nuts, and washers shall conform to the following, unless specified otherwise in the contract documents:

Bolts	ASTM A307
Nuts	ASTM A563 Grade A or better
Washers	ASTM F844

The fasteners shall be galvanized in accordance with the requirements of §719-01 Type II.

Gates. Gates shall be constructed of Class A Schedule 40 Pipe conforming to §710-10 welded at all corners or assembled with corner fittings. The size of the pipe used to fabricate the gate shall be as shown on the Standard Sheets. When corner fittings are used the gates shall have truss rods of minimum 3/8 inch diameter to prevent sag or twist. Gate leaves shall have vertical intermediate bracing so that no vertical members are more than 8 feet apart. Gate leaves over 10 feet shall have a truss rod of 3/8 inch minimum diameter even if the corners are welded. The fence fabric used on the gate shall conform to the fence fabric in the remainder of the fence.

A. Hinges. Hinges shall be weldable steel, cast steel, or malleable iron 180° offset industrial type. The hinges shall not twist or turn under the action of the gate. The gate shall be able to be opened by one person. The hinges shall be galvanized in accordance with the requirements of §719-01 Type I.

B. Latches. Latches, stops, and keepers shall be provided for all gates.

Latches for single leaf gates may be a forked latch type. Double leaf gates shall have a plunger bar type latch arranged to engage a stop. Latches shall be capable of being locked and the Contractor shall provide a lock with triplicate keys for each gate. Keepers shall consist of a mechanical device for securing the free end of a gate when in the full open position.

C. Gate Posts. Gate posts shall conform to the dimensions shown on the Standard Sheets.

Steel gate posts shall be fabricated from either Class A Schedule 40 Pipe or Class B Steel Tubing conforming to the requirements of §710-10.

Wood gate posts shall be made from wood conforming to the requirements for wood posts and braces as specified in "Fence Posts and Braces".

BASIS OF ACCEPTANCE. Right-of-way fencing will be accepted on the basis of a material certification that specifies the product conforms to this specification. *Buy America requirements apply.*

SECTION 711 - CONCRETE CURING MATERIALS AND ADMIXTURES

711-01 FIBERS FOR CONCRETE REINFORCEMENT

SCOPE. This specification covers the material requirements for fibers for concrete reinforcement.

MATERIAL REQUIREMENTS. Synthetic, fibrillated fibers, specifically engineered and manufactured for use as secondary concrete reinforcement meeting ASTM C1116 Type III.

BASIS OF ACCEPTANCE. Acceptance will be based on the product name and manufacturer appearing on the Department's Approved List and material certification that states the product conforms to this specification.

711-02 QUILTED COVERS (FOR CURING)

SCOPE. These specifications cover cotton mats to be used for curing Portland Cement concrete pavements and bases, and concrete structures.

GENERAL. The mats shall consist of a filling material of cotton "bat" or "bats" covered with unsized cloth, and tufted or stitched to maintain the shape and stability of the unit under job conditions of handling.

MATERIALS REQUIREMENTS

Cotton. Cotton cloth covering shall weigh not less than 6.3 ounces per square yard and shall have an average of not less than 32 threads in warp and not less than 28 threads in filling, having a minimum average breaking strength (grab method) of 60 pounds in the warp and of 60 pounds in the filling. The weight of the cotton cloth covering shall not fall below the specified weight by more than 5 percent. The raw materials used in the manufacture of the cotton cloth shall be raw cotton, cotton comber waste, cotton card strip waste, or combination thereof. The other physical characteristics of the cloth shall be equal to those in such material for industrial purposes.

Burlap or Jute. Burlap or jute covering for cotton mats shall weigh not less than 6.7 ounces per square yard and shall have not less than 8 threads per 1 inch of warp and not less than 8 threads per 1 inch of filling. It shall be the grade known commercially as "firsts" and shall be free from avoidable imperfections in manufacture and from defects or blemishes affecting the serviceability. A tolerance in weight of minus 5 percent will be permitted.

Filling Material. The filling material for the mats shall be cotton bat, or bats, made of raw cotton, cotton waste, cotton linters, or combinations thereof, and shall weigh not less than 12 ounces per square

§711

yard. The batting used shall not be lower in quality than a batting made of U. S. Standard Grade No. 3 Linters.

Thread

A. Tufting. The cotton thread for tufting shall be not less than 4-cord number 12's.

B. Sewing or Stitching. The thread used for all sewing or stitching shall be at least equivalent in size and strength to standard 3-cord number 30 cotton thread.

DIMENSIONS

A. Mats. Mats shall have a filler of 5 feet 9 inches in width and shall have a flap 6 inches or more in width, consisting of an extension of two thicknesses of the covering material, extending along one longitudinal edge of the mat. The length of the mats shall be 2 feet 6 inches greater than the width of pavement slab to be cured.

B. Tolerance. The length or width of the mats shall not be less than that specified by more than 2 percent.

FABRICATION

A. Covering Material. The covering material for each surface of the mat shall consist of two widths of cloth joined by a lapped seam or by a seam formed by superimposing the two widths and uniting them by one row of stitches. If the seam of the latter type, the edges shall be on the inside of the finished mat.

B. Filling. The cotton filling materials in the form of a bat or bats shall be held in place between the coverings by sewing or tufting all around the periphery of the mat within 1 inch of each of the four edges of the filler, and by sewing or quilting longitudinally at intervals not greater than 4 inches, or by tufting at intervals both longitudinally and transversely, not greater than 3 inches. The sewing or tufting shall be sufficiently loose to permit substantially all of the surface of the mat to come in contact with a flat surface when in use, but not so loose as to permit the filling material to shift.

C. Flap and Ends. The flap shall be constructed by sewing the upper and lower covering together longitudinally within 1 inch of the outer edges of the flap. Along the edge of the mat opposite the flap, the filling materials shall be within 1 inch of the edges of the covering material, and the covering material shall be sewn together so as to enclose the filling material. The ends of the mats shall be finished by running an additional seam (i.e., a seam in addition to the seam holding the filling material in place) across the mats. This seam shall not be closer to the seam holding the filling material in place than 1/4 inch and not closer to the end of either covering than 1/2 inch, unless the ends of the mat are finished with an overlying or whip stitch, or in a manner which will not leave a raw edge.

D. Stitching. All longitudinal sewing or quilting shall average at least three stitches per 1 inch and shall have not less than five stitches in any 2 inches. All other sewing shall average six stitches per 1 inch and shall have not less than nine stitches in any 2 inches.

BASIS OF ACCEPTANCE. Quilted covers (for curing) will be accepted on the basis of a material certification that specifies the product conforms to this specification.

711-03 PLASTIC COATED FIBER BLANKETS (FOR CURING)

SCOPE. These specifications cover white plastic coated fiber blankets or white plastic coated absorbent synthetic fabric blankets.

MATERIAL REQUIREMENTS. The blankets shall conform to the test requirements of A.S.T.M. C171, for White burlap - polyethylene sheets, for Moisture Loss and Reflectance.

BASIS OF ACCEPTANCE. Application for approval of plastic fiber blankets shall be submitted to the Director, Materials Bureau. Upon approval, the name and manufacturer of the product will be placed on the Department's Approved List. Each roll of the blankets shall be marked with an indelible marking, every 10 feet, with the following.

- Manufacturer's name and/or logo
- Product name
- Meet ASTM C171, White Burlap - Polyethylene Sheets, for Moisture Loss and Reflectance

The product shall be accepted at the work site on the basis of the appearance of the name and manufacturer of the product on the Approved List and marking as required herein.

711-04 POLYETHYLENE CURING COVER (WHITE OPAQUE)

SCOPE. This specification covers the material requirements for polyethylene curing covers (white opaque) to be used for curing of Portland Cement concrete.

MATERIAL REQUIREMENTS. The blankets shall conform to the material requirements of AASHTO M171 (ASTM C171) for Polyethylene Film: White Opaque. Rolls shall be wound on serviceable handling members which extend beyond the edges of the roll, forming handles to facilitate applying the covers over concrete.

BASIS OF ACCEPTANCE. Each shipment shall be accompanied by the manufacturer's certificate attesting to the fact that the shipment meets the specified standards. Upon request, the manufacturer shall supply a record of the results of the prescribed tests as made on the samples.

711-05 MEMBRANE CURING COMPOUND

SCOPE. This specification covers white-pigmented and clear membrane curing compound material and quality requirements for spray application on surfaces of newly placed Portland Cement concrete.

GENERAL. Samples of membrane curing compound shall be submitted to the Materials Bureau by the manufacturer upon application for approval. Approved material shall be delivered to the work site in clean containers. The curing compound shall be agitated mechanically to a uniform consistency throughout the container immediately before use.

MATERIAL REQUIREMENTS

A. White Pigmented. The compound shall consist of finely ground white pigment and wax-free vehicle, ready mixed for immediate use without alteration. When applied to freshly placed damp concrete at the rate of one gallon per 150 square feet, the compound shall adhere and present a uniform white appearance and effectively obscure the original color of the concrete. The compound applied at the specified rate shall provide a curing compound displaying the following properties:

1. Drying. The compound shall produce a uniform coating at a minimum temperature of 40°F and shall dry track-free within 4 hours.

2. Permeability. The moisture loss through the membrane shall be no more than 0.04 grams per square centimeter of surface area after three days.

3. Reflectivity. The membrane shall have a reflectance value of 60 percent, minimum based on Magnesium Oxide as a standard.

4. Durability. The membrane shall remain intact for at least seven days before becoming powdery and non-adherent due to weathering.

B. Clear. The compound shall consist of a wax-free vehicle, ready mixed for immediate use without alteration containing a fugitive dye that will fade uniformly. When applied to freshly placed, damp concrete, at the rate of 1 gallon per 150 square feet, it shall provide a curing membrane displaying the following properties :

1. Drying. The compound shall produce a uniform coating at a minimum temperature of 40°F and shall dry tack-free within 4 hours.

2. Permeability. The moisture loss through the membrane shall be no more than 0.04 grams per square centimeter of surface after three days.

3. Durability. The membrane shall remain intact for at least 7 days.

4. Fugitive Dye. The membrane-forming compounds with fugitive dye shall be readily distinguishable upon the concrete surface for at least 4 hours after application, but shall become inconspicuous within 7 days after application.

TESTS. The properties of a membrane curing compound shall be tested on laboratory specimens. Details of the tests may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. The approval of the membrane curing compound shall be based upon tests performed by the Materials Bureau. Upon approval by the Materials Bureau, the name of the product will be placed on an Approved List. Such products shall then be accepted on the basis of the brand name labeled on the container.

711-06 BURLAP

SCOPE. This specification covers requirements for burlap for use in curing concrete.

MATERIAL REQUIREMENTS. Burlap shall conform to the requirements of AASHTO M182. The burlap shall be made from jute or kenaf and shall weigh 10 to 12 ounces per linear yard on a 40 inch basis. Burlap shall be cleaned and free from cuts, tears, uneven weaving and contaminants.

BASIS OF ACCEPTANCE. The burlap will be accepted on the basis of a visual inspection by the Engineer and weighing of a sample at the point of use.

711-07 FORM INSULATING MATERIALS FOR WINTER CONCRETING

SCOPE. This specification covers the material details, quality requirements, and method of application for approval of form insulating materials used for winter concreting operations.

MATERIAL REQUIREMENTS. Each insulating material will be judged on its ease and practicability of installation, durability and imperviousness to moisture penetration and absorption. The minimum thickness for any foam board and blanket insulation considered shall be 1 inch. The thermal conductivity (k) of any proposed insulating material shall not exceed 0.32 BTU per square foot per °F per inch of thickness.

Application of approval of an insulating material shall be made to the Materials Bureau. Certified laboratory test results for thermal conductivity (k) and thermal resistance (R), °F per BTU per hour per square foot, measured at the nominal product thickness shall be required for evaluation. A 3 foot square

(minimum) sample shall accompany each request for approval. The sample shall exhibit all major features of the insulating product such as covers, seams, fasteners, grommets, etc. All necessary and normal product information shall accompany the sample. If there is a specific process required to apply the insulating material, complete details of the process shall accompany the sample.

If sprayed foam is the material in question, the Contractor shall also be required to send the applicator's name plus a list of jobs done by the applicator during the last 12 months. If investigation of these jobs demonstrates quality workmanship, the applicator shall be issued a temporary approval good for one contract. Based upon its subsequent performance, a decision will be made as to whether or not to place the applicator's name on the Approved List.

BASIS OF ACCEPTANCE. Insulating materials for winter concreting shall be accepted on the basis of Approved List issued by the Materials Bureau.

711-08 ADMIXTURES

SCOPE. These specifications cover the material requirements for air-entraining, water-reducing and retarding, water-reducing (normal range and high range), and non-chloride accelerating admixtures used in the manufacture of Portland Cement concrete. ~~SCOPE. These specifications cover the material requirements for air-entraining, water-reducing and retarding and water-reducing admixtures used in the manufacture of Portland Cement concrete. The specification also covers the requirements for water-reducing (high-range) admixtures.~~

Comment [c135]:
EI09003

GENERAL. All admixtures shall be in liquid form having a consistency that flows readily. The admixtures shall not contain chemicals which, when mixed with concrete, produce a condition that is injurious to the quality and durability of the concrete or reinforcing steel. This applies specifically to compounds which, when used in manufacturing process, produce a significant amount of chloride ions in the final product. (Total chloride ion content shall be less than 1000 ppm.) Admixtures manufactured from carbohydrates such as sucrose (table sugar), glucose, and maltose when used alone will not be permitted.

MATERIAL REQUIREMENTS

Air-Entraining. The air-entraining agent shall entrain air in the concrete and the concrete containing an air-entraining agent shall conform to the following requirements:

A. Bleeding. The bleeding of the concrete made with the admixture under test shall not exceed that of concrete made with the reference admixture by more than 2 percentage points, the bleeding being computed as a percentage of the net amount of mixing water in each concrete. The net mixing water is the water in excess of that present as absorbed water in the aggregate.

B. Time of Setting. The initial time of setting of concrete containing the admixture under test shall not deviate from that of the concrete made with the reference admixture by more than ± 1 hour and 15 minutes.

C. Compressive Strength. The compressive strength of concrete containing the admixture under test shall be not less than 90 percent of the control concrete, at the same air content, containing the reference admixture at 48 hours, 7 days and 28 days.

D. Resistance to Freezing and Thawing. The hardened concrete containing the admixture under test shall not exceed a weight loss of 4.0 percent in 25 cycles in a 10% NaCl solution.

E. Length Change. Length changes shall be based on initial measurements taken at the time of removal of the specimens from the molds and final measurements taken at the end of 14 days of air drying. The specimens shall be moist-cured for 14 days followed by 14 days of air drying. Length change shall not be greater than $\pm 20\%$ of similar concrete containing the reference admixture.

Non-Chloride Accelerating Admixtures. Non-chloride accelerating admixtures shall conform to the requirements outlined in ASTM C494 for Type C or Type E admixtures.

Comment [c136]:
E109003

Water-Reducing and Retarding Admixtures (ASTM TYPE D). The water-reducing and retarding admixtures shall reduce the quantity of mixing water required to produce concrete of a given consistency, and retard the setting of concrete. Concrete containing this admixture shall conform to the following requirements:

A. Water Reduction. The mixing water required for concrete containing the admixture under test shall be reduced at least 5.0 percent when compared to that of the reference concrete without the admixture under test.

B. Time of Setting. The initial set time of the concrete containing the admixture under test shall be increased by at least 50 percent when compared to that of the reference concrete without the admixture under test.

C. Compressive Strength. The compressive strength of the concrete containing the admixture under test, when compared to concrete without the admixture under test, shall be equal or greater at 48 hours, 7 days and 28 days.

D. Resistance to Freezing and Thawing. The hardened concrete containing the admixture under test shall not exceed a weight loss of 4.0 percent, in 25 cycles in a 10% NaCl solution.

E. Length Change. Length changes shall be based on initial measurements taken at the time of removal of the specimens from the molds and final measurements taken at the end of 14 days of air drying. The specimens shall be moist-cured for 14 days followed by 14 days of air drying. Length change shall not be greater than ± 35% of similar concrete containing the reference admixture.

Water-Reducing Admixtures (ASTM TYPE A). The water-reducing admixtures shall reduce the quantity of mixing water required to produce concrete of a given consistency. Concrete containing this admixture shall meet the requirements of the water reducing and retarding admixtures above except that the time of setting of the concrete containing the admixture under test shall not deviate from that of similar concrete without the admixture under test used as a reference by more than ±1 hour and 15 minutes.

Water-Reducing (High Range) Admixtures (ASTM TYPE F). The water-reducing (High Range) admixture shall reduce the quantity of mixing water required to produce concrete of a given consistency. Concrete containing this admixture shall conform to the following requirements:

A. Water Reduction. The mixing water required for concrete containing the admixture under test shall be reduced at least 12.0 percent when compared to that of the reference concrete without the admixture under test.

B. Time of Setting. The initial set time of the concrete containing the admixture under test when compared to that of the reference concrete shall not be more than 1 hour earlier nor 1 hour, 30 minutes later.

C. Compressive Strength. The compressive strength of the concrete containing the admixture under test when compared to concrete without the admixture under test shall be as follows:
Compressive Strength, minimum percent of control:

1 day	140%	7 days	115%
3 days	125%	28 days	110%

The compressive strength of the concrete containing the admixture under test at any test age shall be not less than 100% of that attained at any previous age.

D. Resistance to Freezing and Thawing. The hardened concrete containing the admixture under test shall not exceed a weight loss of 4.0 percent in 25 cycles in a 10% NaCl solution.

E. Length Change. Length changes shall be based on initial measurements taken at the time of removal of the specimens from the molds and final measurements taken at the end of 14 days of air drying. The specimens shall be moist-cured for 14 days followed by 14 days of air drying. Length change shall not be greater than ± 35% of similar concrete containing the reference admixture.

SAMPLING AND TESTING. A one quart sample of admixture shall be submitted to the Materials Bureau by the manufacturer applying for approval, except that for Water-reducing (High Range) admixtures, two quarts will be required. The manufacturer shall submit information on the formulation of the product including the raw materials from which it is compounded, data from tests performed in accordance with these specifications and a description of the manufacturing process. Data from tests performed in accordance with ASTM C260 for air-entraining agents and ASTM C494 for water-reducing and retarding, water-reducing (normal range and high range), and non-chloride accelerating admixtures may be substituted.

The Department will test the submitted admixture sample according to written Department instructions. The test procedures are available from the Materials Bureau upon request.

The Department reserves the right to monitor the performance of any previously approved admixture. Samples of admixture may be taken from actual concrete operations and retested by the Materials Bureau.

~~SAMPLING AND TESTING. A 1 quart sample of admixture shall be submitted to the Materials Bureau by the manufacturer applying for approval except that for Water-Reducing (High Range) Admixtures 2 quarts will be required. Along with the sample the manufacturer shall include data from test performed in accordance with these specifications. Data from tests performed in accordance with ASTM C260 for air-entraining agents and ASTM C494 for water-reducing and retarding admixtures and water-reducing admixtures may be substituted.~~

~~— In addition to the sample and test data, information on the formulation of the product, including the raw materials from which it is compounded and a description of the manufacturing process, shall be submitted.~~

~~— The Department will test the submitted admixture sample according to written Department instructions. The test procedures are available from the Materials Bureau upon request.~~

~~— The Department reserves the right to monitor the performance of any previously approved admixture. Samples of admixture may be taken from actual concrete operations and retested by the Materials Bureau.~~

Comment [c137]:
EI09003

BASIS OF APPROVAL. The approval of the admixture shall be based upon the submitted information and tests performed by the Materials Bureau. Upon approval by the Materials Bureau, the name of the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Admixtures will be accepted on the basis of the brand name appearing on the Approved List and the product containers plainly labeled with the brand name.

Any admixtures sampled from actual concrete operations and retested in the Materials Bureau shall give substantially the same results, at the same dosage rate, as the original tests. Any significant change will be cause for rejection of that material and may require a resubmission of the admixture by the manufacturer for a complete retest to determine specification compliance. The admixture may be withdrawn from the Approved List during the retest period.

~~**BASIS OF ACCEPTANCE.** The approval of the admixture shall be based upon the submitted information and tests performed by the Materials Bureau. Upon approval by the Materials Bureau, the name of the product will be placed on the Approved List. Such products shall then be accepted on the basis of the brand name labeled plainly on the containers.~~

Comment [c138]:

The admixture may be withdrawn from the Approved List during the retest period.~~

711-09 EMULSIFIED CARBON BLACK

SCOPE. This specification covers the material requirements for Emulsified Carbon Black, which is used as a coloring agent in mortar or concrete.

GENERAL. The method of test shall conform to the requirements of AASHTO T 106, the standard method of test for compressive strength of hydraulic cement mortars.

MATERIAL REQUIREMENTS. Emulsified Carbon Black shall be a uniform colloidal dispersion of standard carbon black in a liquid medium. The air content of the concrete shall not be changed by more than 10% by addition of 2%, by weight of cement, of the dispersed carbon black. The ash content shall not exceed 3% by weight of the finished product. At least 25% of the commercial product shall be carbon black.

The Emulsified Carbon Black shall be stable and shall have the same effect on the air entrainment, after standing for a period of 28 days, as specified above.

The color produced on the broken surface after the seven day test shall be equal to that produced by a previously established standard of color.

The Emulsified Carbon Black shall show uniform dispersion in mortars or concrete when used in concentrations necessary to produce the desired pigmentation.

TEST. Test specimens shall be prepared as follows: Portland Cement Type 2 containing 2% by weight of Emulsified Carbon Black shall be used with standard Ottawa Sand to prepare 1:2.75 compressive cubes. The compressive strength of these cubes at the age of seven days and thereafter shall be not less than 85% of the strength of similar cubes with no pigment added.

BASIS OF ACCEPTANCE. This material will be considered for acceptance in stock lot quantities at manufacture of supply locations in accordance with procedural directives of the Materials Bureau.

711-10 FLY ASH

SCOPE. This specification covers the material requirements for fly ash when used as a partial replacement for Portland Cement in Portland Cement concrete.

MATERIAL REQUIREMENTS. Fly ash shall conform to the chemical and physical requirements for Mineral Admixture, Class F listed in AASHTO M 295 including Table 2 (except for Footnote A). Loss of Ignition shall not exceed 4.0%.

A. Storage. The fly ash shall be stored at its source of supply in weather-tight silos approved by the Director, Materials Bureau. All silos shall be completely empty and clean before fly ash is deposited therein unless the silo contains fly ash of the same type.

Fly ash remaining in bulk storage at the source of distribution terminal for a period greater than one year after completion of tests will be resampled and retested by the Materials Bureau before shipment or use. However, fly ash which has been in bulk storage at sources or distribution terminals more than two years from the time of original manufacture shall not be used.

B. Shipment. All shipments of fly ash shall be made in accordance with procedural directives issued by the Materials Bureau. Conveyances for bulk fly ash shipment shall be of a type approved by the Director, Materials Bureau. The compartments of all such conveyances shall be completely empty and clean before any fly ash is deposited therein.

C. Inspection and Testing. Inspection and testing shall be in accordance with procedural directives by the Materials Bureau. Tests for chemical and physical properties shall be in accordance with test methods stipulated by AASHTO M 295 as modified in test methods prescribed by the Materials Bureau.

Special Note. The Department will consider requests to evaluate alternate classes of fly ash, such as Class C or N. The Department's evaluation may include laboratory testing, field trials and other related work required to determine equivalency with specified materials, mix designs, and performance. Use of alternates is subject to approval by the Director, Materials Bureau.

BASIS OF ACCEPTANCE. Fly ash will be considered for acceptance at the source or terminal locations in accordance with procedural directives issued by the Materials Bureau.

711-11 MICROSILICA

~~**SCOPE.** This specification covers the material requirements for microsilica admixture for use in portland cement concrete and other mixes.~~

~~**GENERAL.** Supply microsilica admixture as a dry powder. When necessary for testing purposes, microsilica slurries will be dried to obtain a representative sample of dry powder.~~

~~**MATERIAL REQUIREMENTS.** The microsilica powder shall conform to the requirements of AASHTO M 307* (including optional chemical and optional physical requirements) and the following:~~

~~**Uniformity of Silicon Dioxide Content.** Maximum $\pm 7.0\%$ from the acceptance value.~~

~~**Chloride Content.** Maximum 0.20% as determined by AASHTO T 260, Procedure B.~~

~~**Fineness.** Maximum 5.0% retained on a No. 325 sieve (wet method).~~

~~* For Materials other than Silica fume as defined by AASHTO M307, the requirement for SiO_2 may be reduced if the combined quantity of reactive $\text{SiO}_2 + \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$ is at least 85%, and all other chemical and physical requirements are met as determined by the Materials Bureau.~~

~~**SAMPLING AND TESTING.** Submit two—1 quart samples of microsilica to the Materials Bureau for approval, with the following:~~

~~**Supplier and Manufacturer's Names and Addresses.** If the material will be manufactured at several locations, identify each location and submit a separate sample representing each location.~~

~~**Product Label, Product Information Sheets and Material Safety Data Sheets.** Include the date of manufacture and shelf life of the supplied sample.~~

~~**Test Results.** Submit laboratory test results indicating the product meets all specification requirements. The testing laboratory must be acceptable to the Director, Materials Bureau. The Department will test the submitted microsilica sample in accordance with the specification and Department instructions. Test procedures are available from the Materials Bureau upon request. Upon approval by the Materials Bureau, the name of the product will be placed on the Approved List. The Department reserves the right to monitor the performance of any approved microsilica. Samples of microsilica may be taken from actual concrete operations and tested by the Materials Bureau. If these test results indicate that the sampled microsilica does not meet this specification, concrete incorporating the microsilica represented by the sample may be rejected.~~

~~**BASIS OF ACCEPTANCE.** Each shipment of microsilica will be considered for acceptance where it will be incorporated into the concrete. Acceptance will be based on the product name appearing on the Approved List and Manufacturer's certification of conformance to this specification.~~

711-11 MICROSILICA

SCOPE. This specification covers the material requirements for Microsilica (Silica Fume) for use in enhancing the performance properties of Portland Cement Concrete, shotcrete and other mixtures.

GENERAL. Supply Microsilica admixture in bulk form as a dry powder. When necessary for testing purposes, or in special placement situations, the admixture may be supplied in bags or barrels.

MATERIAL REQUIREMENTS. For approved list consideration, submit supporting documentation showing conformance with the standard and optional physical and chemical requirements of AASHTO M 307 *SILICA FUME*, and the following:

Uniformity of Silicon Dioxide Content: Maximum $\pm 7.0\%$ variation between any two samples.

Chloride Content: 0.20% maximum (as determined by AASHTO T 260, Procedure B).

Fineness: *Undensified powder:* 10% maximum percent retained on the No. 325 sieve (AASHTO T 192).

MONITOR SAMPLING. For monitor sampling of previously approved materials, follow the procedures directed in Materials Procedure 90-1 or Materials Method 10. The Department will monitor the product for conformity with the standard physical and chemical requirements of AASHTO M 307 at its discretion.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall submit one 5 gallon sample of the admixture for each manufacturing or supply location to the Materials Bureau.

Provide a Quality Control report for each manufacturing or supply location. The report will be required prior to Departments evaluation of the product, and annually thereafter. Details of the Quality Control report are available from the Materials Bureau. If the material will be manufactured or supplied from multiple locations, identify each location separately. Submit a separate sample and Quality Control Report for each manufacturing or supply location.

Submit laboratory test results from a testing laboratory that is accepted by the Cement and Concrete Reference Laboratory (CCRL) indicating conformance to this specification. For each sample submitted for approved list evaluation, provide a certification declaring conformance to this, and the applicable AASHTO specification, the production lot number, the date of manufacture, and the date tested. Clearly state the chemical and physical properties as required by AASHTO M 307, and the pH of the material. Provide supporting data, relative to these specifications, detailing the performance of the product when used in concrete mixtures. Provide a manufacturer's label clearly stating the product and manufacturer's name and a Material Safety Data Sheet for each product submitted for approved list evaluation.

The Department will test the submitted sample in accordance with these specifications and Department instructions. The review process requires a minimum of 30 calendar days. Test procedures are available from the Materials Bureau upon request. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Each shipment will be considered for acceptance where it will be incorporated into the concrete. Acceptance will be based on the product name appearing on the Approved List, and a material certification indicating conformance to this specification. The Department reserves the right to monitor the performance of any previously approved Microsilica from concrete production. If the monitor test results indicate that the sampled product does not meet this specification, the concrete incorporating the product represented by the sample may be rejected.

711-12 GROUND GRANULATED BLAST- FURNACE SLAG

SCOPE. This specification covers the material requirements for ground granulated blast-furnace slag when used as a partial replacement for portland cement in portland cement concrete.

MATERIAL REQUIREMENTS. Ground granulated blast-furnace slag (GGBFS) shall conform to the chemical and physical requirements for Grade 100 slag as described in AASHTO M 302.

Storage. The ground granulated blast-furnace slag shall be stored at its source of supply in approved weather-tight silos. Facilities shall be provided for maintaining such silos under Department seal control when and as directed by the Materials Bureau. All silos shall be completely empty and clean before GGBFS is deposited therein unless the silo contains Department specification GGBFS of the same type.

GGBFS remaining in bulk storage at the mill and/or distribution terminal for a period greater than one year after completion of tests shall be resampled and retested before shipment. However, GGBFS which has been in bulk storage at mills and/or distribution terminals more than two years from the time of original manufacture shall not be used. No GGBFS stored by the Contractor over the winter shall be used until retested by the Materials Bureau.

SHIPPING. All shipments of ground granulated blast-furnace slag shall be made in accordance with procedural directives issued by the Materials Bureau. Conveyances for bulk shipment shall be of a type approved by the Department. The compartments of all such conveyances shall be completely empty and clean before any GGBFS is loaded therein.

INSPECTION AND TESTING. All inspection and testing shall be in accordance with procedural directives issued by the Materials Bureau. When required by the Materials Bureau, GGBFS shall be sampled by means of an automatic sampling device constructed so as to obtain continuous samples across the full stream of GGBFS and deliver such samples into a sealed container approved by the Materials Bureau.

Tests for chemical and physical properties shall be in accordance with test methods stipulated by AASHTO M 302.

BASIS OF ACCEPTANCE. Ground granulated blast-furnace slag will be considered for acceptance at mill or terminal locations in accordance with procedural directives issued by the Materials Bureau.

711-13 CALCIUM NITRITE BASED CORROSION INHIBITORS

SCOPE. This specification covers the material requirements for corrosion inhibitors used in the manufacture of Portland Cement Concrete.

GENERAL. The corrosion inhibitor shall consist of a calcium nitrite solution. The admixture shall not contain chemicals which, when mixed with concrete, produce a condition that is injurious to the quality and durability of the concrete or reinforcing steel.

MATERIALS REQUIREMENTS. The corrosion inhibitor shall consist of a calcium nitrite solution, containing 30 +/-2% calcium nitrite solids by weight and having a specific gravity of 1.27 +/-0.02. The corrosion inhibitor when used in the manufacturing process shall not produce a significant amount of chloride ions in the final product (Less than 1000 ppm, as determined by the Department). The pH shall be greater than 8.

SAMPLING AND TESTING. A two quart sample of admixture shall be submitted to the Materials Bureau by the manufacturer applying for approval. Along with the sample, the Manufacturer shall provide information to include the manufacturer's name and address, a copy of the product literature, material safety data sheets, and written certification stating that the material meets the physical and chemical requirements of this specification (711-13, Calcium Nitrite Based Corrosion Inhibitors).

The Department will test the sample for specific gravity and percent calcium nitrite in accordance with written Department instructions. The Sampling and testing procedure is available from the Materials Bureau upon request. Upon testing by the Materials Bureau, if the sample submitted is within tolerance, it will be placed on the Department's Approved List of Materials for corrosion inhibitors. In order to ensure their quality, regular monitor sampling and testing will be performed at the point of use. The concrete batching facility is typically the point of use.

BASIS OF ACCEPTANCE. The initial approval of the admixture shall be based upon the submitted information and tests performed by the Materials Bureau. Upon approval by the Materials Bureau, the name of the product will be placed on the Approved List. Such products shall then be accepted on the basis of the brand name labeled plainly on the containers.

711-14 HIGH REACTIVITY POZZOLAN

SCOPE. This specification covers the material requirements for High Reactivity Pozzolan for use in enhancing the performance properties of Portland Cement Concrete, shotcrete and other mixtures.

GENERAL. Supply the High Reactivity Pozzolan admixture in bulk form as a dry powder. When necessary for testing purposes, or in special placement situations, the admixture may be supplied in bags or barrels.

MATERIAL REQUIREMENTS. For approved list consideration, submit supporting documentation showing conformance with the standard and optional physical and chemical requirements of AASHTO M 321 *HIGH REACTIVITY POZZOLANS FOR USE IN HYDRAULIC CEMENT CONCRETE, MORTAR, AND GROUT*, and the following:

Uniformity of Reactive Oxides: Maximum $\pm 7.0\%$ variation between any two samples.

Chloride Content: 0.20% maximum (as determined by AASHTO T 260, Procedure B).

Fineness: 10% maximum percent retained on the No. 325 sieve (AASHTO T 192).

MONITOR SAMPLING. For monitor sampling of previously approved materials, follow the procedures directed in Materials Procedure 90-1 or Materials Method 10. The Department will monitor the product for conformity with the physical and chemical requirements of AASHTO M 321 at its discretion.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall submit one 5 gallon sample of the admixture for each manufacturing or supply location to the Materials Bureau.

Provide a Quality Control report for each manufacturing or supply location. The report will be required prior to Departments evaluation of the product, and annually thereafter. Details of the Quality Control plan are available by contacting the Materials Bureau. If the material will be manufactured or supplied from multiple locations, identify each location separately. Submit a separate sample and Quality Control Report for each location.

Submit laboratory test results from a testing laboratory that is accepted by the Cement and Concrete Reference Laboratory (CCRL) indicating conformance to this specification. For each sample submitted for approved list evaluation, provide a certification declaring conformance to this, and the applicable AASHTO specification, the production lot number, the date of manufacture, and the date tested. Clearly state the chemical and physical properties as required by AASHTO M 321, and the pH of the material. Provide supporting data, relative to these specifications, detailing the performance of the product when used in concrete mixtures. Provide a manufacturer's label clearly stating the product and manufacturer's name and a Material Safety Data Sheet for each product submitted for approved list evaluation.

The Department will test the submitted sample in accordance with these specifications and Department instructions. The review process requires a minimum of 30 calendar days. Test procedures are available from the Materials Bureau upon request. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Each shipment will be considered for acceptance where it will be incorporated into the concrete. Acceptance will be based on the product name appearing on the Approved List, and a material certification indicating conformance to this specification. The Department reserves the right to monitor the performance of any previously approved High Reactivity Pozzolan from actual concrete production. If the monitor test results indicate that the sampled product does not meet this specification, the concrete incorporating the product represented by the sample may be rejected.

Comment [cjt140]:

SECTION 712 - MISCELLANEOUS

712-01 WATER

SCOPE. This specification contains the requirements for water used in Portland Cement concrete, mortar, concrete curing, treated subgrade, soil cement and for application to plants, seeded or sodded areas and planted areas.

MATERIAL REQUIREMENTS. Water used for mixing and curing Portland Cement concrete, mortar, treated subgrade and soil cement shall meet the requirements indicated in Table 712-1, Water. NYSDOT Test Method No. 712-01P shall apply to all Physical tests.

Water for curing concrete shall not contain any impurities in sufficient amount to cause discoloration or surface deterioration.

Water applied to seeded or sodded areas, plants or planted areas shall be free from oil, have a pH not less than 6.0 nor greater than 8.0 and shall be free from impurities injurious to vegetation.

BASIS OF ACCEPTANCE. Municipal water supplies are considered acceptable sources. Acceptance of questionable sources of water, as determined by the Regional Director or his/her representative, shall be determined by the Materials Bureau on samples taken by Department representatives.

TABLE 712-1 WATER	
Air Content of Mortar, percent by volume	12.0 Max.
Soundness, Autoclave Expansion, percent	0.50 Max.
Compressive Strength, 7 day, 28 day (optional) percent of compressive strength of mortar cubes made with standard water	90 Min.
Time of Setting, Vicat Test, Initial Set, minutes	45 Min.
Final Set, hours	8 Max.
Presence of Oil	None
pH, AASHTO T26	5.0 - 8.5
Organic Solids, AASHTO T26, ppm	200 Max.
Total Inorganic Solids, AASHTO T26, ppm	2000 Max.
Chloride Ion Content, ppm	500 Max.
Sulphate Ion Content, ppm	1000 Max.

712-02 CALCIUM CHLORIDE

SCOPE. This specification covers the material requirements for calcium chloride for use in dust control, stabilization, ice control and for other highway construction related purposes.

Calcium chloride material shall be either Type A - Solid Flake Calcium Chloride or Type B - Liquid Calcium Chloride Solution.

MATERIAL REQUIREMENTS

Type A - Solid Flake Calcium Chloride. Solid Flake Calcium Chloride shall meet the requirements of ASTM D98 and upon analysis shall show not less than 77.0% CaCl₂. The calcium chloride shall be supplied in the form of dry, loose flakes, pellets or granules and shall be fine enough to feed through the common types of spreaders used in roadwork. The Engineer reserves the right to reject any material that has become caked or otherwise damaged.

Type B - Liquid Calcium Chloride Solution. Liquid Calcium Chloride shall be supplied as a mixed solution which upon analysis shall show not less than 30.0% of CaCl₂.

Equivalent Spreading Rates. For purposes of these specifications 1.0 lb/sy of Type A, Solid Flake CaCl₂ is equivalent to 0.2 gal/sy of Type B, Liquid CaCl₂ Solution. These factors shall be used as the basis for determining other rates of application.

PACKAGING, MARKING & SHIPPING

Type A - Solid Flake Calcium Chloride. Solid Calcium chloride shall be packaged in moistureproof bags containing not more than 100 lbs each, or in airtight drums weighing not more than 450 lbs each, or it may be delivered in bulk in tank cars, covered hopper cars, or covered trucks. All bulk shipments that are to be stored and stockpiled on the job site shall be protected with waterproof covers. The location and protection of stockpiled material shall be approved by the Engineer prior to shipment.

The name of the manufacturer, name of the product, net weight, and the percentage of calcium chloride (CaCl₂) guaranteed by the manufacturer shall be legibly marked on each container, except in the case of bulk shipments where the invoice shall be accepted as evidence of compliance with these requirements.

Type B - Liquid Calcium Chloride Solution. Liquid calcium chloride shall be delivered in bulk shipments on a supplied-and-applied basis. The delivery equipment shall be capable of applying the liquid solution at the specified rate(s). The delivery equipment shall be subject to approval by the Engineer and shall be equipped with suitable calibration devices to insure the correct rate of application. Each bulk shipment shall be accompanied with the manufacturer's invoice.

BASIS OF ACCEPTANCE. Calcium chloride will be accepted based on its use as follows:

A. For dust control, ice control and other highway construction related purposes.

Type A and Type B calcium chloride will be accepted based on the Engineer's approval.

B. For soil stabilization. Type A and Type B calcium chloride will be accepted on the basis of the manufacturer's certification that the product conforms to the above specifications. The certification shall reference the number of containers shipped, or in the case of bulk deliveries, the invoice numbers associated with each delivery.

712-03 SODIUM CHLORIDE

SCOPE. This specification covers the material requirements for sodium chloride to be used as a soil admixture or deicing agent for maintenance.

MATERIAL REQUIREMENTS. Sodium chloride shall meet the requirements of ASTM D632, Sodium Chloride - Type 1, Grade 1.

Sodium chloride shall be packaged in moistureproof bags containing not more than 100 lbs each, or in airtight drums weighing not more than 450 lbs each, or it may be delivered in bulk in tank cars, covered hopper cars, or covered trucks. All bulk shipments that are to be stored and stockpiled on the job site shall be protected with waterproof covers. The location and protection of stockpiled material shall be approved, by the Engineer, prior to shipment.

BASIS OF ACCEPTANCE. Sodium chloride will be accepted based upon the Engineer's approval. The Department reserves the right to sample and test this material subsequent to delivery at the project site.

712-04 HYDRATED LIME

SCOPE. This specification contains the material requirements pertaining to Hydrated Lime.

MATERIAL REQUIREMENTS. Hydrated Lime shall meet the requirements of ASTM C207, Hydrated Lime for Masonry Purposes - Type NA or SA.

BASIS OF ACCEPTANCE. The manufacturer's certification shall constitute sufficient documentation for acceptance of this material at the site of the work. The Department reserves the right to sample this material to test for conformance to these specifications.

712-05 PRECAST CONCRETE RIGHT-OF-WAY MARKERS

SCOPE. This specification covers the material and fabrication requirements for precast concrete right-of-way markers.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following shall apply.

Precast right-of-way markers shall be fabricated to conform to the size and shape shown on the standard sheet unless otherwise shown on the plans.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein.

Markings shall be placed on the bottom end face of each unit such that they won't be exposed to view after installation. Instead of marking the contract number on each unit they may be marked with "NYSDOT".

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis of Acceptance requirements contained in §704-03 shall apply.

712-06 (VACANT)

712-07 INERTIAL BARRIER MODULES

SCOPE. This specification covers the material and performance requirements for sand-filled inertial barrier systems used for site hazard protection.

§712

GENERAL. Modules composing the array shall be free-draining with respect to residual moisture in the fill sand. Their lids shall be such that they divert precipitation and stop moisture from seeping into the shell. Lids shall be fastened with a minimum of six equally spaced pop rivets or secured by other approved fasteners so as to provide a reasonably vandal resistant, closed barrel .

MATERIAL REQUIREMENTS. The modules shall be federal yellow or as shown on the plans. They shall be durable, waterproof, resistant to deterioration from ultra-violet rays, deformation from dynamic loadings due to vibration in the placement area and long-term stresses induced by thermal expansion and contraction and fill settlement.

The fill sand shall conform to the requirements of either §703-06, Cushion Sand, or §703-07, Concrete Sand. Sodium chloride, as dry rock salt, equal to 3-5 percent by weight of the sand, shall be thoroughly mixed into the sand. Sodium chloride shall meet the requirements of §712-03, Sodium Chloride.

TESTS. To determine the crash worthiness of inertial barrier modules not on the NYSDOT's Approved List, an array containing each size module shall be subjected to crash tests to verify that the barrier system can safely decelerate an impacting vehicle. These tests shall be done in accordance with the National Cooperative Highway Research Program Report 350, test numbers, 3-40, 3-41, 3-42, 3-43 and 3-44. Evaluation criteria shall conform to the safety evaluation guidelines found in Table 5.1, as specified in Table 3.2.

Crash cushion arrays shall be designed to conform to the occupant risk values found in NCHRP Report 350, Table 5.1, Criteria D, H and I.

Any values deviating from these shall be justified by site and/or shape limitations, or cost, and approved by the Director, Materials Bureau.

BASIS OF ACCEPTANCE. The Department requires the submission of Materials Details. The manufacturer or supplier shall prepare and submit the appropriate material in accordance with the procedural directives of the Materials Bureau. Upon approval by the Materials Bureau, the name of the product and/or supplier, and the reference number assigned to the approved Materials Details will be placed on the Approved List. Such products shall then be accepted on the basis of their brand and conformance to the approved Materials Details.

712-08 THRU 712-11 (VACANT)

712-12 ASPHALT ROOFING FELT

SCOPE. These specifications contain the material requirements pertaining to Asphalt Roofing Felt.

MATERIAL REQUIREMENTS. Roofing shall conform to the requirements of the standard specifications for Asphalt-Saturated Roofing Felt for use in Waterproofing and in Constructing Built-Up Roofs, ASTM D226.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification of compliance with these specification requirements.

712-13 TIMBER AND LUMBER

GENERAL. Unless otherwise specified or noted upon the plans or in the itemized proposal, timber and lumber shall be of any kind acceptable to the Engineer. The material shall be sound, square-edged, free from shakes, loose knots or decay.

712-14 STRESS GRADED TIMBER AND LUMBER

GENERAL. Stress graded timber and lumber shall be graded for the stress grade selected, in accordance with grading rules for the indicated stress grade, developed from ASTM D245.

Commercial stress grades of timber and lumber, with grade descriptions providing material which will meet the indicated stress requirements under rules conforming to ASTM D245, will be acceptable.

MATERIAL REQUIREMENTS. The manufacturer shall inspect and grade the timber and lumber. Each piece shall be clearly branded with the stress grade mark of the manufacturer's inspector. Stress graded timber and lumber will be subject to inspection by representatives of the Department, to whom the manufacturer shall supply three copies of its certification of inspection and piece tally.

The Contractor shall furnish all facilities for the inspection of this material by the Department's representatives and shall allow them free access to all premises where inspections can be made.

BASIS OF ACCEPTANCE. This material will be accepted on the basis of certification by the manufacturer that the timber and lumber has been inspected and stress graded under grading rules which conform to the requirements of ASTM D245. The certification shall show the identifying stress grade mark used by the manufacturer's inspector.

712-15 GABIONS

SCOPE. This specification covers the material and quality requirements for galvanized gabions and galvanized with polyvinyl chloride (PVC) gabions.

GENERAL. The materials used in fabricating and filling of gabions shall comply to specifications and tests set forth below.

MATERIAL REQUIREMENTS.

Gabions. Gabions produced from twisted wire shall conform to the requirements of ASTM A975. Gabions produced from welded wire shall conform to the requirements of ASTM A974. The physical properties of the PVC coating shall conform to the requirements of ASTM A975 or ASTM A974, as appropriate.

Tiewire or Lacing Wire. Tiewire or lacing wire shall conform to the requirements of ASTM A975 or ASTM A974, as appropriate.

Stone Fill. The baskets shall be filled with approved stone of the following sizes:

Basket Depth or Height	Minimum Stone Size	Maximum Stone Size
12 inches	4 inches	8 inches
Greater than 12 inches	4 inches	12 inches

The soundness of all stone used for gabions shall be approved on the basis of a geologic evaluation in accordance with the control procedure in effect on the date of advertisement for bids. Prior to the evaluation, the Contractor shall stockpile the material. Where the State elects to conduct tests, a material will be rejected if it fails to meet the following criteria:

- A. Freeze-Thaw Test. A maximum 10 percent loss, by weight, after 25 cycles of freezing and thawing.
- B. Magnesium Sulfate Soundness Test. A maximum 10 percent loss, by weight, after 10 cycles of the magnesium sulfate soundness test.

Fabrication. Gabions shall be supplied, as specified, in various lengths and heights. The lengths shall be multiples (2, 3, or 4) of the horizontal width. The heights shall be fractions (1, 1/2, or 1/3) of the horizontal width. The horizontal width shall not be less than 3 feet. However, all gabions furnished by a manufacturer shall be uniform width. Dimensions for height, lengths and widths are subject to a tolerance limit of ± 5% of manufacturer's stated sizes.

Gabions shall be fabricated in such a manner that the front, back, sides, ends, lid and diaphragms can be assembled at the construction site into a rectangular basket of the specified sizes. Gabions shall be of

§712

single-unit construction. The base, lid, ends, front and back shall be either woven into a single unit or one edge of these members connected to the base section of the gabion in such a manner that strength and flexibility at the point of connection is at least equal to that of the mesh. Where the length of the gabion exceeds its horizontal width, the gabion shall be equally divided by diaphragms of the same mesh and gage as the body of the gabion, forming cells such that the length does not exceed the horizontal width.

The gabion shall be furnished with the necessary diaphragms secured in proper position on the base in such a manner that no additional tying at this juncture will be necessary. All perimeter edges of the mesh forming the gabion shall be securely selvaged so that the joints formed by tying the selvages have at least the same strength as the body of the mesh.

BASIS OF ACCEPTANCE. Each shipment of gabions to a job site shall be accompanied by a certification which states that the material conforms to the requirements of this specification. A shipment shall consist of all material arriving at the job site at substantially the same time. The certification shall be on company letterhead and shall be signed by an officer of the company having legal authority to bind the company.

712-16 PIGMENT FOR COLORED SYNTHETIC RESIN BINDER CONCRETE

SCOPE. This specification covers the material requirements for pigment used in colored synthetic resin binder concrete.

MATERIAL REQUIREMENTS. The pigment shall be compatible with the synthetic resin binder material and shall provide the colored synthetic resin binder concrete with a non-fading, heat stable color. When the color specified is white, the pigment shall be Rutile Titanium Dioxide.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

712-17 WOOD CROSS TIES

SCOPE. This specification covers the material requirements for wood cross ties for railroads.

MATERIAL REQUIREMENTS

A. Species. The following kinds of wood suitable for cross ties will be accepted.

Ash	Elm	Sassafras
Beech	Hackberry	Sycamore
Birch	Locust	Walnut
Black Gum	Maple	
Catalpa	Mulberry	
Cherry	Oak	

B. Manufacture. Cross ties shall be well sawed in top, bottom and sides. A cross tie shall be considered well sawed as long as score marks are not more than 1/4 inch deep and the surfaces are even.

Cross ties shall be straight, cut square at the ends, have bottom and top parallel, and have all bark entirely removed. A cross tie shall be considered straight only if it meets both of the following requirements:

1. A straight line drawn along the top of the tie from the middle of one end to the middle of the other end of the tie, falls entirely within the width of the tie.
2. A straight line drawn along a side of the tie from the middle of one end to the middle of the other end of the tie, is everywhere more than 2 inches from the top and 2 inches from the bottom of the tie.

The top and bottom of a tie will be considered parallel if any difference in the thickness at the sides or ends does not exceed 1/2 inch.

C. Dimensions. All thicknesses and widths apply to areas of the tie defined as the 'rail bearing area(s)'. The rail bearing areas are those areas which lie between 20 and 40 inches on both sides of the mid-point of the tie length. The rail bearing area for switch ties is the area between 12 inches from each end of the switch tie.

All determinations of width shall be made on the top of the tie. The top is defined as the narrower of the horizontal surfaces, or the surface with the least or no heartwood if both surfaces are the same width.

Standard size thickness and width dimensions are shown in Table 712-17, and apply to the rail bearing areas. The dimensions of the tie shall not be averaged. All ties shall be 8 feet 6 inches long, or as required.

TABLE 712-17	
Size	Dimensions in Rail Bearing Areas
5	7 in. thick by 9 in. wide (top)
4	7 in. thick by 8 in. wide (top)
3A	7 in. thick by 7 in. wide (top) minimum 8 in. wide through body
3	6 in. thick by 8 in. wide (top)
2	6 in. thick by 7 in. wide (top)
1	6 in. thick by 6 in. wide (top) minimum 7 in. wide through body

D. Tolerances. Individual untreated ties shall have the following tolerances applied to the thickness and width dimensions shown in Table 712-17.

Length:	plus 2 in.,	minus 1 in.
Thickness:	plus 2 in.,	minus 1/4 in.
Width:	plus 1 in.,	minus 1/4 in.

It is not the intent of this specification that all ties shall be manufactured to the minimum allowable dimensions. A minimum of 75% of the ties presented for inspection shall conform to the dimensions shown in Table 712-17 without the application of the minus tolerances.

E. Defects. The occurrence of any of the following defects in an individual tie shall be the cause for rejection.

1. Shakes. A separation along the grain, occurring between the annual growth rings. A shake length more than one-third the nominal width of the tie shall not be allowed.

2. Slant or Slope of Grain. Except in the case of woods with interlocking grain, a slant or slope of grain in excess of 1 in 15 shall not be allowed.

3. Holes. Large holes shall not be allowed. A large hole is more than 1/2 inch in diameter and 3 inches deep within the rail bearing areas, or more than one-fourth the width of the surface on which it appears and 3 inches deep outside the rail bearing area. Numerous holes shall not be allowed. Numerous holes are any number equalling a large hole in size.

4. Knots. Large knots shall not be allowed. A large knot is one whose average diameter exceeds one-fourth the width of the face on which it appears. Numerous knots shall not be allowed. Numerous knots are any number equalling a large knot in size.

5. Checks. A separation along the grain of the wood occurring across the annual rings. Fully seasoned and treated ties with check depths greater than one-fourth the thickness and longer than one-half the length of the tie shall not be allowed.

6. Decay. Ties shall contain no decay. Although blue stain is not considered decay and is not a defect, ties shall be inspected with extra care for presence of decay in heavily stained areas.

7. Wane. The lack of wood on the edge or corner of the tie due to the natural curvature of the log from which the tie is cut. Wane which reduces the face dimension greater than 3 inches outside the rail bearing area shall not be allowed. In the rail bearing area, dimensions given in Table 712-17 apply.

8. Splits. A split is a separation of the wood extending from one surface to an opposite or adjacent surface. In unseasoned ties, a split more than 1/8 inch wide or longer than 5 inches shall not be allowed.

After treatment, a split in either end of the tie greater than 1/8 inch wide or longer than 5 inches is not acceptable without an anti-splitting device. A split tie which has had an anti-splitting device applied but which re-opens after treatment to exceed 1/2 inch in width is not acceptable.

9. Twist. The deviation from a flat plane of all four faces by a spiraling or torsional action. A rotation of more than 3.5° from end face to end face shall not be allowed.

F. Anti-Splitting Devices. Anti-Splitting devices are to be installed prior to preservative treatment.

1. Dowelling. Dowels are anti-splitting devices driven or pushed into pre-bored holes. The length of dowel embedded shall not be less than half the width or thickness through which it is placed. Use of lubricants to facilitate driving of dowels is prohibited.

a. Equipment. These specifications are based on dowelling by mechanical dowel machines. Alternate methods may be used if the results are equal to those obtained by mechanical devices that press the tie together, drill and dowel in one or two operation. Dowelling by mechanical means is considered satisfactory as long as sufficient pressure is applied to completely close the split. Substitution of hand drills and pneumatic hammers for drilling dowels in switch ties is satisfactory as long as splits are held closed during dowelling by the use of clamps or other devices.

b. Pre-Drilled Holes. The maximum diameter of the pre-drilled holes is 1/8 inch less than the diameter of dowel. The minimum length of the hole shall be equal to the length of the dowel, except that holes drilled from the face opposite the face where the dowel enters shall be completely through the tie.

c. Location of Dowels. Dowels shall be driven perpendicular to the face most parallel to the split. Two dowels shall be used to close each split. They shall be located a minimum of 4 inches and a maximum of 6 inches from the end of the tie. Where the tie is split parallel to the narrow faces, the 7 3/4 inches long dowels shall be located 1 1/2 inch plus or minus 1/4 inch from each wide face. Where the tie is split parallel to the wide faces, 5 3/4 inches long dowels are driven 2 inches plus or minus 1/4 inch from each narrow face.

d. Protruding Dowels. Dowels not completely driven by dowelling machines shall be driven flush with the wood with a hammer. Dowels which protrude more than 1/4 inch after driving should be burned off with an oxyacetylene torch. However, dowels bent over flush with the surface of the wood will be accepted, provided this is done without splitting the wood.

2. Irons. Anti-splitting irons are driven into the ends of ties and shall be placed to cross at right angles and the greatest possible number of radial lines of the wood. Irons shall be placed far enough from the wide faces to prevent splitting of the tie.

a. Design. Anti-splitting irons shall be made from a strip of steel formed to an “S” iron or “C” iron design. They will be of adequate size to prevent splitting of the tie.

b. Material. Irons shall conform to specifications for anti-splitting irons given in the AREA Manual, Chapter 3, Section 1.9.2.1.

3. Nail Plates. Anti-splitting nail plates shall be applied to the ends of the ties.

a. Design. Anti-splitting nail plates shall be rectangular and perforated to form multiple nails.

b. Material. Nail plates shall be stamped from 18 gage galvanized sheet steel.

c. Size. The area of anti-splitting nail plates shall not be less than 60% of the nominal end area of the tie.

G. Conditioning. Ties shall be dried before preservative treatment until the amount of moisture in the wood will not prevent adequate penetration and retention of preservative. The producer may use any of the following methods as long as satisfactory results are obtained.

1. Air Seasoning. Ties shall be stacked for air seasoning in accordance with the American Wood Preservers Association (AWPA) Standard C6, Cross Ties and Switch Ties - Preservative Treatment by Pressure Process. Stacking dates during the period of stacking shall be painted on the front of the stack. A maximum of 60 days age spread shall be allowed between the dates of the first ties stacked and the last ties stacked.

Ties shall be stacked as grouped below:

Group Ta	Group Tc	Group Td	
Black Locust	Black Gum	Ash	Hackberry
Black Walnut		Beech	Hard Maples
Honey Locust		Birches	Mulberries
Red Oaks		Catalpa	Sassafras
White Oaks		Cherries	Sycamores
		Elms	White Walnut

2. Accelerated Seasoning. Ties may be conditioned by the Boulton drying process, kiln drying, vapor drying or controlled air seasoning in accordance with AWPA Standard C6, Cross ties and Switch Ties - Preservative Treatment by Pressure Process.

H. Preservative Treatment. Plants used for the treatment of wood shall conform to AWPA Standard 3, Standard Quality Control Procedures for Wood Preserving Plants.

All cross ties shall be treated with creosote-coal tar solution conforming to AWPA Standard P2, Standard for Creosote and Creosote Solutions, Grade C. Grades A or B may be substituted for Grade C.

Preservative treatment shall be carried out in accordance with AWPA Standard C1, All Timber Products - Preservative Treatment by Pressure Processing or C6, Cross Ties and Switch Ties - Preservative Treatment by Pressure Processes. The method used shall be the empty cell process by use of initial air to control retention.

Retention of preservative shall be 7 pounds of preservative per cubic foot of wood. Retention shall be determined by gauge in accordance with paragraph 3.1 of AWPA Standard C1.

When specified, pentachlorophenol in heavy AWP Standard P9A solvent may be used as a preservative. Minimum retention shall be 0.4 pounds of preservative per cubic foot of wood.

INSPECTION AND TESTING. The Contractor shall give the Materials Bureau thirty days written notice prior to the start of preservative treatment. This notice shall include at the minimum, the name of the tie treater, the location of the treating plant and that date of the initial treatment.

The treating company is responsible for performing quality control in accordance with AWP M3, Standard Quality Control Procedures for Wood Preserving Plants. All records required to be maintained in accordance with the quality control procedure shall be made available to the Department upon request. A Department representative may be assigned, at the option of the Materials Bureau, to perform sampling and inspection in accordance with Materials Bureau directives and AWP M2, Standard For Inspection of Treated Timber Products. The producer shall furnish all facilities and equipment for the inspection and testing of the materials and workmanship.

In the event plant inspection is waived, written notice will be provided to the tie treater by the Materials Bureau. The tie treater shall then supply the Materials Bureau with all preservative charge reports, which describe the treatment process and preservative retention, and written certification that the treatment and ties conform to these specifications.

All treated ties shipped to the project site shall bear in legible form, the inspector's stamp of approval; however, in the event plant inspection has been waived, ties shall be shipped only if they are accompanied by a copy of the Materials Bureau notification waiving plant inspection.

Treated ties shall be subject to final inspection and approval by the Engineer after arrival at the project site.

SHIPMENT AND STORAGE. Ties delivered at the job site shall be stacked not less than 10 feet from the nearest rail of any track at suitable and convenient places. They shall not be stacked at public crossing or where they will interfere with the view of trainmen or of people approaching the railroad. Where room for spaced stacking is not available, ties may be piled together provided the lowest layer is at least 6 inches above the ground.

BASIS OF ACCEPTANCE. The wood cross ties will be considered for acceptance in stock lot quantities at the treatment facility in accordance with procedural directives of the Materials Bureau.

712-18 IMPACT ATTENUATOR, HDPE CYLINDER AND CABLE TYPE

SCOPE. Impact Attenuators, HDPE Cylinder and Cable Type are manufactured, NCHRP 350 crash tested products intended for the protection of narrow objects having width of 24 inches or less. These impact attenuators are four, six, or nine cylinders in length. They are suitable in situations where frequent frontal impacts are expected.

MATERIALS REQUIREMENTS. Impact Attenuator, HDPE Cylinder and Cable Type components shall meet the following requirements:

Cylinders. Cylinders shall be black, high molecular weight polyethylene conforming to ASTM D3350. Dimensions and wall thicknesses of all cylinders shall be as given on the manufacturer's drawings.

Cables. Cables shall be approved 6 x 25 FW plow steel conforming to API STD-9A, galvanized, prestretched and nominally 58,500 lbs minimum breaking strength of the size and lengths indicated on the manufacture's drawings. Cables shall be fitted both ends with galvanized fittings of the type indicated on the approved manufacture's drawings.

Other Steel Parts. Anchor plates and structural angles shall be ASTM A36 steel, galvanized after fabrication. Structural tube used to construct the back up structure, used in the rear section of the rail unit of the six (6) and nine (9) cylinder units and in the railing for the four (4) cylinder units shall be ASTM A500, Grade B. Chain shall be high strength steel linked chain of the indicated sizes, galvanized and

fitted each end with screw pin anchor shackles. Fasteners, anchor bolts and anchor pins and other parts not specified herein shall be as given on the manufacturer's drawings or in the fabricators instructions.

All metal parts shall be galvanized after fabrication in accordance with §719-01 Galvanized Coatings and Repair Methods, Type I. Welding shall be in accordance with the *Steel Construction Manual*.

Reflectorization. Reflectorization, consisting of Class B (High Intensity) sheeting conforming to §730-05 directly applied to aluminum sheeting, shall be affixed to the front cylinder of the impact attenuator in a manner satisfactory to the Engineer. Aluminum sheeting shall be 6061T6, 20 gage. The pattern and color of the reflectorization shall be as indicated on the plans.

If no pattern is provided, the pattern shall be approximately square, 18 inches on a side. Whenever approaching traffic is allowed to pass on both sides of the unit, the pattern shall be upward pointing chevrons formed with alternating 4 inch reflectorized stripes and black opaque non-reflectorized stripes. When traffic will be permitted on only one side, the pattern shall be diagonal 4 inch stripes, downward sloping to the side traffic is to be permitted, formed as indicated above. If no color is given, color shall be yellow.

BASIS OF ACCEPTANCE. Impact Attenuator, HDPE Cylinder and Cable Type will be accepted at the project site on the basis of the manufacturer's name appearing on the Approved List, conformance of the delivered article with the manufacturer's drawings, and the manufacturer's certification that the product delivered is in conformance with these specifications.

712-19 IMPACT ATTENUATOR, QUAD BEAM TYPE WITH EXPENDABLE MODULES

SCOPE. Impact Attenuator, Quad Beam Type With Expendable Modules are manufactured, NCHRP 350 crash tested products intended for the protections of objects having widths of 24 to 90 inches. These attenuators are three, four, five, six, and nine bays in length, and may transition to concrete barriers, vertical walls, corrugated barrier, and three beam corrugated barrier.

MATERIALS REQUIREMENTS Each Impact Attenuator, Quad Beam Type With Expendable Modules shall contain all external and internal parts necessary to give satisfactory service at the indicated site. Components shall meet the following requirements:

Cartridges. The cartridge boxes shall be Type I and Type II cartridge boxes and shall be of the number and arrangement indicated by the manufacturer for the intended application. Cartridge boxes shall be manufactured from a weather resistant plastic material. Type I cartridges shall contain paper honeycomb material. Type II cartridges shall contain steel honeycomb material which shall be coated to minimize the effects of corrosion.

Cartridge Brackets. Each bay shall be equipped with cartridge brackets.

Diaphragms. Diaphragms shall be made from 10 gage ASTM A36 steel quadruple corrugated beam. The length of each diaphragm shall be as required for each application. Two support legs shall be welded to a channel which, in turn, shall be welded to the quadruple corrugated beam. Ski shaped plates shall be welded to the bottom of the support legs. The diaphragms shall be designed to lock onto, and be guided by, an anchored and mounted center monorail support structure.

Fender Panels. Fender panels shall be fabricated from 10 gage steel quadruple corrugated beam guide rail sections. Each fender panel shall be drilled and slotted so that when assembled in the field, the front end shall be bolted to a diaphragm by means of the three horizontally placed 5/8 inch bolts, one of which shall be a "mushroom bolt." The back end of each quadruple corrugated beam fender panel shall overlap and be connected to the fender panel of the next bay by means of mushroom bolts which shall fit through the long horizontal slot in the forward fender panel and the short vertical slot in the overlapped fender panel. (The bolt shall have a nut and square washer on the inside.) This permits movement, front to back, of one set of fender panels relative to the panels in the following bay.

§712

Monorail Assembly. The monorail assembly shall be fabricated to the dimensions shown on the manufacturer's or working drawings.

Tension Strut Back-up. If a concrete back-up structure is **not** to be provided, a tension strut back-up assembly shall be provided. The details of this assembly shall be as indicated in the manufacturer's or working drawings.

Nose Cover. The nose cover shall be made from a high density polyethylene plastic material of the color indicated in the plans or directed by the Engineer.

Metal Work. All metal work, except transition panels, shall be fabricated from either M1020 Merchant Quality or ASTM A36 steel. After fabrication, all metal work shall be hot dip galvanized in accordance with §719-01 Galvanized Coatings and Repair Methods. Welding shall be in accordance with the *New York State Steel Construction Manual*.

Fasteners. All bolts shall be American Standard Regular Bolts, unless indicated otherwise in the Plans. Anchor bolts shall be ASTM A193, Grade B7 grouted into the concrete slab with polyester grout.

Transition Panels. Transition panels shall be fabricated from steel conforming to ASTM A36, hot dip galvanized in accordance with ASTM A123. Five standard transition panels shall be available. These shall transition to: Jersey Barrier; W-rail Corrugated Beam; Thrie Beam; vertical surfaces; and Single Slope Concrete Barrier.

Reflectorization. Reflectorization, consisting of Class B (High Intensity) sheeting conforming to §730-05 directly applied to aluminum sheeting, shall be affixed to the nose cover of the Quad Beam Type Impact Attenuator in a manner satisfactory to the engineer. Aluminum sheeting shall be 6061T6, 20 gage thick. The pattern and color of the reflectorization shall be as indicated on the plans.

If no pattern is provided, the pattern shall be approximately square, 18 inches on a side. Whenever approaching traffic is allowed to pass on both sides of the unit, the pattern shall be upward pointing chevrons formed with alternating 4 inch reflectorized stripes and black opaque non-reflectorized stripes. When traffic will be permitted on only one side, the pattern shall be diagonal 4 inch stripes, downward pointing to the side traffic is to be permitted, formed as indicated above. Unless otherwise noted, the color shall be yellow.

BASIS OF ACCEPTANCE. Impact Attenuator, Quad Beam Type With Expendable Modules will be accepted at the site of the work on the basis of appearance of the product on the Approved List, conformance of the delivered product with the manufacturer's or working drawings, and receipt of the manufacturer's certificate of compliance with these specifications.

712-20 IMPACT ATTENUATOR, CORRUGATED BEAM TYPE WITH METAL TEARING STRIPS

SCOPE. Impact Attenuator, Corrugated Beam Type With Metal Tearing Strips are fabricated, NCHRP 350 crash tested products intended for the protection of narrow objects 24 inches or less in width and for the protection of concrete jersey shaped median barrier barrier. These impact attenuators are available in six and nine bay lengths.

MATERIAL REQUIREMENTS. Each Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips shall contain all external and internal parts necessary to give satisfactory service at the indicated site.

The major components of the Each Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips are - 1 sled assembly, 7 (nine bay) or 4 (six bay) intermediate frames, 1 backup frame, base assembly, cross ties and 20 (nine bay) or 12 (six bay) fender panels. One or more of the following components may also be required- metal transition panels, wood or plastic block outs, backup frame adapter and W-beam end shoes.

Fender Panels. Fender panels shall be fabricated from 10 gage steel, double corrugated beam guide rail sections.

Nose Cover. The nose cover shall be made from a high density polyethylene plastic material of the color indicated in the contract documents. If no color is given, the color of the nose cover shall be yellow, or the color directed by the Engineer.

Metal Work. All metal work except fasteners shall be fabricated from ASTM A36 steel. After fabrication, all metal work shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, Type I. Welding shall be in accordance with the *New York State Steel Construction Manual*.

Fasteners. All bolts shall be American Standard Regular Bolts, unless indicated otherwise in the Plans. Anchor studs shall be ASTM A193, Grade B7, grouted into the concrete or asphalt.

Grout. Anchors requiring grouting shall be grouted with material approved under §701-05 Concrete Grouting Material or §701-07 Anchoring Materials - Chemically Curing.

Transition Panels. Standard transition panels between Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips and Jersey Barrier shall be available. Transition panels shall be fabricated from 12 gage steel, double corrugated beam guide rail sections. They shall be terminated at the concrete barrier end with W-beam end shoes. Details of the transition shall be provided by the manufacturer.

Plastic Block Outs. Plastic block outs shall conform to §710-26 Plastic and Synthetic Block Outs for Heavy Post Guiderail System, except the dimensions shall be as per the approved manufacturer's or working drawings.

Wood Block Outs. Wood block outs shall conform to §710-13 Wood and Timber Posts and Timber Block outs, except the dimensions shall be as per the approved manufacturer's or working drawings. Pressure treatment shall be done after all cutting, sawing, trimming and drilling has been completed.

Reflectorization. Reflectorization, consisting of Class B (High Intensity) sheeting conforming to §730-05 directly applied to aluminum sheeting, shall be affixed to the front face of the sled assembly in a manner satisfactory to the engineer. Aluminum sheeting shall be 6061 T6, 20 gage. The pattern and color of the reflectorization shall be as indicated on the plans.

If no pattern is provided, the pattern shall be approximately square, minimum 24 inches on a side. Whenever approaching traffic is allowed to pass on both sides of the unit, the pattern shall be upward pointing chevrons formed with alternating 4 inch reflectorized stripes and black opaque non-reflectorized stripes. When approaching traffic is permitted on only one side, the pattern shall be diagonal 4 inch stripes, downward pointing to the side traffic is to be permitted, formed as indicated above. If no color is given, color shall be yellow.

BASIS OF ACCEPTANCE. Each Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips will be accepted at the project site on the basis of the manufacturer's name appearing on the Approved List, its conformance with the manufacturer's drawings, and the manufacturer's certificate of compliance with these specifications.

712-21 IMPACT ATTENUATOR, THRIE BEAM TYPE WITH EXPENDABLE MODULES

SCOPE. Impact Attenuators, Thrie Beam Type With Expendable Modules are manufactured, NCHRP 350 crash tested products intended for the protection of objects having widths of up to 8 1/2 feet. These attenuators are configured with a varying number of bays (4-12), and may transition to vertical walls, safety-shape concrete barriers, thrie beam corrugated barrier, and corrugated beam (when using an intermediate thrie beam transition).

MATERIAL REQUIREMENTS. Each Impact Attenuator, Thrie Beam Type with Expendable Modules shall contain all external and internal parts necessary to give satisfactory performance at the indicated site. Components shall meet the following requirements:

Modules. The module shall be Type A and Type B and shall be of the number and arrangement indicated by the manufacturer for the intended application. The modules shall be manufactured from a weather-resistant, high-density, cross-linked, polyethylene plastic material. The modules shall be designed to collapse under a manufacturer-defined critical loading consistent with the designed system requirements.

Front Support and Diaphragms. The diaphragms and front supports shall be rectangular frame structures constructed of ASTM A36 steel C 3 x 5 channels, or equal. They shall include centrally-located, horizontal and vertical cross bracing. They shall have provisions to retain and support the modules.

A. Diaphragms. The top width of each interior diaphragm shall vary based on the design configuration and shall include 1/2 inch lips on both sides to reduce fender panel ride up during and immediately after an impact. Attached to the bottom horizontal support channel shall be two support legs connected to a ski-shaped base plate with turned up ends. The diaphragms shall include cable guide mounts for the anchor cables.

B. Front Support. The top width of the front support shall vary based on the design configuration. Two rubber or polyurethane support legs shall be attached to the bottom horizontal channel

Fender Panels. Fender panels shall be fabricated from 10 gage, steel thrie beam guide rail sections. Each fender panel shall be factory drilled and slotted for field assembly. The front end shall be fastened to a diaphragm using 3/4 inch stainless steel hex bolts. The back end of each thrie beam fender panel shall overlap and be connected to the fender panel of the next bay using sliding mushroom bolts inserted through the long horizontal slot in the forward fender panel and the short vertical slot in the overlapped fender panel, thus permitting movement, front to back, of one set of fender panels relative to the panels in the following bay. The rear panel is fixed to the rear support using a through bolt connection, through a 6 inch diameter, 1/4 inch thickness, steel pipe with cut out conical sections on the front end.

Cable. Two cables, of the length required for the particular installation according to the manufacturer's instructions, shall provide tension in the system to support the diaphragms and guide them during and immediately after impact. The cables shall be 1 inch diameter steel wire rope, galvanized in accordance with ASTM A603. Both cable ends shall have steel reinforcement eyes formed using a swaged steel connector. A threaded eye bolt shall be connected to one of these eyes during its fabrication for field connection to the rear anchor lugs. The cable tension is adjusted by rotating the nut attached to this bolt.

Front Anchor Plate. The front cable anchor shall consist of a rectangular ASTM A36 steel plate, 1 inch thickness, 20 x 12 inches, with welded 4 inch lugs to connect to fasteners to cables. Eight holes, four along each longitudinal edges, shall be provided to accept anchor bolts.

Rear Diaphragm. The rear diaphragm shall be constructed of fabricated C3x5 channels, or equal, with both horizontal and vertical bracing. The height shall be approximately 31 1/2 inches. The width of the support will vary based on the design configuration.

The diaphragm shall be attached to the rear support structure in accordance with the manufacturer's drawings.

Rear Support Structure and Cable Anchorage for Transitions to Concrete Barriers and Concrete Structures. When the attenuator is transitioned to a concrete barrier, the barrier may provide rear structural support. In such a case, the cables shall be anchored to a built-up steel plate connection bolted to the barrier. The transition to the concrete barrier shall be in accordance with the

manufacturer's details. The attenuating system shall be in accordance with the manufacturer's details when protecting concrete piers, concrete parapets, concrete walls, or other rigid objects.

Rear Anchor Plate and Backstop. For designs using steel backup structure, the fabricated steel support structure shall be as detailed on the manufacturer's drawings.

Nose Cover. The nose cover shall be made from a polyurethane material of the color indicated in the contract documents. The cover shall be bolted to the front support.

Metal Work. All metal work, except transition panels, shall be fabricated from ASTM A36 steel. After fabrication, all metal work shall be hot-dip galvanized in accordance with §719-01 Galvanized Coatings and Repair Methods. Welding shall be in accordance with the New York State Steel Construction Manual.

Fasteners. All bolts shall be ANSI Standard Regular Bolts, unless indicated otherwise in the plans.

A. Anchor Bolts. Anchor bolts shall be 3/4 inch diameter, ASTM A193, Grade B7 grouted into the concrete slab with polyester grout. The length of the anchor bolts shall be 8 1/4 inches for installations.

B. Front Cable Fastener. A shackle with screw pin shall attach the cable to the front anchor.

Transitions. Transition panels shall be standard AASHTO fabricated panels from steel conforming to ASTM A36 and hot-dip galvanized in accordance with ASTM A123. Transitions can be made directly to thrie beam guide rail; to corrugated beam using a thrie beam transition to corrugated beam; and to safety-shape concrete barrier and vertical walls using an additional thrie beam section and a thrie beam bridge shoe.

Reflectorization. Reflectorization, consisting of Class B (High-Intensity) sheeting conforming to §730-05 directly applied to aluminum sheeting, shall be affixed to the nose cover of the Thrie Beam Type Impact Attenuator. Aluminum sheeting shall be 6061 T6, 20 gage. The pattern and color of the reflectorization shall be as indicated in the contract documents.

If no pattern is provided, the pattern shall be approximately square, 18 inches on a side. Whenever approaching traffic is allowed to pass on both sides of the unit, the pattern shall be upward-pointing chevrons formed with alternating 4 inch reflectorized stripes and black opaque nonreflectorized stripes. When traffic will be permitted on only one side, the pattern shall be diagonal 4 inch stripes, downward pointing to the side traffic is to be permitted, formed as indicated above. Unless otherwise noted, the color shall be yellow.

BASIS OF ACCEPTANCE. Impact Attenuator, Thrie Beam Type With Expendable Modules will be accepted at the site of the work on the basis of appearance of the product on the Approved List, conformance of the delivered article with the manufacturer's drawings, and the manufacturer's certification that the product delivered is in conformance with these specifications.

712-22 IMPACT ATTENUATOR, HDPE CYLINDERS WITH MONORAIL AND DIAPHRAGMS

SCOPE. Impact Attenuator, HDPE Cylinders with Monorail and Diaphragms are manufactured, NCHRP 350 Test Level 3 crash-tested products intended for the protection of objects having width of 118 inches or less. These impact attenuators have 27 HDPE cylinders arranged in 14 rows or 29 arranged in 15 rows. They are suitable in situations where frequent frontal impacts are expected.

MATERIALS REQUIREMENTS. The components shall meet the following requirements:

§712

Cylinders. Cylinders shall be black, high-molecular-weight polyethylene conforming to ASTM D3350 cell class 345434C. Dimensions and wall thicknesses of all cylinders shall be as given on the manufacturer's drawings.

Steel Parts. Metal parts shall be fabricated from M1020 Merchant Quality or ASTM A36 steel. Chain shall be high-strength-steel-linked chain of the indicated sizes, galvanized, and fitted each end with screw-pin anchor shackles. Fasteners, anchor bolts and anchor pins, and other parts not specified herein shall be as given on the manufacturer's drawings or in the fabricator's instructions.

All metal parts shall be galvanized after fabrication in accordance with §719-01 Galvanized Coatings and Repair Methods, Type I. Welding shall be in accordance with the Steel Construction Manual.

Reflectorized Sheeting. Class B (High-Intensity) sheeting conforming to §730-05, premounted on a weatherproof substrate, shall be affixed to the front cylinder of the impact attenuator. Aluminum sheeting, if used, shall be 6061T6, 20 gage thick. The pattern and color of the reflectorization shall be as indicated on the plans.

If no pattern is provided, the pattern shall be approximately square, 18 inches on a side. Whenever approaching traffic is allowed to pass on both sides of the unit, the pattern shall be upward-pointing chevrons formed with alternating 4 inch reflectorized stripes and black-opaque-nonreflectorized stripes. When traffic will be permitted on only one side, the pattern shall be diagonal 4 inch stripes, downward sloping to the side traffic is to be permitted, formed as indicated above. If no color is given, the color shall be yellow.

BASIS OF ACCEPTANCE. Impact Attenuator, HDPE Cylinder with Monorail and Diaphragms will be accepted at the project site on the basis of the manufacturer's name appearing on the Approved List, conformance of the delivered article with the manufacturer's drawings, and the manufacturer's certification that the product delivered is in conformance with these specifications.

SECTION 713 - LANDSCAPE DEVELOPMENT MATERIALS

713-01 TOPSOIL

SCOPE. This specification covers the material requirements for topsoil for use in turf and wildflower establishment, sodding, or planting.

MATERIAL REQUIREMENTS. Topsoil may be naturally occurring or may be manufactured. Manufactured topsoil is a mixture of materials comprised of a mineral(soil) component that by itself does not exhibit the properties and characteristics of topsoil, an organic material component consisting of compost(s) meeting the requirements of §713-15 Organic Material, and amendment(s), such as limestone that, when combined together, meet the requirements for topsoil.

Topsoil shall be free from refuse, material toxic or otherwise deleterious to plant growth, subsoil, seeds or other viable propagules of invasive plants, woody vegetation and stumps, roots, brush, stones, clay lumps, or similar objects. Construction and demolition debris as classified under 6 NYCRR Part 360, other than uncontaminated land clearing debris, shall not be used to manufacture or amend topsoil. Sod and herbaceous growth such as grass and weeds need not be removed but shall be thoroughly broken up and mixed with the soil during handling or manufacturing operations.

Topsoil shall meet the following requirements:

Topsoil-Type A

- The pH of the material shall be between 5.5 and 7.6.
- The organic content shall be not less than 6% or more than 12%, (dry weight basis).
- Gradation:

Sieve Size	Percent Passing by Weight
2 inch	100
1 inch	85 to 100
1/4 inch	65 to 100

1048

No. 200	20 to 65
2 micron particle	0 to 20

Topsoil-Type B

- The pH of the material shall be between 5.5 and 7.6.
- The organic content shall be not less than 2% or more than 20%, (dry weight basis).
- Gradation:

Sieve Size	Percent Passing by Weight
2 inch	100
1 inch	85 to 100
1/4 inch	65 to 100
No. 200	20 to 80

The Contractor may amend topsoil with approved materials and by approved methods to meet the above specifications.

STOCKPILING. Topsoil acquired from sites designated in the contract documents or approved by the Engineer shall be stockpiled prior to its use. Topsoil acquired from sites that are designated in the contract documents or approved by the Engineer is not subject to requirements for stockpiles, sampling, and testing. If no topsoil sites within the contract limits are designated in the contract documents or approved by the Engineer, the material proposed for use, either naturally occurring topsoil or manufactured topsoil, must be stockpiled, sampled, and tested prior to its use.

Stockpiles shall contain not less than 200 cubic yards or the minimum required for the contract, shall have a height of at least 4 feet unless otherwise approved, and shall be trimmed to uniform surfaces and slopes.

Ramps formed for stockpile construction shall be topsoil and will be considered part of the stockpile. Any contaminated ramp surface material shall be removed before steepening, reshaping, addition of topsoil to the area of a ramp, ramp removal, and/or sampling.

Each stockpile shall be identified with a durable and legible sign placed prior to sampling. The sign shall remain until the stockpile is depleted or disposed of. The information on stockpile signs shall include the contract number(s), a stockpile identification number, and the following: "NYSDOT 713-01 Topsoil".

The Contractor/Supplier shall supply Department contracts with a substantial portion of the topsoil in approved stockpiles. A stockpile created for multiple contracts shall be a minimum of 1300 cubic yards and a maximum of 10,400 cubic yards unless the Contractor or Material Supplier has a written quality control plan approved by the Regional Construction Engineer prior to construction of a larger stockpile.

Approved topsoil stockpiles or portions of approved stockpiles shall not be moved to another location without written approval from the Department of the Contractor's/Supplier's relocation plan for ensuring preservation of the quality of the stockpiled topsoil.

The Contractor shall maintain a current record for each topsoil stockpile used for Department contracts. The record shall indicate the stockpile identification number, the dates when material was shipped to Department contracts, contract number(s), and the quantity of topsoil shipped. The record shall be available for Department inspection upon request.

SAMPLING. The Contractor shall notify the Engineer of the intended source of the material a minimum of 21 calendar days in advance of the scheduled use of the material to allow time for sampling, sample shipment and testing. Samples of naturally occurring topsoil, manufactured topsoil or amended topsoil mixture will be taken by a representative of the Department. Samples taken for topsoil that has been amended or manufactured with approved composted biosolids shall be identified as such.

For stockpiles up to 5200 cubic yards, a minimum of one sample shall be taken, for each 1300 cubic yards or portion thereof. For stockpiles containing more than 5200 cubic yards, one sample should be obtained from each of four quadrants that are approximately equal in size. The Contractor/Supplier shall form a face for the full height of the stockpile at the locations specified by the Department's sampler. A loader bucket or similar equipment shall then be filled by channeling the full height of the stockpile face, from the bottom to the top, in one operation.

§713

The bucket shall then be lowered and emptied by rotation to form a small pile at each sampling location.

The sampler shall place a shovel full of soil from each pile into a large container. The soil shall be thoroughly mixed and, either by splitting or quartering, a sufficient amount of mixed topsoil shall be taken to fill a standard topsoil sampling container. Containers shall be supplied by the Department.

Contractors who believe that an error was made in sampling the topsoil shall, within one work day, indicate the alleged error in writing to the Engineer.

Topsoil shall be free from refuse, material toxic or otherwise deleterious to plant growth, subsoil, seeds or other viable propagules of invasive plants, woody vegetation and stumps, roots, brush, stones, clay lumps, or similar objects. Sod and herbaceous growth such as grass and weeds need not be removed but shall be thoroughly broken up and mixed with the soil during handling or manufacturing operations.

Additional topsoil shall not be added to the stockpile after sampling. If additional material is added after the stockpile has been sampled, or if the stockpile is otherwise tampered with, the stockpile will be rejected.

TESTING. All material tests required by this section, except for the testing of composted biosolids and topsoil containing composted biosolids, will be performed by the Department in conformance with the procedures contained in the appropriate Department publications or test methods.

Composted biosolids used to amend or manufacture topsoil shall conform to the applicable requirements of §713-15 Organic Material. Composted biosolids shall require a certificate, from a laboratory approved by the NYS Department of Health, verifying compliance with all applicable laws, rules, and regulations. The certification shall be supplied by the Contractor prior to the delivery of any composted biosolids, topsoil containing composted biosolids, or other such regulated material to the contract site. The material shall be approved before it is used.

Topsoil that has been amended with approved composted biosolids or other such regulated material shall be tested to ensure compliance with the pH, organic content, and gradation requirements certified by a nationally recognized entity which provides soils laboratory services. The Contractor shall provide laboratory results to the Engineer.

BASIS OF ACCEPTANCE. Acceptance of topsoil will be based upon the test results unless otherwise specified.

713-02 LIMESTONE

SCOPE. This specification covers the material requirements for limestone.

MATERIAL REQUIREMENTS. Limestone shall be ground limestone having a minimum total neutralizing value of 88% calcium carbonate equivalence. A minimum of 90% shall pass the No. 20 sieve and a minimum of 60% shall pass the No. 100 sieve.

PACKAGING. Agricultural limestone packed in the manufacturer's standard containers shall weigh not over 100 lbs each, with the name of the material, net weight of contents and the manufacturer's name and guaranteed analysis appearing on each container.

DELIVERY. Bulk shipments shall be accompanied by a certificate providing the names, weight and analysis as specified herein for packaged material.

BASIS OF ACCEPTANCE. The manufacturer's label or certificate indicating compliance with these specifications shall be the basis of acceptance.

713-03 FERTILIZER

SCOPE. This specification covers the material requirements for fertilizers.

MATERIAL REQUIREMENTS. Fertilizers may be either fluid or dry formulations of commercial carriers of available plant nutrients.

The following mixed commercial fertilizers shall contain total nitrogen, phosphoric acid and soluble potash in the ratios stated:

- Type No. 1. 1-2-1 (approximate analysis)
- Type No. 2. 1-1-1 (approximate analysis)

The following fertilizers shall be as specified:

- Type No. 3. 10-6-4 (50% N/UF). 50% of total nitrogen shall be derived from ureaform furnishing a minimum of 3.5% water insoluble nitrogen(3.5%WIN). The balance of the nitrogen shall be present as methylene urea, water soluble urea, nitrate and ammoniacal compounds.
- Type No. 4. Nitrate of soda, shall contain a minimum of 16% nitrogen.
- Type No. 5. Ammonium sulfate shall contain a minimum of 20.5% nitrogen.
- Type No. 6. Ammonium nitrate shall contain a minimum of 33% nitrogen, one-half of which is in the ammonium form and one-half of which is in the nitrate form.
- Type No. 7. A nitrogen carrier containing a minimum of 45% nitrogen such as Urea or equivalent.
- Type No. 8. Bonemeal shall be commercial steamed bonemeal, finely ground with a minimum of 1.0% nitrogen and a minimum of 20% phosphoric acid.
- Type No. 9. Superphosphate shall be an approximate 0-20-0 formulation with an acceptable minimum of eighteen percent (18%) available phosphoric acid.
- Type No. 10. Vacant
- Type No. 11. A fertilizer in standardized packets designed to control the release of their contents over a specified period of time. The minimum guaranteed analysis shall be 16-8-8.
- Type No. 12. Shall be as specified in the contract documents.

PACKAGING. Fertilizers shall be in the manufacturer's standard containers. Containers shall not weigh more than 100 lbs and shall include a label stating the name of the material, the net weight of the contents, the manufacturer's name, and the guaranteed analysis of the fertilizer. Labels on containers of fluid fertilizers shall state the net volume of the container.

DELIVERY. Bulk delivery of fertilizer shall be accompanied by the manufacturer's certificate stating the name of the manufacturer, the guaranteed analysis and the weight of the shipment. Certificates accompanying bulk deliveries of fluid fertilizers shall also state the net volume of the shipment.

BASIS OF ACCEPTANCE. The manufacturer's label or certificate indicating compliance with these specifications shall be the basis of acceptance. The Engineer reserves the right to reject any material that has become caked or otherwise damaged.

713-04 SEEDS

SCOPE. This specification covers the material requirements for seeds.

MATERIAL REQUIREMENTS. Each species, variety and strain of grasses, legumes, wildflowers and cereals and the minimum percentage of germination of each shall be as specified in the contract documents unless otherwise approved.

Material other than pure live seed shall comprise only nonviable seed, chaff, hulls, live seed of crop plants other than those specified, harmless inert matter and weed seeds except that weed seeds other than seeds of noxious weeds will be permitted up to 1% of the gross weight of each kind of seed. Legume seeds requiring inoculation shall be accompanied by adequate amounts of their proper inoculants unless accompanied by certification of preinoculation.

The percentage of purity shown on the label will be acceptable. The percentage of germination for each of the species, variety or strains of seeds shown on the label shall not be less than the minimum percentage specified in the contract documents. The percentage of pure live seed of each kind in each

§713

container or bag of seeds delivered will be computed by multiplying the percent germination by percent purity and dividing by 100. The percentage of pure live seed of each kind multiplied by the net weight of the container or bag will indicate the number of pounds of pure live seed of each kind in the container or bag.

Nomenclature. The common and scientific names of grasses, legumes, wildflowers and cereals specified in the contract documents shall conform to one or more of the authorities on botanical nomenclature recognized by the American Association of Nurserymen.

Legume Inoculants. Inoculants for treating legume seeds shall be a standard culture of nitrogen fixing bacteria that is not more than one year old. Each inoculant shall be the specific culture required for each legume. It shall be supplied only from manufacturers licensed to sell legume inoculants in New York State.

Packaging. Seeds shall be furnished and delivered in labeled containers or bags that are acceptably sealed or sewn tight.

When seeds are to be accepted by certification, they may be mixed prior to delivery.

When sampling and testing is specified, seeds shall not be sown until written approval is issued. Approved seeds may be mixed prior to delivery.

LABELING. All seed and seed labels shall be in accordance with State and Federal Laws, Rules and Regulations, including Article 9 Section 137 of the Agriculture and Markets Law.

SAMPLING AND TESTING

A. Certification. Seeds will be accepted on the basis of certification unless otherwise specified in the contract documents. The certification shall consist of the label that shall be attached to each container of seed in accordance with the provisions of the New York State Agriculture and Markets' Law. Seeds will not be accepted by certification unless the test dates shown on the seed container labels are within the same calendar year that the seeds are sown.

Seeds will not be accepted if seed container labels are removed prior to the time of sowing nor will seeds be accepted if container labels have been altered, are obliterated or are otherwise illegible.

B. Sampling and Testing. Seeds will be subject to sampling and testing when specified in the contract documents and/or whenever the Engineer determines that seed damage or deterioration may have occurred as a result of handling, transit or storage.

Seeds specified for sampling and testing, and other seeds to be sampled and tested as determined by the Engineer, shall not be sown until test results are received and written approval is issued.

Sampling shall be done by a representative of the New York State Department of Transportation. Testing shall be done by the Department of Seed Investigations, New York State Agricultural Experiment Station, Geneva, New York, and the test results obtained will be considered final.

Tolerances established by the Agricultural Experiment Station will be used to determine if the seeds conform to the specifications.

BASIS OF ACCEPTANCE. The seeds shall meet the minimum specified requirements regardless of the guarantee of qualities or dates of testing and after the application of tolerances approved by the Department of Seed Investigations, New York State Agricultural Experiment Station, Geneva, New York. Seed that has become wet, moldy or otherwise damaged in transit or storage will not be acceptable. After delivery to the Contractor, seed shall be stored so that it is protected from damage or deterioration from any source. Provisional acceptance of seeds shall be obtained before the seeds are sown. Final acceptance may be subject to the results of official sampling and testing. The Contractor shall furnish the vendor with the specifications for the material.

713-05 WOOD CHIPS

1052

SCOPE. This specification covers the material requirements for wood chips used as mulch, landscape bedding or erosion control.

MATERIAL REQUIREMENT. Wood chips used for mulch, landscape bedding or erosion control may be either of the following, unless otherwise specified in the contract documents. Wood chips shall not exceed 3 inches in the greatest dimension.

A. TYPE A. This shall be derived from green hardwood or softwood. The chips shall be free from leaves, young growth, unchipped branches, twigs 2 inches or less in diameter, wood shavings, sawdust or foreign materials such as stones, nails, plastic, etc.

B. TYPE B. Shall be either Type A green wood chips or wood chips derived from unadulterated construction and/or demolition waste wood. Wood chips derived from construction and/or demolition waste wood shall not be contaminated with paint, chemicals, shingles, glass, nails, etc.

BASIS OF ACCEPTANCE. Acceptance shall be based on inspection, upon delivery, by the Engineer for compliance with the materials requirements and applicable certification of compliance with 6 NYCRR Part 360.

713-06 TREES, SHRUBS AND VINES

Nomenclature. The common and scientific nomenclature for plants shall be in conformity with the American Association of Nurserymen's currently recognized authorities on botanical nomenclature.

Quality and Size. Plants, including root spread and ball size, shall be in accordance with the current edition of "American Standard for Nursery Stock (ANSI Z60.1)," unless otherwise specified in the contract documents. All plants shall have a normal habit of growth and be typically characteristic of their respective kinds. The specified plant sizes shall be the minimum size allowed and shall include plants from that size up to but not including the next larger size. Plants shall not be pruned at the time of digging or before delivery and no plants shall be cut back from larger sizes to meet the sizes specified. Plants shall be free from injury, insect damage, infestation and disease. Plants shall be nursery grown unless otherwise specified and bear evidence of proper nursery care, including adequate transplanting and root pruning. Plants specified from collected sources shall be clean, sound stock, free from decayed stumps and from fire injury.

Container grown material, including container sizes and soil, shall be as specified in the Contract Documents.

Containers shall be sufficiently rigid to hold the ball shapes and protect the root balls during handling and shipping. Container grown plants shall have been grown in the container long enough for new fibrous roots to have developed so that the root ball is firm and will retain its shape and hold together when removed from the container. The plants shall be in a healthy growing condition with tops which are of good quality, and shall have been adequately hardened off before shipment.

Specimen plants shall be as specified in the Contract Documents.

Digging Plants. Plants shall be dug with care and skill immediately before shipment. Digging shall avoid all possible injury to, or loss of roots, but when required, roots cut shall be cleanly cut. No cold storage plants will be accepted unless approved in writing prior to delivery. Plants stored temporarily shall be properly heeled in or otherwise protected from injury.

Root Protection. After plants are dug, their roots shall be protected from injury such as caused by heat, sun, wind and freezing temperatures. All bare roots of trees, shrubs and vines shall be puddled at the time of digging unless otherwise approved. Puddling shall be done in a wet clay mixture, of a quality to adhere to all parts of the root system. Roots of bare root plants which have been thoroughly covered at the time of digging with an anti-desiccant as specified under §713-08 will not require puddling. Bare roots shall be further protected by wrapping in wet straw, moss, burlap or other suitable material.

Transportation. Tarpaulins or other covers shall be placed over plants transported by open trucks or by open freight cars. Closed trucks and closed railroad cars shall be ventilated to avoid overheating and the doors shall be kept closed during shipment to prevent plants from drying. The heads of trees shall be tied-in carefully to prevent fracturing or breaking the branches. Trunks and branches shall be adequately supported and padded to avoid scraping or bruising.

GENERAL.

Trees. Nursery grown trees shall have no pruning cuts which are not healing and no cuts over 3/4 inch which have not completely calloused over, no cut back crowns or leaders and no abrasions of the bark. Trees must have good fibrous root systems characteristic of the kind. Deciduous trees shall have normal spread of crowns unless otherwise specified.

Bare root trees shall not require earth adhering to the roots except as required for puddling as specified. Any trees specified as bare root will be accepted balled and burlapped at the unit price bid for bare root trees.

Balled and burlapped trees shall be properly dug and protected to preserve the natural earth in contact with the roots. No manufactured balls will be accepted. The balls shall be of the required size, firmly wrapped and tied with approved materials. No balled plants will be acceptable if the ball is cracked or broken.

Balled and platformed trees shall be balled as specified for balled and burlapped trees. Platforms shall be square or octagonal shaped in a size slightly larger than the diameter of the bottom of the soil mass, inserted under each ball and securely lashed to the ball by means of ties from the platform corners to the rope collar on top of the ball.

Container grown trees shall be as specified in the contract documents.

The tops of trees shall be well formed structurally, but they are not required to have more than reasonably straight trunks, nor better than average well balanced crowns, nor be of specimen quality unless the requirements for "specimen" trees are specified on the plans.

When "street trees" are specified, they shall be consistent with the current American Standard For Nursery Stock standards for street trees, and the branching heights shall be as specified in the contract documents.

Shrubs. Shrubs shall have good fibrous root systems. The quality of balled and burlapped and balled and platformed shrubs shall be as specified for balled and burlapped and balled and platform trees herein. Container grown shrubs shall be as specified in the contract documents.

Plants specified as sods or clumps shall be dug from good soil which has produced a fibrous root system typical of the nature of the plant. The sods shall be dug with earth and incidental vegetation adhering to the roots. If the soil or habit of the root growth is such that the roots are not adequately protected, the sods shall be wrapped in burlap or other suitable material.

Vines. Vines shall be vigorous, well-furnished plants with good vigorous root systems. Vines shall be field grown unless otherwise specified. Pot grown plants shall be vigorous, well-developed plants, well established in pots with sufficient roots to hold the earth intact after removal from containers but they shall not be rootbound.

Substitutions. No change of size, kind or quality of plants as specified will be accepted except upon written approval of the engineer.

Labeling. Labeling shall be in accordance with currently accepted nursery labeling practice except that the Contractor may be required at any time to supply positive identification of any plant.

Inspection. The Contractor shall be responsible for all certificates of inspection of plant materials which may be required by federal, state, provincial or other authority to accompany shipments of plants. When nursery inspections are specified in the contract documents, they shall be limited to inspections of plants specified elsewhere in the contract documents. Unless otherwise specified in the contract documents, the Contractor shall provide at least 15 days notice to the Engineer stating the date, time and

place where specified nursery inspections may be conducted. The Contractor shall be represented at all inspections. The Department's expenses associated with inspections, will be paid for by the Department under the provisions of Section 106 Control of Material of the Standard Specifications. The Department reserves the right and option to place Department seals on any or all materials selected. Selection and/or tagging of material shall cover the type and body quality of the plant only, but shall not constitute acceptance nor preclude the right of rejecting plants not fully meeting the requirements of the specifications.

The Department reserves the right to identify by suitable non-injurious means such as painting, marking by various methods, etc. all plant material rejected upon delivery to the contract site.

BASIS OF ACCEPTANCE: Acceptance shall be based on inspection, upon delivery, by the Engineer for compliance with the materials requirements.

713-07 ROLLED EROSION CONTROL PRODUCTS AND SOIL STABILIZERS

SCOPE. This specification covers the material requirements for Rolled Erosion Control Products and Soil Stabilizers.

MATERIAL REQUIREMENTS

Class I (Short-Term) Light-duty, organic, or synthetic erosion control products.

Type A. Products for use where the slopes do not exceed 1:4. No minimum shear stress is required. The product shall be capable of withstanding moderate foot traffic without tearing or puncturing.

Type B. Products for use on slopes 1:3 and flatter. No minimum shear stress is required.

Type C. Products for use on slopes 1:3 or flatter, or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 1 1/2 psf at 1/2 inch soil loss.

Class II (Intermediate) Erosion control products.

Type A. Jute Mesh. For use on slopes 1:2 or flatter. Jute mesh shall be of a uniform, open, plain weave of undyed and unbleached, single-jute yarn. Jute mesh shall be woven as follows:

- Approximately 55 warp ends per yard width.
- Approximately 37 weft ends per linear yard.
- Mass of jute mesh shall average 1.0 (\pm 5%) pound per square yard.

Type B. Organic or nonorganic products for use on slopes 1:2 or flatter. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 1 psf at 1/2 inch soil loss.

Type C. Products made entirely of organic materials. For use on slopes 1:2 or flatter. Only 100% organic materials are allowed. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 1 psf at 1/2 inch soil loss.

Type D. Organic or nonorganic products for use on slopes 1:2 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 2 psf at 1/2 inch soil loss.

~~**Class III (Permanent)** Nondegradable synthetic products Turf Reinforcement Mat (TRM) [fibers, filaments, or nettings] which may be supplemented with natural or fiber components[composite].~~

~~**Type A.** A TRM for use on slopes 1:2 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 2 psf at 1/2 inch soil loss.~~

~~**Type B.** A TRM mat for use on slopes 1:2 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 3 psf at 1/2 inch soil loss.~~

~~**Type C.** A TRM mat (which includes a composite) for slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 2 1/4 psf at 1/2 inch soil loss.~~

~~**Type D.** A TRM mat (which includes a composite) for slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 3 psf at 1/2 inch soil loss.~~

Class III (Permanent Nondegradable synthetic [fibers, filaments, or nettings] which may be supplemented with degradable natural fiber components).

Type A. A TRM mat for use on slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 2 psf at 1/2 inch soil loss.

Type B. A TRM mat for use on slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 3 psf at 1/2 inch soil loss.

Type C. A TRM mat (which includes a composite) for slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 2 1/4 psf at 1/2 inch soil loss.

Type D. A TRM mat (which includes a composite) for slopes 1:1 or flatter or in channels. Products shall have the ability to protect soil from hydraulically induced shear stresses under bench scale conditions for at least 3 psf at 1/2 inch soil loss.

Comment [cjt141]:
EI 08-013

Class IV Soil Stabilizers. Soil stabilizers are short-term duration, erosion control products. When used alone, they shall be used on slopes 1:2 or flatter. They shall not be used in channels.

Type A. A cementitious soil binder which is added to wood cellulose fiber mulch, a Bonded Fiber Matrix (BFM). Intended to form a thick, heavy-bodied crust or mat-like barrier that controls water, and wind induced erosion. BFMs last up to six months and require a cure time up to 48 hours, without rain, to develop intimate soil contact.

Type B. A polyacrylamide (PAM) and calcium solution intended to reduce the erodibility of bare soils during construction activities or to enhance the performance of mulching on permanent slopes. Soil stabilizers, Type B, shall bond soil particles and shall effectively increase the soil particle size to 3/64 inch or larger. Soil stabilizers, Type B shall reduce the movement of soil through chemical bonding, increase the particle size thus making silt fence more effective, and increase the water absorption of the soil.

Type C. A soil binder made up of wood fibers, interlocking fibers, polymers and hydro-colloid tackifiers, a Flexible Growth Medium (FGM). Intended to form a thick, heavy-bodied crust or mat-like barrier that controls water, and wind induced erosion. FGMs last up to a year and require no cure time to develop intimate soil contact.

Type A, B and C soil stabilizers may be used alone and are approved for use with Class III, Types A and B TRMs where those products are used on slope applications.

BASIS OF APPROVAL. Application for approval shall be submitted to the Landscape Architecture Section by the manufacturer, accompanied by twelve (6 x 6 inch) samples of the product along with lab testing of the product by the National Transportation Product Evaluation Program (NTPEP), and a certification that the product conforms to this specification.

Upon approval by the Landscape Architecture Section, the product will be placed on the Department's Approved List.

BASIS OF ACCEPTANCE. Materials will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

713-08 MATERIALS FOR PROTECTION OF PLANTS

SCOPE. This specification covers the material requirements for materials used in planting operations. For methods of installation, see current standard sheet, as applicable.

MATERIAL REQUIREMENTS

Rodent Guards. Rodent guards shall be capable of protecting plants from girdling by rodents and shall be as specified in the contract documents or as approved by the Engineer.

Stakes for Supporting Trees

A. Above Ground Support. Stakes for supporting trees shall be of white or red cedar, or other approved material. Stakes 8 to 10 feet long shall have a minimum diameter of 2 to 2 1/2 inches. Stakes 12 feet long shall have a minimum diameter of 3 inches. The maximum diameter of stakes shall not exceed 4 inches. Stakes shall be pointed at one end and shall have a maximum allowable deflection of 1 1/2 inches for every yard of length. All stakes shall be sound and free from insects and fungi.

B. Underground Support. Stakes for supporting trees shall be of approved hardwood or other approved material. Hardwood stakes shall be 2 inches by 4 inches nominal size, approximately 4 feet long. Stakes shall be pointed at one end. All stakes shall be sound and free from insects and fungi.

Deadmen and Guy Stakes. Deadmen and guy stakes used to anchor guy wires or cables, which support trees, shall be of the quality and sizes required.

Wire. Wire for guying plants shall be new annealed steel wire (either galvanized or ungalvanized) or aluminum wire of the A.S. & W. gauge specified.

Bracing Materials. The size and quality of cables, turnbuckles, thimbles, leg hooks, eye bolts, rods, washers and nuts shall be as specified on the plans or as approved.

Jute Burlap. Jute burlap shall be in 4 inches wide strips and weigh 8 oz/yd².

Hose. Hose for protecting the bark from guy wires shall be good quality braided rubber, plastic hose as approved, or reinforced materials. Hose shall be at least 3/4 inch outside diameter.

Twine. Twine for use in wrapping trees shall be jute twine not less than two ply for trees 3 inches or less in diameter, and three ply for trees over 3 inches in diameter.

§713

Paper. Wrapping paper for trees shall be waterproof paper 30-30-30 krinklecraft or equal in 4 inch wide strips.

Anti-Desiccants. Anti-desiccants shall be emulsions or other materials which will provide a protective film over plant surfaces, permeable enough to permit transpiration.

BASIS OF ACCEPTANCE. Acceptance shall be based on inspection by the Engineer for compliance with the material requirements.

713-09 MYCORRHIZAL FUNGI

SCOPE. This specification covers the materials requirements for mycorrhizal fungi.

MATERIALS. Mycorrhizal fungi shall be approved commercially available products.

PACKAGING. Mycorrhizal fungi shall be delivered in the manufacturer's standard containers. Containers shall include a label stating the name of the material, application rates, expiration date, the net weight of the contents, and the manufacturer's name.

BASIS OF ACCEPTANCE. The manufacturer's label or certification indicating compliance with these specifications shall be the basis of acceptance. The Engineer reserves the right to reject any material that has become caked or otherwise damaged. All manufacturers' labels shall have an expiration date. The date on the label shall be within the current year of application.

Comment [cjt142]:
EI 08-013

~~713-09 AND 713-10 (VACANT)~~

713-10 Moisture Retention Additive

SCOPE. This specification covers the material requirements for moisture retention additive.

MATERIALS. Moisture retention additives shall be approved commercially available products.

PACKAGING. Moisture retention additives shall be delivered in the manufacturer's standard containers. Containers shall include a label stating the name of the material, application rates, expiration date, the net weight of the contents, and the manufacturer's name.

BASIS OF ACCEPTANCE. The manufacturer's label or certification indicating compliance with these specifications shall be the basis of acceptance.

Comment [cjt143]:
EI 08-013

713-11 WOOD FIBER MULCH

SCOPE. This specification covers the material requirements for wood fiber for use as a mulch in conjunction with turf establishment or erosion control.

MATERIAL REQUIREMENTS. Wood fiber shall be a first generation product manufactured directly from 100 percent wood which has been recovered or diverted from solid waste. Wood fiber shall be manufactured from unadulterated wood that is not contaminated with paint, chemicals, shingles, plastic or other foreign materials. Wood fiber mulch shall not be manufactured from or include paper.

Wood fiber mulch shall be manufactured so that the wood fibers will remain uniformly suspended in water under agitation and will blend with seeds, fertilizer and other additives to form a homogeneous slurry. It shall have the characteristics which, upon hydraulic application, shall form a blotter-like ground coating with moisture absorption and percolation properties and the ability to cover and hold seeds in contact with the soil.

Wood fiber mulch shall contain no growth or germination inhibiting factors, and shall contain a non-permanent green dye. Wood fiber mulch shall be supplied in the manufacturer's standard containers, with

the name of the material, net weight of contents, the manufacturer's name and the air dry weight of fiber (equivalent to 10% moisture) appearing on each container.

BASIS OF ACCEPTANCE. The Engineer's acceptance of wood fiber mulch shall be based on the manufacturer's product label, including methods and rates of applications, and certification indicating compliance with these specifications and any applicable regulatory requirements pertaining to solid waste management.

713-12 MULCH ANCHORAGE

SCOPE. This specification covers the material requirements for mulch anchorage.

MATERIAL REQUIREMENTS. Mulch anchorage shall be Type A, unless otherwise specified in the contract documents.

Type A: Shall be approved non-asphaltic commercially available products that are specifically formulated for the purpose of anchoring or tacking straw mulch. Mulch anchorage shall include a non-permanent green dye. The paper content of paper-based hydraulic mulch anchorage shall be 100 percent post consumer recovered from solid waste. At least 98 percent of such paper shall be recovered newsprint. The materials shall be mixed and applied in accordance with the manufacturer's instructions.

Type B: Shall be either Type A or asphalt emulsion meeting the requirements of either 702-3201 Asphalt Emulsion or 702-90 Asphalt Emulsion Tack Coat. When asphalt emulsion is used it shall be uniformly applied at the rate of 200 gal/acre, unless otherwise specified in contract documents.

PACKAGING. Mulch Anchorage Type A shall be furnished in the manufacturer's standard containers with the name of the material, net weight of contents, the manufacturer's name and the dry weight of fiber (equivalent to 10% moisture) appearing on each container. The instructions for mixing and application shall also appear on each container.

Asphalt emulsion used for Mulch Anchorage Type B has no packaging requirements. The Engineer shall reject any asphalt material that is not homogenous or has separated. Asphalt separation caused by freezing unacceptable.

The Engineer shall reject any materials that have become wet, caked, frozen, separated or otherwise unfit for use.

BASIS OF ACCEPTANCE. The basis of acceptance for Mulch Anchorage Type A shall be the manufacturer's product label or product literature that indicates compliance with this specification. The basis of acceptance for asphalt emulsion used as Mulch Anchorage Type B shall be as specified under Section 702 Bituminous Materials.

713-13 PESTICIDES

SCOPE. This specification covers the material requirements for pesticides used to manage vegetation, insects, rodents and/or other target pests.

MATERIAL REQUIREMENTS. Pesticides shall be approved commercially available products that are currently registered by the United States Environmental Protection Agency and the New York State Department of Environmental Conservation. Pesticides shall also have all required labels indicating that they are approved for the intended use.

Pesticides shall be mixed and used in strict conformance with the instructions on the label or supplemental labels.

§713

PACKAGING. Pesticides shall be delivered and securely stored until used in the manufacturer's standard containers that have legible labels affixed in accordance with the provisions of the federal and state pesticides laws, rules and regulations in effect at the time of delivery.

Pesticides that do not meet these packaging requirements, at any time, will be rejected by the Engineer and shall be removed from the Contract site immediately.

The Engineer shall reject any pesticides that have become wet, caked or otherwise unfit for use.

BASIS OF ACCEPTANCE. The basis of acceptance shall be original, sealed, and properly labeled pesticide containers; and two copies of sample labels and supplemental labels that include instructions for the intended use of the pesticide.

The Department reserves the right to inspect the condition of pesticides and pesticide containers at any time while they are on the Contract site and to direct immediate removal of any pesticides and/or containers that do not meet these specifications.

713-14 SOD

SCOPE. This specification covers the material requirements for sod.

MATERIAL REQUIREMENTS. Sod shall be commercially grown sod and shall be accompanied by a certificate indicating compliance with the regulations of the New York State Department of Agriculture and Markets.

Sources of sod shall be made known to the Engineer at least five days before cutting. Sod shall be cut into squares or rectangular portions which shall be 12 inches wide, or as approved, and may vary in length, but shall be of a size which will permit them to be lifted without breaking. The sod, when delivered to the contract site, shall be sufficiently moist so the soil will adhere firmly to the roots when it is handled. Height of the grass shall not exceed 3 inches. The sod shall be cut to a minimum thickness of 3/4 inch. The sod shall be reasonably free from weeds in conformance with accepted commercial practice and shall consist of a mixture of permanent grasses such as bluegrass and/or fine leaved fescues, unless otherwise specified.

BASIS OF ACCEPTANCE. Acceptance shall be based on inspection by the Engineer for compliance with the material requirements.

713-15 ORGANIC MATERIAL

SCOPE. This specification covers the material requirements for organic material used in conjunction with amending or manufacturing topsoil and for erosion control products.

GENERAL. Organic materials regulated by the NYS Department of Environmental Conservation and the NYS Department of Health (NYSDOH) shall meet all applicable regulatory requirements.

MATERIAL REQUIREMENTS.

Peat Moss. Peat moss shall be commercially produced and shall be composed of the partly decomposed stems and leaves of any or several species of sphagnum moss. It shall be free from wood, decomposed colloidal residue, and other foreign matter. It shall have an acidity range of 3.5 pH to 5.5 pH as determined in accordance with methods of testing of Association of Official Agricultural Chemists. Its water-absorbing ability shall be a minimum of 1100% by weight on an oven-dry basis.

Compost. Compost shall be source-separated compost or composted biosolids that have been commercially or municipally produced and shall be an organic substance produced by the biological and biochemical decomposition of compostable source-separated or biosolid material that is separated at the point of waste generation. Source-separated and biosolid materials may include, but not be limited to, leaves and yard trimmings, food scraps, food processing residues, manure and/or other agricultural residuals, forest residues and bark, soiled and/or unrecyclable paper, and biosolid materials.

Source-separated compost and composted biosolids shall be reasonably free of sticks, stones, refuse, materials deleterious to soil structure, or any material toxic or detrimental to plant germination and growth. Compost containing foreign material may be rejected on the basis of a visual examination. Biosolids are regulated by the NYSDOH, and must meet all applicable regulatory requirements.

Type A. Compost for Turf Establishment, Sodding, and Planting.

- 1) Minimum organic-matter content shall be 30% (dry-weight basis) as determined by loss on ignition.
- 2) Product shall be loose and friable, not dusty, and have a moisture content of 35% - 60%, (wet weight basis).
- 3) Particle size shall be < 1/2 inch, (100% passing).
- 4) Soluble salts concentration shall be < 4.0 mmhos/cm (ds/m), maximum.
- 5) Compost shall be stable to very stable according to the test method current on the date of advertisement for bids.
- 6) pH shall be between 6.0-8.5.

Type B. Compost for Erosion/Sediment Control Filter Berms.

- 1) Compost for Erosion/Sediment Control Filter Berms shall meet the requirements of AASHTO Designation MP 9-03 and as follows:
- 2) Minimum organic matter content 25% - 65% (dry-weight basis) surfaces to be vegetated; 25% - 100% (dry weight basis) surfaces to be left unvegetated.
- 3) Gradation:

Sieve Size	Percent Passing by Weight
3 inch	100
1 inch	90 to 100
3/4 inch	70 to 100
1/4 inch	30 to 75

Maximum particle length; 6 inch
- 4) Soluble salt concentration shall be 5 mmhos/cm; (ds/m) maximum.
- 5) Compost shall be stable to very stable according to the current test method.
- 6) pH shall be between 5.0 - 8.5.

Type C. Compost for Erosion/Sediment Control Compost Blankets (Mulch for Seeded Areas).

- 1) Compost for Erosion/Sediment Control Compost Blankets, (mulch for seeded areas), shall meet the requirements of AASHTO Designation MP 10-03 and as follows:
- 2) Minimum organic matter content 25% - 65% (dry weight basis) surfaces to be vegetated; 25% - 100% (dry-weight basis) surfaces to be left unvegetated.
- 3) Gradation:

Sieve Size	Percent Passing by Weight
3 inch	100
1 inch	90 to 100
3/4 inch	65 to 100
1/4 inch	0 to 75

Maximum particle length; 6 inch
- 4) Soluble salt concentration shall be 5 mmhos/cm; (ds/m) maximum.
- 5) Compost shall be stable to very stable according to the current test method.
- 6) pH shall be between 5.0 - 8.5.

Composted biosolids used to amend or manufacture topsoil shall have a certificate from a laboratory approved by the NYSDOH verifying compliance with all applicable laws, rules, and regulations. Only facilities permitted to compost biosolids under 6 NYCRR Part 360, will be allowed to furnish finished compost for use in topsoil. The certification shall be supplied by the Contractor prior to the delivery of any composted biosolids, topsoil containing composted sewage sludge, or other such regulated material to the contract site.

§713

BASIS OF ACCEPTANCE. Peat moss and compost will be accepted on the basis of a Producer's label or a certificate of analysis by a laboratory certified by a nationally recognized entity indicating compliance with the material requirements and visual inspection.

Acceptance of composted biosolids shall be based on certification by a NYSDOH approved laboratory indicating compliance within the material requirements and all applicable regulations.

Compost supplied or manufactured by participants in the US Composting Council's Seal of Testing Approval Program will be accepted based on the Program's Compost Technical Data Sheets. The data shall represent a minimum of one year of testing results and the most recent test shall have been conducted with ninety days of material acceptance.

Compost supplied or manufactured by suppliers that do not participate in the US Composting Council will be accepted based on certification by a laboratory certified by a nationally recognized entity indicating compliance with the material requirements.

Compost may be sampled and tested by the Department to ensure compliance with the material requirements.

713-16 AND 713-18 (VACANT)

713-19 STRAW

SCOPE. This specification covers the materials requirements for straw.

MATERIAL REQUIREMENTS. Straw for mulching shall be stalks of oats, wheat, rye or the approved crops which are free from noxious weeds. Materials which are low grade and unfit for farm use, such as "U.S. sample grade" will be acceptable. Weight shall be calculated on the basis of the materials having not more than 15% of moisture content.

BASIS OF ACCEPTANCE. Acceptance shall be based on inspection by the Engineer for compliance with the material requirements.

SECTION 714 - CURBING AND GUTTER

714-01 STONE CURB

SCOPE . This specification covers the material and fabrication requirements for stone curb used in highway and bridge construction.

MATERIAL REQUIREMENTS. Stone curb shall be either a bluestone, sandstone or granite. The stone shall be sound and durable, free from seams which impair its structural integrity and of a smooth splitting and machining character. Natural color variations that are characteristic of the deposit will be permitted. Any curb containing discoloration other than cleanable surface stains shall be sampled and submitted to the Materials Bureau for evaluation.

Dimensions

A. General. Curb shall be cut to conform to the shape and size shown on the standard sheets and contract plans.

B. Curbs on Straight Sections. Minimum lengths of straight segments of Economy and Sloped curbs shall be 2 feet. All other straight curb types shall have 3 foot minimum lengths.

C. Curbs on Curved Sections. No minimum length requirements are specified for curb segments on curves with radii of 200 feet or less. When directed by the Engineer, curb segments on curves with radii 100 to 200 feet shall be cut in 3 to 4 feet straight lengths. With exception of Economy and Sloped curbs, segments on curves with radii of 100 feet or less shall be shaped to the

required curvature and the ends cut on radial lines. Economy and Sloped curbs shall be furnished only in straight segments and on curves with radii less than 10 feet, their ends shall be cut on radial lines.

D. Transition Curb for Bridge to Roadway Curbs. A transition curb for bridge curb to roadway curb shall be furnished, if required. Where an 8 inch exposed face is desired for a roadway curb, the appropriate curb sections with a 6 inch exposed face shown on the appropriate section of the standard sheet shall be increased 2 inches in depth.

E. Curb Widths. The bottom width of the various types of curbing shall be as follows:

Type	Width
A,B,C,D,E,T2 and Economy	4 inch minimum for 2/3 of length
F1,G1,M and T1	4 inch minimum for entire length
R1 and R2	8 inch minimum for entire length
S	5 inch minimum for entire length

Finish

A. General. Curb surfaces shall be finished as indicated on the plans or standard sheets.

B. Top Surfaces. Top surfaces shall be finished to approximately true planes. When sawed, hammered or thermal finishes are applied, no projection or depression shall be greater than 3/16 inch. Saw marks normal to the sawing process will be permitted if within the 3/16 inch tolerance.

C. Arris Lines. Top front arris lines shall be straight and true with no variations greater than 1/8 inch measured from a 2 foot straightedge placed along the arris line.

Back arris lines on curb types E,F1,M,T1, and T2 curb and the lower front arris lines on types E,F1,M,R1,R2,S,T1 and T2 curbs shall be straight and true with no variations from a straight line greater than 1/4 inch measured in the same manner. Back arris lines are not required for types R1,R2 and S curbs.

Exposed arris lines at the joints shall not project beyond the plane of a split face and shall not fall under the plane of a split face more than 1/4 inch.

D. Back Surfaces. Back surfaces shall have no projection or depression which exceeds a batter of 1 inch in 3 inches for a distance of 3 inches from the top.

E. Front Exposed Faces. Front exposed faces of straight Types A, F1, and G1 curbs, when split, shall have no projection greater than 1 inch or depression greater than 1/2 inch measured from a vertical plane passing through the arris line at the top of the split face. For radius units the front exposed faces when split, shall have no projection greater than 1 1/4 inch. The entire face of Type G1 curb shall be considered as exposed face. Front exposed faces of types M, R1, R2, S, T1 and T2 curbs, when split, shall have no projection or depression greater than 1/2 inch measured from a vertical plane passing through the arris line at the top of the split face. Front faces below grade shall have no projection or depression greater than 1 inch measured in the same manner.

No projection on the exposed face of type C curb shall extend over 1/4 inch beyond a vertical plane extending from the intersection of the pavement grade line and the curb face. The exposed face of type C curb shall have no depression greater than 1/2 inch measured from the plane of the face through the top arris line.

F. Ends. Ends of curbs shall be approximately square with the planes of the exposed curb surfaces and shall be finished so that when curbs are set, no space greater than 3/4 inch shall show in the joints for the full length of the exposed joint. The curb ends below the pavement surface or shoulder shall break not over 8 inches from the joint plane on curb types A, B, C, D, E and T2 curbs and not more than 2 inches on types G1, R2, and T1.

Ends of types F1, G1, M, R1, R2, S and T1 curbs shall be sawed at locations called for on the contract plans.

G. Drill Holes. Drill holes will not be permitted in exposed curb surfaces.

Exceptions to Finish Requirements

A. Economy Type Curbs. Top surfaces shall be split so that no projections or depressions are greater than 1/2 inch. Front arris lines shall not vary from a straight line more than 1/2 inch. Exposed joint openings shall not exceed 1 1/2 inch. Drill holes will be permitted in top and face surfaces.

B. Sloped Type Curb. Exposed faces shall be smooth and quarry split to an approximately true plane having no projection or depression greater than 1 inch from a 2 foot straightedge placed as closely as possible to the plane of the curb face.

Drill holes not more than 3 inches long and 1/2 inch deep will be permitted in the face. Arris lines at joints shall not project beyond the plane of the split face and shall not fall more than 1/2 inch under the plane of the split face.

Curb ends shall be approximately square with the plane of the exposed curb surfaces and finished so that when curbs are set, no space greater than 1 1/2 inch shall show in the joints for the full width of the face.

BASIS OF ACCEPTANCE. Stone curb shall be from a source appearing on the Department's Approved List and will be accepted in accordance with procedural directives of the Materials Bureau. In addition, the stone curbing will be inspected for dimensional compliance at the project site by the Engineer. Curbing not in compliance with the dimensions on the standard sheets or contract plans will be rejected by the Engineer.

714-02 AND 714-03 (VACANT)

714-04 PRECAST CONCRETE CURB

SCOPE. This specification covers the material and fabrication requirements for precast concrete curb.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following shall apply. Precast curb shall be fabricated to conform to the size and shape shown on the standard sheet unless otherwise shown on the plans.

Minimum curb lengths shall be 6 feet except for radial curb and closures. Maximum curb lengths shall be 10 feet. Curb to be set on a radius of 100 feet or less shall be cast to the curve required and the ends shall be formed or sawed on radial lines. Curbs to be set on a radius of 101 to 200 feet may be cast or cut in 3 or 4 foot straight lengths, if approved by the Engineer.

Reinforcing. Reinforcement is optional, however if the manufacturer chooses to reinforce the curb for handling the reinforcement shall be epoxy coated or the concrete shall contain corrosion inhibitor.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §704-03 shall apply.

1064 MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein.

Markings shall be placed on an end face of each unit such that they won't be exposed to view after installation. Instead of marking the contract number on each unit they may be marked with "NYSDOT".

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply.

714-05 (VACANT)

714-06 ASPHALT CONCRETE CURB

SCOPE. This specification covers the material requirements for asphalt concrete curb.

MATERIAL REQUIREMENTS. The Contractor shall have the option of supplying the mix specified herein or he may elect to furnish an alternate mixture subject to prior approval by the Director, Materials Bureau. The requirements of Section 401 - Hot Mix Asphalt Production shall apply with the following modifications:

- A. Automatic batching and recording equipment will not be required.
- B. The asphalt concrete mix shall include a powdered, devulcanized tire rubber which is moisture free, black in color, free flowing and containing no fabric or cord material. The gradation shall conform to the following sieve analysis; percent passing of total weight:

Sieve Size	No. 4 No. 20	No. 8 No. 30	No. 12
% Passing		100 65-100 15-40	85-100 35-80

C. The asphalt cement used in the mix shall comply with either material specification §702-0400, §702-0500, or §702-0600.

D. The aggregate gradation shall be as follows:

Sieve Size	% Passing ⁽¹⁾	Job Mix Tolerances (%)
1/2 inch	100	--
1/4 inch	90-100	± 5
1/8 inch	80-100	± 6
No. 20	30-70	± 7
No. 40	15-45	± 6
No. 80	5-23	± 3
No. 200	2-10	± 2
Asphalt Cement ⁽²⁾	6-9	± 0.4
Tire Rubber ⁽²⁾	1/2 - 2	± 0.1

(1) Based on total aggregate weight.

(2) Based on total weight of mix.

BASIS OF ACCEPTANCE. The acceptance of the asphalt concrete used in asphalt curb shall be in accordance with the Department written instructions.

714-07 PRECAST CONCRETE GUTTER

§714

SCOPE. This specification covers the material and fabrication requirements for precast concrete gutter.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03, along with the following shall apply.

Precast concrete gutter shall be fabricated to conform to the size and shape shown on the standard sheet unless otherwise shown on the plans.

Reinforcing. Wire mesh reinforcement shall consist of one layer of Size 4 x 4 inch - W4 x W4 embedded midway between the upper and lower surfaces, unless otherwise shown on the plans. Reinforcing bars of equivalent area may be substituted for the wire mesh reinforcement. Reinforcement shall be epoxy coated or the concrete shall contain corrosion inhibitor.

SAMPLING AND TESTING. The Sampling And Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein.

Markings shall be placed on an end face of each unit such that they won't be exposed to view after installation. Instead of marking the contract number on each unit they may be marked with "NYSDOT".

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis Of Acceptance requirements contained in §704-03 shall apply.

SECTION 715 - CASTINGS, FORGINGS AND METALS

715-01 STRUCTURAL STEEL

SCOPE. This specification covers structural steels used in bridge construction that have a minimum specified yield point of 345 MPa, or less. Steel ordered under this specification may be subject to stress in any direction; longitudinal, transverse and/or through-thickness.

MATERIAL REQUIREMENTS. The manufacture, testing, delivery, and requirements for mill inspection of structural steel shall comply with the requirements of the applicable ASTM Specifications except as modified herein.

Requirements for shop inspection of plates and shapes, and provisions for rejection or shop repair of plates and shapes because of rejectable surface or internal discontinuities, are described in the New York State Steel Construction Manual.

Steels to be Furnished. The contract plans or specifications will indicate, by the proper ASTM Designation, the steel to be used in specific portions of the structure. If the steel type is not indicated on the plans or specifications, the type to be furnished shall meet the requirements of ASTM A36.

All structural steel plates and shapes used in areas subject to tensile stress as designated on the plans or as listed herein shall be furnished to minimum Charpy V-Notch toughness requirements as provided in this specification. Structural Steel furnished to minimum notch toughness requirements shall include but not necessarily be limited to the following:

- Tension flanges and webs of stringers and girders, splice plates, and lateral gusset plates welded to the members in areas subject to tensile stress.
- Structural shapes used as main stress carrying members including attached cover plates and gusset plates welded to the members in areas subject to tensile stress.
- All truss web and chord members and attached gusset and splice plates.
- Truss lateral bracing
- Portions of Arches, Bents, Towers and Rigid Frames, plus attached gusset and splice plates, designated on the plans as being subject to tensile stress.

TESTS. Physical (mechanical) tests and chemical analysis shall be conducted by the steel manufacturer as required by the specifications.

The method of sampling, preparing test specimens and testing shall be in accordance with the applicable ASTM Designation, except as modified herein.

Charpy V-Notch Impact Test. When the provisions of these specifications require that steel be furnished with specified impact properties, and the steel is not “fracture-critical” as defined in Section 9 of the SCM, the steel shall be accepted on the basis of heat-lot qualification tests as described herein. The tests shall be performed as described for V-Notch test specimens under the heading, “Charpy Impact Testing” of ASTM Designation A370. Full size (10 mm x 10 mm) specimens shall be used whenever thickness permits. When plate thickness requires that subsize specimens be used, the specimens shall be 10 mm x 7.5 mm, or 10 mm x 5 mm. The largest possible specimens shall be used in each case.

When steel thickness is 1 inch or greater, Charpy specimens shall be taken midway between the center and the surface of the plate.

The manufacturer shall conduct and report the results of Charpy V-Notch impact tests to the State. For heat qualification, sampling and testing shall be in conformance with ASTM A673 using the “H” testing frequency.

For any heat to qualify, the average energy, as defined in ASTM A370, absorbed by a full-size specimen shall not be less than that shown for the type of steel in the Table 715-01-1.

If test specimens fail to meet the heat qualification impact requirements, the plate thickness represented by the failed specimens shall be rejected. The producer may test specimens from the next thinner material proposed to be furnished from the same heat and if they meet specification requirements, the heat will be considered qualified for those thicknesses equal to or less than that tested and found acceptable in the retest.

Any thickness that fails to qualify in the as-rolled condition may be normalized and retested provided that all required mechanical tests are remade on the normalized material. Those thicknesses that passed the test above described in the as-rolled condition need not be normalized even though they were rolled from the same heat of steel.

TABLE 715-01-1 CHARPY V-NOTCH IMPACT REQUIREMENTS	
TYPE OF STEEL	ENERGY (Ft-lbs @ 40°F)
A36, A242	15
A572 Grade 50	14 15 ¹
A588 (up to 4 inches mechanically fastened)	14 15 ¹
A588 (up to 2 inches welded)	14 15 ¹
A588 (2 to 4 inches welded)	20 20 ¹
Sign Structure steel plates and shapes greater than 1/2 inch thick ²	20

NOTE:

1. If the yield strength of the material exceeds 65 ksi, the temperature for the Charpy V-Notch tests for acceptability shall be reduced by 15°F for each increment of 10 ksi above 65 ksi.
2. Samples shall be taken after galvanizing.

§715

If the plate thickness requires that subsize specimens be used, Table 715-01-2 shall be used to find the equivalent absorbed energy for the full size specimen:

Impact tests for fracture-critical members shall be as described in section 9 of the SCM

Full Size (10 x 10 mm)	3/4 Size (10 x 7.5 mm)	1/2 Size (10 x 5 mm)
20	16	10
15	12	8
13	10	7
12	10	7
10	8	5
7	6	4

BASIS OF ACCEPTANCE. A certified copy of test results of chemical analyses and physical (mechanical) tests required shall be furnished for all steel. These test data shall be given to the shop inspector for submittal to the Deputy Chief Engineer (Structures) with his/her final inspection report.

When steel is furnished under an item which does not require shop inspection, these data shall be submitted to the Engineer-in-Charge who will perform the visual inspection required by this specification and the payment item.

A manufacturer's certification of the results of chemical and physical (mechanical) tests conducted as required by the specifications will be interpreted to mean that the manufacturer has tested the product as required by the specifications, and has found both materials and workmanship to conform to the specification designation listed on the report of physical and chemical test results that are certified to be accurate. Workmanship as defined herein shall include dimensional accuracy, surface finish, temper and any other physical and/or mechanical property which may be affected by manufacturing procedures.

715-02 STEEL CASTINGS

SCOPE. This specification covers the material requirements for steel casting for highway bridges.

GENERAL. Steel castings shall conform to the requirements of ASTM A27M. Unless otherwise specified, all steel castings shall be Grade 485-275 Class 1.

MATERIAL REQUIREMENTS

Fracture. Test specimens shall show a fracture having a silky or fine granular structure throughout.

Structural Defects. Steel castings shall be true to pattern in form and dimensions, without sharp unfilleted angles, or corners, and shall be free of pouring faults, sponginess, cracks, blow holes and other defects in positions affecting their strength and value for the service intended.

Blow holes appearing upon finished castings shall be so located that a straight line laid in any direction will not cut a total length of cavity greater than 1 inch in any 12 inches, nor shall any single blow hole exceed 1 inch in any dimension or have an area greater than 1/2 square inch. Blow holes shall not have a depth injuriously affecting the strength of the casting as determined by the Deputy Chief Engineer (Structures). Minor defects which do not impair the strength may, with the approval of the Deputy Chief Engineer (Structures), be welded by an approved process. The defects shall be removed to solid metal by drilling, grinding, or air-carbon arc gouging followed by grinding. After welding, the castings shall be heat treated again if required by the approved repair procedure.

Castings which have been, or are being, welded without prior approval of the repair welding procedure will be rejected.

Large castings may be subjected to non-destructive tests if required by the Contract Documents.

BASIS OF ACCEPTANCE. Acceptance shall be based upon shop inspection at the manufacturing plant by representatives of the Department, or on the basis of inspection at the project site by the Engineer-in-Charge. Certified copies of the results of the chemical and physical tests required by the specifications shall be submitted as required under the provisions of “Basis of Acceptance” in 715-01, Structural Steel.

715-03 ALUMINUM CASTINGS

SCOPE. This specification covers the requirements for various aluminum alloys and shapes.

GENERAL. Aluminum castings shall conform to the requirements of ASTM Specifications as shown in the following table, and as modified herein and by the plans and specifications.

Commercial Specification Alloy & Temper	ASTM Alloy & Temper	ASTM Specification	Product
B443.0-F	S5A-F	B108	Permanent Mold Castings
B443.0-F	S5A-F	B26M	Sand Castings
A356.0(modified) ¹	SG 70-B(modified) ¹	B108	Permanent Mold Castings
356.0-T6	SG 70A-T6	B26M	Sand Castings
356.0-F	SG 70A-F	B26M	Sand Castings
360.0	SG 100-B	B85	Die Castings
A712.0	ZG 61-B	B26M	Sand Castings

NOTE: 1. Where this material is required, castings shall be solution treated and aged to produce the following mechanical properties (Yield strength need not be determined unless ordered by the Deputy Chief Engineer (Technical Services)):

Ultimate Tensile Strength	25 ksi min.
Yield Strength (0.2 percent offset)	18 ksi min. ²
Elongation (measured with gage length of four times the diameter of the specimen.)	6 percent min.

MATERIAL REQUIREMENTS

Quality. The castings shall be of uniform quality and condition, free from cracks, blow holes, porous places, hard spots, or shrinkage defects which affect the suitability of the castings for their intended use. Before inspection the castings shall be smooth and clean.

Heat Treatment. Casting shall be heat treated in such a manner as to produce material which will conform to the properties specified herein with the approved uniformity.

Castings to be used as bridge railing posts shall be produced under radiographic control. This shall consist of radiographic examination of castings until proper foundry technique, which will produce castings consistently free from harmful internal defects, is established for each mold. Production castings shall be examined as necessary to insure maintenance of satisfactory quality.

Tension test specimens shall be machined from integrally cast test coupons extending sufficiently from one side of the base of the posts to obtain a 0.35 inch diameter test specimen as defined in “Methods of Tension Testing of Metallic Materials” ASTM E8, with the exception that the radii at the ends of the reduced section shall not be less than 1/2 inch.

The method of test and determination of tensile properties shall be in accordance with ASTM E8. A minimum of one percent of the posts in any lot, but not less than one, shall be sampled for tensile testing. For the purpose of sampling, a lot shall consist of not more than 1000 pounds of clean castings when produced from a batch type furnace charged with one heat of ingot of known analysis or not more than 1 ton of clean castings when produced from one continuous furnace in not more than 8 consecutive hours.

§715

If the results of any tensile test do not conform to the requirements prescribed, two additional tests shall be taken from the same group of castings, and the average of the three tests must meet the requirements.

BASIS OF ACCEPTANCE. This material is accepted on the basis of a manufacturer's certification of compliance as described in "Basis of Acceptance," 715-01 except as follows, when the material is used in:

Bridge Railings. Accepted on the basis of shop inspection by the Department in accordance with Department directives.

Fencing. Accepted on the basis of samples secured in accordance with Department directives.

715-04 WROUGHT ALUMINUM

SCOPE. This specification covers the requirements for various aluminum alloys and shapes.

MATERIAL REQUIREMENTS

Physical & Chemical Requirements. Wrought aluminum shall conform to the requirements of ASTM specifications as shown in Table 715-04-1 and as modified herein and by the plans and specifications.

Each piece shall be marked with the manufacturer's name or trade mark and with alloy and temper designations in the manner described in the pertinent ASTM specifications.

When a clad material is specified, it shall be clad on both sides unless specified otherwise.

Mechanical Properties. When alloy 6061-T94 is required by the plans or specifications, it shall be defined as that temper which will produce in the wire the following mechanical properties after weaving:

- minimum ultimate tensile strength: 54 ksi
- minimum tensile yield strength: 47 ksi

BASIS OF ACCEPTANCE. This material shall be accepted on the basis of a manufacturer's certification of compliance except when this material is used in Bridge Railing when it shall be accepted on the basis of shop inspection by the Department in accordance with Department directives, or Fencing when it shall be accepted on the basis of samples received in accordance with Departmental directives.

715-05 IRON CASTINGS

SCOPE. This specification covers material requirements for iron castings.

MATERIAL REQUIREMENTS. Iron castings shall conform to the requirements of AASHTO M 105, Class 30B or Class 35B.

FABRICATION. Castings shall be true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow holes and other defects at locations affecting their strength and value for the service intended. Castings shall be boldly filleted at angles and the arises shall be sharp and perfect. Castings having blow holes plugged or filled with putty or cement of any kind will be rejected.

Grates, covers and curb boxes shall have continuous, full, and uniform bearing contact with their corresponding frames and shall be non-rocking when in place and under the influence of traffic or other loads. Methods that are permissible to achieve secure non-rocking fit between grates, covers and their corresponding frames are:

- Ground mating surfaces
- Machined and milled mating surfaces (horizontal and/or vertical).

All cast gratings, covers, frames and curb boxes shall be delivered to the work site free of any coatings unless specified otherwise.

Castings that fail to meet the requirements of this specification shall be rejected and immediately removed from the work site.

BASIS OF ACCEPTANCE. Iron castings shall be accepted in accordance with the procedural directives of the Department.

715-06 STEEL FORGINGS

MATERIAL REQUIREMENTS. Steel forgings shall conform to the requirements of ASTM A668/A668M, Class C, or other class approved by the DCES.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

715-07 PROOF LOADED IRON CASTINGS

§715

SCOPE. This specification covers material and testing requirements for proof loaded iron castings.

MATERIAL REQUIREMENTS. Iron castings shall conform to the requirements of AASHTO M 105, Class 30B or Class 35B. Castings shall be true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow holes and other defects at locations affecting their strength and value for the service intended.

Grates, covers and curb boxes shall have continuous, full, and uniform bearing contact with their corresponding frames and shall be non-rocking when in place and under the influence of traffic or other loads. Methods that are permissible to achieve secure non-rocking fit between grates, covers and their corresponding frames are:

- Ground mating surfaces
- Machined and milled mating surfaces (horizontal and/or vertical).

All gratings, covers, frames and curb boxes shall be delivered to the work site free of any coatings unless specified otherwise.

Castings shall be boldly filleted at angles, and the arises shall be sharp and perfect.

Castings having blow-holes plugged or filled with putty or cement of any kind will be rejected.

Castings that fail to meet the requirements of this specification shall be rejected and immediately removed from the work site.

Approved List. All iron castings conforming to the requirements of Standard Sheets "Cast Manhole Frames, Grates and Covers" and "Cast Frames and Curb Boxes and Welded Frames" will be approved without any proof load requirements. No Materials Details need be prepared for those articles.

For all other iron castings Materials Details shall be prepared and submitted to the Director of Materials Bureau for approval. All dimensions shall conform to those depicted on the standard sheets. Also the articles will be proof-load tested in accordance to the Department's Test Method "Proof Loading of Cast Iron Frames, Grates, Covers and Curb Boxes", a copy of which may be obtained from the Director of Materials Bureau. After the proof-load tests are successful and the drawings are approved, the manufacturer's name, material details reference number and approval date will be placed on the Department's Approved List.

DETAILS. All dimensions, including specified tolerances, in the Material Details shall be within the limits specified on the standard sheets.

Corresponding section thicknesses of frames F1, F2 and F3 shall be same unless load tested.

Corresponding section thicknesses and number of stiffeners of the mountable curb boxes (CMs) and unmountable curb boxes (CUs) shall be same. Also corresponding section thicknesses and number of stiffeners of all curb boxes, CUs and CMs, shall be same unless load tested. The class of iron to be used shall be clearly identified. Payment areas as indicated on the standard sheets shall be included.

Testing Facility. The Department's laboratory will conduct the proof load testing for acceptance of the design.

SAMPLES AND SUBMISSIONS. The manufacturer/supplier shall provide the following to the Materials Bureau before any testing can begin:

- Two (2) copies of the Material Details for each iron casting to be approved
- Two (2) samples of each cast iron article to be load tested as directed by the Materials Bureau
- One (1) sample of corresponding reticuline grate and any nuts and bolts required for assembly
- Two (2) B-Bar test specimens cast within an hour of casting each of the test samples and machined as per AASHTO M 105. Both ends of the specimen shall be machined to 1 1/8 inch x 7 threads per 1 inch.

It is the manufacturer/supplier's responsibility to remove in an expedient manner all supplied material from the Department's premises after the tests are done.

1072 Failure Criteria. The design of an iron casting will be rejected if the following conditions are not met:

A. Permanent Set. This criterion applies to cast iron grate and cover. The maximum permanent set in any article, measured relative to a fixed horizontal plane, shall not exceed the lesser of 1/8 inch or 1/150 of the clear opening.

B. Cracks. All articles will be inspected after the completion of each test. No part of any article shall break or have any cracks.

Retests and Re-submissions. If the dimensions of the article(s) do not fall within the limits of the Material Details, either new article(s) or new Details shall be submitted at the manufacturer's option.

Upon failure under proof loading no retests will be allowed. Complete new designs shall be submitted for further testing.

Quality Assurance During Production. The B-Bar test results for each lot of castings (a lot is defined as per AASHTO M 105) shall be maintained by the foundry for a period of seven (7) years and shall be made available to the Department upon request. Although proof load testing is not required during the production phase, the Department reserves the right to test any piece at any time.

BASIS OF ACCEPTANCE. Cast iron frames, grates, covers and curb boxes shall be accepted at the project site based on the manufacturer's name appearing on the Approved List, conformance to the approved Materials Details or standard sheets, and the required manufacturer's certifications. For each contract supplied, the following shall be provided to the Engineer:

A. Manufacturer's Certification. The manufacturer shall provide certification that every piece of cast iron frame, grate, cover and curb box supplied was manufactured in accordance with these specifications and the approved Materials Details or Standard Sheets.

B. Materials Details. Two (2) copies of the approved Material Details, identified by reference number and approval date as shown on the Approved List.

715-08 (VACANT)

715-09 MALLEABLE IRON CASTINGS

SCOPE. Malleable Iron Castings shall conform to the requirements of ASTM A47/A47M. The Grade shall be Grade 32510.

MATERIAL REQUIREMENTS. Castings shall be true to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blow holes and other defects in positions affecting their strength and value for the service intended.

The casting shall be boldly filleted at angles and the arises shall be sharp and perfect. The surface shall have a standard quality finish.

When galvanizing is required, it shall be in accordance with 719-01, Galvanized Coatings and Repair Methods, Type II. Particular care shall be exercised so as not to embrittle malleable castings when galvanizing. All galvanized castings shall meet specification requirements after galvanizing.

BASIS OF ACCEPTANCE. Acceptance of this material shall be in accordance with procedural directives of the Department.

715-10 (VACANT)

715-11 METAL BIN TYPE RETAINING WALL

SCOPE. This specification covers the material and quality requirements for metal bin-type retaining walls.

MATERIAL REQUIREMENTS

Base Metal. The base metal for all components except fasteners shall be manufactured by the open hearth, basic oxygen process or electric furnace process and shall conform to the requirements of AASHTO M218. Base metal for the fasteners shall conform to the requirements of ASTM A307.

FABRICATION

Details. All members shall be so fabricated that members of the same nominal size shall be freely interchangeable. No drilling, punching or drifting to correct defects in manufacture shall be permitted. Any units having holes improperly punched shall be replaced by the Contractor at no expense to the State.

The members in the wall shall conform to the gages, surface treatments and descriptions in Table 715-11, as well as the gages and dimensions shown in the plans. All materials receiving the Type IV surface treatment shall have a nominal zinc coating weight of 2.0 oz/sf such that the minimum check limits for the triple-spot and single-spot tests shall be 2.0 oz/sf and 1.8 oz/sf respectively.

Configuration. Walls shall consist of a series of pairs of columns, one column in each pair being in the plane of the wall face and the other column being in the plane of the rear of the wall, with the pair of columns spaced longitudinally with overlapping S-shaped facing and rear members (stringers) and transversely with overlapping U-shaped tie-members (spacers). All necessary bolts and appurtenances shall be furnished to form a continuous closed-face wall of connected bins.

BASIS OF ACCEPTANCE. The metal bin-type retaining wall members shall be accepted on the basis of the manufacturer's certified analysis and guarantee for the metal and the Engineer's inspection.

TABLE 715-11			
Name	Gage	Surface Treatment	Description
Column	8	719-01 Type IV	Vertical Member, Front & Back
Column Cap	12	719-01 Type IV	Cover for front Column
Stringer Stiffener	8	719-01 Type IV	Top flange return
Stringer	16,14,12,10	719-01 Type IV	Horizontal Longitudinal members, front & rear
Connecting Channel	8	719-01 Type I	Connector, Stringer to Column
Spacer	16,14,12	719-01 Type IV	Horizontal Transverse member
Bottom Spacer	16,14,12	719-01 Type IV	Special bottom transverse member
Base Plate	1	719-01 Type I

715-12 (VACANT)

715-13 PREFABRICATED ADJUSTMENT RINGS, FRAMES AND UTILITY VALVE RISERS FOR DRAINAGE UNITS, MANHOLES AND UTILITIES

SCOPE. This specification covers the material requirements and fabrication of adjustment rings, frames and utility valve risers for drainage structures, manholes and utilities.

The adjustment rings, frames and utility valve risers shall consist of one of the following types unless otherwise approved by the Director, Materials Bureau:

RINGS

Type AR1 - Single Height Segmented Unit

Type AR2 - Single Height - One Cut Unit

Type AR3 - Single Height - Solid Unit

FRAMES

Type AF1 - Single Height Segmented Unit

Type AF2 - Single Height Solid Unit

UTILITY VALVE RISERS

Type UVR1 - Single Height - Solid Ring Unit

Type UVF1 - Single Height - Solid Frame Unit

MATERIAL REQUIREMENTS All adjustment rings, frames and utility valve risers shall be fabricated from steel, iron castings, a combination of these two materials, or an alternative material or materials as approved by the Director of the Materials Bureau.

The steel used for fabrication of rings, frames and utility valve risers shall meet the requirements of ASTM A36, A108, A242 or equivalent. If cast iron is used, the cast iron units shall be iron castings meeting the requirements of §715-05, IRON CASTINGS. All welding shall meet the requirements of the New York State Steel Construction Manual. All bolts, nuts, washers and threaded studs shall be stainless steel meeting the requirements of ASTM A240 or equivalent.

FABRICATION. All adjustment rings, frames and utility valve risers shall be designed to allow full bearing of the unit on the existing frame seat. Designs shall include a clamping device capable of securing the adjustment ring, frame or utility valve riser to the existing frame. Alternate methods of securing the rings, frames and utility valve risers to the existing frame shall be approved by the Director, Materials Bureau. All adjustment rings, frames and utility valve risers shall be reinforced to prevent bending during construction and routine service.

Steel rings, frames and utility valve risers shall be galvanized in accordance with §719-01 Galvanized Coatings and Repair Methods. When steel rings, frames and utility valve risers contain no component parts which are less than 1/4 inch in thickness, they may be coated with a bituminous base or coal tar product and will not require galvanizing. Any alternate coating system shall be approved by the Director, Materials Bureau. Cast iron rings, frames and utility valve risers do not require any galvanizing, but may instead be coated with a bituminous based or coal tar product approved by the Director, Materials Bureau.

Rings

Type AR1 - Single Height Segmented Unit. This ring shall consist of two or more radial segments which may be adjusted to open and close the diameter of the ring. When fully expanded the ring shall bear firmly against the sidewalls and seat of the existing manhole frame.

Type AR2 - Single Height - One Cut Unit. This ring shall consist of a single circular unit which is cut through its circumference at one point. The ring shall include an adjusting device that shall enable the ring to be expanded to bear firmly against the sidewalls and seat of the existing manhole frame.

Type AR3 - Single Height - Solid Unit. This ring shall consist of a solid unit with no cuts or openings in its circumference. The diameter of this ring is not field adjustable, unless approved by the Materials Bureau..

Frames

Type AF1 - Single Height Segmented Unit. This frame shall consist of a rectangular, segmented unit which is adjustable for length and width. When expanded the frame shall bear firmly against the sidewalls and seat of the existing frame.

Type AF2 - Single Height Solid Unit. This frame shall consist of a solid rectangular unit with fixed lengths and widths.

§715

Utility Valve Risers

Type UVR1 - Single Height Solid Ring Unit. This unit shall consist of a solid ring with no cuts or openings along its length.

Type UVF1 - Single Height Solid Frame Unit. This unit shall consist of a solid rectangular with fixed lengths and widths.

BASIS OF ACCEPTANCE. The Department requires the submission of Materials Details. The manufacturer or supplier shall prepare and submit the appropriate material in accordance with the procedural directives of the Materials Bureau. Upon approval by the Materials Bureau, the name of the manufacturer or supplier along with the drawing number and date assigned to the approved Materials Details will be placed on the Approved List. Such products shall then be accepted on the basis of their appearance on the Approved list and conformance to the approved Materials Details.

The manufacturer or supplier shall provide two copies of the approved Materials Details through the Contractor to the Engineer as part of the evidence of acceptability for the product at least 10 days prior to its use.

715-14 HIGH STRENGTH BOLTS, NUTS AND WASHERS

SCOPE. This specification covers the requirements for high-strength steel bolts, nuts and washers used for structural steel connections.

MATERIAL REQUIREMENTS. The bolts, nuts and washers shall conform to the provisions of ASTM A325 and §715-01 except as modified herein.

Bolt and Nut Dimensions. Bolt and nut dimensions shall conform to the current requirements of the American National Standard for Metric Heavy Hexagon Structural Bolts (ANSI B18.2.3.7M), and Metric Heavy Hexagon Nuts (ANSI B18.2.4.6M). Alternate fasteners which differ in dimensions from those specified by the ANSI may be used provided that the body diameter and bearing areas under the head and nut, or their equivalent areas, are not less than those of the same nominal dimensions specified by the ANSI, and that approval for the use is given by the DCES.

Washer Dimensions. Circular washers shall be flat and smooth and their nominal dimensions shall conform to the dimensions given in Table 715-14. Beveled washers for American Standard beams and channels shall be square or rectangular, shall have an average thickness of 5/16 inch, and shall conform to the dimensions and taper in thickness given in Table 715-14.

TESTS AND ACCEPTANCE. Tests and acceptance of high strength bolts, nuts and washers shall be as described in section 10 of the SCM.

TABLE 715-14 WASHER DIMENSIONS ¹						
Bolt Size	Circular Washers				Beveled Washer for American Standard Beams and Channels	
	Nominal Outside Diam. ²	Nominal Diam. of hole	Thickness		Min. Side Dimensions	Slope, or Taper in Thickness
			Min.	Max.		
1/2	1 1/16	17/32	0.097	0.177	1 3/4	1:6

Over 2 to 4 incl.	2D-1/2	D+1/8	0.24 ⁴	0.34 ⁴	-	-

- NOTES:** 1. Dimensions in inches.
 2. May be exceeded by 1/4 inch
 3. 3/16 inch nominal.
 4. 1/4 inch nominal.

715-15 PINS AND ROLLERS

SCOPE. This specification covers steel pins and rollers used in bridge construction.

GENERAL. The material furnished for pins and rollers shall conform to the following requirements:

- Pins and rollers designed for a minimum yield stress of 36 ksi shall conform to ASTM A668, Class D
- Pins and rollers designed for a minimum yield stress of 50 ksi shall conform to the requirements of ASTM A668, Class F
- Any pin or roller greater than 12 inches in diameter shall be furnished in conformance with the requirements of ASTM A668, Class G.

Tests and Acceptance. Tests are to be performed as required in the applicable ASTM Designation. Certified copies of the results of the specified tests are to be furnished as described in "Basis of Acceptance," of §715-01. Acceptance of material will be based on satisfactory test results and dimensional compliance with the contract plans and specifications.

715-16 STAINLESS STEEL CONNECTING PRODUCTS

SCOPE. This specification covers stainless steel bolts, nuts, washers, and set screws used in the construction of sign structures.

MATERIAL REQUIREMENTS. Stainless steel connecting products shall conform to the following:

- Hex bolts designed for 85 ksi minimum yield strength shall conform to the requirements of ASTM A193, Grade B6 (AISI 410).
- Nuts for Grade B6 bolts shall conform to the requirements of ASTM A194, Grade B6 (AISI 416).
- Hex bolts and U-bolts designed for 30 ksi minimum yield strength shall be either AISI 304 or 305 stainless steel conforming to the requirements of ASTM A193, Grade B8 or Grade B8P, Class 1.
- Hex bolts and U-bolts designed for 100 ksi minimum yield strength shall be either AISI 304 or 305 stainless steel conforming to the requirements of ASTM A193, Grade B8 or Grade B8P, Class 2.
- Nuts for Grade B8 or Grade B8P bolts shall conform to the requirements of ASTM A194, Grade B8 (AISI 304).
- Flat washers shall be circular, flat, smooth, and fabricated from material conforming to the requirements of ASTM A167 (AISI 302B (UNS S30215) or ASTM A240 (AISI 302 or 304 (UNS S30200 or S30400))).
- Lock washers shall be fabricated in accordance with ANSI B18.21.1 from material conforming to the requirements of ASTM A313 (AISI 302, 304, or 305 (UNS S30200, S30400, or S30500)) with a hardness Rc 35-43.
- Set screws shall conform to the requirements of ASTM A320, Grade B8F (AISI 303).

Cleaning. Following heat treatment, all stainless steel connecting products shall be descaled and cleaned in accordance with the requirements of ASTM A380. After cleaning and descaling the stainless steel hardware shall be passivated. Stainless steel hardware with a black or speckled rusty appearance is acceptable provided the discoloration does not run when installed, as determined by the Engineer.

§715

Delivery. All stainless steel connecting products shall be delivered to the project site no less than 30 days prior to utilization of the hardware to allow ample time for sampling and testing.

SAMPLING AND TESTING. Stainless steel connecting products will be sampled at the project site or supply location. Sampling and testing will be in accordance with procedural directives of the Materials Bureau.

BASIS OF ACCEPTANCE. Stainless steel connecting products will be accepted in stock-lot quantities at the project site or supplier's location in accordance with procedural directives of the Materials Bureau. Grade B8 bolts less than 3/8 inch in diameter will be accepted based on chemical properties only.

SECTION 716 - BEARINGS AND EXPANSION PLATES

716-01 THRU 716-04 (VACANT)

716-05 SELF-LUBRICATING BRONZE PLATES

SCOPE. This specification covers requirements for self-lubricating bronze plates used as bearing plates in expansion bearings.

MATERIAL REQUIREMENTS. Self-lubricating bronze shall conform to the requirements of ASTM B22, Alloy 911.

The lubricant shall be of the solid type and shall consist of graphite, metallic substances having lubricating properties and a lubricating binder. Materials which do not have lubricating qualities or promote chemical or electrolytic reactions, shall not be acceptable. The lubricant shall be integrally molded and compressed into the lubrication recesses with hydraulic pressure of at least five times the maximum design unit loading to form a dense, non-plastic lubricant which shall project above the surface of the bronze a minimum of 0.005 inch.

The recesses for the lubricant shall consist of annular rings with or without central circular recess with a depth at least equal to the width of the ring or diameter of hole for proper containment of lubricant. The recesses shall be arranged in a geometrical pattern such that successive rows shall overlap in the direction of motion and the distance between extremities of recesses shall be closer in the direction of motion than that perpendicular to motion. The entire bearing area of all surfaces which have provision for motion shall be lubricated by means of these lubricant filled recesses. The total area of these recesses shall comprise not less than 25 percent nor more than 35 percent of the total bearing area of the plate.

The bearing plates shall be furnished to the sizes and shapes specified on the plans. The maximum permissible variation in the specified thickness of bronze plates shall be ± 0.01 inch. The lay of the tool marks shall be in the direction of motion or shall be omnidirectional.

On flat faces the machined surface shall be flat to a tolerance of 0.0005 inches in each inch of length and width.

On curved faces the radius of the machined surface shall have the following tolerances:

	Positive tolerance	Negative tolerance
Concave Surface	0.010 inch	Zero
Convex Surface	Zero	0.010 inch

The curved surface shall be machined to a tolerance of 0.0005 inches in each inch of length perpendicular to the circular section.

Surfaces of bronze plates in contact with machined surfaces of steel plates shall be machine finished in accordance with the requirements of the SCM, Section 6, Part 612 (When the SCM requires DCES approval, delete the term "DCES" and replace it with "the Regional Director.>"). Machining shall be of the same surface roughness as that required for sliding bearings.

The coefficient of friction between the self-lubricating bronze plates and the steel plates in contact with them shall not exceed 0.10 when subjected to the maximum designed unit loading and also at twice the maximum design unit loading.

BASIS OF ACCEPTANCE. The manufacturer shall supply the Engineer with certification that the bronze plate was manufactured in accordance with this specification. This certification must be received by the Engineer prior to the placement of the bronze plate or any fabricated piece containing the bronze plate into any construction work.

716-06 DISC-DESIGN STRUCTURAL BRIDGE BEARINGS

SCOPE. This specification covers the material requirements for disc-design structural bridge bearings. Bearings furnished under this specification shall adequately provide for the thermal expansion and contraction, rotation, camber changes, and creep and shrinkage of structural members, where applicable.

GENERAL. Disc-design structural bridge bearings shall consist of a polyether urethane structural element (disc) confined by upper and lower steel bearing plates. The bearings shall be equipped with a shear restriction mechanism to prevent movement of the disc.

Disc-design structural bridge bearings shall be supplied as fixed bearings; guided expansion bearings; and non-guided expansion bearings as designated by the Contract Documents.

Fixed Bearings. Fixed bearings shall allow rotation but no longitudinal or transverse movement in the bearing plane.

Guided Expansion Bearings. Guided expansion bearings shall allow rotation and longitudinal movement in the bearing plane; transverse movement shall be restricted. To allow longitudinal movement, the upper steel bearing plate shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel top bearing plate shall be faced with polished stainless steel. To restrict transverse movement, either a guide bar or keyway system shall be used. If required, the guide bar or keyway systems and their mating steel surfaces shall be faced with strips of either PTFE or PTFE-stainless steel.

Non-Guided Expansion Bearings. Non-guided expansion bearings shall allow rotation, longitudinal, and transverse movement in the bearing plane. To allow longitudinal and transverse movement, the upper steel bearing plate shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel top bearing plate shall be faced with polished stainless steel.

MATERIAL REQUIREMENTS. All material shall be new and unused, with no reclaimed material incorporated in the finished bearing.

Polyether Urethane Structural Element. The polyether urethane structural element used in the construction of disc-design bearings shall be molded from a polyether urethane compound. The physical properties of the polyether urethane shall conform to the requirements of Table 716-06-1.

TABLE 716-06-1 PHYSICAL REQUIREMENTS OF POLYETHER URETHANE STRUCTURAL ELEMENT			
Physical Property	ASTM Test Method	Requirements	
		Min.	Max.
Hardness, Type D Durometer	D2240	57	67
Tensile Stress, psi ¹	D412	2000	---
At 100% elongation			
At 300% elongation		3750	---
Tensile Strength, psi ¹	D412	5000	---
Ultimate Elongation, % ¹	D412	220	---
Compression Set ^{1,2} , %	D395	---	40

NOTES: 1. A 10% deviation from specified values is permissible.

2. 22 hours at 158°F

Steel. All steel except stainless steel components of the bearing shall conform to the requirements of the type of steel designated on the Contract Plans and applicable provisions of the New York State Steel Construction Manual.

Stainless Steel. Stainless steel shall conform to the requirements of ASTM A167, or ASTM A240, Type 304. Stainless steel in contact with PTFE shall be polished to a No. 8, bright mirror finish. The minimum thickness of the stainless steel shall be 0.050 inches.

Polytetrafluoroethylene Sheet and Strip. Polytetrafluoroethylene (PTFE) sheet and strip shall be manufactured from pure virgin (not reprocessed) unfilled TFE resin; or from TFE resin uniformly blended with either 15% glass fiber or 25% carbon (maximum, percent by weight).

PTFE sheet shall be bonded to or recessed into its steel substrate. Bonded PTFE sheet shall be etched on its bonding side, and shall have a minimum thickness of 1/16 inch. Recessed PTFE sheet shall have a minimum thickness of 1/8 inch and be recessed for at least one-half its thickness into its steel substrate. The surface of filled PTFE sheet in contact with stainless steel shall be polished or burnished to insure smooth and low friction movement of the bearing.

Finished PTFE sheet and strip shall be resistant to all acids, alkalis and petroleum products, stable at temperatures from -360°F to +500°F, non-flammable, non-absorbing of water, and shall conform to the physical requirements of Table 716-01-2.

TABLE 716-06-2 PHYSICAL REQUIREMENTS OF PTFE SHEET AND STRIP				
Physical Property	ASTM Test Method	MINIMUM REQUIREMENTS		
		Unfilled	Filled 15% Glass	Filled 25% Carbon
Ultimate Tensile Strength, psi	D638M	2800	2000	1300
Ultimate Elongation, %	D638M	200	150	75
Specific Gravity	D792	2.13	2.18	2.05

FABRICATION. The finish of the mold used to produce the bearing elements shall conform to good machine shop practice. Every bearing shall have the Project Identification Number, NYSDOT Lot Number and individual bearing number indelibly marked with ink on a side that will be visible after erection.

The PTFE sheet shall be bonded to its grit blasted steel substrate using an epoxy resin adhesive under controlled factory conditions in accordance with the instructions of the adhesive manufacturer. Alternately, the PTFE sheet may be recessed into its steel substrate for one-half its thickness. The bearing manufacturer shall have the option of bonding recessed PTFE sheet.

All steel surfaces exposed to the atmosphere, except stainless steel surfaces and metal surfaces to be welded, shall be shop painted with one coat of coal-tar epoxy. Coal-tar epoxy paint shall meet the requirements of SSPC Paint Specification No. 16, and be applied at a minimum wet film thickness of 10 mils. Prior to painting, the exposed steel surfaces shall be cleaned in accordance with the recommendations of the coating's manufacturer. Metal surfaces to be welded shall be given a coat of clear lacquer, or other protective coating approved by the Engineer, if exposure is to exceed three months prior to welding. The coating shall be removed at the time of welding. No painting will be done to these surfaces prior to the completion of welding.

Except as noted, all bearing surfaces of steel plates shall be finished or machined flat within 0.010 inch. Out-of-flatness greater than 0.010 inch on any plate shall be cause for rejection. The bottom surfaces of lower bearing plates (masonry plates) designed to rest on bearing pads shall not exceed an out-of-flatness value of 1/16 inch. Oxygen cut surfaces shall not exceed a surface roughness value of 1 mil, as defined by ANSI B46.1. Repair, when necessary, shall conform to the requirements of the New York

State Steel Construction Manual (When the SCM requires DCES approval, delete the term “DCES” and replace it with “the Regional Director.”).

The steel base pot of all bearings shall be either integrally machined or continuously welded to its bottom steel masonry plate. Unless otherwise approved by the Regional Director, all welding shall conform to, and all welders shall be qualified in accordance with the requirements of the New York State Construction Manual (When the SCM requires DCES approval, delete the term “DCES” and replace it with “the Regional Director.”).

Gross bearing dimensions shall have a tolerance of -0, +1/8 inch.

PERFORMANCE CHARACTERISTICS

Compression Strain. The compression stress is based on the net area of the rotational element using the total overall diameter. The compression strain is measured as a percentage of the original thickness of the rotational element.

A load equal to 150% of the bearing's design capacity shall first be applied to seat the bearing components. The 150% load shall then be gradually reduced, over a time period of 30 to 90 seconds, to a pre-load equal to 3% of the bearing's design capacity. Each compression strain shall be recorded relative to the initial 3% pre-load deflection, one minute after the desired stress level has been reached, on dial indicators, at four locations 90° apart on the perimeter of the bearing.

The test results will be evaluated as follows:

- The bearing will be visually examined both during and after the test. Any resultant visual defects (such as extruded elastomer, damaged seals, or cracked steel) shall be cause for rejection
- Non-uniform compression deflections at a desired stress level shall be cause for rejection
- The compression strain of each bearing shall conform to the following requirements:

Compression Stress (psi)	Compression Strain, Max. %
1000	5.0
2000	8.5
3000	11.0
4000	13.2
5000	16.0

Sliding Coefficient of Friction. For all guided and non-guided expansion disc-design bearings, the coefficients of friction shall be measured at the bearing's design capacity, on the fifth and fiftieth cycles, at a sliding speed of 1 inch per minute.

The sliding coefficient of friction shall be calculated as the horizontal load required to maintain continuous sliding of one bearing, divided by the bearing's design capacity vertical load. The vertical load shall have been applied continuously for a minimum of 12 hours prior to testing.

The test results will be evaluated as follows:

- The measured sliding coefficients of friction shall not exceed 75% of the maximum design coefficient of friction
- The bearing will be visually examined both during and after the test. Any resultant visual defects (such as bond failure, physical destruction, cold flow of PTFE, or damaged components) shall be cause for rejection.

Rotation. For all disc-design bearings, the polyether urethane element shall be capable of maintaining its initial uniform contact with the steel bearing plates throughout a rotation range of 0.02 radians under a compressive load equal to 150% of the design capacity of the bearing.

The test results will be evaluated as follows:

- The bearing will be visually examined both during and after the test. Any resultant visual defects shall be cause for rejection
- Continuous and uniform contact between the polyether urethane element and bearing plates, and between the sliding steel top and upper bearing plates shall be maintained for the duration of the test. Any observed “lift-off” shall be cause for rejection.

DRAWINGS. The Contractor shall submit detailed shop drawings, drawn by the Manufacturer only, in conformance with the applicable requirements of the New York State Steel Construction Manual, for approval by the Regional Director prior to the start of fabrication.

In addition to the above requirements, the Manufacturer shall note the following on the shop drawings.

- The total quantity of each kind of disc-design bearing required, i.e., fixed, guided expansion, or non-guided expansion, grouped first according to type (load range) and then by actual design capacity
- The thickness and plan area of the polyether urethane structural elements required
- The maximum design coefficient of friction as noted on the Contract Plans
- The type of PTFE sheet (filled or unfilled) and, if applicable, the type and amount (by weight) of filler
- The type(s) of steel(s) to be used
- If applicable, any welding process used in the bearing manufacture that does not conform to the approved processes of New York State Steel Construction Manual shall be clearly described and detailed
- The location of the fabrication plant
- The Manufacturer's name and the name of the manufacturer's representative who will be responsible for coordinating production, inspection, sampling and testing with the Materials Bureau.

The Contractor shall also provide the Materials Bureau with written notification thirty (30) days prior to the start of bearing fabrication. This notification shall include all of the information required by numbers 1 through 8 above. A copy of this notification shall be sent to the Regional Director.

SAMPLING AND TESTING. The manufacturer shall furnish the required number of samples to perform testing in accordance with Table 716-06-3.

Lot Size. Sampling, testing and acceptance consideration will be made on a lot basis. A lot shall be defined as those bearings presented for inspection at a specific time or date. A lot shall be further defined as the smallest number of bearings as determined by the following criteria:

- A lot shall not exceed a single contract or project quantity
- A lot shall not exceed 25 bearings
- A lot shall consist of those bearings that can be manufactured with polyether urethane rotation elements from one batch of polyether urethane material. The mass of one batch shall not exceed 450 lbs
- A lot shall consist of those bearings of the same type, regardless of load capacity. Bearing types shall be fixed type bearings or expansion type bearings. Guided and non-guided expansion bearings will be considered as a single type.

Schedule. The manufacturer shall complete the required testing and determine compliance with this specification before submitting the lot(s) for inspection, sampling and acceptance consideration.

A minimum of thirty (30) days shall be allowed for the Department's inspection, sampling and testing of production bearings and component materials.

Sampling Method. The manufacturer shall select, at random, the required sample bearing(s) from the completed lots of bearings for testing by the manufacturer.

The Department's representative shall select, at random, the required sample bearing(s) from completed lots of bearings, and samples of the polyether urethane and the PTFE materials for testing by the Materials Bureau. All samples shall be taken in accordance with the Department's written instructions.

TABLE 716-06-3 DISC BEARING SAMPLING AND TESTING REQUIREMENTS		
Test	Performed By	Samples Required
Rotation	Manufacturer	One production bearing per lot ¹

Coefficient of Friction	Manufacturer	One production bearing per lot ¹
Compression Strain	Materials Bureau	Three production bearings per lot ²
Physical Properties Polyether Urethane Rotational Element (except compression set)	Materials Bureau	One 10 x 15 inch sheet of polyether urethane material (thickness of 1/16 - 1/8 inch) per lot. ³
Compression Set of Polyether Urethane Rotation Element	Materials Bureau	One 4 x 4 inch sheet of polyether urethane material, molded or cut to the thickness requirements of ASTM D395, Method B. ⁴
Physical Properties of PTFE Sheet	Materials Bureau	One 10 x 15 inch sheet of polyether urethane material per lot. ⁵

NOTES:

1. Sample production bearings of such size that cannot be tested by the manufacturer at 150% design capacity for rotation shall be tested at actual design capacity. Bearings which are tested at actual design capacity will be tested at that capacity because it is not possible, or not practical in the Department's opinion to test them at a higher capacity. Therefore, bearings tested at 150% design capacity which are rejected, will not be retested below 150% design capacity for the purpose of rendering such bearings acceptable. Sample production bearings that cannot be tested by the manufacturer at their actual design capacity for rotation and/or friction shall be tested by an outside laboratory selected by the Materials Bureau. The Manufacturer shall assume the cost of this testing and submit the certified test results to the Materials Bureau.
2. Bearings with load capacities greater than 600 kip will be tested by an outside laboratory approved by the Materials Bureau. The Department will assume the cost of this testing. The Contractor shall be responsible for transportation, scheduling and related costs. All bearings will be made available for return to the Contractor.
3. All submitted sample sheets of polyether urethane material shall be certified by the bearing manufacturer as having been taken from the same batch of polyether urethane material as was used in the actual production bearings.
4. The manufacturer shall have the option of supplying four (4) die cut specimens in accordance with ASTM D395, Method B. All submitted specimens of polyether urethane material shall be certified by the bearing manufacturer as having been taken from the same batch of polyether urethane material as was used in the actual production bearings.
5. Single sheets of PTFE Material from which the bearing has been fabricated may be submitted to the Materials Bureau for consideration of multiple lot acceptance, provided that the thickness of the material does not vary from lot to lot. All submitted sample sheets shall be certified by the bearing manufacturer as having been taken from the same batch of PTFE material as was used in the actual production bearings.

Finish and Accessories. All exterior surfaces of sampled production bearings shall be smooth and free from irregularities or protrusions that might interfere with testing procedures.

Bearings with tapered sole plates which are selected for testing by the Materials Bureau, shall be delivered to the test site accompanied by a single unattached matching beveled plate. This plate shall be made of the same material and be the same size and thickness as the tapered plate. Additionally, the single beveled plate shall be so constructed that when placed in contact with the tapered sole plate the two shall form a single body, rectangular in shape and uniform in thickness.

Shipping Costs. The Contractor shall assume the cost of transporting all samples from the place of manufacture to the Materials Bureau and return, or, if applicable, to the project site.

BASIS OF ACCEPTANCE. Acceptance of Disc Bearings will be based on the manufacturer's name appearing on the Department's Approved List for Disc Bearings (716-06). Bearings will be considered for acceptance in project lot quantities, or portions thereof, at the manufacturing site in accordance with the procedural directives of the Materials Bureau.

716-07 POT-DESIGN STRUCTURAL BRIDGE BEARINGS

SCOPE. This specification covers the material requirements for pot-design structural bridge bearings. Bearings furnished under this specification shall adequately provide for the thermal expansion and contraction, rotation, camber changes, and creep and shrinkage of structural members, where applicable.

GENERAL. Pot-design structural bridge bearings shall be supplied as fixed bearings; guided expansion bearings; and non-guided expansion bearings as designated by the Contract Documents.

§716

Fixed Bearings. Fixed bearings shall allow rotation but no longitudinal or transverse movement in the bearing plane. Fixed bearings shall consist of an elastomeric rotational element, confined and sealed by a steel piston and steel base pot.

Guided Expansion Bearings. Guided expansion bearings shall allow rotation and longitudinal movement in the bearing plane; transverse movement shall be restricted. Guided expansion bearings shall consist of an elastomeric rotational element, confined and sealed by a steel piston and steel base pot. To allow longitudinal movement, the upper surface of the steel piston shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel bearing plate shall be faced with polished stainless steel. To restrict transverse movement, either a guide bar or keyway system shall be used. If required, the guide bar or keyway systems and their mating steel surfaces shall be faced with strips of either PTFE or PTFE-stainless steel.

Non-Guided Expansion Bearings. Non-guided expansion bearings shall allow rotation, longitudinal, and transverse movement in the bearing plane. Non-guided expansion bearings shall consist of an elastomeric rotational element, confined and sealed by a steel piston and steel base pot. To allow longitudinal and transverse movement, the upper surface of the steel piston shall be faced with polytetrafluoroethylene (PTFE) sheet and support a sliding steel top bearing plate. The mating surface of the sliding steel bearing plate shall be faced with polished stainless steel.

MATERIAL REQUIREMENTS. All material shall be new and unused, with no reclaimed material incorporated in the finished bearing.

Elastomeric Rotational Element. The elastomeric rotational element used in the construction of pot-design bearings shall contain only virgin crystallization resistant polychloroprene (neoprene) or virgin natural polyisoprene (natural rubber) as the raw polymer. The physical properties of neoprene and natural rubber used in these bearings shall conform to ASTM or AASHTO requirements, with modifications as noted, in Table 716-07-1.

TABLE 716-07-1 PHYSICAL REQUIREMENTS OF ELASTOMERIC BEARING MATERIAL		
Elastomeric Compound	ASTM Requirement	AASHTO Standard Specifications for Bridge
Neoprene	D2000, Line Call Out M2BC517A14B34	Section 2.25.2, Materials, 50 Durometer Hardness.
Natural Rubber	D2000, Line Call Out M4AA517A13B33	Section 2.25.2, Materials, 50 Durometer Hardness.

NOTES:

1. The Shore A Durometer hardness shall be 50±10 points.
2. Samples for compression set tests shall be prepared using a Type 2 die. The compression set of the neoprene specimens shall not exceed 35%. The compression set of the natural rubber specimens shall not exceed 25%.
3. For the purpose of determining conformance with these specifications, an observed or calculated value shall be rounded off to the nearest 10 psi for tensile strength, to the nearest 10% for elongation, and to the nearest 1% for the change in aged tensile and aged elongation. Hardness and aged hardness shall be rounded off to the nearest point.

Sealant. If used, the type of sealant between the steel base pot and the top steel bearing plate shall be as recommended by the Manufacturer.

Sealing Rings. The sealing rings between the steel piston and the elastomeric rotational element shall be brass formed to the size recommended by the Manufacturer.

Steel. All steel except stainless steel components of the bearing shall conform to the requirements of the type of steel designated on the Contract Plans and applicable provisions of the New York State Steel Construction Manual (When the SCM requires DCES approval, delete the term “DCES” and replace it with “the Regional Director.”).

Stainless Steel. Stainless steel shall conform to the requirements of ASTM A167, or ASTM A240, Type 304. Stainless steel in contact with PTFE sheet shall be polished to a No. 8. bright mirror finish. The minimum thickness of the stainless steel shall be 0.050 inch.

Polytetrafluoroethylene Sheet and Strip. Polytetrafluoroethylene (PTFE) sheet and strip shall be manufactured from pure virgin (not processed) unfilled TFE resin; or from TFE resin uniformly blended with either 15% glass fiber or 25% carbon (maximum filler, percent by weight).

PTFE sheet shall be bonded to or recessed into its steel substrate. Bonded PTFE sheet shall be etched on its bonding side, and shall have a minimum thickness of 1/16 inch. Recessed PTFE sheet shall have a minimum thickness of 1/8 inch and be recessed for at least one-half its thickness into its steel substrate. The surface of filled PTFE sheet in contact with stainless steel shall be polished or burnished to insure smooth and low friction movement of the bearing.

Finished PTFE sheet and strip shall be resistant to all acids, alkalis and petroleum products, stable at temperatures from -360°F to +500°F, non-flammable, non-absorbing of water, and shall conform to the physical requirements of Table 716-07-2.

TABLE 716-07-2 PHYSICAL REQUIREMENTS OF PTFE SHEET AND STRIP				
Physical Property	ASTM Test Method	MINIMUM REQUIREMENTS		
		Unfilled	Filled 15% Glass	Filled 25% Carbon
Ultimate Tensile Strength, psi	D638M	2800	2000	1300
Ultimate Elongation, %	D638M	200	150	75
Specific Gravity	D792	2.13	2.18	2.05

FABRICATION. The finish of the mold used to produce the elastomeric rotational elements shall conform to good machine shop practices. Every bearing shall have the Contract D#, Project Identification Number, NYSDOT Lot Number and individual bearing number indelibly marked with ink on a side that will be visible after erection.

The PTFE shall be bonded to its grit blasted steel substrate using an epoxy resin adhesive under controlled factory conditions in accordance with the instructions of the adhesive manufacturer. Alternately, the PTFE sheet may be recessed into its steel substrate for one-half its thickness. The bearing manufacturer shall have the option of bonding recessed PTFE sheet.

All steel surfaces exposed to the atmosphere, except stainless steel surfaces and metal surfaces to be welded shall be shop painted with one coat of coal-tar epoxy. Coal-tar epoxy paint shall meet the requirements of SSPC Paint Specification No. 16, and be applied at a minimum wet film thickness of 10 mils. Prior to painting, the exposed steel surfaces shall be cleaned with the recommendations of the coating's manufacturer. Metal surfaces to be welded shall be given a coat of clear lacquer, or other protective coating approved by the Engineer, if exposure is to exceed three months prior to welding. The coating shall be removed at the time of welding.

Except as noted, all bearing surfaces of steel plates shall be finished or machined flat within 0.010 inch. Out-of-flatness greater than 0.010 inch on any plate shall be cause for rejection. The bottom surface of lower bearing plates (masonry plates) designed to rest on bearing pads shall not exceed an out-of-flatness value of 1/16 inch. Oxygen cut surfaces shall not exceed a surface roughness value of 1 mil, as defined by ANSI B46.1. Repair, when necessary shall conform to the requirements of the New York State Steel Construction Manual.

The steel base pot of all bearings shall be either integrally machined or continuously welded to its bottom steel masonry plate. Unless otherwise approved by the Regional Director, all welding shall conform to, and all welders shall be qualified in accordance with, the requirements of the New York State Steel Construction Manual (When the SCM requires DCES approval, delete the term "DCES" and replace it with "the Regional Director.").

Gross bearing dimensions shall have a tolerance of -0, +1/8 inch.

PERFORMANCE CHARACTERISTICS

§716

Sliding Coefficient of Friction. For all guided and non-guided expansion type pot-design bearings, the sliding coefficients of friction shall be measured at the bearing's design capacity, on the fifth and fiftieth cycles, at a sliding speed of 1 inch per minute.

The sliding coefficient of friction shall be calculated as the horizontal load required to maintain continuous sliding of one bearing, divided by the bearing's design capacity vertical load. The vertical load shall have been applied continuously for a minimum of 12 hours prior to testing.

The test results will be evaluated as follows:

- The measured sliding coefficients of friction shall not exceed 75% of the maximum design coefficient of friction
- The bearing will be visually examined both during and after the test. Any resultant visual defects (such as bond failure, physical destruction, cold flow of PTFE, or damaged bearing components) shall be cause for rejection.

Rotation. For all pot-design bearings, the elastomeric rotational element shall be capable of maintaining its initial uniform contact with the steel piston and steel base pot throughout a rotation range of 0.02 radians, under a compressive load equal to 150% of the design capacity of the bearing.

The test results will be evaluated as follows:

- The bearing will be visually examined both during and after the test. Any resultant defects shall be cause for rejection
- The sole plate, top bearing plate, and steel piston shall maintain continuous and uniform contact for the duration of the test. Any observed "lift-off" will be cause for rejection.

DRAWINGS. The Contractor shall submit detailed shop drawings, drawn by the Manufacturer only, in conformance with the applicable requirements of the New York State Steel Construction Manual, for approval by the Regional Director prior to the start of the fabrication. (When the SCM requires DCES approval, delete the term "DCES" and replace it with "the Regional Director.").

In addition to the above requirements, the Manufacturer shall note the following on the shop drawings.

- The total quantity of each kind of pot-design bearing required, (i.e. fixed, guided expansion, or non-guided expansion), grouped first according to type (load range) and then by actual design capacity
- The thickness and plan area of the elastomeric rotational elements and the internal diameters of the steel base pots required
- The maximum design coefficient of friction as noted on the Contract Plans
- The type of PTFE sheet (filled or unfilled) and, if applicable, the type and amount (by weight) of filler
- The type(s) of steel(s) to be used
- If applicable, any welding process used in the bearing manufacture that does not conform to the approved processes of the New York State Steel Construction Manual shall be clearly described and detailed. (When the SCM requires DCES approval, delete the term "DCES" and replace it with "the Regional Director.").
- The location of the fabrication plant
- The Manufacturer's name and the name of the manufacturer's representative will be responsible for coordinating production, inspection, sampling and testing with the Materials Bureau.

The Contractor shall also provide the Materials Bureau with written notification thirty (30) days prior to the start of the bearing fabrication. This notification shall include all of the information required by numbers 1 through 8 above. A copy of this notification shall be sent to the Regional Director.

SAMPLING AND TESTING

Lot Size. Sampling, testing and acceptance consideration will be made on a lot basis. A lot shall be defined as the smallest number of bearings as determined by the following criteria:

- A lot shall not exceed a single contract or project quantity
- A lot shall not exceed 25 bearings

- A lot shall consist of those bearings of the same type, regardless of load capacity. Bearing types shall be fixed type bearings or expansion type bearings. Guided and non-guided expansion bearings will be considered a single type.

Sampling and Testing Requirements. The manufacturer shall furnish the required number and size of samples to perform testing in accordance with Table 716-07-3.

A minimum of thirty (30) days shall be allowed for the Department's inspection, sampling and testing of production bearings and component materials.

All exterior surfaces of sampled production bearings shall be smooth and free from irregularities or protrusions that might interfere with testing procedures.

The manufacturer shall select, at random, the required sample bearing(s) from completed lots of bearings for testing by the manufacturer. The manufacturer shall complete the required testing and determine compliance with this specification before submitting the lot(s) for inspection, sampling and acceptance consideration.

The Department's representative shall select, at random, samples of elastomeric and PTFE materials for testing by the Materials Bureau. All samples shall be taken in accordance with the Department's written instructions.

The Contractor shall assume the cost of transporting all samples from the place of manufacture to the Materials Bureau and return, or, if applicable, to the project site.

TABLE 716-07-3 POT BEARING SAMPLING AND TESTING REQUIREMENTS		
Test	Performed By	Samples Required
Rotation	Manufacturer	One production bearing per lot ¹
Coefficient of Friction	Manufacturer	One production bearing per lot ¹
Physical Properties of Elastomeric Rotational Element	Materials Bureau	One Elastomeric element per lot. ²
Physical Properties of PTFE Sheet	Materials Bureau	One 10 x 15 inch sheet of polyether urethane material per lot. ³

NOTES:

1. Sample production bearings of such size that cannot be tested by the manufacturer at 150% design capacity for rotation shall be tested at actual design capacity. Bearings which are tested at actual design capacity will be tested at that capacity because it is not possible, or not practical in the Department's opinion to test them at a higher capacity. Therefore, bearings tested at 150% design capacity which are rejected, will not be retested below 150% design capacity for the purpose of rendering such bearings acceptable. Sample production bearings that cannot be tested by the manufacturer at their actual design capacity for rotation and/or friction shall be tested by an outside laboratory selected by the Materials Bureau. The Manufacturer shall assume the cost of this testing and submit the certified test results to the Materials Bureau.
2. At the time of sampling the Department representative shall remove an elastomeric rotational element from a production bearing (not from a bearing that requires compressive strain testing) and forward it to the Materials Bureau for test. This testing will be destructive and the manufacturer shall, at the cost of the manufacturer, replace the sample elastomeric element.
3. The sample sheet of PTFE material shall be certified by the Manufacturer as having been taken from the same batch of material as was used in the actual production bearings.

BASIS OF ACCEPTANCE. Acceptance of Pot Bearings will be based on the manufacturer's name appearing on the Department's Approved List for Pot Bearings (716-07). Bearings will be considered for acceptance in project lot quantities, or portions thereof, at the manufacturing site in accordance with the procedural directives of the Materials Bureau.

716-08 AND 716-09 (VACANT)

716-10 PLAIN ELASTOMERIC BRIDGE BEARINGS

SCOPE. This specification covers the material requirements for plain elastomeric bridge bearings. Bearings furnished under this specification shall be adequate for the specified design load, and provide for the thermal expansion and contraction, rotation, camber changes, creep, and shrinkage of structural members.

GENERAL. Plain elastomeric bridge bearings (Type EP bearings) are composed entirely of elastomeric material. They may be used for both fixed and expansion applications without changes in details. The bearings will accommodate longitudinal, transverse, and rotational movements.

Elastomeric bridge bearings shall be designed in accordance with New York State Standard Specifications for Highway Bridges.

MATERIAL REQUIREMENTS. All materials shall be new with no reclaimed material incorporated in the finished bearing. The elastomeric compound used in the construction of these bearings shall contain only virgin crystallization resistant polychloroprene (neoprene) or virgin natural polyisoprene (natural rubber) as the raw polymer. The resulting product shall be free of porous areas, weak sections, bubbles, foreign matter, or other defects affecting serviceability. The physical properties of the cured elastomeric compound shall meet the requirements of Table 716-10-1.

The manufacturer shall certify that the elastomeric compound passes Grade 3 Low - Temperature Brittleness as determined by ASTM D746 - Brittleness Temperature of Plastics and Elastomers by Impact Procedure B.

DRAWINGS. Shop drawings are not required for Type EP bearings.

FABRICATION. The finish of the mold used to produce these bearings shall conform to good machine shop practice. Each bearing shall be marked in indelible ink or flexible paint. The marking shall consist of the manufacturer's name and location. The marking shall be placed on at least one side or face that will be visible after erection and, if possible, on two sides or faces.

TABLE 716-10-1 PROPERTIES OF ELASTOMERIC MATERIAL			
PHYSICAL PROPERTIES:	ASTM TEST METHOD	REQUIREMENTS	
		NEOPRENE	NATURAL RUBBER
Tensile Strength, Min., (psi)	D412	2000	2000
Ultimate Elongation, Min., (%)	D412	400	400

NOTES:

1. Tolerances for samples cut from finished parts have already been applied to each of these requirements. No greater tolerances will be allowed.
2. For the purpose of determining conformance with these specifications, an observed or calculated value shall be rounded off to the nearest 10 psi for tensile strength and to the nearest 10% for elongation.

The bearings shall be cast in a mold under pressure and heat to the specified thickness.

They may be molded and vulcanized in large sheets and cut to size. Cutting shall not heat the material, and the finish produced shall be equal to a surface roughness average of 2 mils as defined by ANSI B46.1. A type EP bearing that has been cut from a larger piece of material and fabricated to the finished size by bonding or plying smaller pieces together will not be acceptable.

Bearing Tolerances. Finished elastomeric bearings shall conform to the design dimensions, with the tolerances listed in Table 716-10-2.

TABLE 716-10-2 BEARING TOLERANCES	
Dimension	Tolerance
Overall Vertical	-0, +1/8 inch
Overall Horizontal	-0, +1/4 inch
Position of Holes and Slots centerline	±1/16 inch from centerline
Size of Holes, Slots and Internal Steel Plates	-0, +1/16 inch

PERFORMANCE CHARACTERISTICS

Compression Deflection. The compression deflection of each bearing shall not exceed 10.0% of the design effective rubber thickness at a compressive load equal to the actual design load.

The compression deflection shall be determined by loading the bearings to 500 psi and 800 psi. At each load a deflection reading will be taken and the readings used to calculate the slope between the two loads. The slope shall then be used to determine the deflection at the bearing's design load.

The bearing and ambient temperature shall be $75^{\circ}\text{F} \pm 5^{\circ}\text{F}$ at the time of testing.

NOTE: For conformance to this specification an observed or calculated value shall be rounded off (ASTM E29) to the nearest 0.1% for compression deflection.

BASIS OF ACCEPTANCE. Acceptance of this material will be based upon the manufacturer's name appearing on the Department's Approved List for Elastomeric Bridge Bearings, and a manufacturer's certification stating conformance with these specifications.

716-11 STEEL LAMINATED ELASTOMERIC BRIDGE BEARINGS

SCOPE. This specification covers the material requirements for steel laminated elastomeric bridge bearings without external load plates. Bearings furnished under this specification shall be adequate for the specified design load, and provide for the thermal expansion and contraction, rotation, camber changes, creep, and shrinkage of structural members.

GENERAL. Steel laminated elastomeric bridge bearings (Type EL bearings) are composed of multiple layers of elastomeric material separated by steel plates. They may be used for both fixed and expansion applications without changes in details. The bearings will accommodate longitudinal, transverse, and rotational movements.

Elastomeric bridge bearings shall be designed in accordance with New York State Standard Specifications for Highway Bridges.

MATERIALS REQUIREMENTS. All materials shall be new with no reclaimed material incorporated in the finished bearing.

Elastomeric Material. The elastomeric compound used in the construction of these bearings shall contain only virgin crystallization resistant polychloroprene (neoprene) or virgin natural polyisoprene (natural rubber) as the raw polymer. The resulting product shall be free of porous areas, weak sections, bubbles, foreign matter, or other defects affecting serviceability. The physical properties of the cured elastomeric compound shall be determined by using samples taken from bearings and shall meet the requirements of Table 716-10-1.

The manufacturer shall certify that the elastomeric compound passes Grade 3 Low - Temperature Brittleness as determined by ASTM D746 - Brittleness Temperature of Plastics and Elastomers by Impact Procedure B.

Internal Steel Plates. Steel plates for internal laminates shall be rolled mild steel conforming to the requirements of ASTM A36M, ASTM 1008/A1008/M or ASTM 1011/A1011/M (Grade 33, 36 and 40).

DRAWINGS. Shop drawings are not required for Department approval unless a change in the details shown on the plans is proposed. When Department approved shop drawings are required, they shall be furnished in accordance with the Steel Construction Manual (SCM), Section 2, except that in place of two sets of Department approved drawings submitted to the designated Shop Inspection Agency, five sets of Department approved drawings shall be submitted to the Materials Bureau. The Contractor shall submit one copy of these drawings to the Engineer.

When the bearing details are identical to the plans, the Contractor shall be responsible for supplying shop drawings prepared by the Manufacturer. The Manufacturer shall certify that the bearings depicted on the drawings are in conformance with the contract documents. The Contractor shall submit one copy of the certified drawings to the Engineer and five copies of their certified drawings to the Materials Bureau. The Department's acceptance procedures will commence subsequent to receipt of these drawings. The Manufacturer shall note the following on all shop drawings:

- The Contract number, bridge identification number (BIN), feature carried/feature crossed, specification pay item no. and the type, size and quantity of bearings being produced.

§716

- The design load (dead load plus live load) for each type and size bearing. If bearings of the same type and size are designed for differing load conditions the maximum design load shall be noted.
- The effective rubber thickness, typical laminate thickness, compressive area, shear area and shape factor.
- The Manufacturer's name, the location of the fabrication plant and the name and phone number of the Manufacturer's representative who will coordinate production, inspection, and sampling and testing with the Materials Bureau.
- The specification reference and grade of steel used.

FABRICATION. The finish of the mold used to produce these bearings shall conform to good machine shop practice. Each bearing shall be marked in indelible ink or flexible paint. The marking shall consist of the manufacturer's name, contract number, lot number, and individual bearing number. The marking shall be placed on at least one side or face that will be visible after erection and, if possible, on two sides or faces.

Type EL bearings shall be cast as a single unit in a mold and bonded and vulcanized under pressure and heat to the specified size and thickness. The internal steel plate(s) shall be commercially blast cleaned to a condition matching that of SSPC-Vis1, Pictorial Standards A SP6, B SP6 or C SP6, and cleaned of all oil or grease before bonding.

Bearing Tolerances. Finished elastomeric bearings shall conform to the design dimensions, with the tolerances listed in Table 716-11 and the following details:

TABLE 716-11 BEARING TOLERANCES	
Dimension	Tolerance
Overall Vertical	-0, +1/8 inch
Overall Horizontal	-0, +1/4 inch
Position of Holes and Slots centerline	±1/16 inch from centerline
Size of Holes, Slots and Internal Steel Plates	-0, +1.6 mm
Edge Cover over External Steel Plates ¹	1/8 inch min.
Bedding Surface (Top and Bottom) Over Internal Steel Plates	1/4 inch min.

NOTES:

1. No edge cover will be required over internal details that will not be exposed after erection (i.e. - vertical holes covered by bearing seats or flanges).
2. For 716-12, With external load plate(s) there shall be an effective rubber laminate between the load plate(s) and internal steel plate(s).

A. Internal Steel Plates. The internal steel plates shall be checked for parallelism by measuring the distance between each individual steel plate, and between the top or bottom edge of the bearing to the first adjacent steel plate. For rectangular bearings, take measurements for each plate along the vertical surface of the bearing, located 1 inch from the edge of the four alternate corners. For round bearings, measurements will be taken at four points located at 90° intervals around the perimeter. The smallest of the four measurements shall be recorded for each plate. The cumulative total of these measurements shall not be less than 75% of the design effective rubber thickness.

B. Elastomeric Laminae. The average thickness of individual layers of elastomer in steel laminated elastomeric bearings shall not vary more than ±20% of the design thickness and in no case exceed the design thickness by 1/8 inch. Average thickness will be calculated from measurements taken at four points, located at 1 inch from the edge of the four alternate corners for rectangular bearings and at 90° intervals around the perimeter for round bearings.

PERFORMANCE CHARACTERISTICS

Compression Deflection. The compression deflection of each bearing shall not exceed 10.0% of the design effective rubber thickness at a compressive load equal to the actual design load.

The compression deflection shall be determined by loading the bearings to 500 psi and 800 psi. At each load a deflection reading will be taken and the readings used to calculate a slope between the two loads. The slope shall then be used to determine the deflection at the bearing's design load.

The bearing and ambient temperature shall be $75^{\circ}\text{F} \pm 5^{\circ}\text{F}$ at the time of testing.

Adhesion. The adhesion of the elastomer to the internal plates shall be demonstrated by subjecting the bearing to a compressive load equal to 150% of the actual design load. Upon visual examination, the bearing shall be free of visual defects.

The bearing and ambient temperature shall be $75^{\circ}\text{F} \pm 5^{\circ}\text{F}$ at the time of testing.

NOTE: For conformance to this specification an observed or calculated value shall be rounded off (ASTM E29) to the nearest 0.1% for compression deflection.

SAMPLING AND TESTING

Lot Size. Sampling, testing and acceptance consideration will be made on a lot basis. A lot shall be defined as those bearings presented for inspection at a specific time or date. A lot shall be further defined as the smallest number of bearings as determined by the following criteria:

- A lot shall not exceed a single contract quantity.
- A lot shall consist of bearings with the elastomer being of the same dimensions and configuration.
- A lot shall consist of bearings produced in a continuous manner.

Procedure. The Department's representative shall select at random the required sample bearings from completed lots of bearings for testing by the Materials Bureau. Bearings with a plan area of less than 4 sf shall be tested for performance characteristics by the Materials Bureau. Bearings with a plan area greater than 4 sf shall be tested by an outside laboratory approved by the Materials Bureau. The Department shall assume the cost of testing the sampled bearings and the Contractor shall assume the responsibility and cost of transporting the sampled bearings from the place of manufacture to the testing laboratory. After testing, the Contractor has the responsibility for the cost of transporting the sampled bearings back to the bearing manufacturer or, if applicable, to the project site. All samples shall be taken and delivered for tests in accordance with the Department's written instructions. A minimum of thirty (30) days shall be allowed for inspection, sampling and testing by the Materials Bureau. This thirty days is exclusive of shipping time which is the Contractor's responsibility. The sampling procedure and test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Department's Approved List for Elastomeric Bridge Bearings and in accordance with the procedural directives of the Materials Bureau.

716-12 ELASTOMERIC BRIDGE BEARINGS WITH EXTERNAL LOAD PLATES

SCOPE. This specification covers the material requirements for elastomeric bridge bearings with external load plates. Bearings furnished under this specification shall be adequate for the specified design load, and provide for the thermal expansion and contraction, rotation, camber changes, and creep and shrinkage of structural members.

GENERAL. Elastomeric bridge bearings with external load plates (Type EB bearings) are composed of either plain elastomeric or laminated elastomeric bearings with external steel load bearing plates. The steel load bearing plates are bonded to the elastomer by vulcanization during the primary molding process. These bearings may be used for both fixed and expansion applications with appropriate changes in details, as shown on the contract plans. The bearings will accommodate longitudinal, transverse, and rotational movements.

Elastomeric bridge bearings with external load plates shall be designed in accordance with New York State Standard Specifications for Highway Bridges.

MATERIALS REQUIREMENTS. All materials shall be new with no reclaimed material incorporated in the finished bearing.

Elastomeric Material. The elastomeric compound used in the construction of these bearings shall contain only virgin crystallization resistant polychloroprene (neoprene) or virgin natural polyisoprene (natural rubber) as the raw polymer. The resulting product shall be free of porous areas, weak sections, bubbles, foreign matter, or other defects affecting serviceability. The physical properties of the cured elastomeric compound shall be determined by using samples taken from bearings and shall meet the requirements of Table 716-10-1.

The manufacturer shall certify that the elastomeric compound passes Grade 3 Low - Temperature Brittleness as determined by ASTM D746 - Brittleness Temperature of Plastics and Elastomers by Impact Procedure B.

Internal Steel Plates. Steel plates for internal laminates shall be rolled mild steel conforming to the requirements of ASTM A36, or ASTM 1008/A1008/M ASTM 1011/A1011/M (Grade 33, 36 and 40).

External Load Bearing Plates and Steel Backing Plates. External load bearing plates shall conform to the requirements of ASTM A36 and to the requirements of the Steel Construction Manual (SCM), unless otherwise provided for in the contract documents.

Except as noted, all bearing surfaces of external load plates shall be finished or machined flat within 0.010 inch. Out-of-flatness greater than 0.010 inch on any plate, except the bottom surface of the lower external plates (masonry plates), shall be cause for rejection. The bottom surface of lower external load plates (masonry plates) shall not exceed an out-of-flatness value of 1/16 inch. Oxygen cut surfaces shall not exceed a surface roughness average of 1 mil as defined by ANSI B46.1. Repairs shall conform to the requirements of the SCM.

External load bearing plate surfaces to be welded shall be painted with one coat of lacquer or other protective coatings approved by the Director of the Materials Bureau. This coating shall be removed before welding. All surfaces shall be cleaned and painted in accordance with §572, Structural Steel Paint System, Shop Applied. Color shall match that of the finish coat of other structural steel. For bearing used in conjunction with unpainted steel, the finish coat shall match "Weathered Brown" as defined by 708-05 *Standard Paint Colors*.

DRAWINGS. Department approval of shop drawings are not required unless a change in the details shown on the plans is proposed. When Department approved drawings are required, they shall be furnished in accordance with SCM, Section 2, except that in place of two sets of Department approved drawings submitted to the designated Shop Inspection Agency, five sets of Department approved drawings shall be submitted to the Materials Bureau. The Contractor shall submit one copy of these drawings to the Engineer.

When the bearing details are identical to the plans, the Contractor shall be responsible for supplying shop drawings prepared by the manufacturer. The manufacturer shall certify that the bearings depicted on the drawings are in conformance with the contract documents. The Contractor shall submit one copy of the certified drawings to the Engineer and five copies of their certified drawings to the Materials Bureau. The Department's acceptance procedures will commence subsequent to receipt of these drawings. The Manufacturer shall note the following on all shop drawings:

- The Contract number, bridge identification number (BIN), feature carried/feature crossed, specification pay item no. and the type, size and quantity of bearings being produced.
- The design load (dead load plus live load) for each type and size bearing. If bearings of the same type and size are designed for differing load conditions the maximum design load shall be noted.
- The effective rubber thickness, typical laminate thickness, compressive area, shear area and shape factor.
- The Manufacturer's name, the location of the fabrication plant and the name and phone number of the manufacturer's representative who will coordinate production, inspection, and sampling and testing with the Materials Bureau.

- The specification references and grades of steel to be used.
- All welding procedures to be used in the manufacture of the bearings.

WELDING PROCEDURE. The bearing manufacturer shall submit a Welding Procedure to the Deputy Chief Engineer Structures (DCES) for each welding process to be used in the manufacture of the bearings. No welding shall be performed until the manufacturer receives an approved Welding Procedure.

FABRICATION. The finish of the mold used to produce these bearings shall conform to good machine shop practice. Each bearing shall be marked in indelible ink or flexible paint. The marking shall consist of the manufacturer's name, contract number, lot number, and individual bearing number. The marking shall be placed on at least one side or face that will be visible after erection and, if possible, on two sides or faces.

The bearings shall be cast as a single unit in a mold and bonded and vulcanized under pressure and heat to the specified size and thickness. They shall be cast as a single unit with the external load plate(s) bonded to the elastomer by vulcanization during the primary molding process. If internal steel plate(s) are required, they shall be commercially blast cleaned to a condition matching that of SSPC-Vis1, Pictorial Standards A SP6, B SP6 or C SP6, and cleaned of all oil or grease before bonding.

During any welding, the temperature of the steel adjacent to the elastomer shall not exceed 200°F. Temperature shall be controlled by welding procedures and temperature indicating crayons, or other devices approved by the Engineer. Unless otherwise approved by the DCES, all welding shall conform to, and all welders shall be qualified in accordance with the requirements of the SCM.

Bearing Tolerances. Finished elastomeric bearings shall conform to the design dimensions, with the tolerances listed in Table 716-11 and the following details:

A. Internal Steel Plates. The internal steel plates shall be checked for parallelism by measuring the distance between each individual steel plate, and between the top or bottom edge of the bearing to the first adjacent steel plate. For rectangular bearings, take measurements for each plate along the vertical surface of the bearing, located 1 inch from the edge of the four alternate corners. For round bearings, measurements will be taken at four points located at 90° intervals around the perimeter. The smallest of the four measurements shall be recorded for each plate. The cumulative total of these measurements shall not be less than 75% of the design effective rubber thickness.

B. Elastomeric Laminae. The average thickness of individual layers of elastomer in steel laminated elastomeric bearings shall not vary more than ±20% of the design thickness and in no case exceed the design thickness by 1/8 inch. Average thickness will be calculated from measurements taken at four points, located at 1 inch from the edge of the four alternate corners for rectangular bearings and at 90° intervals around the perimeter for round bearings.

Performance Characteristics

Compression Deflection. The compression deflection of each bearing shall not exceed 10.0% of the design effective rubber thickness at a compressive load equal to the actual design load.

The compression deflection shall be determined by loading the bearings to 500 psi and 800 psi. At each load a deflection reading will be taken and the readings used to calculate a slope between the two loads. The slope shall then be used to determine the deflection at the bearing's design load.

The bearing and ambient temperature shall be 75°F ± 5°F at the time of testing.

Adhesion. The adhesion of the elastomer to the internal plates shall be demonstrated by subjecting the bearing to a compressive load equal to 150% of the actual design load. Upon visual examination, the bearing shall be free of visual defects.

The bearing and ambient temperature shall be 75°F ± 5°F at the time of testing.

§716

NOTE: For conformance to this specification an observed or calculated value shall be rounded off (ASTM E29) to the nearest 0.1% for compression deflection.

SAMPLING AND TESTING

Lot Size. Sampling, testing and acceptance consideration will be made on a lot basis. A lot shall be defined as those bearings presented for inspection at a specific time or date. A lot shall be further defined as the smallest number of bearings as determined by the following criteria:

- A lot shall not exceed a single contract quantity
- A lot shall consist of bearings with the elastomer being of the same dimensions and configuration
- A lot shall consist of bearings produced in a continuous manner.

Procedure. The Department's representative shall select at random the required sample bearings from completed lots of bearings for testing by the Materials Bureau. The manufacturer shall supply the Department's representative with a copy of an approved Welding Procedure for each welding process used in the manufacture of the bearings. Bearings with a plan area greater than 4 sf shall be tested by an outside laboratory approved by the Materials Bureau. The Department shall assume the cost of testing the sampled bearings and the Contractor shall assume the responsibility and cost of transporting the sampled bearings from the place of manufacture to the testing laboratory. After testing the Contractor has the responsibility for the cost of transporting the sampled bearings back to the bearing manufacturer or, if applicable, to the project site. All samples shall be taken and delivered for test in accordance with the Department's written instructions. A minimum of thirty (30) days shall be allowed for inspection, sampling and testing by the Materials Bureau. This thirty days is exclusive of shipping time which is the Contractor's responsibility. The sampling procedure and test methods may be obtained from the Materials Bureau.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's name appearing on the Department's Approved List for Elastomeric Bridge Bearings and in accordance with the procedural directives of the Materials Bureau.

SECTION 717 - CONCRETE PROTECTIVE COATINGS

717-01 AND 717-02 (VACANT)

717-03 PENETRATING TYPE PROTECTIVE SEALERS

SCOPE. This specification covers the material requirements of penetrating type protective sealers for use on portland cement concrete.

GENERAL. The material shall be a one component material consisting of a penetrating sealer which does not alter the color or texture of portland cement concrete.

MATERIAL REQUIREMENTS. Penetrating sealers shall be a one-part liquid, composed of a minimum of 40% silane or siloxane material, with no petroleum distillates. The Department will test the sealers as delivered, in accordance with Department written instructions, to ensure that the following properties are attainable. If the material attains these properties, the Department will place the material on its Approved List. The properties are:

Water Absorption. The final average percent water absorbed, for concrete coated with the protective sealer, shall not be greater than 20.0% of the final average percent water absorbed by the uncoated reference concrete.

Moisture Vapor Transmission. The final average percent moisture loss, for concrete coated with the protective sealer, shall not be less than 75.0% of its final average percent water absorption.

Chloride Ion Penetration. The final average absorbed chloride ion content, for concrete coated with the protective sealer, shall not be greater than 15.0% of the final average absorbed chloride ion content of the uncoated reference concrete.

Durability. The protective sealer shall not show any signs of weathering, discoloration, or deterioration after 6 months of exposure to atmospheric conditions.

PACKAGING. All materials shall be packaged in strong, substantial containers. Each container shall be plainly marked with the following information: name of the product; name and address of Manufacturer; application instructions; lot/batch number; date of manufacture; quantity of material; and date of expiration or shelf life. The printed shelf life shall not exceed one year from the date of manufacture.

BASIS OF ACCEPTANCE. Acceptance of penetrating type sealers will be based upon the product appearing on the Department's Approved List, and the Manufacturer's certification that the material meets the requirements of this section. The shelf life of this material shall not exceed one year from the date of manufacture printed on the product label. The Department reserves the right to sample and test the material at its discretion.

717-04 COATING TYPE PROTECTIVE SEALERS

SCOPE. This specification covers the material requirements of coating type protective sealers for use on portland cement concrete.

GENERAL. The coating system shall be either a single coating material or a primer coat followed by a top coat. After application, the sealer shall be opaque and uniform in color.

MATERIAL REQUIREMENTS. The Department will test the sealers as delivered, in accordance with Department written instructions, to ensure that the following properties are attainable. If the material attains these properties, the Department will place the material on its Approved List. The properties are:

Water Absorption. The final average percent water absorbed, for concrete coated with the protective sealer, shall not be greater than 25.0% of the final average percent water absorbed by the uncoated reference concrete.

Moisture Vapor Transmission. The final average percent moisture loss, for concrete coated with the protective sealer, shall not be less than 50.0% of its final average percent water absorption.

Chloride Ion Penetration. The final average absorbed chloride ion content, for concrete coated with the protective sealer, shall not be greater than 25.0% of the final average absorbed chloride ion content of the uncoated reference concrete.

Durability. The protective sealer shall not show any signs of weathering, discoloration, or deterioration after 6 months of exposure to atmospheric conditions.

PACKAGING. All materials shall be packaged in strong, substantial containers. Each container shall be plainly marked with the following information: name of the product; name and address of Manufacturer; mix proportions(if applicable) and application instructions; lot/batch number; date of manufacture; quantity of material; and date of expiration or shelf life. The printed shelf life shall not exceed one year from the date of manufacture.

BASIS OF ACCEPTANCE. Acceptance of coating type sealers will be based upon the product appearing on the Department's Approved List, and the Manufacturer's certification that the material meets the requirements of this section. The shelf life of this material shall not exceed one year from the date of manufacture printed on the product label. The Department reserves the right to sample and test the material at its discretion.

SECTION 718 - PRESTRESSED CONCRETE UNITS

718-01 PRESTRESSED CONCRETE UNITS (STRUCTURAL)

SCOPE. This specification covers the material and fabrication requirements for prestressed concrete units.

GENERAL. Prestressed concrete units provided under this specification shall meet all design requirements for the structure for which they are being fabricated.

MATERIAL REQUIREMENTS

Concrete. The concrete shall meet the requirements of §501-2, under 501, Portland Cement Concrete, General, with the following modifications:

- Cement shall be either Type 1, Type 2 or Type 3. Only one type of cement shall be used to fabricate units for any one structure
- Coarse aggregate gradation shall be No. 1 Size or ASTM D448, No. 67
- Concrete requirements for Classes A and C concrete shall not apply
- Air content shall be 7 percent + 2 percent
- The use of calcium chloride, or an admixture containing calcium chloride will not be permitted.

Steel.

Bar Reinforcement	709-01
Wire Fabric	709-02
Chairs or other devices to ensure proper placement of steel items	556-2.02
Prestressing steel	709-06
Bearing plates, if required	715-01

Epoxy. Epoxy shall meet the requirements of §721-01, Epoxy Resin System; §721-03, Epoxy Polysulfide Grout, or §721-05, Epoxy Repair Paste.

Fine Aggregate. Fine aggregate shall meet the requirements of §703-03, Mortar Sand or §703-04, Grout Sand. Fine aggregate shall be absolutely dry.

DRAWINGS

Contract Drawings. Drawings which accompany the contract proposal are designated as contract drawings. These drawings are not intended to be working drawings.

Working Drawings. Complete and accurate drawings shall be made by the Contractor, indicating how each prestressed concrete unit is to be fabricated. The Contractor shall be responsible for modifying the dimensions of units to compensate for elastic shortening, shrinkage, grade correction and other phenomena that make in-process fabricating dimensions different from those shown on the contract drawings. Approval of the working drawings by the DCES shall not relieve the Contractor from the responsibility for the correctness of all dimensions shown on these drawings. These drawings shall be made as soon as possible after the award of contract and they shall be designated as working drawings.

A. Size and Type. Working Drawings shall be neatly drawn and clearly legible to produce microfilm negatives. The drawings shall be made in ink, or reproduced from the pencil drawings by a process subject to the approval of the DCES, on tracing cloth or mylar of acceptable quality. Working drawings shall be cut to a standard size of 22 x 34 inches (nominal) and arranged to conform to the contract drawings.

Failure to submit working drawings of the required size will be cause for their return without examination. The margin line shall be drawn 1/2 inch from the top, bottom, and right-hand edges and 2 inches from the left-hand edge to permit binding. A space 3 x 11 inches, and parallel to the length of the sheet shall be reserved in the lower right-hand corner for title and approval signature. Each working drawing shall have an identical (top right) corner box to the one shown on the contract drawings. The sheets shall be arranged so that, as far as possible, the notes will appear above each other near the right edge of the sheet.

B. Information Required on Working Drawings. The working drawings shall include the following information:

- Plan layout of superstructure indicating the piece mark assigned to each prestressed unit
- Fabricating plant production schedule
- Description of the fabricating plant, including any backup concrete mixing facilities, original design mix and proposed method of placement. Modifications or deviations from the original mix at any time after the working drawings have been approved, shall be submitted, in writing to the DCES
- Proposed admixture to be added to the concrete mix
- Quality control tests and procedures
- Method and outline of unit and cylinder curing procedure, as required by "Curing"
- The name of the manufacturer of the prestressing steel, including any alternate source
- Material and manner of sealing the exposed portions of the prestressing steel
- Transfer of prestress procedure for all unit types to be fabricated
- Complete details, including anticipated camber, tensioning force (initial and final), concrete strength (transfer and 28 day), and type and location of lifting device for all prestressed concrete units to be fabricated.
- Proposed method of handling and transporting prestressed concrete units to the project site
- Working drawings shall clearly indicate any proposed deviations from the prestressed concrete unit shown on the contract drawings
- Winter concreting procedures, if need is anticipated.

Submission of Working Drawings. When the working drawings, prepared by the Contractor, as specified, are completed, check prints shall be submitted to the DCES, who will indicate thereon such corrections as may be necessary to secure the completion of the contract in accordance with the requirements of the contract documents. The Contractor shall submit three sets of check prints for the DCES and two additional sets of check prints for each Railroad or other Agency involved with the contract. All sets of check prints shall be submitted to the DCES, who will make the distribution to the Railroad and other Agencies involved. One set of check prints or sepias with desired corrections indicated thereon in colored crayon or pencil, will be returned to the Contractor. When the revisions have been completed to the satisfaction of the DCES, the original drawings shall be forwarded to the DCES for written approval, after which a set of approved drawings will be returned. The original drawings shall remain the property of the State.

The DCES shall be allowed two work days for the examination of each drawing in a set of working drawings, or ten work days minimum per set. A set of working drawings shall be considered to be all drawings received by the DCES from any given Contractor for a particular contract on any calendar day. If the working drawings are detained for examination for a period longer than that previously stated, such detention will be taken into account when considering application by the Contractor for an extension of time for the completion of the contract. All working drawings are time and date stamped as they are received and recorded in a log at the office of the DCES. This log shall be the basis for determining when

§718

drawings must be returned without consideration for an adjustment of the completion date as described herein.

Approval of working drawings shall not constitute approval for the following information required on the working drawings 2B(3) and 2B(7). This data is required for information only.

FABRICATION

Approval of Working Drawings. No fabrication shall be started until after the working drawings have been approved and the Inspector has received prints made from the original drawings.

Data Required with Working Drawings. Data required by the DCES prior to approval of the working drawings shall be as follows:

- Calculations of strand elongation for each unique casting length (grip-to-grip)
- A calibration certificate indicating the load calibration of each gage and hydraulic jack combination used for tensioning. The gage shall be calibrated from zero, throughout its entire load range. The gage shall have clearly marked divisions that are easily readable at the initial and final tensioning force. The calibration date of each combination gage and hydraulic jack shall be within the 12 month period immediately prior to the start of the work.
- A calibration certificate attesting to the fact that the concrete cylinder testing machine to be used has been calibrated within the 12 month period immediately prior to the first date of actual use of the machine.

Data for Inspector. Data required to be submitted to the Inspector for approval prior to the inclusion of the respective materials in the unit, shall be as follows:

A. Prestressing Steel Certification. A certificate from the prestressing steel manufacturer stating that the prestressing steel has been manufactured in accordance with §709-06.

B. Load-Strain Curves. Typical load-strain curves made during the processing of steel from which the elongation appropriate to the required prestressing force can be determined, including the following information:

- The breaking strength
- The elongation at rupture
- The load at one percent elongation
- The test dates

The aforesaid information shall be submitted to the Inspector, in triplicate, for each 25 ton lot, or fraction thereof, of prestressing steel.

C. Other Certifications. Certificates indicating acceptance of bar reinforcement, concrete materials and any other material used in the prestressed concrete unit.

Inspection. Fabrication of units shall be inspected by an Inspector designated by the State. The Contractor shall inform the State 72 hours prior to:

- Commencement of work
- Commencement of work after a work suspension of 48 hours or more
- Unit shipping

The Contractor shall keep the Inspector informed of the day-to-day scheduling of operations. The Inspector shall have free access throughout the fabrication plant to see that the work being done is in conformance with the contract documents. Work done while the Inspector has been refused access shall be automatically rejected. The Inspector shall be present when necessary tests are made on the prestressing steel at the place of manufacture.

1098

Concrete Forms

A. General. Forms shall be well-constructed, carefully aligned, clean, substantial and firm, securely braced and fastened together and sufficiently tight to prevent leakage of mortar. They shall be strong enough to withstand the action of mechanical vibrators. All forms for each unit shall be approved by the Inspector prior to placing concrete.

All form surfaces that come in contact with the concrete shall be thoroughly treated with an approved form coating in the manner and at the rate specified by the manufacturer. Forms so treated shall be protected against damage and dirt prior to placing concrete.

Any form coating material that will stick to or discolor concrete shall not be used.

B. Void-Producing Forms. Void forms shall be coated with a waterproofing material on the outside and shall have a 3/4 inch (nominal) diameter drain placed at each end of each void.

When units are steam-cured, all voids shall be vented.

Reinforcement and Prestressing Steel. Prior to installation in the units, reinforcement and prestressing steel shall be free of frost, dirt, oil, paint, mill scale, corrosion, or any foreign material that may prevent bond between the steel and the concrete.

Tack welding of bar reinforcement shall not be allowed under any circumstances.

Welded wire fabric, smooth or deformed, may be substituted for the required bar reinforcement provided that:

- The required cover is maintained
- The design steel area of the fabric equals that of the bar reinforcement
- Splices to the fabric are made in accordance with the requirements of the N.Y.S.D.O.T. Standard Specifications for Highway Bridges, §1.5.22D and §1.5.22E as applicable.

If wire fabric is used, the details shall be indicated on the working drawings. Design computations shall also be included.

Tensioning of Prestressing Strands. A calibrated force of 3000 pounds shall be applied initially to each strand. Consideration will be given by the DCES to a different initial force for special cases. This force shall be the starting point for additional tensioning by elongation.

For draped strands, the additional tensioning or prestressing force induced in the prestressing steel shall be measured by jacking gages and by elongation of the steel. The jacking gages shall read within 5 percent of the force theoretically calculated to be induced by elongation.

For straight strands, elongation only shall determine the prestressing force.

During tensioning of any one strand, the process shall be so conducted that the applied load and the elongation of the strand may be measured at all times.

Two copies of recorded gage pressures and measured elongations, as required for the tensioning of prestressing strands in each unit, shall be submitted to the Inspector.

The use of load cells or other tension measuring devices may be required. They shall be furnished by the Inspector and used in accordance with his/her instructions.

Concrete Mix Design and Proportioning. The Contractor shall be responsible for designing a concrete mix to produce the strength and other requirements specified on the contract plans. If no strength is indicated, the required minimum strength shall be 4000 psi at transfer and 5000 psi at 28 days. Maximum cement content for any proposed mix shall be 750 lb/cy. Proposed mixes shall be submitted in accordance with the requirements of Drawings, Paragraph 2B(3). Automatic proportioning equipment will not be required.

The Contractor may request permission from the DCES to incorporate a High Range Water Reducing (HRWR) admixture into the concrete mix. The DCES will grant such permission only if deemed to be in the best interests of the State and then only under such conditions as the DCES requires.

Placing Concrete. No concrete shall be placed without the Inspector's approval. Compliance with the precasting tolerances is a prerequisite for casting approval by the Inspector.

§718

When the atmospheric temperature is below 40°F, the fabrication of the units shall be in accordance with the winter concrete procedures as approved on the working drawings.

Suitable means shall be used for placing concrete without segregation. The concrete mixture shall not be dropped from a height greater than 12 inches above the top of the forms. Special care shall be taken to deposit the concrete in its final position in each part of the form.

The plastic concrete shall be consolidated in place by either external or internal vibration methods, or both, if necessary. The vibrators shall be of a type and design approved by the Inspector and the size of the vibrating head will be governed by the spacing of the prestressing steel and reinforcement. Vibrators shall be used only to consolidate the concrete after it has been properly placed.

The internal vibrator shall be slowly inserted and removed from the concrete.

The following quality control tests shall be performed, by the Contractor in the presence of the Inspector from the same concrete sample as that used for the Concrete Strength Requirements of this specification:

- Slump
- Air content
- Temperature
- Unit mass.

Finishing. To assure production of well-formed matching beams with overall pleasing appearance, all surfaces of concrete shall be true and even, free from rough, open or honeycombed areas, depressions or projections. After all the concrete has been placed and thoroughly compacted as required under Placing Concrete, the tops of units shall be magnesium-float finished, or finished as shown on the Working Drawings. If required, all exposed surfaces shall be finished by bagging.

All exposed reinforcement shall be coated with neat cement paste prior to placement in the storage area.

Curing. The Contractor shall indicate on the working drawings, for approval, the method of cure and complete outline of the proposed procedure under each of the phases of the curing cycle. The full curing cycle consists of an Initial Curing Phase and Final Curing Phase. The Contractor may choose any one of the following acceptable curing methods, however only one curing method will be allowed for the units of a single structure.

To ensure complete hydration of cement, and to prevent the formation of cracks, moisture must be retained within the concrete. Therefore, immediately upon the completion of concrete placement for each unit, an enclosure shall be placed over the casting bed. The Contractor shall submit all covers for inspection prior to the commencement of work.

A. Accelerated Cures. Acceptable methods for accelerated cures are by application of low pressure steam or by application of radiant heat and moisture.

1. Initial Curing Phase. The initial curing phase for each unit shall be that period beginning from the time each unit is completely covered and continuing until the final curing phase commences.

The Contractor shall indicate the duration of the initial curing phase for each unit. However, the initial curing phase shall not exceed eight hours. During this phase, the enclosure temperature shall be maintained at approximately the concrete placing temperature; artificial heat shall be applied if necessary.

2. Final Curing Phase. The final curing phase for each unit shall be that period required to raise the initial curing phase temperature to the selected temperature range at a rate not exceeding 50°F per hour and continuing until the concrete has attained the minimum transfer strength as noted on the contract plans or as noted in this specification, under the paragraph Concrete Mix Design and Proportioning, whichever is applicable.

The selected curing temperature range shall be as approved on the working drawings.

B. Non-Accelerated Cure. The acceptable method of non-accelerated cure is by the application of a saturated cover.

1. Initial Curing Phase. The requirements of A1 above, shall apply.

2. Final Curing Phase. The final curing phase may begin at anytime after commencement of the initial curing phase. Each unit shall be covered with heavy, water saturated burlap, or other material acceptable to the Inspector. The burlap shall be kept saturated, and the concrete surface temperature shall not drop below 68°F. These conditions shall be maintained until either of the following has occurred:

- a. Seventy-two hours have passed from the time of burlap placement; or
- b. Minimum transfer strength has been reached.

Record of Curing Time - Temperature. The Contractor shall provide one (1) automatic temperature recorder for every 100 feet of casting bed. The recorder shall continuously record curing temperatures for the initial and final curing phases. Temperature sensors shall be carefully placed within the curing enclosure to ensure that ambient temperatures are measured at the designated locations. Recorder accuracy shall be certified once every 12 months and the certificate displayed with each recorder. In addition, random temperature checks of each recorder shall be made by the Inspector.

Each temperature chart shall indicate the casting bed, date of casting, time of commencing graphic plot and units represented by chart. The start of artificial heat and the transfer of prestress shall be indicated on each graphic record.

After completion of the final curing phase, the charts shall be properly marked and given to the Inspector. Temperatures recorded on the charts shall be considered as verification of whether the units have been cured in accordance with the approved working drawings.

Transfer of Prestress. Transfer of prestress shall be accomplished as soon as the final curing phase is complete.

Concrete Strength Requirements

A. Test Cylinders. The concrete strength shall be determined from concrete test cylinders made in conformance with ASTM C31, except that all cylinders shall be vibrated. All cylinders shall be tested in conformance with ASTM C39, on an approved testing machine. All cylinders shall be made and tested by the Contractor in the presence of the Inspector.

The cylinders shall be made from concrete actually placed in the units. The Inspector shall be the sole judge of which cylinders are defective or damaged and are not to be included in the determination of the strength class. Test cylinders used to determine required strengths for detensioning shall be cured as specified on the working drawings.

All cylinders used to test for concrete strength shall be cured in the same manner as the units they represent unless otherwise indicated on the working drawings.

The Contractor shall cast a sufficient number of concrete test cylinders to fulfill the concrete strength test requirements as stated in 2 below. This testing procedure may be altered by the DCES. If an alternate procedure is to be followed, it shall be indicated on the contract drawings. The number of test cylinders to be cast for each unit shall be shown on the working drawings.

B. Testing for Concrete Strength. The strength requirements for each unit shall be certified by the Contractor, as follows, before the unit is accepted for strength:

1. Transfer Strength. Two cylinders from each unit shall be tested in immediate succession to verify prestress transfer strength. One of the two cylinders tested to determine the strength of the last unit cast in any bed shall be taken from the last batch of concrete placed in that unit. The strength of each cylinder shall be at least 95 percent of the required prestress transfer strength.

The average strength of the two cylinders shall be equal to or greater than the required prestress transfer strength.

2. 28 Day Strength

- a. Two cylinders from each unit shall be tested in immediate succession at 28 days of age to verify the required 28 day strength of the concrete. The average strength of the two cylinders shall be equal to or greater than the required 28 day strength. If this requirement is not met, any remaining cylinders representing the unit shall be tested at 28 days of age. The average strength of all cylinders representing the 28 day strength of any one unit shall be equal to or greater than the required 28 day strength.
- b. The Contractor may elect to test two cylinders from each unit in immediate succession, prior to the 28 day age limit. If this option is exercised sufficient cylinders shall be made to ensure that at least two cylinders are available for the 28 day test. Each cylinder shall have a strength of at least 95 percent of the required 28 day strength. The average of the two cylinders must be equal to or greater than the required 28 day strength. If these requirements are met, the cylinder test at 28 days of age shall be waived.

Rejection of Units. Any unit not fabricated in accordance with the contract documents or displaying any of the following defects shall be subject to rejection:

A. Strength Requirement. Any unit represented by cylinders not meeting the required strengths, as specified in Concrete Strength Requirements.

B. Exposed Prestressing Steel. Any unit that has one (1) prestress strand exposed in excess of 24 diameters, or two (2) or more exposed strands.

C. Honeycombing. Honeycombing of the unit to such an extent that chipping away from the honeycombed concrete results in the conditions described in the above paragraph 2, Exposed Prestressing Steel.

All honeycombed areas in a unit must be chipped until sound concrete is detected. Sound concrete is defined as that point at which chipping causes fracture of the aggregates.

D. Stress Cracks. Any unit that has a stress crack in the area beginning 4 inches from the unit end to the center line of the unit that is greater than 1/2 inch in depth and 2.5 mils in width.

E. Injurious Materials. Materials used for the manufacture of concrete shall not contain, nor cause concentration of, chemicals, or other materials injurious to concrete.

Concentrations of total chloride ions in excess of 0.05% by mass of cement are considered injurious.

Other material and concentration injury potential will be determined by the D.C.E.T.S. according to Department written instructions.

Damaged units. The Inspector shall determine whether spalled, honeycombed, or otherwise defective concrete shall be repaired or be subject to rejection. The decision to repair a unit or reject a unit shall require the concurrence of the DCES.

Removal of Unsuitable Material. Prior to beginning the repair, all spalled, honeycombed or disintegrated concrete shall be removed by chipping the unsuitable material away until sound concrete is reached. Sound concrete shall be as defined under Rejection of Units, Subparagraph 3. Chipping tools shall be pneumatic. The type and size of tools and the depth at which sound concrete is reached shall be determined by the Inspector.

Blast Cleaning Surfaces. All surfaces to be repaired shall be thoroughly blast-cleaned with No. 40 boiler slag grit or No. 2 sandblast sand, or as ordered by the Inspector.

REPAIR. Repair shall be designated as “structural repair” or “nonstructural repair” by the Deputy Chief Engineer (Structures). Repair to a unit shall be done in accordance with the following.

Structural Repair. Repair, designated as “structural” by the DCES, shall be made with an epoxy grout comprised of an epoxy resin system (721-01), or an epoxy polysulfide grout (721-03), mixed with fine aggregate. The grout shall be mixed and placed in accordance with the following:

A. Mixing. No mixing shall be started until all preparations have been made to use the grout. The Contractor shall be familiar with the pot life limitations of the epoxy being used, and its operations shall be governed accordingly. Mixing shall be carried out in strict accordance with the manufacturer's instructions and the following:

- Mixing shall be done as close as possible to the portion to be repaired.
- All necessary equipment for mixing and placing shall be present at the site, and in good working order, prior to the start of mixing.
- The grout shall be proportioned by volume in the approximate ratio of two (2) parts fine aggregate to one (1) part epoxy. The exact ratio of sand to epoxy resin system shall be determined on-site to produce a dense void-free grout.
- Dry, fine aggregate shall be placed in the mix container first. It shall be thoroughly agitated prior to the addition of the epoxy.
- The two components of the epoxy system shall be thoroughly mixed together before being added to the fine aggregate.
- The epoxy shall be added to the fine aggregate slowly, but mixing time shall not exceed three minutes.
- All grout, in any individual batch, shall be used within 25 minutes after the start of mixing of the two components to create the epoxy system. All grout not used within the time limit shall be discarded.
- The epoxy grout shall not be retempered.

B. Placing. The epoxy grout shall be placed against a clean, primed, receiving surface, in accordance with the following:

- The receiving surface shall be cleaned of all oil, grease, or other material which may prevent effective bond, immediately prior to priming the surface with neat epoxy (epoxy without aggregate).
- The priming of the receiving surface shall be done immediately prior to the placement of the epoxy grout.
- The epoxy grout shall be placed quickly and continuously. It shall not be overworked.
- The temperature of the receiving surface shall be above 50°F at the time of grout placement.
- Grout placement shall not be permitted when ambient temperatures are 50°F or lower, unless methods of protection, acceptable to the Inspector, are employed. Methods of protection, if permitted, shall be continued for a period of 15 hours following grout placement. The 15 hour period may be shortened, at the discretion of the Inspector, but under no circumstances will it be less than 12 hours. Methods of protection, if permitted, are conveniences granted by the State. As such, they are not considered extra work, and therefore they are not entitled to extra compensation.
- Upon completion of grout placement, the new surface of the repaired area shall be flush with the adjacent surfaces, unless the design of the unit specifically requires otherwise.
- On surfaces which will be exposed to view after installation, the repaired area shall be color matched to the adjacent surfaces by use of cement dust, or other means acceptable to the Inspector.

Nonstructural Repair. Repair, designated as “nonstructural” by the DCES shall be made with either of the following:

§718

- Epoxy grout composed of §721-01 Epoxy Resin System or §721-03 Epoxy Polysulfide Grout, and fine aggregate; or,
- §721-05 Epoxy Repair Paste.

The Contractor has the choice of materials.

A. Mixing. Epoxy grout shall be mixed in accordance with the requirements of A. Mixing as given under Structural Repair.

Epoxy repair paste shall be mixed in strict accordance with the manufacturer's instructions.

B. Placing. Placing of either material shall be done in accordance with the requirements of B. Placing as given under Structural Repair.

TOLERANCES. Tolerances of the Prestressed Concrete Units shall meet the requirements specified in the Contract Documents.

Units which fail to meet the tolerances shall be rejected with the concurrence of the DCES.

SHIPPING. Units shall not be shipped until the minimum 28 day strength has been attained, but in no case, before 72 hours' storage time has elapsed following transfer of prestress.

BASIS OF ACCEPTANCE. The Inspector's stamp of approval shall constitute the basis of acceptance for shipment to the job site. The Inspector's stamp shall be placed on the unit after loading for shipment.

Application of the Inspector's acceptance stamp indicates that at the time of shipment, it was the Inspector's opinion that the unit was fabricated from accepted materials, by approved processes, and was properly loaded for shipment.

Such application does not imply that the material will not be rejected by the State if it is subsequently found to be defective.

718-02 THRU 718-04 (VACANT)

718-05 PRESTRESSED CONCRETE FORM UNITS

SCOPE. This specification contains the requirements for prestressed concrete form units. These units are used to form the lower portion of a structural slab. They act compositely with the cast-in-place portion of the slab and become an integral part of the structural slab.

GENERAL. §718-01 Prestressed Concrete Units (Structural) shall apply except for the following modifications to the FABRICATION, REPAIR and TOLERANCES:

FABRICATION. §718-01 shall apply except as follows:

Reinforcement and Prestressing Steel. §718-01 shall apply. In addition, devices which will be used as hold-down points for outside reinforcing steel shall be placed prior to concrete placement in the forms. Devices used to lift the units are acceptable for this purpose. The maximum spacing between hold-down devices shall be 4 feet center-to-center of device.

Finishing. §718-01 shall apply except the tops of units do not have to be magnesium float finished.

Concrete Strength Requirements. §718-01 shall apply except the testing shall be as follows:

Testing for Concrete Strength. The strength requirements for each day's production shall be certified by the Contractor before that day's production is accepted for strength. Certification shall be done in accordance with the terms of this subsection. All cylinders cast shall be cast in sets of three.

One set shall be cast from the first concrete placement of the day. One set shall be cast from the last concrete placement of the day. In addition to those, there shall be a set cast for each 15 cubic yards of concrete, or major fraction thereof, placed in any one day.

1. Transfer Strength. Three cylinders from each day's production shall be tested in immediate succession to verify prestress transfer strength. One cylinder shall be taken from the first set cast; one cylinder shall be taken from the last set cast. The strength of each cylinder shall be at least 95 percent of the required prestress transfer strength. The average strength of the three cylinders shall be equal to, or greater than, the required prestress transfer strength.

2. 28-Day Strength. Three (3) cylinders representing each day's production shall be tested in immediate succession at twenty-eight (28) days of age to verify the required 28-day strength. The strength of each cylinder shall be at least ninety-five (95) percent of the required 28-day strength. The average strength of the three cylinders shall be equal to, or greater than, the required 28-day strength. If these requirements are not met, any remaining cylinders representing the day's production shall also be tested at 28 days of age. The average strength of all cylinders representing the 28-day strength of any one day's production shall be equal to, or greater than, the required 28-day strength.

3. Option. The Contractor may test three (3) cylinders, representing each day's production in immediate succession, prior to the 28-day age limit. Each cylinder shall have a strength of at least ninety-five (95) percent of the required 28-day strength. The average strength of the three cylinders shall be equal to, or greater than, the required 28-day strength. If these requirements are met, the cylinder test at 28 days of age shall be waived. If this option is exercised, sufficient cylinders shall be made to ensure that at least 3 cylinders are available for the 28-day test.

Rejection of Units. Any unit not fabricated in accordance with the Contract Documents, or displaying any of the following defects, shall be subject to rejection:

A. Strength Requirements. Any unit represented by cylinders not meeting the required strengths, as specified in Concrete Strength Requirements, of this specification.

B. Exposed Prestressing Steel. Any unit which exhibits one or more exposed prestressing strand(s) on a top or bottom surface.

C. Honeycombing. Honeycombing of the unit to such an extent that chipping away from the honeycombed concrete results in the exposure of one, or more, prestressing strands on a top, or bottom, surface.

All honeycombed areas shall be chipped until sound concrete is reached. Sound concrete is defined as that point at which chipping causes fracture of the aggregates. If chipping of the honeycombed portion results in a hole more than one-half the thickness of the unit, the unit will be rejected.

D. Cracks. Any unit which exhibits a crack that is greater than 1/2 inch in depth, and 2.5 mils in width.

REPAIR. Repair, if allowed by the DCES, shall be made with §721-05 Epoxy Repair Paste. Epoxy repair paste shall be mixed and placed in strict accordance with the manufacturer's instructions.

Form Supports Form supports for installation of the units shall be supplied as part of this work. They shall conform to the latest specification for ASTM A446, Grades A through E. Fabrication shall be in conformance with ASTM A653/A653M, Coating Class G165.

The Contractor shall supply the Engineer with certification that the form supports meet the foregoing requirements.

§718

TOLERANCES. All units shall be checked for compliance with the tolerances listed below, after the units have completed the final curing phase and within three (3) days prior to shipping. The Inspector shall document to the DCES any unit with dimensions out of tolerance. Any unit which fails to meet these tolerances shall be rejected with the concurrence of the DCES.

Finished Dimensions

*Width \pm 1/4 inch

Length \pm 1/2 inch

Depth \pm 1/4 inch

*Width is defined as the dimension measured parallel to the prestressing strands.

Position of Strands

Vertical \pm 1/4 inch

Horizontal \pm 1/2 inch

718-06 HIGH PERFORMANCE CONCRETE FOR PRECAST AND PRESTRESSED BRIDGE BEAMS

SCOPE. This specification covers the material requirements for high performance concrete for precast and prestressed bridge beams.

MATERIAL REQUIREMENTS. The concrete shall meet the requirements of the approved Mix Design Sheet, described below, and the PCCM. The concrete mix shall contain a minimum of 5% microsilica measured as a percent of the total cementitious material.

MIX DESIGN SHEETS (MDS). These sheets shall contain all the information on the mix design, materials, material sources, production facilities, quality control, curing, and preproduction testing of the mix. Once approved for production, the MDS may be used in any contract requiring high performance concrete for precast and prestressed bridge beams.

The MDS will have a two-step approval process. The first submittal shall contain all the information required in A. through N. Complete submittals that meet the specification requirements will be examined according to Section 2.5 of the PCCM and, if found acceptable, it will be returned with the notation "APPROVED FOR TESTING." Section 2.5.7 of the PCCM does not apply.

Following required testing of the mix, the MDS shall be submitted to the DCES with the information in O. through Q. added to the sheet. If the test results meet the requirements of this specification, the MDS will be returned with the notation "APPROVED." After approval for production, no changes in materials sources, production, curing, or mix design shall be made, except those changes necessitated by a change in the fineness modulus of the aggregate.

If changes are required after the approval of the MDS, a revised MDS with all the required changes shall be submitted to the DCES. After examining the revised MDS, the DCES will determine if repetition of any testing is required for the approval of the revised MDS. If it is determined that some or all tests shall be repeated, the revised MDS will be returned marked up, specifying the required tests to be repeated and stamped "APPROVED FOR TESTING." Remaining portions of the approval process will exactly follow the procedure used for the initial approval of the MDS except that the tests to be performed will be limited to the tests to be repeated marked up by the DCES.

If it is determined that there is no need for repeating the preproduction testing and if the proposed changes are acceptable to the DCES, the revised MDS will be approved and returned.

Information Required on MDS. The MDS shall include the following information:

- A. The source and type of cement.
- B. The specific source of the coarse aggregate.
- C. The specific source of the fine aggregate and the fineness modulus of the material proposed for use in the preproduction testing.
- D. The brand and type of all admixtures that will be used.
- E. The complete mix design including all ingredient and quantities proposed for the production concrete.
- F. The maximum water-to-total-cementitious-material ratio that is proposed for production.
- G. Description of the concrete batching and mixing facilities, including the date of last annual inspection and date of last scale calibration check.
- H. Description of the concrete transport equipment.
- I. The method of concrete placement.

- J. Outline of the curing procedure to be used for the production units and test samples.
- K. Quality control tests and procedures that the fabricator will perform.
- L. Detailed description of the preproduction testing procedure to establish that concrete made from the proposed mix design meets the required performance criteria.
- M. The name and address of the testing laboratory(s) conducting the tests.
- N. A fabricator selected identifier for the mix.
- O. Test results for the preproduction test mix.
- P. Actual fineness modulus of the fine aggregate used in the preproduction test mix.
- Q. Graph of compressive strength versus age.

TESTING. The concrete mix design shall be tested prior to making any bridge beams and shall meet the following performance criteria.

TABLE 718-06-1 TESTING REQUIREMENTS FOR HP CONCRETE		
PROPERTY	TEST METHOD	ACCEPTANCE CRITERIA
Compressive Strength (at 56 days)	AASHTO T22	> 10,000 psi (all tests)
Freeze/Thaw Durability (x=relative dynamic modulus of elasticity after 300 cycles)	AASHTO T161 Procedure A	$x \geq 80\%$
Scaling Resistance (y= visual rating of surface after 50 cycles)	ASTM C672	$y \leq 3$
Elasticity (E = modulus of elasticity)	ASTM C469 (Note C)	$E \geq 4.35 \times 10^6$ psi
Shrinkage (s= microstrain)	AASHTO T160-97 (at 56 days)	$s < 600$
Creep (c = microstrain/pressure unit)	ASTM C512(at 56 days, 40% fc')	$c \leq 414/$ psi
Chloride Penetration (p= increase in percent of chloride ion by weight of concrete)	AASHTO T259 modified (Note A)	$p \leq 0.025\%$ at 1 inch
Air Content	AASHTO T 152	A = % selected by contractor, $A \geq 3\%$
Water/Cementitious-Materials ratio (W= mass ratio)	AASHTO TP23-93 (Note B)	Supplier selects W, $W < 0.40$

Note A: The test specimens are to be cured under the same conditions and for the same time as proposed for production. They shall then be stored for 28 days in the drying room specified by the AASHTO T259.

Note B: The AASHTO TP23 test shall be corrected for the absorbed water in the aggregate. This correction shall be made using the mass percentage of absorption shown under “ABS” in the Approved List of Sources of Fine and Coarse Aggregates (or as determined by AASHTO T-84 for fine aggregates and AASHTO T-85 for coarse aggregate) by an AASHTO accredited testing laboratory.

Note C: Test two samples. Each sample is to be loaded at 40% of the load required to break a companion sample cast from the same mix at the same time as the test sample. Sample 1 is to be loaded when the strength of a companion sample achieves a strength of 7000 ± 430 psi. Sample 2 is to be loaded when the strength of a companion sample achieves a strength of $10,000 \pm 860$ psi.

PREPRODUCTION TESTING

The Contractor shall engage an AASHTO Accredited testing laboratory for testing of all preproduction concrete specimens except compressive strength, air content, and water/cementitious-materials ratio. These tests shall be performed in the presence of the Quality Assurance (QA) Inspector. The DCES may approve laboratories with equivalent certification from another organization. The testing laboratory shall send a copy of the test results directly to the DCES.

The Contractor shall notify the Department at least three work days prior to casting preproduction test specimens. No test specimens shall be cast unless the QA Inspector is present to witness the mixing, casting, and curing of the specimens. The test specimens shall be prepared of concrete made using materials from sources shown on the “Approved For Testing” MDS.

The water-to-total-cementitious-materials ratio for concrete mix for purposes of preparing specimens for chloride penetration testing shall be 0.03 higher than the maximum water-to-total-cementitious-materials ratio that is proposed for production. In addition to those specimens needed for AASHTO T259

§718

testing, the fabricator shall cast eighteen 4 x 8 inch cylinders from the chloride penetration test mix, cure the cylinders in accordance with the approved production curing procedures for long-term independent testing and research. These cylinders shall be delivered to the testing laboratory designated by the DCES.

The test mix for all other tests shall be the water-to-total-cementitious-materials ratio that is proposed for production within a tolerance of 0.01. Include the total aggregate moisture, as determined according to AASHTO T 255, in the calculation of the water-to-total-cementitious-materials ratio with appropriate adjustments. (See Note B in Material Requirements.)

Using the test mix, cast and test compressive strength cylinders at 18 hours, 3 days, 7 days, 28 days, and 56 days. Present the test results in a graph.

Acceptance of Test Specimens. All test specimens shall be prepared in accordance with an "Approved for Testing" MDS. The preparation, casting, and curing of the test specimens shall be done in the presence of the QA Inspector. The QA Inspector shall indicate the procedures on the MDS were followed by affixing the inspection agency stamp on the samples prior to shipping to the Independent Testing Laboratories.

FABRICATION. The requirements of the PCCM shall apply with the following modifications:

1. Submitted Shop Drawings shall include approved Mix Design Sheets.
2. The required 56-day strength is 10,000 psi, unless shown otherwise in the Contract Documents.
3. The required minimum strength for imparting prestressing force into the concrete is 7000 psi unless shown otherwise in the Contract Documents.
4. The fineness modulus of the fine aggregate shall not vary more than 0.2 from the actual fineness modulus used in the preproduction test mix.
5. Water/Cementitious-materials ratio shall be measured by the Fabricator for the first batch of concrete in a day's placement and monitored by slump tests throughout production. If the QA Inspector has reason to believe the water/cementitious-materials ratio is changing, or if the slump increases by more than the allowed increase in the table below, additional water/cementitious-materials ratio tests may be ordered.

Slump of First Batch	Allowed Increase
Less than 4 inches	1 inch
4 inches or more	1 1/2 inch

6. Batch tickets shall be provided to the Inspector to verify the concrete mix contents.

BASIS OF ACCEPTANCE. Units will be considered for acceptance at the manufacturing location in accordance with the PCCM.

718-07 DIAPHRAGMS FOR PRESTRESSED CONCRETE BEAMS

SCOPE. This specification covers the material requirements for diaphragms used with prestressed concrete beam spread systems. Diaphragms may be cast-in-place concrete, precast concrete, or steel.

MATERIAL REQUIREMENTS. Diaphragms shall meet the requirements of the PCCM, and the following:

- A. Cast-in-place concrete shall meet the requirements for Class HP concrete. Damaged or defective concrete shall be defined by and repaired in accordance with the requirements of §555-3.11, Damaged or Defective Concrete.
- B. Steel Diaphragms.
 - a. Steel shall meet the requirements of §715-01. Stock steel is allowed.
 - b. All steel shall be galvanized in accordance with §719-01.

- c. Fabrication and transportation shall follow the requirements of the SCM.
- d. Shop drawings shall be submitted as part of the complete package of prestressed concrete beam drawings.
- e. Erection shall follow the requirements of the SCM, except that the erection drawings will be included with the erection drawings for the concrete beams and shall follow the approval procedure in the PCCM.
- f. Shop inspection may be performed at the discretion of the Department.
- g. All steel-to-steel connections shall meet the requirements of the SCM.
- h. Bolts in steel-to-concrete connections shall be snug tight only.

BASIS OF ACCEPTANCE. Steel diaphragms will be accepted by the Engineer in accordance with the requirements of 715.01. Precast diaphragms will be accepted in accordance with the requirements of the PCCM. Cast-in-place diaphragms will be accepted by the Engineer.

718-08 THRU 718-29 (VACANT)

SECTION 719 - METAL COATINGS

719-01 GALVANIZED COATINGS AND REPAIR METHODS

SCOPE. These specifications cover the galvanized coatings applied to various materials and the repair thereto.

MATERIAL REQUIREMENTS. Materials shall be galvanized in accordance with the specification indicated by Type on the plans or in the specifications.

Type I. ASTM A123 Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products.

Type II. ASTM A153, Zinc Coating (Hot Dip) on Iron and Steel Hardware. As an alternate to the hot dip method of ASTM A153, nuts, bolts, washers and other miscellaneous hardware, approved by the Engineer, may be mechanically galvanized. The mechanically zinc-coated product(s) shall conform to the applicable coating thickness, adherence and quality requirements of ASTM A153. Mechanically zinc-coated nuts for assembly with mechanically zinc-coated bolts shall be tapped oversize prior to coating and need not be re-tapped afterwards.

Type III. ASTM A123 Zinc (Hot-Dip Galvanized) Coating on Iron and Steel Products, except as modified herein. A minimum weight of coating (oz/ft² of surface) for base metal less than 1/16 inch thickness shall be as follows:

Average of Specimen	Any Individual Specimen or Computed Value
1.5	1.25

Type IV. ASTM A653/A653M, Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process, Coating Designation G 210 unless otherwise specified.

Type V. Flame Sprayed Coating System.

A. Preparation of Base. Those areas to be coated shall be sand blasted with silica sand or crushed garnet of such gradation that sand shall be mesh size 20 to 40 with a minimum of 40% retained on a No. 30 mesh screen (U.S. Standard Sieve series). Pressure of not less than 75 psi shall be maintained at the blast generator. A sample steel plate shall be blasted until the surface cannot be further cleaned or roughened. This plate shall be used for visual comparison and any areas that do not meet this standard as to roughness or cleanliness shall be reblasted.

B. Zinc Application. The wire used in spraying shall be 15 ga., 1/8 inch or 3/16 inch diameter, zinc 99.0% purity. Air pressure at the Air Control Unit shall be 60 psi and there shall be no more than 35 feet of 3/8 inch I.D. hose between the Air Control Unit and the gun.

The metal coating shall be applied at a minimum thickness of 3 mils. At least one coating shall be applied within 4 hours of blasting and the surface must be completely coated within 8 hours of blasting. The specified thickness of coating shall be applied in multiple layers and in no case shall less than two passes be made over every part of the surface.

C. Finish Coat. The zinc coating shall be given a finish coating consisting of two coats of Aluminum Vinyl sealer. This sealer shall consist of a volatile vehicle containing a minimum of 20% Vinyl Copolymer and plasticizer and a minimum of 10% Non-Leafing Aluminum Flake.

REPAIR. The Contractor shall be required to repair damaged areas of galvanized zinc coating. Damage may result from wet storage (white rust), welding or cutting (flame), or from excessive rough handling during shipping or erection. In general, only field repairs will be allowed. Shop repairs shall only be permitted when the total area of damage on any single piece is less than 2% of the coated surface or 16 square inches, whichever is less. Any coated piece on which the total area of damage exceeds these amounts in the shop shall be rejected.

Materials for field repair shall be selected from Department's Approved List of Galvanized Repair Materials. Zinc solders shall be zinc-cadmium and zinc-tin-lead alloys supplied in stick or paste form, and that liquidize for application at temperature ranges of from 518 to 527^oF and 446 to 500^oF, respectively. Zinc paints shall contain not less than 65% zinc dust (by weight) in the dried paint film and shall meet current standards for the emission of volatile organic compounds. Detailed requirements for the approval of galvanized repair materials are available from the Materials Bureau.

Corrosion deposits shall be removed in a manner satisfactory to the Department prior to incorporation of the material in the work. After removal of these deposits, the coating shall have a uniform appearance free from uncoated spots, lumps, blisters, gritty areas, acid, flux and black spots. Materials with these defects will be rejected and shall be immediately removed from the worksite. Acceptable material shall be provided to replace rejected material at no additional expense to the State.

Damaged areas of loose and deteriorated galvanized zinc coating shall be cleaned by power sanding, power grinding, or abrasive blast cleaning to bright metal.

If zinc solder is used for repairs the cleaned area shall be preheated in accordance with the manufacturers instructions for use. The heated surface shall then be rubbed with a repair stick to evenly distribute a layer of zinc alloy, or if zinc paste is used it shall be spread evenly using a spatula or similar tool. Zinc solder shall be deposited in a uniform layer at a minimum dry film thickness of 3 mils.

If zinc paint is used for repairs it shall be applied in accordance with the manufacturers instructions for use, using a brush or by spray methods. Zinc paint shall be applied in such quantity as to produce a minimum dry film thickness of 3 mils.

BASIS OF ACCEPTANCE. The acceptance of galvanized coating and repairs is included in the acceptance of the materials receiving the coating.

719-02 ALUMINUM ANODIC COATINGS

SCOPE. This specification covers the material requirements for Anodic Coatings for Aluminum and Aluminum Alloys.

TABLE 719-02-1 MINIMUM COATING THICKNESS AND WEIGHT
--

Coating Designation	Sealed with	Minimum Coating Thickness, mil	Minimum Coating Weight (mg/in ²)	
			Alloys 1100, 3003, 5052, 5005, 5357, 5457, 6463, 6563, 6061, 6063	Alloys 2014, 2024
Type 202	Boiling water	0.3	14.0	7.0
Type 302	Nickel Acetate	0.3	14.0	---
Type 204	Boiling water	0.4	21.0	11.0
Type 205	Chromate	0.2	---	---
Type 210	Chromate	0.4	---	---
Type 215	Boiling water	0.8	40.0	17.0
Type 226	None required	2.0	86.0	66.0

MATERIAL REQUIREMENTS. Anodic coatings for Aluminum and its alloys shall conform to the requirements of Table 719-02-1 for the coating designation shown on the plans or in the proposal:

719-03 ALUMINUM COATING (HOT DIP)

SCOPE. This specification covers the material requirements for hot dip aluminum coatings applied to steel appurtenances in contact with aluminum surfaces, or where applied as shown on the contract plans.

MATERIAL REQUIREMENTS. The material used shall be 99 percent pure aluminum conforming to the specifications for Aluminum Alloy Number 1100 according to ANSI H 35.1.

Thickness of the coating shall not be less than 2 mils on any individual specimen and the average of the specimens tested shall not be less than 2.3 mils. The thickness of coating may be determined by the use of a Magna-Gage.

The aluminum coating on threads, except on topped threads, shall not be subjected to a cutting, rolling, or finishing tool operation, unless specifically authorized by the Engineer.

The coating shall be continuous and uniform in thickness. The coating shall adhere tenaciously to the surface of the base metal. When the coating is cut or pried into, such as with a stout knife applied with considerable pressure in a manner tending to remove a portion of the coating, it shall only be possible to remove small particles of the coating by paring or whittling, and it shall not be possible to peel any portion of the coating so as to expose the steel.

The aluminum coated articles shall be free from uncoated spots and other defects not consistent with good aluminum coating practice.

SECTION 720 - PILES

720-01 UNTREATED TIMBER PILES

SCOPE. This specification covers the material requirements for untreated timber piles.

GENERAL. Timber piling shall consist of any species of wood that will withstand driving, except white or gray birch, poplar or basswood.

Piles shall be clean-peeled and shall conform to the requirements of ASTM D25.

BASIS OF ACCEPTANCE. The inspector's indelible stamp of approval shall constitute sufficient basis of acceptance at the job site.

720-02 TREATED TIMBER PILES

SCOPE. This specification covers the material requirements for treated timber piles.

§720

GENERAL. The requirements for treated timber piles shall conform to the applicable provisions of §720-01 Untreated Timber Piles with the following additions and modifications:

Piles shall be Southern Yellow Pine or Douglas Fir containing a minimum thickness of sapwood of not less than 1 1/2 inches in Southern Yellow Pine and not less than 1 inch of Douglas Fir at the butt ends.

Piles shall be peeled clean of bark, including the inner bark, soon after cutting, so that the piles are smooth and clean. Care shall be taken to remove as little sapwood as possible in the bark peeling operation.

The preservative used in the treatment of piles shall conform to the requirements of §708-30, Wood Preservative Creosote Oil, American Wood Preservers' Association Standard P-1 for land and fresh water use; P-13 for Marine (Coastal Waters) or §708-31 Wood Preservative-Water Borne.

Conditioning and treatment. The conditioning before treatment and the preservative treatment shall conform to the requirements of American Wood Preservers' Association Standards C-1, C-3, C-12, C-14, or C-18.

Inspection of piles. The Contractor shall give the Department ample notice relative to the location of, and time when treating operations will take place. Inspection of piles will be made by inspectors designated by the Department, before, during and after the piles are treated at the treatment plant. No piles shall be shipped which do not bear, in legible form, the inspector's stamp of approval.

The piles shall be subject to inspection by the Engineer after arrival at the site and no previous approval at the plant shall bar rejection in the field for injury, breakage, or defects discovered after the piles have left the treatment plant.

Piles shall be free from damage or defects which would impair their usefulness or durability for the purpose intended. The use of "S" irons or other devices for repairing or preventing checks, splits, or other defects will not be permitted.

STORAGE AND HANDLING. All treated timber piles shall be carefully handled and properly stored. Any surface breaks which do not warrant the rejection of the pile shall be treated in accordance with AWWA M4 with the addition that at least three coats of preservative shall be applied.

Treatment of Pile Heads and Bolt Holes. The heads of piles shall be treated as follows: The sawed surface shall be treated in accordance with AWWA M4 with the addition that at least three coats of preservative shall be applied followed by a thick application of a mixture of 30% creosote and 70% pitch. The application of the pitch coat shall not apply to pile heads encased in concrete. All bolt holes bored subsequent to treatment shall be treated with preservative by means of an approved pressure bolt hole treater.

Any unfilled holes, after being treated with preservative shall be plugged with preservative treated plugs.

The Contractor shall obtain all necessary permits pertaining to the purchase and field application of wood preservatives from the U.S. Environmental Protection Agency (EPA) and the New York State Department of Environmental Conservation.

BASIS OF ACCEPTANCE. The Inspector's indelible stamp of approval shall constitute basis of acceptance at the job site.

720-03 CASINGS FOR CAST-IN-PLACE CONCRETE PILES

SCOPE. This specification covers the material requirements for casings used for cast-in-place concrete piles.

GENERAL. When the diameter and thickness of pipes are shown on the plans, the material used shall conform to the requirements of ASTM A252, Grade 2, unless otherwise specified. The Contractor will be required to furnish the Engineer with two certified copies of the records of the physical tests performed on the newly manufactured pipe in accordance with the above ASTM requirements. In addition, a

manufacturer's statement of certification, which explicitly verifies that the material and workmanship comply with the current ASTM standards for ASTM A252, Grade 2, must accompany each heat.

Thickness Requirements. The metal of shells which are directly driven shall have a thickness sufficient to withstand the driving without fracture or failure, but in no case shall the thickness be less than 0.1053 inch. Shells driven with a mandrel shall have a thickness not less than 0.0538 inch.

Pipes shall have a thickness sufficient to withstand driving without fracture or failure but in no case shall the thickness of pipes be less than 3/16 inch unless otherwise shown on the plans.

BASIS OF ACCEPTANCE. The manufacturer's certification shall constitute sufficient basis of acceptance at the job site.

720-04 STEEL BEARING PILES

SCOPE. This specification covers the material requirements for steel bearing piles.

GENERAL. All steel bearing piles shall be rolled HP sections of standard dimensions. Steel for bearing piles shall be new and unused and shall conform to the requirements of §715-01, Structural Steel. Stock steel may be used.

BASIS OF ACCEPTANCE. Material acceptance will be by manufacturer's certification. The certifying statement must accompany each heat and must verify that the material and workmanship comply with the current ASTM standards for ASTM A36. Two copies shall be furnished to the Engineer.

720-05 PILE SHOES

SCOPE. This specification covers the material requirements for pile shoes.

GENERAL. The pile shoes shall consist of ASTM A36 steel or equivalent material capable of withstanding driving without excessive deformation.

BASIS OF ACCEPTANCE. Approval by the DCES shall constitute acceptance.

720-06 MECHANICAL PILE SPLICES

SCOPE. This specification covers the requirements for mechanical splices for steel bearing piles.

GENERAL. Steel used in the mechanical pile splices shall meet the requirements of §715-01.

BASIS OF ACCEPTANCE. The product will be accepted at the job site based on its appearance on the Approved List. The Contractor shall provide the Engineer with an installation drawing approved by the DCES showing the sizes and types of welds that are required. In addition, the Contractor shall provide manufacturer certification that the supplied product has the same chemical composition and mechanical properties as the product used in the testing.

At the Department's discretion, the material will be evaluated for conformance to the stated specifications, and product samples may be required to be submitted for testing.

Manufacturers may submit their product for evaluation to the DCES. The submission shall include copies of installation drawings, specifications, welding procedures meeting the requirements of the Steel Construction Manual, engineering calculations, test results, and quality control procedures for the splice manufacture.

Stamped engineering calculations, performed by a New York State Licensed Professional Engineer with current registration, shall show that the spliced pile has a theoretical bending capacity of at least 95% of the unspliced pile.

Test results by an independent testing agency shall show that the bending strength on both the strong and weak axes of the spliced pile is at least as great as the calculated capacity of the splice. The tests

§720

shall be third point loadings of a spliced pile with the splice in the middle of the span. The tests shall be continued to failure. A minimum of two pile sizes shall be tested in each direction to prove the engineering calculations.

If the submission is acceptable, the installation drawings will be stamped approved, returned to the manufacturer and the product will be placed on the Approved List. Any changes to the product, product manufacturing, or installation procedure will require re-submission and re-approval.

SECTION 721 - CONCRETE ADHESIVES AND REPAIR MATERIALS

721-01 EPOXY RESIN SYSTEM

SCOPE. This specification covers the material requirements of a two-component, rapid setting, high strength epoxy resin system for use as an adhesive and for making epoxy mortar for the repair of minor damaged areas of hardened concrete. This material should not be used when the temperature is below 40°F or when there is moisture present in any of the materials or surfaces it will be in contact with while in the uncured state.

MATERIAL REQUIREMENTS

Component A. Component A shall consist of a blend of epoxy resin, plasticizer and fillers so that when mixed with component B the mix will have the characteristics described under “Characteristics of the Mixture”.

Component B. Component B shall consist of an amine adduct curing agent capable of curing the epoxy system from 40°F and above when mixed according to the manufacturer's recommendations.

TABLE 721-01-1 EPOXY RESIN MIXTURE REQUIREMENTS			
Property	Test Method	Minimum	Maximum
Pot life for 1 pint unit, minutes	measured from time of original mixing at 75°±2°F	10	30
Viscosity, cps @ 75°±2°F	Brookfield Model RVT Spindle No. 3 @ 20 rpm	—	2,000

Characteristics of the Mixture. Mixture shall meet the requirements of Table 721-01-1.

Cured Materials. Mixed with three (3) parts by volume of Ottawa silica sand conforming to the requirements for graded standard sand in ASTM C778, the resulting mortar shall have the following characteristics after being cured at 75°±2°F for 24 hours:

TABLE 721-01-2 COMPRESSIVE AND TENSILE STRENGTH			
Property	Test Method	Specimen size and shape	Min.
Compressive Strength, psi	AASHTO T 106	2 in cubic	8,000
Tensile Splitting Strength, psi	NYSDOT TM 721-04 P	2 x 4 in cylinder	1,500

PACKAGING. All material furnished must be shipped in strong, substantial containers. The containers shall be identified as “Part A - contains epoxy resin” and “Part B - contains curing agent” and shall be plainly marked with the following information:

- N.Y.S.D.O.T. materials specification number
- Name of product
- Mixing proportions and instructions
- Name and address of the manufacturer
- Lot number and batch number

- Date of manufacture
- Quantity
- Date of expiration of acceptance

SAMPLING. Material shall be sampled and inspected at the place of manufacture or in warehouse lots as determined by the Department. Samples submitted to the Materials Bureau shall be taken as directed by the Department.

TESTING

Pot Life. The pot life shall be determined as follows: The mixed components shall be set on a bench top and probed with a small flat stick every two (2) minutes. The time at which a soft ball forms in the center of the container is the pot life.

Initial Viscosity. Components A and B shall be conditioned at $75^{\circ}\pm 2^{\circ}\text{F}$ prior to mixing and the reading taken two (2) minutes after mixing. The viscosity shall be measured with a Brookfield Model RVT viscometer, spindle No. 3 at 20 rpm.

BASIS OF ACCEPTANCE. This material will be considered for acceptance in stock lot quantities at manufacture or supply locations in accordance with procedural directives of the Materials Bureau. The expiration date of acceptance of this material shall be one year after the date of manufacture. Any unauthorized tampering or breaking of the seals on the containers between the time of sampling and delivery to the job site will be cause for rejection of the material.

721-02 (VACANT)

721-03 EPOXY POLYSULFIDE GROUT

SCOPE. This specification covers the material requirements of a two-component, flexible, polysulfide modified epoxy grout containing an inert mineral filler. This material is used for bonding fresh concrete to hardened concrete in both vertical and horizontal planes; grouting studs, etc. into hardened concrete; and making epoxy mortar for the repair of minor damaged areas on hardened concrete. This material should not be used when the temperature is below 50°F .

GENERAL. The two-component epoxy system shall have a maximum ratio of epoxy resin to polysulfide polymer of 2:1 by weight (Min. 1 3/4:1). In addition, the ratio of epoxy resin to curing agent shall be 11:1 by weight (Max. 12:1, Min. 10:1). The fine inert mineral filler when incorporated into the carrying component(s) shall be nonsettling.

MATERIAL REQUIREMENTS

Component A. This component shall consist of an unmodified epoxy resin and may contain a portion of fine inert mineral filler. It shall not contain solvents or reactive diluents. The epoxy resin shall be the condensation product of the reaction of bisphenol A with epichlorohydrin, shall be translucent, and shall have the following physical characteristics:

TABLE 721-03-1 COMPONENT A REQUIREMENTS			
Property	Test Method	Min.	Max.
Color, Hellige	ASTM D1544	0	5
Epoxide equivalent	ASTM D1652	180	200

Component B. This material shall consist of a blend of a low viscosity polysulfide polymer and a tertiary amine catalyst. The "B" component shall include a fine inert mineral filler. The component shall

§721

not contain solvents or dilutents. When mixed with Component "A" as directed by the manufacturer, the resulting characteristics shall be as specified in "Characteristics of the Mixture."

The polysulfide polymer flexibilizer shall be a dichloroethyl formal polysulfide in the 1000-molecular weight range having the following characteristics:

TABLE 721-03-2 COMPONENT B REQUIREMENTS			
Property	Test Method	Min.	Max.
Color, Hellige	ASTM D1544	9	12
Sulphur Content, percent	ASTM D129	36	40
Shelf Life	---	1 year	---

Characteristics of the Mixture. When the two components are mixed in accordance with the manufacturer's instructions, the mixture shall have the physical characteristics in Table 721-03-3.

TABLE 721-03-3 MIXTURE REQUIREMENTS				
Property		Test Method	Min.	Max.
Pot Life at 77°F,	minutes	See TESTING	30	---
Initial Viscosity at 77°F,	poises	See TESTING	20	200
Spray applications			20	400
Other applications				
Tack free time at 77°F,	hrs	---	2	---
Degree of temporary gelation, depth, in		See TESTING	1/8	---
Ash content,	percent	ASTM D482	—	50
Volatiles,	percent	ASTM D1259	1	4

Properties of Cured Materials. The grout, when mixed according to the manufacturer's instructions, shall harden into a solid having the physical characteristics in Table 721-03-4.

TABLE 721-03-4 CURED MATERIALS REQUIREMENTS			
Property	Test Method	Min.	Max.
Compressive Shear	Federal Specification		
Double Strength, psi	MMM-B-350 Paragraph 4.4.3	400	---
Beam Break Test, psi	Described under "Test"	800	---

PACKAGING. All material furnished must be shipped in strong substantial containers. The containers shall be identified as "Part A - contains epoxy resin" and "Part B- contains curing agent" and shall be plainly marked with the following information:

- N.Y.S.D.O.T. materials specification number
- Name of product
- Mixing proportions and instructions
- Name and address of the manufacturer
- Lot number and batch number
- Date of manufacture
- Quantity
- Date of expiration of acceptance

SAMPLING. Material shall be sampled and inspected at the place of manufacture or in warehouse lots as determined by the Department. Samples submitted to the Materials Bureau shall be taken as directed by the Department.

TESTING

Pot Life. The pot life shall be determined as follows: The two components are conditioned to 77°F and mixed in accordance with the manufacturer's instructions. The pot life of the material shall be considered to have ended when the viscosity reaches 850 poises•s (Brookfield Model MBT with Helipath Attachment) at 77°F ambient. The time from initial mixing of the components until the mixture reaches 850 poises•s shall be recorded as the pot life.

Initial Viscosity. The initial viscosity shall be measured with a Brookfield Model HBT, Spindle No. 3 at 20 rpm.

Tack Free Time. The epoxy mixture shall remain tacky and capable of bonding during a contact period of at least two hours at 77°F ambient measured from the time of spreading.

Degree of Temporary Gelation. The epoxy grout mixture shall have a degree of temporary gelation such that a 1/8 inch film can be maintained on the surface of a standard 2 x 5 inch paint panel after dripping ceases.

Compressive Shear Test. The test shall be performed in accordance with Federal Specification MMM-B-350 Paragraph 4.4.3 except that hand mixing of the epoxy will be permitted.

Beam Break Test. The specimens shall be tested for flexural strength using a simple beam with third point loading. The specimen shall be prepared and tested in accordance with ASTM Methods C192 and C78 except that the concrete shall be designed for 800 - 900 psi flexural strength and shall be cast in 3 x 4 x 16 inch molds using a well-graded coarse aggregate all of which passes a 1 inch square sieve. Each beam to be tested shall be sawed transversely at midpoint, the sawed faces etched with a 10 percent aqueous solution of HCl and then thoroughly washed, and bonded with a 10 mil thickness of the epoxy adhesive under test. The surface to be bonded shall be maintained in a vertical position during application and cure of epoxy adhesive and plastic concrete. The hardened specimens shall be cured for a total time of at least 96 hours. During the last 24 hours of the curing period, they shall be immersed in water.

The result reported shall be the average of two tests. Any result below 400 psi which fails outside the plane of adhesion will be disregarded and a retest performed. Any result below 800 psi and above 400 psi, of which 80% of the failure occurs outside the plane of adhesion, shall be considered acceptable. Any result above 800 psi will be considered acceptable regardless of where the failure occurs.

BASIS OF ACCEPTANCE. This material will be considered for acceptance in stock lot quantities at manufacture or supply locations in accordance with procedural directives of the Materials Bureau. The expiration date of acceptance of this material shall be one year after the date of manufacture. Any unauthorized tampering or breaking of the seals on the containers between the time of sampling and delivery to the job site will be cause for rejection of the material.

721-04 (VACANT)**721-05 EPOXY REPAIR PASTE**

SCOPE. This specification covers the material requirements of a two-component, flexible, rapid-hardening epoxy resin paste for making epoxy mortar. This material is used for the repair and sealing of cracks and other minor damaged areas in hardened concrete. It is suitable for patching on horizontal, vertical, and overhead applications. It develops high early strengths and achieves final cure in seven (7) days. This material shall not be used when the concrete or ambient temperature is below 50°F or above 100°F. It is suitable for damp, moist, and underwater applications.

MATERIAL REQUIREMENTS

§721

Component A. Component A shall be the condensation product of the reaction of bisphenol A with epichlorohydrin. It may contain fillers but shall not contain non-reactive diluents. When mixed with Component B the mixture shall have the characteristics described under Characteristics of the Mixture.

Component B. Component B shall be the curing agent for the system and shall be capable of curing the system from 40°F and above when mixed according to the manufacturer's instructions. It shall contain no non-reactive diluents but may contain flexibilizers or fillers. Component B shall be completely reactive with Component A.

Components A and B shall each have a shelf life of one (1) year.

Characteristics of the Mixture. When Components A and B are mixed according to the manufacturer's instructions, the mixture will have a paste or gel consistency such that a 1/2 inch thick layer of the mixture will not sag or drip from an overhead surface throughout the temperature range from 50°F to 100°F. It shall also have the following characteristics:

Property	Requirement
Pot Life @ 77°F, minutes	10 min.- 60 max.

Properties of Cured Material. For testing purposes the Components A and B shall be mixed with ASTM C109 Ottawa Silica Sand in the ratio of 1 part sand to 1 part epoxy by volume. This paste shall also be non-sagging and non-dripping as stated under Characteristics of the Mixture. The cured material shall have the following physical properties:

TABLE 721-05-1 CURED MATERIAL REQUIREMENTS		
Property	Test Method	Minimum
Compressive Strength ¹ , psi	AASHTO T 106	3,000
Bond Test Modulus of Rupture, psi	See Testing	800
Freeze-Thaw	See Testing	80% Bond Strength

NOTE: 2 inch cubic samples conditioned 24 hrs.

PACKAGING. All materials furnished shall be shipped in strong, substantial containers. The containers shall be identified as "Part A contains epoxy resin" and "Part B contains curing agent." It shall also be plainly marked with the following information:

- N.Y.S.D.O.T. materials specification number
- Name of product
- Mixing proportions and instructions
- Name and address of manufacturer
- Lot number and batch number
- Date of manufacturer
- Quantity
- Date of expiration of acceptance.

TESTING

Pot Life. The components will be conditioned to 77°F and mixed according to the manufacturer's instructions. A 60±0.4 g. total weight will be placed in an unwaxed paper cup and placed on a work bench. The mixture will be probed every 2 minutes with a small stick starting 8 minutes from the time of mixing. The time at which a small ball forms in the center of the container is recorded as the pot life.

Bond Test. The epoxy will be tested for flexural strength using a simple beam with third point loading. The concrete will be designed for 800 to 900 psi flexural strength and will be cast in 3 x 4 x 16 inch molds using a well-graded coarse aggregate all of which passes a 1 inch square sieve. Each beam to be tested will be sawed transversely at midpoint, the sawed faces etched with a 10% aqueous solution of

HCL and then thoroughly washed. A 10 mil thickness of the epoxy adhesive under test will be applied to both wet etched surfaces while in a vertical position and worked into the surface. One of the prism halves will be inverted and placed on the matching half and allowed to cure for 72 hours.

The result reported will be the average of two tests. Any result below 400 psi which fails outside the plane of adhesion will be disregarded and a retest performed. Any result below 800 psi and above 400 psi, of which 80% of the failure occurs outside the plane of adhesion, will be considered acceptable. Any result above 800 psi will be considered acceptable regardless of where the failure occurs.

Freeze-Thaw. Testing will be conducted in accordance with New York Test Method 216. In addition bond test specimens will be subjected to 7 freeze-thaw cycles before breaking in third point loading. A bond strength of 80% of the original average bond strength will be considered acceptable.

BASIS OF ACCEPTANCE. This material will be considered for acceptance in stock lot quantities at the manufacture or supply locations in accordance with procedural directives of the Materials Bureau.

The expiration date of acceptance of this material shall be one year after the date of manufacture. Any unauthorized tampering or breaking of the seals on the containers between the time of sampling and delivery to the job site will be cause for rejection of the material.

721-06 THRU 721-19 (VACANT)

721-20 RAPID HARDENING POLYMER CONCRETE

SCOPE. This specification covers the material requirements of a two component, rapid hardening, methyl methacrylate based polymer concrete repair material. The material is used with a primer to repair hardened concrete.

MATERIALS REQUIREMENTS

Polymer Concrete Mortar. The polymer concrete mortar shall be a two component methyl methacrylate based system. One component shall be a premixed powder consisting of catalyst, fine fillers, and fine aggregate not to exceed 1/16 inch in size. The other component shall be a methyl methacrylate monomer liquid capable of chemically reacting with the powder component such that the mixture hardens to a completely cured condition within three (3) hours at temperatures between 35°F and 100°F inclusive.

The working life of the mixture shall be a minimum of 10 minutes and its workability shall be consistent throughout the above temperature range. The shelf life of the unopened components, stored at room temperature and in a dry atmosphere, shall be 6 months, minimum. Material older than 12 months from the date of manufacturer shall not be used.

Properties of Cured Polymer Concrete. Polymer Concrete Mortar specimens, when prepared in accordance with the manufacturer's mixing instructions, shall exhibit the following properties when cured 168±2 hours at 73°F± 5°F:

TABLE 721-20-1 CURED POLYMER CONCRETE REQUIREMENTS				
Property		Test Method	Min.	Max.
Modulus of Rupture,	psi	ASTM C580	1,500	---
Elastic Modulus,	psi	ASTM C580	0.5x10 ⁶	1.0x10 ⁶
Thermal Expansion Coefficient,	in/in/°F	ASTM C531	(1.0 to 2.0) x 10 ⁻⁵	---

The material shall also exhibit the following properties when tested under NYSDOT Test Method 701-13F:

A minimum one hour compressive strength of 2500 psi, a 24 hour strength of 3500 psi, and a 28 day strength of 5000 psi.

Be able to withstand 50 cycles of freeze-thaw (10% NaCl solution) with a maximum loss of 4%.

§721

Primer. The primer shall be a two component methyl methacrylate resin system capable of enhancing the bond between the polymer concrete and the substrate. It shall have a curing time of 20 to 60 minutes at temperatures between 35°F and 100°F inclusive.

Flammability. The polymer concrete shall not support or sustain combustion within five (5) minutes after mixing.

PACKAGING. The material delivered from the manufacturer shall be in moisture proof bags and the contents shall weigh within $\pm 3\%$ of the labeled bag weight. The manufacturer's name, address, date of manufacture and mixing instructions shall be printed on each bag.

BASIS OF ACCEPTANCE. Application for material approval shall be submitted to the Director of the Materials Bureau accompanied by at least a 50 lbs, production run, sample of material. Upon approval, the name of the product will be placed on the Department's Approved List. Products so listed will be acceptable at the work site on the basis of the brand name labeled on the container. The Department reserves the right to sample and test the material at any time.

SECTION 722 - WATER SUPPLY

722-01 DUCTILE IRON WATER PIPE, FITTINGS AND ENCASEMENT

SCOPE. This specification covers the material and quality requirements for ductile iron water pipe, miscellaneous fittings, coatings and encasement.

GENERAL. Ductile iron water pipe, fittings and encasement shall conform to the requirements of the following:

Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water	AWWA C104 / ANSI A21.4
Polyethylene Encasement for Ductile-Iron Pipe Systems	AWWA C105 / ANSI A21.5
Ductile Iron and Gray Iron Fittings, 3 through 48 in. diam. for Water	AWWA C110 / ANSI A21.10
Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings	AWWA C111 / ANSI A21.11
Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges	AWWA C115 / ANSI A21.15
Protective Fusion-Bonded Epoxy Coating for the Interior and Exterior Surfaces of Ductile-Iron and Gray-Iron Fittings for Water Supply Service	AWWA C116 / ANSI A21.16
Thickness Design of Ductile-Iron Pipe	AWWA C150 / ANSI A21.50
Ductile-Iron Pipe, Centrifugally Cast, for Water	AWWA C151 / ANSI A21.51
Ductile-Iron Compact Fittings, 3 through 24 in. diam. and 54 through 64 in. diam., for Water Service	AWWA C153 / ANSI A21.53

BASIS OF ACCEPTANCE. Ductile iron water pipe and fittings will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification for iron fittings shall list a fitting description, quantity, bare fitting weight and source, (AWWA Standard C110, C153 or Manufacturer, if fitting is not listed in either standard). The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-02 STEEL WATER PIPE AND FITTINGS

1120

SCOPE. This specification covers the material and quality requirements for steel water pipe and miscellaneous fittings.

GENERAL. Steel water pipe and fittings shall conform to the requirements of the following:

Steel Water Pipe - 6 in. diam. and Larger	AWWA C200
Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied	AWWA C203
Cement-Mortar Protective Lining and Coating for Steel Water Pipe - 4 in. diam. and Larger - Shop Applied	AWWA C205
Field Welding of Steel Water Pipe	AWWA C206
Steel Pipe Flanges for Waterworks Service - Sizes 4 to 144 in. diam.	AWWA C207
Dimensions for Fabricated Steel Water Pipe Fittings	AWWA C208
Cold-Applied Exterior Tape Coatings for the Exterior of Special Sections, Connections and Fittings for Steel Water Pipelines	AWWA C209
Liquid-Epoxy Coatings for Steel Pipelines	AWWA C210
Fusion-Bonded Epoxy Coatings Systems for the Interior and Exterior of Steel Water Pipelines	AWWA C213
Tape Coating Systems for the Exterior of Steel Water Pipelines	AWWA C214
Extruded Polyolefin Coatings for the Exterior of Steel Water Pipelines	AWWA C215
Heat-Shrinkable Cross-Linked Polyolefin Coatings for the Exterior of Fittings for Buried or Submerged Steel Water Pipelines	AWWA C216
Cold-Applied Petrolatum Tape and Petroleum Wax Tape Coatings for the Exterior of Special Sections, Connections and Fittings for Buried Steel Water Pipelines	AWWA C217
Coating the Exterior of Aboveground Steel Water Pipelines and Fittings Bolted, Sleeve-Type Couplings for Plain-End Pipe	AWWA C218
Stainless-Steel Pipe, 4 in. diam. and Larger	AWWA C220
Fabricated Steel Mechanical Slip-Type Expansion Joints	AWWA C221
Polyurethane Coatings for the Interior and Exterior of Steel Water Pipe Fittings	AWWA C222

BASIS OF ACCEPTANCE. Steel water pipe and fittings will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-03 CONCRETE WATER PIPE

SCOPE. This specification covers the material and quality requirements for concrete water pipe.

GENERAL. Concrete water pipe shall conform to the requirements of the following:

Reinforced Concrete Pressure Pipe, Steel Cylinder Type	AWWA C300
Prestressed Concrete Pressure Pipe, Steel Cylinder Type	AWWA C301
Reinforced Concrete Pressure Pipe, Noncylinder Type	AWWA C302
Concrete Pressure Pipe, Bar-Wrapped, Steel Cylinder Type	AWWA C303

BASIS OF ACCEPTANCE. Concrete water pipe will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-04 WATER VALVES AND HYDRANTS

SCOPE. This specification covers the material and quality requirements for water valves and hydrants.

GENERAL. Water valves and hydrants shall conform to the requirements of the following:

Metal-Seated Gate Valves for Water Supply Service	AWWA C500
Cast-Iron Sluice Gates	AWWA C501
Dry Barrel Hydrants	AWWA C502
Rubber-Seated Butterfly Valves	AWWA C504
Ball Valves (6 through 48 in. diam.)	AWWA C507
Swing Check Valves for Waterworks Service (2 through 24 in. diam.)	AWWA C508
Resilient-Seated Gate Valves	AWWA C509
Double-Check Valve Backflow Prevention Assembly	AWWA C510
Reduced-Pressure Principle Backflow Prevention Assembly	AWWA C511
Air-Release, Air/Vacuum and Combination Air Valves for Waterworks Service	AWWA C512
Open-Channel, Fabricated Metal Slides	AWWA C513
Reduced-Wall, Resilient Seated Gate Valves for Water Supply Service	AWWA C515
Power Actuating Devices for Valves and Sluice Gates	AWWA C540
Protective Epoxy Interior Coatings for Valves and Hydrants	AWWA C550

BASIS OF ACCEPTANCE. Water valves and hydrants will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-05 PLASTIC WATER PIPE AND FITTINGS

SCOPE. This specification covers the material and quality requirements for plastic water pipe and fittings.

GENERAL. Plastic water pipe and fittings shall conform to the requirements of the following:

Polyvinyl Chloride (PVC) Pressure Pipe 4 through 12 in. diam. for Water Distribution	AWWA C900
Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings (14 through 48 in. diam.) for Water Transmission and Distribution	AWWA C905
Polyethylene Water Pipe and Fittings, 4 through 63 in. diam., for Water Distribution and Transmission	AWWA C906
Polyvinyl Chloride (PVC) Pressure Fittings for Water, 4 through 8 in. diam.	AWWA C907
PVC Self-Tapping Saddle Tees for Use on PVC Pipe	AWWA C908
Molecularly Oriented Polyvinyl Chloride (PVCO) Pressure Pipe, 4 through 12 in. diam.	AWWA C909
Fiberglass Pressure Pipe	AWWA C950

BASIS OF ACCEPTANCE. Plastic water pipe and fittings will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-06 WATER SERVICE PIPE, SERVICE VALVES AND FITTINGS

SCOPE. This specification covers the material and quality requirements for water service pipe, service valves and fittings.

GENERAL. Water service pipe, service valves and fittings shall conform to the requirements of the following:

Underground Service Line Valves and Fittings	AWWA C800
Polyethylene (PE) Pressure Pipe and Tubing (1/2 through 3 in. diam.) for Water Service	AWWA C901
Steel Water Service Pipe (1/2 to 4 in. diam.)	ASTM A53
Seamless Copper Water Tube, Type K	ASTM B88

BASIS OF ACCEPTANCE. Water service pipe, service valves and fittings will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-07 WEDGE TYPE MECHANICAL RESTRAINT GLANDS

SCOPE. This specification covers the material and quality requirements for wedge type mechanical restraint glands.

GENERAL. Wedge type mechanical restraint glands shall have a number of individually activated wedges around the circumference of a pipe which grip the pipe surface and bolts through the gland which are attached to a fitting or a gland that restrains a pipe bell. Glands shall be constructed of high strength ductile iron in accordance with ASTM Standard A536, and shall have a minimum pressure rating exceeding the system test pressure identified in the Owner requirements. Glands shall be specifically manufactured for the type of pipe used, and may be solid or split ring (two piece). Glands shall be manufactured with twist off bolts.

BASIS OF ACCEPTANCE. Wedge type mechanical restraint glands will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

722-08 INSULATION FOR WATER MAINS

SCOPE. This specification covers the material and quality requirements for insulation for water mains.

GENERAL. Insulation for water mains shall be made of fiberglass, cellular glass, urethane or cellular phenol and shall conform to the requirements of the following:

Fiberglass Pipe Insulation	ASTM C547
Cellular Glass Insulation	ASTM C552
Urethane Foam Pipe Insulation	ASTM C591
Spray Applied Urethane Insulation	ASTM C1029
Rigid Cellular Phenolic Pipe Insulation	ASTM C1126, Type III
Waterproof Jacket for Insulation	ASTM C1136

BASIS OF ACCEPTANCE. Insulation for water mains will be accepted on the basis of the Manufacturer's certification that the material conforms to this specification. The certification shall accompany the material delivered to the project site.

The Department reserves the right to sample and test this material subsequent to delivery at the project site.

SECTION 723 - LIGHTING

723-01 ALUMINUM LIGHT STANDARDS AND ARMS

SCOPE. This specification covers the material and quality requirements for aluminum light standard shafts and aluminum bracket arms.

MATERIAL REQUIREMENTS

General. All light standards and arms shall be designed in accordance with the latest edition of the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals. The ARTBA Guide to Standardized Highway Lighting Pole Hardware may be used in conjunction with the AASHTO Standard Specifications in lieu of actual design computations. Wind pressure for design purposes shall be determined in accordance with the above AASHTO Standard Specifications, utilizing the wind speeds listed below. In addition, the dimensions of all lighting hardware shall also be consistent with the requirements of the appropriate maintenance agency.

Shaft. The shaft shall be a one-piece, seamless, round tapered spun aluminum tube of alloy 6063. The aluminum shaft shall be heat treated for its full length to produce a T6 temper, and an anchor base shall be welded to the bottom of the shaft. Shafts, which are to be mounted without transformer bases, shall be equipped with a 4 inch wide by 6 inch to 8 inch high reinforced handhole centered 14 to 18 inches above the base of the shaft, and located 90 degrees from the plane of the arm and on the side away from traffic if possible. Each handhole shall have a cover with stainless steel attachment screws to secure the cover. A grounding nut shall be provided inside the shaft opposite the handhole to accommodate a 1/2 inch threaded bolt or stud. The shaft shall have a satin finish accomplished by mechanical rotary grinding.

An anchor base shall be joined to the shaft by means of complete circumferential welds, externally at top of anchor base and internally at bottom of shaft.

The anchor base shall be a one-piece permanent mold casting, aluminum alloy 356-T6 provided with four (4) slots to receive 1 inch diameter bolts. The casting shall be free of cracks, pits, blow holes and non-metallic inclusions. Each anchor base shall be provided with four anchor bolt covers fabricated from aluminum alloy with stainless steel screws for attaching the covers.

If bracket arm light standards are proposed, a removable ornamental cast aluminum pole cap with stainless steel setscrews to hold it in place shall be provided and installed on the top of each shaft. A 1 1/2 inch diameter hole shall be furnished near the top of each shaft where the arm is to be attached to provide a cable entrance from the shaft into the bracket arm. The opening shall have an approved metal or rubber grommet placed to provide a smooth cable guide for pulling the electrical cable through. The pole cap and hole are not required for davit arm light standards. Wall thickness and tube diameters for 80 mph wind zones shall conform to Table 723-01-1 Light Standard Dimensions.

Truss Arms. The upper and lower members shall be fabricated from seamless tubing of 6063-T6 or 6061-T6 aluminum alloy. The upper member shall be the continuous or wiring member and shall have a 1/8 inch minimum wall thickness. Truss bracket arms shall be designed with the upper and lower members joined near the luminaire end of the arm. The arms shall be braced with one or two vertical pipe struts depending on the arm length. Each truss bracket arm shall be equipped with a 2 inch pipe size slip fitter tenon projecting 5 inches from the luminaire end. The arm shall be secured to the shaft with a bolt type or clamp type attachment similar to those shown in drawings ASA 2-1 or ASA 2-2 of the ARTBA Guide to Standardized Highway Lighting Pole Hardware. Attachments that require welding a fitting directly onto the shaft, similar to ARTBA drawing SPS 2-1, will not be allowed on aluminum light pole shafts. Bolts and nuts shall be fabricated from AISI Type 302 stainless steel according to ANSI B1.1. Washers shall be fabricated from AISI 300 series stainless steel according to the requirements of ANSI

B18.21.2. In projects where arm lengths are intermixed, the rise for each length is to be set to keep the upper chord of all arms at approximately equal slopes.

TABLE 723-01-1 LIGHT STANDARD DIMENSIONS			
Maximum Pole Height (ft-in)	Maximum Arm Lengths (ft)	Minimum Wall Thickness (in)	Minimum Diameter Bottom x Top (in)
26	15	3/16	8 x 6
29-6	15	3/16	8 x 6
29-6	20	1/4	9 x 6
36	15	3/16	8 x 6
36	20	1/4	10 x 6
42-6	15	3/16	10 x 6
42-6	20	1/4	10 x 6
46	15	1/4	10 x 6
52-6	15	1/4	10 x 6
26	15*	3/16	8 x 6
29-6	15*	1/4	8 x 6
36	15*	1/4	10 x 6
42-6	15*	1/4	10 x 6
46	15*	5/16	10 x 6
52-6	15*	1/4	12 x 6

NOTE: *Twin-Arm.

Single Bracket Arms. 4 to 8 feet. The single member arms shall be fabricated from seamless tubing of 6063-T6 or 6061-T6 aluminum alloy. Wall thickness shall not be less than 1/8 inch. The arms shall be designed in accordance with AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals. Each arm shall be equipped with a 2 in. diam. pipe size slip fitter tenon projecting 6 - 8 inches from the luminaire end. The arms shall be secured to the shaft with a bolt type or clamp type attachment similar to those shown in drawings ASA 2-1 or ASA 2-2 of the ARTBA Guide to Standardized Highway Lighting Pole Hardware. Attachments that require welding a fitting directly onto the shaft, similar to ARTBA drawing SPS 2-1, will not be allowed on aluminum light pole shafts. Bolts and nuts shall be fabricated from AISI Type 302 stainless steel according to ANSI B1.1 Washers shall be fabricated from AISI 300 series stainless steel according to the requirements of ANSI B18.21.2.

Bracket Arms for Wood Utility Poles. Bracket arms to be mounted on wooden utility poles shall be tapered, seamless tube aluminum with a 1/8 inch minimum wall thickness. The bracket arm shall be welded to an appropriate connection plate at the pole end and have a 2 inch slip-fitter tenon at the luminaire end. A 1 1/4 inch cable opening on the underside near the pole shall be protected with a rubber grommet. Arms over 6 feet long shall be trussed, with upper and lower members securely joined by

§723

means of vertical strut(s). All aluminum shall be alloy 6063-T6 and all connecting hardware such as nuts, bolts, etc. shall be stainless steel.

Davit Arm Poles. For davit arm poles the top of the shaft shall terminate in a tenon (or twin tenons for double arm poles) and be equipped with a friction fit outer sleeve to produce a flush joint with the arms(s). The davit arms(s) shall be constructed of the materials and methods specified for the shaft and as dimensioned on the drawings. The davit arm(s) shall be secured to the shaft in a flush connection with two stainless steel bolts, nuts and lockwashers. The davit arms(s) shall terminate in a cast or fabricated flush tenon for a slipfit connection to the luminaire. The tenon shall be secured to the davit arm by stainless steel bolts.

SHIPPING. Shafts and arms shall be tire-wrapped with a heavy water resistant paper, for protection during shipping and installation. All small parts shall be boxed.

Wind speeds. Poles, arms and attachments covered by this specification shall be designed for the following wind speeds in accordance with the AASHTO Standard mentioned above.

- 80 mph - Counties of Allegany, Bronx, Cattaraugus, Chautauqua, Erie, Genesee, Kings, Livingston, Monroe, Nassau, New York, Niagara, Orleans, Ontario, Queens, Richmond, Rockland, Suffolk, Wayne, Westchester & Wyoming.
- 70 mph - All Other Counties.

Welding. All aluminum welding on light standards shall be performed in the shop, using the inert metal-arc welding process. Filler metal shall conform to the A.W.S. Specification A5-10. Welders shall be certified by A.S.M.E. Section 9 or A.W.S. D 1.2.

Vibration Shims. Vibration shims (dampeners) shall be provided by the pole manufacturer for all aluminum poles 30 feet or longer. Vibration shims shall also be provided for poles installed in excessively windy locations or on viaducts with continuous vibration.

BASIS OF ACCEPTANCE. Acceptance of the shaft, anchor base, truss bracket arms, and single member arms covered by this specification will be based on:

- Manufacturer's certification of compliance with these specification requirements.
- Submission, to the Engineer, of design and fabrication details for each shaft, anchor base and arm intended for a particular design load as specified in the contract documents. The design and fabrication details being submitted shall have been approved and signed by a professional engineer licensed to practice in New York State. This submission shall be sent in time to be received at least 10 working days prior to the date the Contractor orders the poles, anchor bases and arms.

723-02 HIGH MAST POLE, HEAD FRAME ASSEMBLY WITH LUMINAIRE RING AND LOWERING DEVICE

SCOPE. This specification covers the material and quality requirements for the pole and head frame assembly with luminaire ring and lowering device to be used in a high mast lighting system.

MATERIAL REQUIREMENTS

General. The steel pole, head frame assembly, luminaire ring and lowering system shall be designed to meet or exceed "AASHTO Standard Specifications, for Structural Supports for Highway Signs, Luminaires and Traffic Signals." The design wind loading shall be chosen to be consistent with the location of the structure and the height factor. See §723-01 Aluminum Light Standards and Arms. It shall be the contractor's responsibility to obtain verification of all necessary weights and effective projected areas as required in the plans.

Poles. The steel pole shall be capable of supporting the combined weight and projected area of both lowering system and number of luminaires with built-in ballast as shown on the contract plans.

1126

The pole shall consist of sections of tapered steel tubes, round or polygonal (8 or more equal sides) in cross section, which telescope into each other with an overlap of 1.5 diameters. Steel used in fabricating the shaft shall have a minimum yield strength of 50,000 psi after all fabricating operations have been completed.

In the base of the pole will be located an adequate size hand hole complete with a weatherproof cover and lock. A plate shall be welded opposite the hand hole for mounting the lowering system winch (unless externally mounted on the portable power drive), circuit breakers and other hardware. The hand hole area shall have a 6 feet reinforcing sleeve. The hand hole and plate shall be designed to accommodate the required High Mast Head Frame and Lowering Assembly.

The finished pole shall be galvanized in accordance with §719-01 Coating and Repair Methods, Type 1. If A588 weathering steel is used for the pole, all slip joints shall have a barrier coating conforming to the requirements of the Materials Bureau or as stated in the proposal.

Anchor Base. The anchor base shall be fabricated of steel meeting or exceeding the yield strength of ASTM A36. The anchor base shall telescope the butt end of the pole and be welded on the inside bottom and outside top.

Anchor bolts, nuts, and washers. Anchor bolts and nuts shall be fabricated of steel meeting or exceeding ASTM A572 (minimum yield strength 50,000 psi). The top of the anchor bolts shall have a minimum of 9 inches of thread and a minimum of 12 inches of galvanizing in accordance with ASTM A153. Each bolt shall be furnished with two (2) heavy duty, galvanized, hex nuts with a strength equal to or exceeding the proof load of the bolts. The Contractor may wish to install pre-assembled anchor bolt cages, subject to approval by the Engineer, in lieu of the design shown on the plans.

Washers shall be plain hardened washers. Nuts, washers and a minimum of the top 12 inches of the anchor bolts shall be hot-dipped galvanized in accordance with the requirements of §719-01 Galvanized Coating and Repair Method, Type II.

The pole manufacturer shall design the anchor bolts and nuts in accordance with "AASHTO Standard Specification for Structural Supports for Highway Signs, Luminaires and Traffic Signals."

Welding. Pole sections shall have no more than two longitudinal welded seam and no transverse seams. All welding shall be performed in accordance with the N.Y.S. Steel Construction Manual. Longitudinal welds shall have a minimum 60% penetration. All circumferential welds for slip joints and shaft to base shall be 100% penetration. All 100% welds shall be inspected ultrasonically by the State.

Reinforcing sleeve. The reinforcing sleeve shall be fabricated of steel meeting or exceeding AISI 1020 steel. The sleeve shall be galvanized under the same ASTM specification as the pole.

Head Frame. The head frame shall be capable of supporting the combined weight and projected areas of the luminaire ring assembly and luminaires with built in ballast as shown on the plans. The luminaire ring shall be designed to use the number and configuration of luminaires shown on the plans.

The head frame shall be equipped with a suitable weather resistant and bird proof cover.

The head frame shall be a zinc-coated steel structure attached to the pole by means of a steel slip fitter and secured by at least four (4) stainless steel set screws.

The head frame shall provide at least three point suspension for the luminaire ring assembly.

For raising and lowering the luminaire ring assembly, three 7x19 aircraft-grade stainless steel, hoisting cables, of sufficient size to support the load shall be included. Hoisting cable sheaves shall be grooved to the exact diameter of the hoisting cable for 180° bearing surface and be equipped with suitable guides to prevent jumping the sheaves. Sheave bearings shall be permanently lubricated on stainless steel shafts.

Permanently lubricated power cable sheave(s) shall be provided over a stainless steel shaft. The grooved diameter of the sheave(s) shall be coordinated with the power cable diameter and be equipped with guides to prevent jumping the sheave(s).

The power cable supplied shall be a minimum of 20 feet longer than the street lighting pole installed. It shall be a water proof cable with the necessary number of conductors and sized to properly operate the street lighting system.

§723

Three latching devices shall be provided to support the luminaire ring assembly when in the latched position. There will be no tension on the hoisting cables when the luminaire ring is in the latched position. The latches shall be actuated from the ground. Locking of the luminaire ring shall be signalled by indicators visible from the ground. All moving parts of the latch mechanism shall be serviceable from the ground. The latching mechanism shall not be impaired by the formation of ice and shall not require adjustment. Each of the latches, independently, shall be strong enough to support eight times the weight of the luminaire ring assembly and all luminaires installed.

Lowering System and Luminaire Assembly. The luminaire ring assembly shall be fabricated of steel with the appropriate number of 2 inch nominal steel pipe mounting arms. It shall be zinc plated and prewired to distribute the power to the required number of luminaires. Power cables shall be positively attached to the ring assembly through a watertight wiring chamber, with watertight cable connectors. A 600 volt terminal block, completely prewired shall be included in the watertight wiring chamber. A watertight twist lock power receptacle shall be installed in the luminaire ring to allow testing of the luminaires at ground level. A cable support shall be provided to hold the power cable in the luminaire ring.

Attached to the luminaire ring assembly shall be a spring loaded roller contact guidance mechanism with a minimum of three arms that maintain positive contact with the pole surface, centering and guiding the ring assembly during lowering to prevent jamming. Rollers shall be made of water resistant non-marking material with permanently lubricated bearings on stainless steel shafts.

Winch Assembly, if permanently mounted in the pole, shall be a worm-gear self locking type (Torque rated) and designed for both hand operation or operation by means of a portable power unit. Winch Cable shall be 1/4 inch or greater diameter stainless steel aircraft cable to support the load. There shall be a take-up guide on the winch assembly to eliminate cable 'fall-off'. Compression springs shall be used in the connection of the hoisting cables to the luminaire ring assembly, but ultimate support of the luminaire ring will not be sacrificed by individual or total compression spring failure.

The lowering system shall also include circuit breaker assembly, twist-lock receptacle and plugs for the power cable.

BASIS OF ACCEPTANCE: Acceptance of the steel poles and appurtenances will be based on the delivery, by the Contractor to the Engineer, of the manufacturer's certification, signed by a N.Y. State P.E., of compliance with the specification requirements and the details of the poles and their appurtenances as indicated in the contract documents. As a condition of acceptance, the Contractor shall submit five copies of the shop drawings, used to fabricate the poles and appurtenances, to the Engineer along with the required certification as per §670-3.02.

When the Contractor proposes to use a shape of pole and/or appurtenances different from that indicated in the contract documents, written approval of the change in shape must be received from the Engineer prior to fabrication of the poles and/or appurtenances. Where the pole and/or appurtenances to be used are not as indicated in the contract documents, the manufacturer shall certify, in writing, to the Engineer, that the pole and/or appurtenances are equal to or superior to the pole and/or appurtenances indicated in the contract documents. Additionally, the differences shall be highlighted on the shop drawings submitted to the [Office of Structures Division](#) for approval.

It will be the responsibility of the Contractor to ensure that the required certifications and shop drawing copies are received by the Engineer prior to the arrival of the poles and/or appurtenances on the site. The Engineer will require ten (10) working days, measured from the date of receipt, to approve any request for a change in shape of poles and/or appurtenances.

723-03 PORTABLE POWER DRIVE FOR HIGH MAST LUMINAIRE LOWERING SYSTEM

SCOPE. This specification covers the functional requirements for a portable power drive unit, and winch when necessary, issued for a High Mast Luminaire Lowering System.

MATERIAL REQUIREMENTS. The portable power drive unit shall be a heavy duty reversing electric drill motor and drive shaft coupled with a torque limiter which shall supply all of the necessary driving power to the winch. A portable winch assembly shall be included with the portable power drive unit

unless the winch has been permanently installed in the base of the high mast pole. The power drive shall be provided with a step down transformer and a remote control cord which will enable the operator to stand at least 16 feet 6 inches from the pole. The unit shall be designed so as to be simply strapped to the base of the pole with a quick-connect securing mechanism that will accommodate any size or shape pole. The unit shall be capable of raising or lowering the lowering ring and luminaires at an approximate rate of 10 feet per minute. All aspects of the power drive shall be compatible with the detailing of the pole base and the lowering system for which it is to be used.

Detail specifications, parts lists, instruction sheets and shop drawings of the portable power drive shall be submitted in accordance with §670-3.02 Shop Drawings.

BASIS OF ACCEPTANCE: Acceptance of the portable power drive will be based on the manufacturer's certificate of compliance with these specification requirements, and the Engineer's approval of the detail specifications and shop drawings.

723-04 THRU 723-09 (VACANT)

723-10 ANCHOR BASE (ALUMINUM)

SCOPE. This specification covers the material and quality requirements for cast aluminum anchor bases for lighting standards.

MATERIAL REQUIREMENTS. Aluminum anchor bases shall be a one piece casting of 356.0 aluminum alloy. The casting shall be free of cracks, pits, blow holes and non-metallic inclusions. Each anchor base shall be provided with four anchor bolt covers fabricated from B443.0 aluminum alloy with stainless steel screws for attaching the covers.

BASIS OF ACCEPTANCE. Anchor bases will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-11 THRU 723-14 (VACANT)

723-15 BREAKAWAY TRANSFORMER BASE (ALUMINUM)

SCOPE. This specification covers the material and quality requirements for Breakaway Aluminum Transformer Bases for Lighting Standards.

GENERAL. Transformer bases shall be one-piece aluminum alloy sand or aluminum alloy permanent-mold castings. The bases shall be equipped with a removable, aluminum or plastic, trapezoidal shaped door (approximately 12 inches high; 7 inches wide (top); 9 inches wide (bottom)). Each door shall be secured to the base with a stainless steel screw(s).

For attachment to the shaft anchor base, each transformer base shall be supplied with four (4) loose bearing plates or other acceptable bearing surfaces and four (4) 1 inch diameter by 3 3/4 inch long or longer hot-dipped galvanized hexhead machine bolts.

A grounding connection, accommodating a 1/2 inch threaded bolt or nut shall be provided inside each transformer base.

The light pole manufacturer shall obtain the base and bolt circle dimensions from the plans and shall then provide the Contractor with a template print, giving complete information for setting the anchor bolts.

Transformer bases shall be so designed as to minimize the possibility of hooking or snagging an impacting vehicle.

MATERIAL REQUIREMENTS. Transformer bases shall be cast of Aluminum-Alloy 356.0-T6 (SG70A-T6) in conformance with ASTM B26M, Aluminum-Alloy Sand Castings or ASTM B108, Aluminum-Alloy Permanent Mold Castings. The trapezoidal shaped door shall be fabricated from B443.0 (S5A) or 356.0-T6 (SG70A-T6) Aluminum Alloy.

§723

Transformer bases and doors may be made of an Aluminum Alloy equivalent to 356.0-T6 (SG70A-T6) upon approval of the Materials Bureau.

TESTS. To determine acceptable breakaway characteristics, transformer bases shall be subjected to dynamic laboratory testing. The test shall apply to transformer bases accommodating poles of less than 700 pounds in weight (including luminaire and bracket) and poles of less than 50 foot mounting height only.

A full size pole, together with luminaire or a suitable weight to simulate the luminaire, shall be mounted on the transformer base. A ballistic pendulum, equipped with a crushable nose, as approved by FHWA, and weighing 1800 pounds, shall be swung in such a manner so as to strike the transformer base at a velocity of 20 mph. The point of impact shall be at a height of 20 inches from the bottom of the transformer base.

Transformer bases shall be considered to have acceptable breakaway features if they produce a change in velocity of 18 feet per second or less. For further specific information concerning the test equipment and procedure, contact the Materials Bureau.

BASIS OF ACCEPTANCE. The Department requires the submission of Materials Details. The manufacturer or supplier shall prepare and submit the appropriate material in accordance with the procedural directives of the Materials Bureau. Upon approval by the Materials Bureau, the name of the product and/or supplier, and the reference number assigned to the approved Materials Details will be placed on the Approved List. Such products shall then be accepted on the basis of their brand name and conformance to the approved Materials Details.

The supplier shall provide two copies of the approved Materials Details through the Contractor to the Engineer as part of the evidence of acceptability for the material at least 10 days prior to the use of the product.

723-16 THRU 723-18 (VACANT)

723-19 RIGID PLASTIC CONDUIT

SCOPE. This specification covers the material requirements for rigid plastic conduits (PVC and high-density PE) for use as raceway for wires or cables of an electrical system. Rigid plastic conduit is acceptable for up to 167°F wiring service. Rigid PVC (polyvinyl chloride) conduit is suitable for installation above or below ground and with or without concrete encasement; high-density PE (polyethylene) conduit is intended for below ground installations only, and with or without concrete encasement.

GENERAL. Under these requirements either Class 1, Heavy Wall PVC or Class 2, High Density PE conduit may be supplied for underground installation. For above ground use, only Class 1 conduit shall be allowed.

MATERIAL REQUIREMENTS. Rigid plastic conduit shall conform to the requirements of UL 651A.

All fittings, couplings and expansion fittings shall conform to the applicable requirements of UL514A. Solvent cement for joining Class 1 conduit and conduit fittings shall meet the requirements of ASTM D2564, or alternately be of the type recommended by the conduit manufacturer. Unless otherwise recommended by the manufacturer, fittings for Class 2 conduit shall be of a drive-on type and solvent cement will not be needed for "jointing."

BASIS OF ACCEPTANCE. Rigid plastic conduit shall be accepted upon the basis of the manufacturer's certification that it meets the requirements of this specification, as well as being Underwriters Laboratory Listed. Fittings, couplings and solvent cement shall be accepted upon the manufacturer's certification that they meet the requirements of this specification.

723-20 METAL STEEL CONDUIT, ZINC COATED

SCOPE. This specification covers the material requirements for zinc coated rigid metal steel and intermediate metal steel conduits, used as raceways for wires or cable of an electrical system. Steel conduit may be embedded in concrete or earth; or may be used under all atmospheric conditions, including those locations classified as hazardous; and may be used in high voltage (over 600 volts) installations.

GENERAL. Under these requirements, either Class 1, Rigid Metal Steel Conduit or Class 2, Intermediate Metal Steel Conduit may be supplied. In addition, Class 1 and Class 2 conduits may be interchanged in the same run, providing the ends of both of the conduits are reamed, so as to create beveled edges and a smooth area over which the wires and cables will pass. Where conduit is to be jacked or exposed to the atmosphere, only Class I, Rigid Metal Steel Conduit, is permitted.

Additionally, conduit exposed to the atmosphere shall be PVC coated.

MATERIAL REQUIREMENTS. The zinc coated metal steel conduit shall conform to the requirements of UL 6, Class 1 - Rigid Metal Conduit; or UL 1242, Class 2 - Intermediate Metal Conduit.

All fittings, couplings and expansion fittings shall be zinc coated and shall meet the same specifications as the conduits. Condulets shall be gasketed and shall be furnished with stainless steel or brass screws for the cover. Expansion fittings shall be metallicly connected for continuity of grounding on either side.

The zinc coating on the outside surfaces shall be equivalent to a minimum thickness of 0.8 mil.

BASIS OF ACCEPTANCE. Metal steel conduit may be accepted upon the manufacturer's certification that it meets the requirements of this section.

723-21 AND 723-22 (VACANT)

723-23 P.V.C. COATED GALVANIZED STEEL CONDUIT

SCOPE. This specification covers the material and quality requirements for P.V.C. coated galvanized steel conduit.

GENERAL. P.V.C. Coated Galvanized Steel Conduit. The hot-dipped galvanized Rigid Steel Conduit; prior to plastic coating, shall conform to N.E.M.A. Standards Publication No. RN 1, and ANSI C80.1.

Elbows in standard and special radii shall be coated as above except that no coupling will be coated with the elbow. Separate couplings will be furnished as required and ordered.

BASIS OF ACCEPTANCE. P.V.C. coated galvanized steel conduit will be accepted upon manufacturer's certification that it meets the requirements of this section.

723-24 FLEXIBLE LIQUID-TIGHT STEEL CONDUIT

SCOPE. This specification covers the material and quality requirements of flexible liquid-tight steel conduit.

GENERAL. The flexible liquid-tight steel conduit shall be of the size indicated on the plans. It shall conform to the requirements of Underwriters' Laboratory specification UL 360 and shall be listed with Underwriters' Laboratory Inc. Connectors furnished under this specification shall be standard liquid-tight connectors.

BASIS OF ACCEPTANCE. Flexible liquid-tight steel conduit will be accepted upon manufacturer's certification that it meets the requirements of this section.

723-25 AND 723-26 (VACANT)

723-27 HIGH PRESSURE SODIUM VAPOR LUMINAIRES (STANDARD MOUNT)

SCOPE. This specification covers the material and quality requirements for high pressure sodium vapor luminaires.

MATERIAL REQUIREMENTS. The luminaires shall be of the high pressure sodium vapor type designed for use with high pressure sodium vapor lamps, color corrected or clear, and fully weatherproof.

The luminaires shall be constructed so they cover a complete self contained insect resistant and shock resistant unit. The entire luminaire assembly shall be completely pre-wired, at the factory, requiring only the connection of the primary circuit wires to the electric power source for its operation. All metallic component parts of the luminaire shall be made of a rust-resistant alloy or coated with an approved rust-resistant finish. Weep holes shall be provided for drainage.

Easy access to the lamp and major electrical components shall be provided requiring no special tools to gain entrance for maintenance purposes. The luminaire shall be provided with a means to prevent accidental exposure of the inner electrical components and accidental separation of the component parts.

The luminaire shall be equipped with an adjustable lamp socket to simplify beam angle setting and an appropriate refractor for the wattage and lighting distribution specified.

The luminaire casing shall be precision die-cast aluminum for the wattage of the lamps specified, and painted inside and out with a coat of baked on epoxy enamel, or polyester powder, virtually pinhole free, leaving no exposed metal. The underside of the luminaire shall be marked with the standard NEMA decal, visible from the ground, indicating the type and wattage of the lamp.

The luminaire shall contain a complete ballast assembly to which are mounted the necessary electrical components for multiple operation including ballast, solid state starting aid, capacitors, adjustable twist-lock three prong receptacle for photo-electric control when specified, and a dead back terminal board with pressure type terminals.

The ballast shall be a high power factor (exceeding 90%) 3 coil lag type (magnetic regulator) capable of operation on a 120 volt, 60 cycle, multiple circuit (unless otherwise shown on the plans) and able to operate the lamp in an open or short-circuit condition for six months without significant loss of ballast life.

The ballast assembly shall be capable of starting and operating the lamp at a temperature of -20°F.

The entire ballast assembly shall be readily removable as a single unit and utilize quick disconnect plugs.

The slipfitter shall be suitable for mounting on a 2 inch standard pipe bracket and capable of securely fastening flush to the mounting brackets without the need of separate mounting parts or rearrangement of mounting components. Leveling and clamping of the luminaire to the bracket shall be accomplished by the tightening of bolts and capable of adjusting the luminaire at least three degrees above and below horizontal. Bird shields shall be supplied and installed on all slipfitter installations.

The optical assembly shall consist of a die cast aluminum lens holder with a glass or aluminum 'Alzak' finished, hydroformed, gasketed reflector, a heat and impact resistant refractor, and a porcelain or polyester enclosed mogul socket. The mogul socket shall be equipped with lamp grip and a spring type center contact.

If a photo-electric control is specified, the receptacle shall be provided with a fully weatherproof covering that is readily removable without tools.

Luminaires shall be complete with compatible high pressure sodium lamps having the following characteristics:

% Mean lumens at 10 hours/start	90%
Warm-up time	3 to 4 minutes
Restart time	1 minute
Maximum power variance around design center	±5%
Lowest ambient starting temperature	-20 °F

The unit shall be supplied with an ANSI-IES vertical light distribution as specified on the plans. It shall be adjustable for a Type II, III or IV lateral light distribution and set at the factory for the distribution shown on the plans. For high mast installations a Type V distribution shall be provided. The downward light efficiency shall be at least 73%.

BASIS OF ACCEPTANCE. Acceptance of the roadway luminaire will be based on manufacturer's certification of compliance with these specification requirements and on inspection by the Engineer that no damage or defects are evident.

723-28 LOW PRESSURE SODIUM VAPOR LUMINAIRES (UNDERDECK MOUNT)

SCOPE. This specification covers the material and quality requirements for Low Pressure Sodium Vapor Underdeck Luminaires.

MATERIAL REQUIREMENTS. The luminaire shall be of the low pressure sodium vapor type suitable for underdeck or wall mounting, designed for use with a horizontally mounted lamp, fully weatherproof and watertight. The luminaire shall operate satisfactorily with any appropriately sized low pressure sodium lamp now commercially available.

The luminaire shall be equipped with a built-in ballast, and shall be designed for operation on a 120 volt, 60 hz. multiple circuit unless otherwise shown on the plans.

The luminaire shall provide efficient even illumination and shall be optically sealed and gasketed. It shall be mechanically strong and easy to maintain. The ballast components shall be mounted in a structurally sound manner within the housing of the luminaire, with provision made for optimum heat dissipation of the ballast. The reflector, socket, terminal board, fuse and ballast components shall be readily accessible. When closed for operation, the optical assembly shall be sealed against the entry of all contaminants.

The luminaire shall withstand severe outdoor conditions due to radical seasonal changes in temperature and shall be structurally capable of operating satisfactorily in winds of 80 mph.

All exposed electrical live parts shall be protected to observe adequate safety precautions, subject to approval of the Engineer.

The whole luminaire assembly shall be completely prewired requiring only the connection of the primary circuit wires for its operation.

All components shall be corrosion resistant. Metals in contact with each other shall be compatible to prevent corrosion. Screws washers and nuts shall be stainless steel.

The luminaire housing shall be constructed of either heavy duty aluminum or heavy duty plastic and shall support the ballast, capacitor component, socket, lamp support, fuse, and terminal board. Those portions of the housing which support the ballast, and to which are connected the mounting hardware and the conduit, shall be aluminum. The underside of the housing shall be marked with the standard NEMA decal indicating the type and wattage of the lamp. All mounting hardware required for attaching the luminaire to the underdeck structure and for adjusting the luminaire about its longitudinal axis through an angle of 45 degrees from horizontal, shall be furnished with the luminaire when required. The luminaire shall be capable of being mounted flush against underdeck or, when required, suspended by rods from the underdeck. The mounting hardware shall be made of stainless steel, prevent rotation of the luminaire, and be capable of adequately supporting the luminaire in winds of 80 mph.

The reflector shall be fabricated from an aluminum alloy sheet mechanically polished and electro-chemically processed to a specular finish. It shall not darken to the extent that it cannot be wiped clean with a soft cloth.

The refractor shall be formed of clear, heat resistant, ultra-violet stabilized polycarbonate plastic, free from imperfections and capable of being removed without the use of tools.

It shall be equipped with a latching arrangement and shall be hinged to the housing of the luminaire. Provisions shall be made to prevent accidental detachment of the refractor or any other luminaire part.

The ballast shall be a modified constant wattage type with high power factor (over 90%) and capable of regulating the output power within $\pm 5\%$ when the input voltage fluctuates $\pm 10\%$. The ballast and lamp shall be capable of starting and operating at ambient temperatures of -20°F .

The lamp socket shall be bayonet type provided with a means to hold the lamp against vibration and achieve close contact between lamp and socket terminals.

A means shall be provided to reduce entrance of foreign material through the wiring opening into the optical system.

§723

The terminal board shall be equipped with two clamp type pressure terminals for connection to the phase leg and neutral of the primary circuit. The terminals shall be properly identified for connection, with notations on terminal board, color coding, or wiring diagram.

The fuse holder shall be gasketed and provide external access to the fuse.

Photometric distribution shall be symmetric or asymmetric as specified.

BASIS OF ACCEPTANCE. Low pressure sodium vapor underdeck luminaires will be accepted upon the manufacturers certification that they meet the requirements of this section and are U.L. approved and on inspection by the Engineer that no damage or defects are evident.

723-29 HIGH PRESSURE SODIUM VAPOR LUMINAIRES (UNDERBRIDGE MOUNT)

SCOPE. This specification covers the material and quality requirements for High Pressure Sodium Vapor Luminaires (Underbridge Mount).

MATERIAL REQUIREMENTS. The luminaires shall be of the high pressure sodium vapor underbridge type designed for use with high pressure sodium vapor lamps.

The luminaires shall be constructed to be a complete self contained waterproof and shock resistant unit. The entire luminaire assembly shall be completely pre-wired, at the factory, requiring only the connection of the primary circuit wires to the electric power source for its operation. All metallic component parts of the luminaire shall be made of a rust-resistant alloy or coated with an approved rust-resistant finish.

Easy access to the lamp and major electrical components shall be provided requiring no special tools to gain entrance for maintenance purposes. The luminaire shall be provided with a means to prevent accidental exposure of the inner electrical components and accidental separation of the component parts.

The luminaire casing shall be precision die-cast aluminum for the wattage of the lamps specified, and marked with the standard NEMA decal, visible from the ground, indicating the type and wattage of the lamp.

The ballast shall be a high power factor (exceeding 90%) 3 coil lag type (magnetic regulator) capable of operation on a 120 volt, 60 cycle, multiple circuit (unless otherwise shown on the plans) and able to operate the lamp in an open or short-circuit condition for six months without significant loss of ballast life.

The ballast assembly shall be capable of starting and operating the lamp at a temperature of minus twenty nine degrees Celsius.

All mounting hardware required for attaching the luminaire to the underdeck structure and for adjusting the luminaire about its longitudinal axis shall be furnished with the luminaire. The luminaire shall be capable of being mounted flush against underdeck or suspended from the underdeck. The mounting hardware shall prevent rotation of the luminaire and be capable of adequately supporting the luminaire in winds of 80 mph.

The optical assembly shall consist of a die cast aluminum lens holder with a glass or aluminum 'Alzak' finished, hydroformed, gasketed reflector, a heat and impact resistant refractor, and a porcelain or polyester enclosed mogul socket. The mogul socket shall be equipped with lamp grip and a spring type center contact. Luminaires shall be complete with compatible high pressure sodium lamps having the following characteristics:

% Mean lumens at 10 hours/start	90%
Warm-up time	3 to 4 minutes
Restart time	1 minute
Maximum power variance around design center	±5%
Lowest ambient starting temperature	-20°F
Bulb finish	Clear

The unit shall be specifically designed and set to produce an ANSI-IES cutoff, type IV light distribution unless otherwise specified on the plans or ordered by the engineer. The downward light efficiency shall be at least 73%.

BASIS OF ACCEPTANCE. Acceptance of the underdeck luminaire will be based on manufacturer's certification of compliance with these specification requirements and on inspection by the Engineer that no damage or defects are evident.

723-30 MERCURY VAPOR LUMINAIRES (STANDARD MOUNT)

SCOPE. This specification covers the material and quality requirements for Mercury Vapor Luminaires.

GENERAL. The luminaire shall be of the mercury vapor type designed for use with a horizontally mounted mercury vapor lamp, color corrected or clear and shall be fully weatherproof. The luminaire and lamp combination shall produce Type II, III, or IV light distribution conforming to ASA Standards, and as shown on the plans. The luminaires shall be equipped with a built-in ballast for the wattage and operating voltage shown on the plans. The components comprising the assembly of the upper half of the luminaire shall include a reflector, a porcelain enclosed mogul socket, a twist-lock three prong receptacle for a photo-electric control, and a ballast.

BASIS OF ACCEPTANCE. Mercury vapor luminaires will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-31 MERCURY VAPOR LUMINAIRES (UNDERBRIDGE MOUNT)

SCOPE. This specification covers the material and quality requirements for Mercury Vapor Luminaires (Underbridge Mount).

GENERAL. The luminaire shall be complete for surface or pendent mounting, as shown on the plans. The luminaire shall be equipped with a prismatic refractor, be shock resistant, and protected with a cast guard. The door and guard assembly shall be equipped with stainless steel pressure latches and a safety chain. The housing shall be gasketed against which the door shall seat when closed. The luminaire shall provide a maximum candela beam of 60 degrees from the vertical for roadways up to 50 feet in width, and 70 degrees for wider roadways and approximately 180 degrees horizontal spread. The ballast shall be an integral part of the luminaire and shall be capable of operating a 175 watt or 250 watt mercury vapor lamp at -20°F. The lamps shall be included with the luminaire.

BASIS OF ACCEPTANCE. Mercury Vapor Luminaires will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-32 THRU 723-39 (VACANT)

723-40 CAST-IRON JUNCTION BOX

SCOPE. This specification covers the material and quality requirements for Cast-Iron Junction Boxes.

GENERAL. Junction boxes shall be hot-dipped galvanized cast-iron with a hot-dipped galvanized cast-iron cover. The cover shall be fastened to the box with brass or stainless steel screws. The box shall be so constructed that when the installation is complete and the cover is secured the box will be water tight.

Galvanizing shall be as specified in §719-01, Type II.

The Manufacturer shall refer to the plans for details and dimensions.

BASIS OF ACCEPTANCE. Junction boxes will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-41 THRU 723-44 (VACANT)

723-45 PRECAST REINFORCED CONCRETE FOUNDATIONS AND PULLBOXES

SCOPE. This specification covers the material and quality requirements for precast concrete foundations and pullboxes.

MATERIAL REQUIREMENTS. The Material Requirements contained in §704-03 shall apply.

DRAWINGS. The Drawing requirements contained in §704-03 shall apply.

FABRICATION. The Fabrication requirements contained in §704-03 shall apply.

SAMPLING AND TESTING. The Sampling and Testing requirements contained in §704-03 shall apply.

MARKING. The Marking requirements contained in §704-03 shall apply except as noted herein.

Markings shall be placed on the inside face of all pullboxes. Instead of marking the contract number on each unit they may be marked with "NYS DOT".

FINAL PRODUCTION INSPECTION. The Final Production Inspection requirements contained in §704-03 shall apply.

SHIPPING. The Shipping requirements contained in §704-03 shall apply.

BASIS OF ACCEPTANCE. The Basis of Acceptance requirements contained in §704-03 shall apply.

723-46 THRU 723-49 (VACANT)**723-50 PHOTOELECTRIC CONTROL**

SCOPE. This specification covers the material and quality requirements for Photoelectric Controls.

MATERIALS REQUIREMENTS. Photoelectric controls shall function to energize artificial lighting when natural lighting falls to a preset value, and to de-energize when natural lighting rises to a preset value. The photoelectric control shall be factory calibrated to energize the luminaire at approximately 3 foot-candles and de-energize at approximately 3 foot-candles. The photoelectric controls shall be adjustable by means of an outside adjustment system. The adjustment mechanism shall be easily accessible and provide a precise foolproof light level adjustment. Photoelectric controls which cannot be adjusted while the unit is in service or have to be disconnected while making adjustments will not be acceptable.

Photoelectric controls shall be suitable for mounting in all three-pronged locking type receptacles that conform to Electrical Engineering Institute (EEI) or National Electrical Manufacturers Association (NEMA) Standard Specifications.

In the event of failure of any component of the control system, the artificial lighting shall be energized.

The housing for the photoelectric control shall be weather resistant and shall be unaffected by ultraviolet rays. A neoprene sponge gasket shall be cemented to the bottom of the base to seal out weather, dust and insects, and shall conform to EEI-NEMA Standards.

The photocell shall be hermetically sealed to prevent electrolysis from moisture. The manufacturer shall certify that each cell has had 24 hours of light preconditioning before assembly.

The photoelectric control shall be solid state and shall be capable of being faced in any direction except south. Generally, it is recommended that the photo sensitive device face north, as this affords maximum spectrum response.

The photoelectric controls shall have an operating voltage range of 105-285 volts, 50/60 cycle and shall be suitable for operation on nominal distribution voltages of 120, 208, 240, and 277 volts.

The controls shall be temperature compensated, and shall be suitable for operation from -40°F to $+160^{\circ}\text{F}$ and shall be completely unaffected by humidity. The switch mechanism shall be snap acting of sufficient capacity to adequately handle loads of 1000 watts of incandescent lighting, or 1800 volt-amperes of ballasted lighting. The photoelectric control shall be able to withstand an inrush current of a maximum of 170 amperes.

Time delay devices shall be built into the photoelectric control to prevent switching of artificial lighting due to transient lighting changes.

The photoelectric controls shall also be equipped with a built-in expulsion-type surge and lightning protection arrester.

BASIS OF ACCEPTANCE. Photoelectric controls will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-51 THRU 723-59 (VACANT)

723-60 ANCHOR BOLTS

SCOPE. This specification covers the material and quality requirements for anchor bolts.

MATERIALS REQUIREMENTS. Anchor bolts shall meet the requirements of ASTM F568 Class 8.8, or ASTM A449, or they may be manufactured from steel meeting the requirements of ASTM A576, Grades 1020 through 1050 inclusive, having a minimum yield strength of 50,000 psi. A hex nut, lock washer, and flat washer shall be supplied with each anchor bolt and their dimensions shall be shown on the plans. The hex nut and flat washer shall be manufactured in accordance with ASTM A325M or A325 and the lock washer shall be manufactured in accordance with Table 730-22-1 Steel Fasteners. The nuts, washers and the top 12 inches of the anchor bolts shall be galvanized in accordance with the requirements for Type II or Type V galvanizing as stated in section 719-01, Galvanized Coatings and Repair Methods.

The anchor bolt dimensions shall be shown on the plans.

SHIPPING. Anchor bolts, hex nuts, and washers shall be shipped to the construction site at a time convenient to the masonry construction.

BASIS OF ACCEPTANCE. Anchor bolts will be accepted upon the manufacturer's certification that they meet the requirements of this section.

723-61 THRU 723-69 (VACANT)

723-70 SINGLE CONDUCTOR CABLE

SCOPE. This specification covers the material and quality requirements for single conductor cable used in highway lighting.

MATERIAL REQUIREMENTS. Single conductor cable shall be copper, Type THW, RHW-2, or XHHW-2 (XLP) as designated by Underwriter's Laboratory Specifications. The single conductor cable shall have heat and moisture resistant insulation for a maximum operating temperature of 165°F , in wet and dry conditions.

BASIS OF ACCEPTANCE. Single conductor cable shall be accepted upon the manufacturer's certification that it meets the requirements of this specification as well as being Underwriter's Laboratory approved.

723-71 SINGLE CONDUCTOR DIRECT BURIAL CABLE

SCOPE. This specification covers the material and quality requirements for direct burial 600V type USE cable for use in conduit or in trenches as shown on the plans and as directed by the Engineer..

§723

MATERIAL REQUIREMENTS. Cable shall bear Underwriters Laboratories Label for type USE. It shall consist of copper conductor and insulation constructed to conform to ICEA (Insulated Cable Engineers Association) Pub. S-95-658 and NEMA Pub. No. 7C-70 (Nonshielded 0-2kV Cables) or their equivalent.

Cable shall consist of 7 copper strands up to and including #2 AWG and shall be constructed of 19 copper strands for sizes larger than #2 AWG.

Insulation shall be chemically cross-linked (vulcanized) polyethylene insulating compound.

Cable shall be mechanically spliced and insulated using the highest quality poured splices available for underground 600V cables.

Cable shall be factory or shop twisted in a duplex or a triplex configuration in accordance with the publications listed above or as shown in the contract documents.

BASIS OF ACCEPTANCE. Single Conductor Direct Burial Cable will be accepted upon the manufacturer's certification that it meets the requirements of this specification as well as being Underwriter's Laboratory approved.

723-72 THRU 723-74 (VACANT)

723-75 GROUND WIRE

SCOPE. This specification covers the material and quality requirements for ground wire used in highway lighting.

MATERIAL REQUIREMENTS. Ground wire shall be #6, soft-drawn bare copper wire, 7 strand single conductor.

BASIS OF ACCEPTANCE. Ground wire shall be accepted upon the manufacturer's certification that it meets the requirements of this specification.

SECTION 724 - TRAFFIC SIGNALS

724-01 SIGNAL CABLE

SCOPE. This specification covers the material requirements for signal cable for use with traffic signal systems and for installation in underground ducts or as an aerial cable supported by a messenger.

MATERIALS REQUIREMENTS. The cable shall conform to the requirements of the International Municipal Signal Association (IMSA) Specification 20-1. The gauge and number of conductors shall be as specified in the plans. The conductors shall be stranded copper wire.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-02 SPAN WIRE

SCOPE. This specification covers the material requirements for span wires used in the suspension of traffic signal heads. Span wires may be used as a single span wire or a dual span wire including a tether wire. The same wire may be used as messenger wires or guy wires.

MATERIALS REQUIREMENTS. Span wire shall meet the requirements of ASTM B228, Grade 30 EHS.

BASIS OF ACCEPTANCE. Acceptance of span wire will be based on the manufacturer's certificate of compliance with these specification requirements, together with supplementary sampling and testing at the discretion of the Materials Bureau.

724-03 TRAFFIC SIGNAL POLES

SCOPE. This specification covers the material requirements and fabrication details for poles used for traffic signals. Traffic signal poles are classified according to the following applications:

A. Span Wire. Span wire poles are used for supporting a steel cable or cables to which are attached traffic signals and overhead signs.

B. Mast Arm. Mast arm poles consist of a vertical shaft and an approximately horizontal arm to which are attached traffic signals and overhead signs. These poles may also be equipped with more than one mast arm.

C. Post Top Mount Post top mount poles are used for mounting traffic signals directly on the top of the pole.

D. Bracket Mount Bracket mount poles are used to support traffic signals and other items bracketed from or attached to the side of the pole.

Traffic Signal Poles with Lighting Arms - Lighting arms may also be attached to all pole types except post top mount.

DESIGN CRITERIA. The poles shall be designed in accordance with the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals (1994), except as modified by this specification. The following elements of a pole shall be designed for the most critical orientation of the loads, applied to a traffic signal pole:

- Any tubular segments of the structure.
- Hand hole reinforcement and other hole reinforcement.
- Device used to connect cable to pole.
- Base plate.
- Mast arm to pole connections.
- Anchor bolts.

The design shall be approved, stamped and signed by a professional engineer licensed in the State of New York.

All necessary holes in the pole below the load attachment point and greater than 11/16 inch in diameter shall be made by the manufacturer and reinforced according to the fabrication details and contract documents. Hand holes shall be located ninety (90⁰) degrees clockwise, top view, from the direction of the cable load, unless otherwise specified.

For those poles on which a traffic signal cabinet will be mounted the pole manufacturer will be required to weld a cabinet wiring access coupling into the pole as part of the pole manufacturing process. This coupling shall be centered 12 inches from the bottom of the base plate and 90⁰ clockwise (top view) from the axis of the hand hole. The coupling shall be designed to accept a standard chase nipple on the inside of the pole, and to accept 1 1/2 inches of a standard 4 inch diam. galvanized pipe from the outside of the pole, and shall protrude no more than 1/2 inch on the out side of the pole. An insulated chase nipple shall be installed in the coupling on the inside of the pole. The coupling shall be designed to reinforce the hole in which it is installed.

Wind Loads. Poles and attachments thereto covered by this specification shall be designed for the following wind speeds in accordance with the AASHTO standard in DESIGN CRITERIA above.

§724

- 80 mph - Counties of Allegany, Bronx, Cattaraugus, Chautauqua, Erie, Genesee, Kings, Livingston, Monroe, Nassau, New York, Niagara, Orleans, Ontario, Queens, Richmond, Rockland, Suffolk, Wayne, Westchester and Wyoming.
- 70 mph - All other counties.

MATERIAL REQUIREMENTS. The following materials, or approved alternates, as determined by the Deputy Chief Engineer, Office of Design-Division, shall be used for fabrication. Span Wire, Mast Arm and Bracket poles shall be galvanized steel. Post top poles may be either galvanized steel or aluminum. Acceptable aluminum materials are those contained in the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals (1994).

The following are the acceptable steel materials for the signal pole components.

Poles and Arms. The finished pole shall be galvanized in accordance with subsection 719-01 Galvanized Coatings and Repair Methods, Type 1, and be made of one of the following:

- ASTM A500, Grade B or ASTM A501.
- ASTM A53, Grade B pipe.
- ASTM A53, Grade B pipe, with a minimum yield of 48,000 psi guaranteed by the manufacturer and documented by the submission of certified copies of physical tests performed on the lots of material from which the poles were manufactured.
- ASTM A252, Grade 2 or Grade 3.
- ASTM A252, Grade 2, with a minimum yield of 48,000 psi guaranteed by the manufacturer and documented by the submission of certified copies of physical tests performed on the lots of material from which the poles were manufactured.
- ASTM A572, Grades 40, 50, 60 or 65.
- ASTM A595, Grade A.
- ASTM A618, Grade I, II or III.
- ASTM A588.
- ASTM A513, with a minimum yield strength of 36,000 psi guaranteed by the manufacturer, and documented by the submission of certified copies of physical tests performed on the lots of material from which the poles were manufactured.
- ASTM A1008/A1008M Grade 60 Class 2.
- ASTM A1011/A1011M Grade 60 Class 2.

Bases. The base shall be galvanized under the same specification as the pole, and made of one of the following:

- ASTM A27M, Grade 65-35, mild to medium strength carbon steel castings.
- ASTM A36.
- ASTM A588.
- ASTM A572, Grade 40, 50, 60 or 65.
- ASTM A633M (Any Grade).

Anchor Bolts, Nuts and Washers

Bolts and nuts shall meet the requirements of one of the following specifications:

- ASTM F568M Class 4.6 (Bolts and Nuts)
- ASTM F568M Class 8.8 (Bolts)
- ASTM A576 (bolts) Grades 1021 and 1025 with a minimum elongation of 18 percent in 2 inches tested in accordance with ASTM A370. The guaranteed minimum yield strength shall be stated by the manufacturer.
- ASTM A675M Grades 485 through 620 (Bolts).
- ASTM A563M Grades A, B, C, D, or DH (Nuts).
- ASTM F1554 Grades 36, 55 or 105 (Bolts).
- ASTM A36 (Bolts) modified to a minimum yield of 55,000 psi, minimum tensile of 65,000 psi and minimum elongation of 18 percent in 2 inches, tested in accordance with ASTM A370.

- ASTM A194, Grade 2H (Nuts)

The type and grade of steel for nuts shall be compatible and of comparable strength to the steel used for the bolts. Washers shall be plain hardened washers.

Nuts, washers and a minimum of the top 12 inches of anchor bolts shall be hot-dipped galvanized, in accordance with the requirements of subsection 719-01, Galvanized Coatings and Repair Methods, Type II.

Connection Devices

- ASTM A36.
- ASTM A588.
- ASTM A325.

Pole Caps and Anchor Bolt Covers. Pole caps shall be galvanized steel, galvanized cast iron, aluminum or zinc alloy AG40A. Anchor bolt covers shall be galvanized steel, galvanized cast iron, or aluminum. Galvanizing shall be done in accordance with the requirements of §719-01, Galvanized Coatings and Repair Methods, Type II.

FABRICATION

Bases and Hardware. The base plate shall be welded to the pole by an acceptable weld in accordance with the New York State Steel Construction Manual.

All anchor bolts, nuts and washers required for each pole shall be supplied by the pole manufacturer. Anchor bolts are to be anchored using double nuts and plates or threaded plates and shall be designed by the fabricator. Anchor bolts shall be long enough to embed at least 30 bolt diameters into the concrete foundation. "L" bends will not be allowed. The number of anchor bolts and the bolt circle diameter shall be determined by the fabricator unless specified in the contract documents. Each anchor bolt shall be equipped with 2 nuts and one or more washers for attaching the pole plus those necessary to provide end anchorage to the anchor bolt.

Washers will not be required when the holes on the base plate are within the following tolerances:

- Hole diameter not more than 1/8 inch greater than the bolt, bolt diameters less than 1 inch.
- Hole diameter not more than 1/4 inch greater than the bolt, bolt diameters equal to or greater than 1 inch.
- Hole diameter not more than 3/8 inch greater than the bolt, bolt diameters equal to or greater than 2 inches.

Anchor bolt covers shall be furnished. These shall be affixed to the base or shaft with stainless steel cap screws.

Shafts and arms shall be equipped with end caps secured with stainless steel set screws.

Shafts. Shafts shall be round or multi-sided shapes.

Shafts shall be equipped with hand holes except for poles intended for transformer base mounting. Hand holes shall be centered approximately 2 feet above the base end of the pole. The maximum hand hole size shall not exceed 4 x 6 1/2 inches. Poles shall be equipped with a grounding terminal accessible through the hand hole. Grounding terminals are not necessary if there is no hand hole.

Holes for wiring fittings shall consist of a pipe coupling of the specified diameter and where feasible shall be shop installed. Hand holes and holes for wiring fittings located near the base of the pole shall be reinforced with metal at least equal to the area removed.

Shafts may be fabricated in any of the following shapes and styles:

A. Round Continuously Tapered. Shafts shall be fabricated with not more than one longitudinal seam which shall be continuously welded and ground or rolled flush. Shafts shall have a uniform wall thickness and shall taper uniformly, starting at the butt end, decreasing in diameter at the rate of not more than 1/2 inch, but not less than 1/4 inch per yard of length.

B. Round Step Tapered Construction. Shafts shall be fabricated from round pipe sections with not more than one longitudinal seam, joined by a hot-swaged shrink fit, continuously seal welded to prevent entrance of water. Stepped, round shafts shall achieve a tapered effect equal to a maximum rate of 1/2 inch and a minimum of 1/4 inch per yard of length by use of decreasing diameter round pipe sections.

C. Multi-sided Continuously Tapered Construction. The multi-sided pole shall conform to the requirements as set forth above under round continuously tapered construction, except that it shall have no more than 2 longitudinal seams which shall be continuously welded and ground or rolled flush. Square or hexagonal shafts will not be allowed.

D. Round Untapered. Poles 26 feet or less in length may be round untapered with not more than one longitudinal seam.

Welding. All welding shall be performed in accordance with the New York State Steel Construction Manual.

Poles with Lighting Arms. Poles with lighting arms shall be constructed in accordance with the configuration in the contract documents and this specification.

Except for bracket-mount traffic signal poles, lighting arms may be of either the single member type or of the truss type if type is not specified. When specified for bracket-mount traffic signal poles, lighting arms shall be of truss-type design with upper and lower members joined near the luminaire end of the arm. Lighting arms of the truss-type design with upper and lower members joined near the luminaire end of the arm shall be braced with one or two vertical struts depending on the length of the arm. Arms may be either galvanized steel or aluminum.

Span Wire Poles

A. Design Load. The design load for span wire poles shall be the Group II or III load per AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals (1994) Section 1.2.6, given in the contract documents and applied at a point 1 foot 6 inches below the top of the pole. Allowable unit stresses shall be as specified in the above AASHTO specification.

B. Physical and Mechanical Properties. Span Wire poles shall conform to the following requirements.

- Minimum Wall Thickness - 0.1196 inch
- Maximum Deflection - To be computed at a point 18 inches from the top of the pole, shall be a maximum of 0.6 inch per foot of pole length and a maximum deflection rate of 0.6 inch per 100 pounds.
- Maximum Pole Diameter at the Base - 0.7 inch per foot of pole length.

C. Pole Marking. The following information shall be stamped on the base plate or ground sleeve in 1/2 inch letters to such a depth as to be clearly visible through subsequent galvanizing:

Desired Information	Example
Pole Length in whole foot	28 feet
Load in 1000 lb Increments	8000 lbs
Manufacturers Name or Logo	-
Month and Year of Manufacture	1104

D. Span Wire Connecting Hardware. The manufacturer shall supply the necessary device for connecting each span wire to the pole. For polygonal poles this device may be either a galvanized thimble eyebolt or a circumferential pole clamp. For round poles, only thimble eyebolts shall be used.

The design strength shall be 70% of yield strength of the connecting device. The yield strength shall be determined using a cable load aligned 85 degrees to the vertical axis of the pole.

Mast Arm Traffic Signal Poles

A. Design Loads. Each part of the structure shall be proportioned for the combination of loads producing the maximum effect, using unit stresses increased for the material and group loads as described in section 1.2.6 of the AASHTO *Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals (1994)*. The wind speed, locations, dimensions, weights, and projected areas of the signals, signs, and supports shall be as specified in the contract documents.

B. Mast Arm Shapes. Arms shall be round or multi-sided shapes and have the same cross-sectional shape as the shaft.

C. Arm Construction. Mast arms of any length may be constructed by any of the methods indicated under Material Requirements Shafts. They may be of two piece construction with a telescoping joint secured by thru-bolt and locknut.

D. Mast Arm to Shaft Connection. The mast arm shall be secured to the shaft by a minimum of four bolts. The mast arm shall be equipped with a flange plate welded to the butt end of the mast arm.

A flange plate shall be attached to the shaft using vertical and horizontal gusset plates both top and bottom and at each side.

Flange plates on shaft and mast arms shall have a hole with a smooth cable guide for wiring.

E. Physical and Mechanical Properties. Mast arms and shafts shall conform to the following requirements:

- Minimum Wall Thickness - 0.1196 inch.
- Maximum Deflection at Design Load.
- Shaft - 1/2 inch per foot of length.
- Arm - 1/2 inch per foot of length.
- Maximum Diameter at base of shaft or arm.
- Shaft - 0.7 inch per foot of length.
- Arm - 0.7 inch per foot of length.

F. Poles with Multiple Arms. Poles with multiple arms shall be constructed in accordance with the arm configuration in the contract documents.

G. Pole Marking. The following information shall be stamped on the top of the base plate or ground sleeve in 1/2 inch letters to such a depth as to be clearly visible through subsequent galvanizing.

Desired Information	Example
Wall Thickness	0.312 inch
Minimum Yield Strength	55 ksi
Manufacturers Name or Logo	-
Month and Year of Manufacture	1004

Post Top Mount and Bracket Mount Traffic Signal Poles. These poles shall be proportioned for the combination of loads producing the maximum effect, using unit stresses increased as indicated for the material and group loads as described in section 1.2.6 of AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals (1994). The wind speed, location, weights, dimensions and projected areas shall be as given in the contract documents.

BASIS OF ACCEPTANCE. Acceptance for poles and mast arms covered by this specification will be based on the following, as appropriate:

All Poles and Arms

- Submission of fabrication details for each pole intended for a worst case configuration of the load as specified in the contract documents approved, stamped and signed by a Professional Engineer licensed and registered to practice in New York State.
- Submission of the manufacturer's certificate of compliance with these specification requirements and the approved fabrication details.

Span Wire Poles

- The acceptance requirements for All Poles and Arms, given above, shall apply.
- Submission of mill certifications for all structural materials.
- Appearance of the manufacturer's name on the Department's list of approved manufacturers.

724-04 TRAFFIC SIGNAL HEADS

SCOPE. This specification covers the material and fabrication requirements for vehicular and pedestrian traffic signal heads, including flashing signals and flashing beacons.

STANDARD SIGNAL HEADS

Material Requirements. Only virgin metal shall be used in making either sand castings or die castings, and where specified, the manufacturer shall furnish standard test bars, poured of the metal of which the castings are made, and a certified chemical analysis of the ingot from which the castings are made.

A. Housing. Unless otherwise specified, all traffic signal head housings shall be made of Aluminum alloy of one of the following compositions:

- 1. Aluminum Sand Castings.** All aluminum sand castings shall be made of ingot, in accordance with ASTM B26, Alloy B443.0 or AC72A.
- 2. Aluminum Die Castings.** All aluminum die castings shall be made of ingot, in accordance with ASTM B85, Alloys SC84A, SC84B, SG100A, SG100B, or S12B.

B. Suspension Components. All suspension components, brackets, clamps, trunnions, arms, elbows, crosses, etc., shall be made of one of the following materials:

- 1. Malleable iron.** Malleable iron material shall be made in accordance with ASTM A47/A47M.
- 2. Steel pipe.** Steel pipe shall be made in accordance with ASTM A53.
- 3. Aluminum Sand Castings.** Aluminum sand castings shall be made in accordance with ASTM B26, Alloy 356-T-6.
- 4. Aluminum Die Castings.** Aluminum die castings shall be made in accordance with ASTM B85, Alloy SC 84B.
- 5. Aluminum pipe.** All aluminum pipe shall be made in accordance with ASTM B429.

C. Fasteners . The following items shall be made of non-magnetic stainless steel, Type 303 or 304, in accordance with ASTM A296 (latest revision).

- All set screws.

- The U/J-bolts, rivet and their related nuts, washers and cotter pin in the span wire lamp.
- The eye-bolt, rivet, tightening bolt and their related nuts, washers, and cotter pin in the balance adjuster.

D. Pipe Arms. Pipe arms shall be made of steel pipe in accordance with ASTM A120 (latest rev.)

Wind Load. Signal heads, mounting brackets, attachments and fittings shall be designed for a wind load pressure for at least a 90 mph wind in accordance with AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals (1994).

Painting. All aluminum traffic signal heads, bracket arms, and mounting attachments shall be painted by first applying a chromate conversion coating and then electrostatically applying a polyester powder coating.

Threads and threaded parts shall not be coated and shall be protected from the coating process at the time of application.

The chromate conversion coating shall be applied and conform to the requirements of ASTM B449, Standard Practice for Chromate Treatments on Aluminum, Class 2 coating. The conversion coating shall be allowed to dry thoroughly and shall be free of entrapped air and contaminants. After drying the chromated surface shall be coated with a polyester powder coating.

The polyester powder shall be electrostatically applied and cured in accordance with the coating manufacturers recommendations. If preheating of the aluminum substrate is required, care shall be taken to prevent damage to the chromate coated surface by not exceeding a preheat temperature of 160°F. The polyester coating shall be applied at a uniform thickness between 2 and 4 mils. The polyester powder used shall have the following properties:

Property	ASTM Test Method	Test Value
Specific Gravity	D3451	1.2 Minimum
Impact Resistance	D2794	16 NCm Minimum
Pencil Hardness	B3363	H - 2H

The color of the finished polyester coating shall be such that a properly prepared color chip shall be a reasonable visual match to Federal Color Standard No. 595A, Color 14056. Viewing shall be done under North Standard Daylight.

Signal Indications. Signal indications shall be as indicated in the proposal or as shown on the plans.

Wiring. All wiring shall consist of No. 18 AWG stranded copper wire with thermoplastic insulation and a 600 volt rating.

Electrical Characteristics. All equipment shall be designed for operation on 115 volts ±30 volts, 60 Hertz, single phase A.C. power unless otherwise indicated.

Mounting. Signal heads shall be arranged for mounting on span wires, mast arms, post tops or vertical pole bracket mounts as specified in the contract documents. For a span wire mounting the signal head shall be provided with a span wire clamp, balance adjuster and wire outlet fitting. The span wire clamp shall consist of a shoe, lockbar, two "U" or "J" bolts, and a rivet, with cotter pin, nuts, washers, etc., as necessary. The balance adjuster shall consist of a body with threaded eye-bolt, a tightening bolt and a rivet, with cotter pin, nuts washers, etc., as necessary. The wire outlet fitting shall have a continuous opening of a minimum nominal diameter of 1 1/2 inches for insertion of signal head wiring. The upper opening shall have a weatherproof insulating composition cover that provides for the insertion of the wiring. The cover shall be securely mounted to the fitting. The bottom opening shall be threaded, and provided with two square or hex drive set screws, located at 180 degrees to each other. The bottom of the fitting shall have integral cast serrations, or shall be notched and provided with a serrated locking ring, or shall be provided with a slotted check nut and serrated locking ring. A 12 or 18 circuit disconnect hanger

shall be supplied if specified in the contract documents. The head shall be assembled so that it hangs plumb.

A. One-way Signal Head. Mounting hardware for a one-way signal head shall also include a 1 1/2 inch galvanized nipple with cast head, gasket, and steel washer for the connection between the wire outlet fitting and the top of the signal head. A metal weather-resistant cap/plug shall be provided for the unused hole in the bottom of the head. The cap/plug shall be of a threaded or flanged design.

B. Multi-way Signal Head. Mounting hardware for multi-way (2, 3 and 4-way) signal heads shall also include a center junction hub and pipe arms with tee or cross end connectors. Tee and cross connectors shall be notched for, and supplied with a serrated locking ring. No pipe/nipple shall be provided for the connection between the center junction hub and the wire outlet fitting. A 1 1/2 inch galvanized nipple with cast head, gasket and steel washer shall be supplied for the connection between the tee or cross connector and the top of the signal head. Tees and crosses will not be accepted in place of the center junction hub.

Center junction hubs shall have a threaded openings on the top and sides. The bottom of the hub shall be essentially fully open, except for the necessary thickness of the housing, and shall be securely covered by a flat plate of weather-resistant design. The plate shall be held in place by a minimum of two screws. Center junction hubs shall be provided with a square or hex drive set screw on all threaded openings, except that the top opening shall be provided with two set screws, located at 90 degrees to each other.

Center junction hubs shall have a minimum nominal opening of 3 1/2 inches in diameter for round openings, or a minimum nominal side length of 3 1/2 inches for rectangular openings.

Tees or crosses shall have threaded openings to accept the necessary pipe arm/signal head connections, plus at least one additional threaded opening to facilitate wiring. The extra opening shall be closed with a threaded metal pipe cap. All threaded openings on the tees and crosses shall be provided with a square or hex drive set screw.

Threaded openings on pipe arms shall be tapered. Threaded openings on other pipe fittings shall be pipe straight threads.

Flat arms or spiders shall be provided for the bottoms of multi-way signal heads, except that bottom hardware shall be omitted for multi-way one section head assemblies. Connections between the bottoms of the signal heads and the arm/spider shall be flanged or threaded to provide a locking, weather-resistant connection.

Signal heads for mast arm mounting shall be furnished with a mount consisting of upper and lower horizontal arms attaching to the top and bottom of the signal head housing. The horizontal arms shall attach to a vertical member which in turn clamps to the mast arm. The mast arm mount shall have provision for adjusting the vertical, angular and rotational positioning of the head in relation to the mast arm so that it is plumb, in line with other signal heads and properly oriented in relation to traffic. Wiring shall be concealed within the mount.

Post top signal heads shall be furnished with a post top type sliplifter mounting. Vertical pole bracket mount signal heads shall be equipped with upper and lower horizontal brackets equipped with pole plates for attachment to the pole with stainless steel bands.

Housing. The housing for each face shall be of unitized sectional construction and shall consist of as many sections as necessary to provide the indications shown on the plan. All sections shall be rigidly and securely fastened together into one weather-tight signal face. An adjustable traffic signal head shall consist of two or more signal faces fastened to and supported by a pipe assembly and suitable entrance fitting.

Each housing shall be arranged with openings in the top and bottom so that it may be rotated about a vertical axis between waterproof supporting brackets or trunnions and shall be capable of being securely fastened at increments of not more than 7 degrees of rotation. The top and bottom of each housing shall have integrally cast locking rings or other provisions to provide positive interlocking and indexing.

The top and bottom of each housing shall be provided with tees or crosses equipped with pipe-plug knobs or caps which can be removed to assist in wiring.

Flat arms or spiders will be accepted as an alternative for use on the bottom of adjustable signals. One-section adjustable beacons may be supplied without bottom bracket arms.

Each housing shall be so designed that additional sections may be added. The construction shall permit the assembly of 12 inch signal sections with 8 inch sections of the same manufacturer. The assembly shall permit the joining of 8 inch sections either above or below the 12 inch sections.

Doors. The door shall be of cast aluminum alloy and shall be provided with four visor mounting holes located equidistant about the lens opening to allow the mounting of the visor in either a vertical or horizontal position. The holes shall be drilled and tapped, and provided with stainless steel mounting screws. Neoprene gasketing shall be provided between the body of the housing and the doors. The doors shall be suitably hinged and shall be forced tightly against the gasket and the housing by simple stainless steel locking devices. All other exterior hardware such as hinge pins, lens clips, etc. shall be of stainless steel. The locking device shall be capable of being operated without the use of tools. Hinges shall be arranged to allow convenient relamping. On the outside of the door, there shall be a rim encircling the lens opening to prevent any light leakage between optical systems.

Visors. The visors shall be separate and removable from the doors, held in place by stainless steel fastenings attached to the door in such a manner as to prevent the possibility of any light leakage between the door and hood which might be discernible from the side. Visors shall be of sheet aluminum, not less than 0.050 inches, and shall mount to the signal head through the use of four slotted mounting tabs which inter-mate with the mounting screws on the signal housing door. Unless otherwise specified in the contract documents all signal heads shall be provided with cap-type visors. The insides of visors and the entire surface of louvers or fins used in front of signal lenses shall be painted a flat black to minimize light reflection to the sides of the signals. Visors shall tilt down from the horizontal a minimum of 3.5° and shall be a minimum of 9 1/2 inches in length for 12 inch diameter lenses and 7 inches in length for 8 inch diameter lenses.

Connection Blocks. Each signal face shall be equipped with a 5-point heat resistant terminal block. It shall have five terminals with connectors for receptacle leads and screw terminals for field wires.

The individual connection blocks in the separate faces of a signal head shall be interconnected. In one face of each multi-face head, there shall be an additional nine terminal block to which all field wires are connected. All socket leads of all signal faces shall terminate at this nine terminal block.

Dust-Tight Optical System. The optical system shall be properly gasketed to exclude dust and dirt from the reflecting surface of the reflector and the inner surface of the lens. Gaskets shall be placed between the reflector and supporting member, and between the reflector holder and the inner surface of the lens.

Reflectors. Reflectors shall conform to the requirements of "Vehicle Traffic Control Signal Heads" published by the Institute of Transportation Engineers (ITE) in ST-017B (Equipment and Material Standards).

Reflectors shall be made of a material that will not distort when subjected to the heat of the specified lamp. Reflectors may be either silvered glass or specular aluminum with anodic coating. Metalized plastic reflectors will not be accepted. The reflecting surface before coating shall be free of flaws. The reflective coating and the reflector shape shall be such that the light distribution and candle power intensity of the combined lamp lens reflector assembly shall meet the specification requirements in "Vehicle Traffic Control Signal Heads."

Reflector Rings. No plastic material will be accepted for the reflector bracket or reflector ring. The reflector ring and complete reflector and socket assembly shall be pivoted between two (2) stainless steel pins in such a manner that it can be swung open for ease in servicing the signal without the use of any tools.

Lenses. Each traffic signal head shall be supplied with traffic signal lens. Lenses shall be red, yellow, or green. Lens shall be made of glass and shall conform to the requirements of "Vehicle Traffic Control

§724

Signal Heads" published by the Institute of Transportation Engineers. Except for multilane use control signals and pedestrian signals, all lenses shall be circular in shape with nominal diameters of either 8 or 12 inches. Each 12 inch lens shall be standard wide angle and clearly marked as such.

Lamp Receptacles. Lamp Receptacles shall conform to the requirements of "Vehicle Traffic Control Signal Heads" published by the Institute of Transportation Engineers.

Lamps. The lamp for the illumination of an 8 inch lens shall be a clear traffic signal lamp which produces a minimum of 595 lumens with an average minimum initial lumen rating of 550 lumens at a working voltage of 120-125 volts AC, has a rated life of at least 8,000 hours and is rated at no more than 60 watts.

The lamp for the illumination of a 12 inch lens shall be a clear traffic signal lamp which produces a minimum of 1750 lumens with an average minimum initial lumen rating of 1650 lumens at a working voltage of 120-125 volts AC, has a rated life of at least 7000 hours and is rated at no more than 135 watts.

Lamps and the intensity and distribution of light from each illuminated signal lens shall conform to the requirements of "Vehicle Traffic Control Signal Heads", and "Standards for Traffic Signal Lamps." Both publications are available from the Institute of Transportation Engineers.

OPTICALLY PROGRAMMED SIGNAL HEADS. The following additional requirements apply to Optically Programmed Signal Heads.

General. The optically programmed signal head shall permit the visibility zone of the indication to be determined optically and require no hoods or louvers. The projected indication may be selectively visible or veiled anywhere within 15° of the optical axis. No indication shall result from external illumination nor shall one light unit illuminate a second.

Optical System. The optical system shall accommodate projection of diverse, selected indicia to separate portions of the roadway such that only one indication will be simultaneously apparent to any viewer. The projected indication shall conform to ITE transmittance and chromaticity standards.

The following components shall comprise the optical system:

A. Lamp and Lamp Collar. The lamp shall be nominal 150 watt, 120 volt AC, three prong, sealed beam having an integral reflector with stippled cover and an average rated life of at least 6000 hours. An equivalent 75 watt lamp shall be used with pedestrian indications. The lamp shall be coupled to the diffusing element with a collar including a specular inner surface.

B. Optical limiter-diffuser. The diffusing element may be discrete or integral with the convex surface of the optical limiter. The optical limiter shall provide an accessible imaging surface at focus on the optical axis for objects 900 to 1200 feet distant, and permit an effective veiling mask to be variously applied as determined by the desired visibility zone. The optical limiter shall be provided with positive indexing means and composed of heat resistant glass.

C. Objective lens. The objective lens shall be a high resolution, planar incremental lens hermetically sealed within a flat laminant of weather-resistant acrylic or approved equal. The lens shall be symmetrical in outline and may be rotated to any 90° orientation about the optical axis without displacing the primary image.

Construction. Signal case and lens holder shall be predrilled for backplates and visors. Hinge and latch pins shall be stainless steel. All access openings shall be sealed with weather-resistant rubber gaskets.

Mounting. The signal shall mount to standard 1 1/2 inch fittings as a single section, as a multiple section face, or in combination with other signals. The signal section shall be provided with an adjustable connection that permits incremental tilting from 0 to 10 degrees above or below the horizontal while maintaining a common vertical axis through couplers and mounting. Terminal connection shall permit

external adjustment about the mounting axis in 5 degree increments. The signal shall be constructed such that it can be installed with ordinary tools and serviced with no tools.

Attachments such as visors, backplates or adapters shall conform and readily fasten to existing mounting surfaces without affecting water and light integrity of the signal.

The programmed signal head shall be arranged for rigid mounting to either a mast arm or a dual span wire assembly. It is important for proper operation of the signal that it be mounted as rigidly as practical to maintain its optical orientation with the roadway. In those cases where span wires are used it should be securely tethered to the lower span wire.

Electrical. Lamp fixture shall comprise a separately accessible housing and integral lamp support, indexed ceramic socket and self-aligning, quick-release lamp retainer. Electrical connection between case and lamp housing shall be accomplished with an interlock assembly which disconnects lamp housing when opened.

Each signal section shall include a covered terminal block for clip or screw attachment of field wires. Concealed No. 18 AWG, stranded and coded wires shall interconnect all sections to permit field connection within any section.

Photo Controls. Each signal section shall include integral means for regulating its intensity between limits as a function of individual background illumination. Lamp intensity shall not be less than 97% of uncontrolled intensity at 1000 fc and shall reduce to 1.4 fc \pm 2% of maximum at less than 1 fc over the applied voltage and ambient temperature range. Response shall be proportional and essentially instantaneous to any detectable increase from darkness to 1000 fc and damped for any decrease from 1000 fc.

The intensity controller shall comprise an integrated, directional light sensing and regulating device interposed between lamp and field wires. The device shall be responsive over an applied voltage of 95 to 130V, 60 Hz, temperature range of -40°F to 165°F and may provide phase controlled output voltage but shall have a nominal open circuit terminal impedance of 1500 ohms. The Photo Control shall not produce sufficient electrical noise or interference to adversely affect the operation of solid state electronic equipment used on traffic signal controllers and associated auxiliary equipment and shall not cause false tripping of conflict monitors.

STANDARD PEDESTRIAN SIGNAL HEADS. In addition to applicable items in STANDARD SIGNAL HEADS the following requirements apply to Standard Pedestrian Signal Heads

General. Pedestrian signal indications are traffic indications intended for the exclusive purpose of controlling pedestrian traffic. These indications consist of the illuminated words WALK and DON'T WALK.

When specified, these messages can be replaced with the "MAN" and "HAND" display. The indications shall be single faced and rectangular in shape with letters made visible by internal illumination and with the legend DON'T WALK above or integral with the legend WALK.

When illuminated, the WALK indication shall be lunar white. When illuminated, the DON'T WALK indication shall be portland orange. All except the letters shall be obscured by an opaque material.

When not illuminated, the WALK and DON'T WALK indications shall not be distinguishable by pedestrians at the far end of the controller crossing.

Pedestrian signal construction and indications shall conform to the requirements of "Pedestrian Traffic Control Signal Indications" published by the Institute of Transportation Engineers, with the following modifications:

- Unless otherwise specified, the head shall be a two section unit. Lettering shall be a minimum of 4 1/2 inches.
- Lamps for the illumination of each section shall be a clear traffic signal lamp with an average initial rating of 1280 lumens at a working voltage of 120-125 volts with a rated life of at least 8000 hours. Lamp fixtures shall not be wired in series.
- Signal head shall be supplied with an 18 AWG, color coded wiring harness, and a four position, barrier type terminal block.

§724

- Lenses shall be made of plastic.

FIBEROPTIC PEDESTRIAN SIGNAL HEADS. In addition to applicable items in STANDARD SIGNAL HEADS and STANDARD PEDESTRIAN SIGNAL HEADS the following requirements apply to Fiberoptic Pedestrian Signal Heads.

General. The unit shall consist of a matrix of fiberoptic bundles forming two displayed messages on a rectangular background facing the same direction. One message shall indicate WALK and the other shall indicate DON'T WALK. Both messages shall have a minimum letter height of 4 1/2 inches using a series B width. If the "MAN" and "HAND" display are specified both messages shall have a minimum symbol height of 10 1/2 inches and 6 1/2 inches width.

The messages shall be clearly legible and shall attract the attention of pedestrians and be readable, under any lighting conditions varying from total darkness to bright sunlight or where high intensity background lighting is present, at distances from 9 feet to the width of the area to be crossed. A visor or hood shall not be required for legibility, but shall be provided with the housing.

The messages shall be visible at full intensity anywhere within a 90 degree cone centered about the optical axis and perpendicular to the surface of the matrix display. When not energized, the signal shall be blanked out (unreadable) with no phantom images, regardless of solar intensity or direction.

The messages shall be bright in color against a flat black background.

The displays shall be made from a single row of fiberoptic bundles with a nominal 1/2 inch spacing between centers.

The light source shall be designed and constructed so that in case of an electrical or mechanical failure of the word DON'T the word WALK in the DON'T WALK message will remain dark.

Each message shall be displayed separately and never concurrently.

Material Requirements. One 42 watt, 10.8 volt lamp type EPT or equivalent with a rated average life expectancy of 10,000 hours shall be as the light source for each display. The lamp shall be a multi-mirror reflector quartz halogen bulb operating at an approximate color temperature of 2900°K.

Optical System. The optical system shall consist of the following:

- Weatherproof housing, door, gaskets, and visor
- Fiberoptic module with individual output attached
- Color filters for desired message colors
- Light sources
- Transformers
- Protective back cover for the module
- Electrical system including wiring

Optical Requirements. The optics shall have a glass-on-glass fiber with an 83% core to 17% cladding ratio. Bundled fiber strands shall be kept free from the contamination of water and polishing agents. Maximum fiber breakage per fiber bundle shall not exceed 3%. A minimum of five spare fiberoptic output bundles shall be provided for each lamp and built into the unit. Damaged output bundles shall be replaceable using these spares. Individual fiberoptic bundles shall not be jacketed or encased.

Color filters shall be optical quality glass. The filters shall be color fast and in accordance with the I.T.E. Signal Color Specification for Chromaticity.

The prismatic polycarbonate lens shall be mounted at a pre-focused distance in the door, away from the fiberoptic panel.

All optical fiber utilized in the production of the fiberoptic unit shall be tested for:

- Core to clad fusion
- Size
- Roundness of fiber
- Optical transmission
- Brittleness

Results of these tests shall be available upon request.

Construction. The front panel shall be flat black aluminum alloy, minimum 1/8 inch thick, and shall have a maintenance-free black anodized, acid tested finish or an equivalent weather resistant polycarbonate.

A heavy plastic mylar water shield shall be used to prevent possible water leaks from dropping onto the lamps.

All fiberoptic transformers and lamps shall be mounted on the door of the unit. All screws, washers, nuts and bolts shall be corrosion resistant. All components shall be readily accessible when the door is opened. The only tool required for maintenance or replacement of components shall be a standard screwdriver.

No moving parts are permitted in the optical system.

Electrical. Electrical connection shall be provided by a barrier-type terminal strip for connecting field wires.

Transformers shall be used to reduce the incoming 120 volts AC to 10.8 volts AC.

Transformers shall be rated at 48.5 volt-amps and shall have Class A insulation impregnated with a double coating of epoxy resin so as to preclude intrusion of moisture.

A separate transformer and bulb shall be used for each color, to allow connection with existing controller wiring and conflict monitors.

The transformer bracket shall be an extruded aluminum member and shall provide adequate heat sinking of transformers.

Environmental Conditions. The unit shall be capable of continuous operation over a temperature range of -34^o F to 167^o F.

FIBEROPTIC DUAL INDICATION ARROW. In addition to applicable items in STANDARD SIGNAL HEADS, the following additional requirements apply to Fiberoptic Dual Indication 12 inch Turn Arrow.

General. The unit shall display alternate indications, consisting of either a green or yellow directional arrow. The indication shall be clearly legible and shall attract the attention of motorists and be visible, under any lighting conditions varying from total darkness to bright sunlight or where high intensity background lighting is present, at a distance of at least 1475 feet under normal atmospheric conditions. A visor or hood shall not be required for legibility.

The indication shall be visible at full intensity anywhere within a 60-degree cone centered about the optical axis and perpendicular to the surface of the display.

When not energized, the signal shall be blanked out (unreadable) with no phantom images, regardless of solar intensity or direction.

The indication shall be bright in color against a flat black background.

Each indication shall be displayed separately and never concurrently.

The borderline arrow indications shall be comprised of a dual row of fiber bundles. The indication shall be in total conformance with I.T.E. standards for Vehicle Control Signal Heads.

Material Requirements. One 42 watt, 10.8 volt lamp type EPT or equivalent with a rated average life expectancy of 10 000 hours shall be used as the light source for each indication. The lamp shall be a multi-mirror reflector quartz halogen bulb operating at an approximate color temperature of 2900°K.

Optical System. The optical system shall consist of the following:

- Weatherproof housing, door, gaskets, and visor
- Fiberoptic module with individual output attached
- Color filters for desired message colors
- Light sources
- Transformers

§724

- Protective back cover for the module
- Electrical system including wiring

Optical Requirements. The optics shall have a glass-on-glass fiber with a 83% core to 17% cladding ratio.

Bundled fiber strands shall be kept free from the contamination of water and polishing agents. Maximum fiber breakage per fiber bundle shall not exceed 3%. At least two (2) spare fiberoptic output bundles shall be provided for and built into each unit. Damaged output bundles shall be replaceable using these spares. A minimum of 56 bundles shall be provided. All optical fiber shall be fully bias randomized by individual fiber with approximately 50% fiber allocated to the green arrow indication and 50% to the amber arrow indication for balanced and corrected color output. Individual fiberoptic bundles shall not be jacketed or encased.

Color filters shall be optical quality glass. The filters shall be color fast and in accordance with I.T.E. Signal Color Specification for Chromaticity. Any combination of colors shall be available by changing color filters installed in the unit.

All optical fiber utilized in the production of the fiberoptic units shall be tested for:

- Core to clad fusion
- Size
- Roundness of fiber
- Optical transmission
- Brittleness

Results of these tests shall be available upon request.

Construction. Complete unit shall be supplied mounted in standard 12 inch vehicle signal section.

The front panel shall be either flat black aluminum alloy, minimum 1/8 inch thick having a maintenance-free black anodized, acid tested finish or an equivalent weather resistant polycarbonate.

Output bundles shall be mounted on the front panel at 90 degrees to the surface. Mounting shall be consistent in manufacture and shall be watertight. A heavy plastic mylar (or equivalent) water shield shall be used to prevent possible water leaks from dripping onto the lamps.

All fiberoptic transformers and lamps shall be mounted on the door of the unit. All screws, washers, nuts and bolts shall be corrosion resistant. All components shall be readily accessible when the door is opened. The only tool required for maintenance or replacement of components shall be a standard screwdriver.

No moving parts are permitted in the optical system.

Front panel, with fiberoptic indication shall be rotatable to form a right, left, or vertical arrow.

Electrical. Electrical connection shall be provided by a barrier type terminal strip for connecting field wires.

Transformers shall be used to reduce the incoming 120 volts AC to 10.8 volts AC.

Transformers shall be rated at 48.5 volt-amps and shall have a Class A insulation impregnated with a double coating of epoxy resin so as to preclude intrusion of moisture.

A separate transformer and bulb shall be used for each color, to allow connection with existing controller wiring and conflict monitors.

Environmental Conditions. The unit shall be capable of continuous operation over a temperature range of -34°F to 167°F.

STROBING SIGNAL INDICATION. In addition to applicable items in STANDARD TRAFFIC HEADS the following additional requirements apply to Strobing Signal Indications.

General. The unit shall consist of a standard red signal indication with the addition of a white bar strobe presented horizontally across the red face. The strobe shall flash at a rate of approximately once per second. The indication shall be single faced and the strobe bulb, control circuitry, and all necessary appurtenances shall be enclosed in and be an integral part of a standard 12 inch aluminum signal housing.

The bar strobe shall attract the attention of motorists and be visible, under any lighting conditions varying from total darkness to bright sunlight or where high intensity background lighting is present, at a distance of at least 1/2 mile under normal atmospheric conditions.

When the bar strobe is not energized, the indication shall operate and appear as a standard red indication.

Optical System. The optical system shall consist of the following:

- Weatherproof housing, door, gaskets, and visor.
- Alzak parabolic reflector or equivalent. No plastic material will be accepted for the reflector or reflector bracket.
- One bar strobe bulb with a minimum 5000 hours duty life enclosed in a dustproof, shockproof and watertight enclosure.
- 12 inch glass red lens.
- Power supply.
- Electrical system including wiring and control circuitry.
- The strobe bulb shall be a minimum of 9 1/2 inches in length to effectively span the width of the lens.

Construction. The unit shall consist of a standard 12 inch red vehicle signal section with a bar strobe light interposed in front of the red lens.

All power supplies and control circuitry for the strobe shall be mounted to the visor assembly and contained within a watertight enclosure(s) which shall not interfere with mounting additional signal sections to form a multiple section signal head.

The strobe bulb shall be enclosed in a dustproof, shockproof and watertight housing securely mounted in front of the red lens. The strobe housing shall contain only the strobe bulb, terminal strips and necessary connecting wires, and shall not interfere with the general visibility of the red lens, nor the ability to change the red lens in the normal manner.

All screws, washers, nuts and bolts shall be stainless steel.

All components shall be readily accessible. The only tool required for maintenance or replacement of all components shall be a standard screwdriver.

Electrical. Electrical connection shall be provided by a barrier type terminal strip for connecting field wires. The power supply shall be of a capacitive discharge type sufficient to fire the bar strobe bulb at a rate of approximately once per second. The power supply shall be encased in a temperature stable epoxy so as to preclude intrusion of moisture. A door switch shall be provided so that when the housing door is opened the switch shall disconnect AC power to the strobe power supply and circuitry and shall also completely discharge the high voltage DC capacitive charge within 10 seconds.

The high voltage power supply shall be fused using a time delay fuse. The current rating of the fuse shall be no more than 50% above the maximum current expected at 135 V AC. The fuse shall be mounted in the housing and located before the door switch in the strobe circuitry.

The barrier type terminal strip shall be equipped with male quick connect spade terminals. Insulated female spade receiver terminals shall be required for the connection of the strobe circuitry to the terminal strip.

Labeling. A CAUTION or WARNING label should be affixed to the visor assembly near the housing door opening, notifying maintenance or repair personnel of the presence of a high voltage capacitive charge within the visor assembly and that the quick disconnect should be disconnected and a check for AC or DC voltage across the strobe bulb should be performed before servicing the strobe bulb or circuitry.

STANDARD POLYCARBONATE TRAFFIC SIGNAL HEADS

General. In addition to applicable material requirements for STANDARD SIGNAL HEADS and STANDARD PEDESTRIAN SIGNAL HEADS, the following additional requirements apply to Polycarbonate Traffic Signal Heads."

Material Requirements. The traffic signal housing, visor and door shall be made of injection molded polycarbonated resin which shall be capable of withstanding a 70 ft-lb impact without fracture or permanent deformation.

Material used in the construction of the signal housing door, visor and lens shall be resistant to heat generated by the signal bulb. No deformation or discoloration shall be evidenced when 116 watts bulbs are used in 8 inch signal sections and 150 watt bulbs are used in 12 inch signal sections. The plastics shall be ultra-violet and heat stabilized and flame retardant.

The signal housing, door and visor shall be dark green and the color shall be fully impregnated into the polycarbonate resin.

Visor shall be made of one piece with a minimum thickness of 1/16 inch. The rear edge of the visor shall be provided with four mounting lugs for attaching the visor to the door using screws. The inside of the visor shall be dull black in color. Unless otherwise specified all signal heads shall be provided with cap-type visors.

Construction. The housing shall have a minimum thickness of 1/16 inch. The housing shall be of one piece construction and the door shall be of one piece construction.. Both the 8 inch & 12 inch housings are to be designed in the same manner so when used in combination heads the design will match each other.

The top and bottom opening of each housing shall have integral serrated bosses that will provide positive positioning of the signal head to eliminate undesirable rotation or misalignment of the signal head between sections. Each opening accommodates standard 1 1/2 in. diam. pipe fittings and brackets.

Doors shall be hinged by two lugs and mounted to the housing using stainless steel pins. The door of each signal section shall be one-piece with a minimum thickness of 1/16 inch.

A neoprene gasket shall be provided between the body of the housing and the door. The doors shall be forced tightly against the gasket and housing by simple stainless steel locking devices. A slotted air cored neoprene lens gasket shall provide a positive seal between the lens and the signal door and between the lens and the reflector holder.

The gasket shall be an unbroken circular gasket with a "U" shaped cross section. The gasket and lens shall be held tightly into the door by four stainless steel clips and screws that shall allow easy removal of the lens and gasket from the door without removal of the door in the field.

The reflector shall be Alzak aluminum. Reflector rings shall be manufactured from die cast aluminum, hinged from one side to allow the reflector assembly to open without use of tools. The lamp receptacle shall be permanently focused to the reflector and held in place by a corrosion-resistant wire spring bail so that it can be removed without the use of tools. The center section shall contain a terminal barrier block having quick-disconnect terminals for the lamp receptacle leads and screw terminals for field wires.

LED TRAFFIC SIGNAL MODULES. In addition to applicable material requirements for STANDARD SIGNAL HEADS, and STANDARD PEDESTRIAN SIGNAL HEADS, the following additional requirements apply to Ball, Arrow, and Pedestrian LED Traffic Signal modules.

General. This specification refers to definitions and practices described in the Institute of Transportation Engineers (ITE) publication ST-017B "Vehicle Traffic Control Signal Heads" (referred to in this document as "VTCSH"), and "Pedestrian Traffic Control Signal Indications" (referred to in this document as "PTCSI"). LED traffic signal modules designed as retrofit replacements for existing signal lamps shall not require special tools for installation. They shall be a single, self-contained device, not requiring on-site assembly for installation into an existing traffic signal housing. The module shall be sealed to provide a weather tight enclosure and an insulating covering for all electrical connections and electronic components and shall fit securely in the housing. A one piece "U-shaped" cross section rubber gasket shall be provided with each module. This gasket shall fit around the perimeter of the module to ensure a weather tight fit between the door and the housing of the module. The module shall connect directly to existing electrical wiring by means of 1/4 inch female quick connect push on type terminals.

Material Requirements. Materials used for the lens and signal module construction shall conform to ASTM specifications for those materials.

Each LED signal module shall be identified on the back side with the manufacturer's trade mark, serial number, voltage rating, Volt-Ampere rating, power consumption (watts and volt amperes) and, if applicable, a vertical indexing indicator (i.e., "up arrow", or the word "UP" or "TOP"). Each LED signal module shall also be identified on the back side with the part number as shown in the NYSDOT LED Traffic Signal Module QPL and the date of manufacture (month and year minimum). Single units shall have identification markings as to the type and color of the module. Bi-Modals shall be marked with model type.

Each LED signal module shall have a permanent sticker stating compliance to FCC Title 47, Subpart B, Section 15 regulations. The sticker will be located on the rear exterior of the unit.

A. Ball and Arrow Modules (Single and Bi-Modal) Only. Retrofit replacement LED signal modules shall fit into existing traffic signal housings built to the VTCSH Standard without modification to the housing. Installation of the retrofit replacement LED signal module into an existing signal housing shall only require the removal of the existing lamp components (i.e., lens, lamp module, gaskets, and reflector).

Red LED signal module lenses shall be tinted with the appropriate color to enhance on/off contrast. The material used to tint the lens shall not affect the luminous intensity or chromaticity and shall be uniform across the face of the lens. The Yellow and Green units shall be supplied with a clear lens. If a polymeric lens is used, a surface coating or chemical surface treatment shall be used to provide front surface abrasion resistance. The module lens shall be replaceable without the need for replacing the complete module unit.

The Arrow LED signal modules shall produce a pattern that conforms to the VTCSH standard for color, size and shape. The Arrow LED signal modules shall not require a specific orientation or have a variance in light output, pattern or visibility for any mounting orientation.

The lens of the LED signal module shall be capable of withstanding ultraviolet light (direct sunlight) exposure for a minimum time period of five years without exhibiting evidence of deterioration.

Each Ball LED shall have a sticker attached stating compliance to the ITE Standard for Color and Luminous Intensity and each Arrow LED shall have a sticker attached stating compliance to the ITE Standard for Color as specified in the VTCSH.

B. Pedestrian Modules (Single & Bi-Modal) Only.

Pedestrian LED traffic signal modules shall be designed as a retrofit replacement for the message bearing surface of a 12 inch by 12 inch or approximately 16 inch by 18 inch (with a 2 3/8 inch corner radius), pedestrian traffic signal housing built to the PTCSI Standard. The Single Pedestrian module shall be designed to display either a "HAND" or "WALKING MAN" symbol that complies with PTCSI standard for this symbol for the size specified. The Bi-Modal Pedestrian module shall be designed to display both "HAND" and "WALKING MAN" symbols that comply with the PTCSI standard for these symbols for the size specified.

The "HAND" and "MAN" symbols for both the Single and Bi-Modal Pedestrian shall be designed so that the entire area comprising the symbol appears illuminated. Outlined shapes will not be accepted.

The LED signal module shall fit into existing Pedestrian signal housings without the need to modify the housing. Installation of the retrofit replacement Pedestrian LED signal module into pedestrian signal housing shall only require the removal of the existing message bearing surface, existing lamp components (i.e., lens, lamp module, gaskets, and reflector), and insertion of the retrofit replacement into the area once occupied by the removed assembly.

Each pedestrian module shall have a sticker attached stating compliance to the ITE standard for chromaticity as defined in the PTCSI.

Optical

A. Ball and Arrow Modules (Single & Bi-modal) Only. The measured chromaticity coordinates of Ball and Arrow LED signal modules shall conform to the chromaticity requirements of

Section 8.04, Limits of Chromaticity Coordinates and the associated Figure 1 of the VTCSH standard.

The light output distribution for Ball LED traffic signal modules shall be as defined in Section 11.04 and Table 1 of the VTCSH standard. The minimum luminous intensity values for Ball LED traffic signal modules shall be, at a line voltage of 120 ± 3 volts rms, as listed in Table 1 of the VTCSH standard. Variations in operating line voltage of between 80 and 135 volts rms shall have minimal effect (less than $\pm 10\%$) on luminous output of the signal module. Minimum Initial Luminous Intensities of units supplied shall equal or exceed, at 36°F , 117.5% of the values defined in Table 1-Maintained Minimum Luminous Intensity Table-of the VTCSH standard for LED signal modules.

Ball LED signal modules, except for yellow modules, shall be designed so that when operated over the specified operating ambient temperature and voltage ranges during the luminous intensity warranty period, the luminous intensity of the unit shall exceed or equal the values shown in Table 1, "Maintained Minimum Luminous Intensity Table" of the VTCSH standard for LED signal modules.

Yellow modules shall be designed so that when operated at 77°F over the specified voltage range during the luminous intensity warranty period, the luminous intensity of the unit shall equal or exceed the values shown for the color Green.

Arrow LED signal modules shall be designed so that when operated over the specified ambient temperature and voltage ranges, the signal is clearly visible and attracts attention for a distance of at least 1/4 mile under normal atmospheric conditions.

B. Pedestrian Modules (Single & Bi-Modal) Only. The measured chromaticity coordinates of Pedestrian LED signal modules shall conform to the chromaticity requirements of Section 5.3, Color and the associated Figure C of the PTCSI standard.

Pedestrian LED signal modules shall be designed so that when operated over the specified ambient temperature and voltage ranges, the signal shall attract the attention of, and be readable to, a viewer (at both day and night) at all distances from 9 feet to the full distance to be crossed.

Performance Tests

A. All LED Modules. Prior to shipment, the vendor shall energize (burn in) each LED signal module for a minimum of 24 hours, at rated voltage, and at a 100 percent on-time duty cycle. This test shall be conducted at the rated voltage in an ambient temperature of 140°F . Any failure within an LED signal module occurring during burn-in shall be cause for rejection.

After burn-in procedure is completed, the following additional tests shall be performed. These tests shall be performed at rated operating voltage and at 77°F unless otherwise specified.

All units shall be powered off for a period of 1 second and then powered back on. Any unit failing to turn on after power restoration shall be rejected. This test shall be performed a minimum of 10 times.

A sample of 10% of units of each configuration, Balls or Arrows or Pedestrian signal modules, on the order shall be randomly selected and tested by the vendor in a flashing mode of operation, at 50 percent duty cycle with a 0.5 sec on time, and for a 24 hour period at 140°F . Any unit failing to function properly shall result in failure of the entire lot from which the sample was selected. Should this occur, the entire quantity ordered shall be tested as described above, and units not functioning properly shall be rejected.

Each LED signal module shall be visually inspected for any exterior physical damage or assembly anomalies. Careful attention shall be paid to the surface of the lens to ensure there are no scratches (abrasions), cracks, chips, discoloration, or other defects.

Each LED signal module shall be tested to ensure light output at 80 and 135 volts without adverse operational effects. Each LED signal under test shall be operated at each voltage level for a time period of five minutes. Signal modules illuminating with any adverse operational effects shall be rejected.

Contractors shall provide, with each shipment, a Manufacturer's Certification of compliance. The certification shall certify that the LED signal modules comply with the requirements of these specifications. In addition to the certification, the modules shall be supplied with a list of the serial numbers of the units, copies of all applicable test reports on the LED signal modules, and signature of the person responsible for certifying the tests.

B. Ball Modules only. Each Ball LED signal module shall be tested for rated initial intensity. A single point measurement (at -2.5° V, 2.5° R or L) with a correlation to the minimum intensity requirements specified herein may be used. This test shall be performed after the burn-in procedure is completed, at rated operating voltage and at 77° F unless otherwise specified.

Electrical

A. All LED modules. All wiring and terminal blocks shall meet the requirements of Section 13.02 Wiring of the VTCSH standard. Each wire shall be approximately 3 feet long. Units shall be supplied with color coded wires as defined below:

Red Balls & Red Arrows-Red & White
 Yellow Balls & Yellow Arrows-Yellow & White
 Green Balls & Green Arrows-Brown & White
 Bi-Modal Arrows- Brown (Green Arrow), Yellow & White (Common)
 Bi-Modal Pedestrians- Red (Hand), Brown (Man) & White (Common)
 Single Pedestrians (Hand)- Red & White
 Single Pedestrians (Walk Man)- Brown & White

The LED signal module shall operate with AC line voltage ranging from 80 volts to 135 volts rms 60 ± 3 Hz. The circuitry shall prevent flicker over this voltage range. Rated voltage for all optical and power measurements shall be 120 ± 3 volts rms.

The signal module on-board circuitry shall include voltage surge protection to withstand high-repetition noise transients and low-repetition high energy transients as stated in Section 2.1.6, NEMA Standard TS-2.

Each LED signal module shall be designed so that there is no noticeable light output when connected to rated voltage through an impedance of 15 kohm (either resistive or capacitive).

The signal module shall be designed so that, under normal operation, an AC voltage of no greater than 10 volts rms shall be developed across the unit when it is connected in series with any value of impedance greater than 15 kohm and for any applied AC voltage between 80 and 135 volts rms that is connected across this series combination. In addition, the signal module shall be designed so that the voltage across the module shall reduce in value to less than 10 volts rms within 100 msec when the module is switched off by any solid state switch or switchpack having an impedance of 15 kohm or greater.

The individual LED light sources shall be wired so that a catastrophic failure of one LED light source will not result in the loss of illumination of more than four LED light sources.

The LED signal module and associated on board circuitry shall meet Federal Communications Commission (FCC) Title 47, Subpart B, Section 15 regulations concerning the emission of electronic noise. All modules shall contain filtering dedicated to prevent inducing electronic noise into the AC power lines.

Modules shall be fused using a time-delay fuse. The fuse shall be located so that it can be easily changed without the need to disassemble the module. If in-line fuses are added into module wire leads, they will be installed in the colored wires of the units. Each individual circuit in the Bi-Modal models shall be fused separately.

All printed circuit boards used in the module shall be coated with a conformal coating containing an ultraviolet tracer.

All unit types shall be operationally compatible with the traffic signal equipment that each type is designed and intended to interface with. This equipment includes all controllers, conflict monitors, current monitors, switchpack and flashers currently in use by the Department.

B. NYSDOT Standard & Type A LED Module Definitions. NYSDOT Standard Units shall be designed so that a normally functioning signal module will generate the needed current to prevent a Model 215 Current Monitor from detecting a loss of current over the voltage range of between 95 and 135 volts rms. The minimum current required to prevent the Model 215 monitor from detecting a loss of current is a 500 milliamp peak AC or pulsed current with a minimum pulse width of 3 msec. Signal modules designed to specifically generate current pulses to prevent the monitor from tripping shall, as

§724

a minimum, generate 6 pulses per second. Generated current pulses shall be evenly spaced, with the first pulse generated within 100 msec after the application of AC power. (Additional information regarding the operation of the Model 215 Current Monitor can be obtained in the latest "New York State Transportation Management Equipment Specifications").

NYSDOT Standard Units shall incorporate circuitry to reliably detect the total loss of LED current due to failures such as, but not limited to, open circuits and power supply problems. Upon detection of this failure, this circuit will disable any current generating circuitry within 400 msec to allow detection of this failure by a Model 215 current monitor.

Type "A" units shall be supplied without the necessary circuitry to function with a Model 215 current monitor.

Total harmonic distortion (current and voltage) induced into an AC power line for Type A units operating at rated voltage shall not exceed 20 percent for units consuming greater than 15 watts at 77°F and 40 percent for units consuming less than 15 watts at 77°F..

All Ball and Single Arrow LED modules may be procured using this specification as either NYSDOT Standard or Type A units. Single Pedestrian, Bi-Modal Pedestrian, and Bi-Modal Arrows will be procured as Type A only.

The maximum power consumption shall not exceed the following wattages at 77 degrees F:

12 inch Balls	Red-14	Yellow-24	Green-18
8 inch Balls	Red-10	Yellow-13	Green-13
12 inch Arrows	Red-10	Yellow-10	Green-10
Bi-Modal Arrows		Yellow-10	Green-10
12 inch by 12 inch Signal Pedestrian		Hand-9	Man-9
12 inch by 12 inch Bi-Modal Pedestrian		Hand-9	Man-9
16 inch by 18 inch Bi-Modal Pedestrian		Hand-12	Man-12

NYSDOT standard units supplied will meet the same low distortion standards without the current generating circuitry included in the measurement.

LED signal modules supplied in conformance with this specification shall have power factors of 0.90 or greater without the current generating circuitry included in the calculations for power factors for NYSDOT Standard units.

C. Pedestrian Modules (Single & Bi-Modal) Only. The maximum power consumed by a pedestrian LED unit shall not exceed 15 volt-amps (VA) at 120 ± 3 volts rms.

Environmental. All LED signal modules shall be rated for use in the ambient temperature range of -40°F to 165°F. LED signal modules shall be sealed against dust and moisture intrusion per the requirements of NEMA Standard 250-1991 for Type 4 enclosures to protect all internal LED and electrical components. LED signal modules shall be capable of operating at rated voltage in an environment of 165°F /85% RH for 1000 hours without the formation of internal condensing moisture.

BASIS OF ACCEPTANCE. Acceptance of signal heads, sections, and/or LED signal modules will be based on manufacturer's certification of compliance with these specification requirements, a list of serial numbers of the units being supplied, copies of all applicable test reports on the signal modules, and signature of the person responsible for certifying the tests. In addition, LED module model number and manufacturer's name must be listed on the NYS Signal Qualified Products List (QPL). The QPL can be obtained from the NYSDOT website.

724-05 THRU 724-07 (VACANT)

724-08 SHIELDED COMMUNICATION CABLE

SCOPE. This specification covers the material requirements and fabrication details of shielded communication cable for use with traffic signal systems.

MATERIALS AND CONSTRUCTION. The cable shall conform to the requirements of the International Municipal Signal Association (IMSA) specification 20-2 for polyethylene insulated, polyethylene jacketed communication cable with electrical shielding. The gauge and number of conductors shall be as specified in the plans. The conductors shall be stranded copper wire.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-09 SIGNAL CABLE WITH INTEGRAL MESSENGER

SCOPE. This specification covers the material requirements for signal cable with integral messenger for use with traffic signal systems and for aerial installations.

MATERIALS AND CONSTRUCTION. The cable shall conform to the requirements of the International Municipal Signal Association (IMSA) Specification 20-3. The gauge and number of conductors shall be as specified in the plans. The conductors shall be stranded copper wire.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-10 SHIELDED COMMUNICATION CABLE WITH INTEGRAL MESSENGER

SCOPE. This specification covers the material requirements for shielded communication cable with integral messenger for use with traffic signal systems and for aerial installations.

MATERIALS AND CONSTRUCTION. The cable shall conform to the requirements of the International Municipal Signal Association (IMSA) Specification 20-4. The gauge and number of conductors shall be as specified in the plans. The conductors shall be stranded copper wire.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-11 THRU 724-14 (VACANT)

724-15 FIRE PRE-EMPTION TELL-TALE LIGHT

SCOPE. This specification covers the material requirements for fire pre-emption tell-tale light.

MATERIALS AND CONSTRUCTION. The fire pre-emption tell-tale light shall consist of a Xenon flash tube rated at 10.76 Mlx and 2000 hours life. The flash rate shall be 60 to 80 flashes per minute. The tell-tale light shall be capable of normal operation between outside temperature from - 46^oC to +60^oC. The tell-tale light shall be contained in a vandal resistant weatherproof housing and mounting with a blue heat resistant and shatterproof globe. It shall be visible through 360^o horizontally. The fire pre-emption tell-tale light shall operate from a 115 volt 60 Hz. single phase power source.

BASIS OF ACCEPTANCE. Acceptance of the fire pre-emption tell-tale light shall be based on the manufacturer's certification of compliance with these specification requirements.

724-16 THRU 724-19 (VACANT)

724-20 INDUCTANCE LOOP WIRE

SCOPE. This specification covers the material requirements for wire used in inductance loop vehicle detectors.

§724

MATERIALS AND CONSTRUCTION. Loop wire shall be one conductor No. 14 AWG wire loosely encased in a tube in conformance to the requirements of the International Municipal Signal Association (IMSA) Specification 51-5.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-21 SHIELDED LEAD-IN CABLE

SCOPE. This specification covers the material requirements for shielded lead-in cable used with inductance loop vehicle detectors.

MATERIALS AND CONSTRUCTION. The cable shall consist of No. 14 AWG conductors in conformance to the requirements of the International Municipal Signal Association(IMSA) Specification 50-2.

BASIS OF ACCEPTANCE. Acceptance of material will be based on the manufacturer's certification of compliance with these specification requirements.

724-22 ROADWAY LOOP EMBEDDING SEALER

SCOPE. This specification covers the material requirements for Roadway Loop Embedding Sealer used when installing inductance loops.

MATERIALS AND CONSTRUCTION. Roadway Loop Embedding Sealer shall be used to encapsulate Traffic Signal Loop Wires embedded in highway materials. The sealer shall be cold applied and may be a one or two component system, the viscosity of which shall be sufficient to allow the material to be either poured or placed under pressure and fully encapsulate the loop wires. The sealer shall be curable at temperatures of 40^oF and above.

When the sealer is bonded to common paving materials, it shall have sufficient strength and resiliency to withstand stresses due to vibrations and differences in expansion and contraction as a result of temperature changes or traffic conditions. The sealer shall be compatible with the sheathing or covering of loop inductance wires.

TABLE 724-22-1 ROADWAY LOOP EMBEDDING SEALER PROPERTIES

Property	Test Method	Flexible		Hard	
		Min.	Max.	Min.	Max.
Hardness, Shore	ASTM D2240	A15	A40	A50	D65
Pot Life @70 ^o F, minutes	NYSDOT 724-40E	15	---	15	---
Curing Time (tack free surface) @ 70 ^o F, hours	NYSDOT 724-40E	---	2	---	2
Tensile Strength, psi	ASTM D412	50	---	400	---
Elongation, percent	ASTM D412	150	---	20	---
Water Absorption, percent	NYSDOT 724-40E	---	1.0	---	1.0
Adhesion to Asphalt Concrete, lbs	NYSDOT 724-40E	200	---	500	---

Adhesion to Concrete, lbs	NYSDOT 724-40E	50	---	300	---
Extension, inches	NYSDOT 724-40E	1/4	---	1/8	---
Accelerated Weathering (Flexible requires additional bend test)	NYSDOT 724-40E	No cracking, checking, chalking, or shrinking			

Chemical Resistance. Cured sealer shall be resistant to most chemicals and solvents, including salts, acids, hydrocarbons, etc.

Packaged stability of each component in original unopened containers, stored in temperatures between 32°F and 100°F shall be a minimum of six months.

MATERIAL REQUIREMENTS. The material shall meet the requirements of either the Flexible or Hard designation in Table 724-22-1. Materials designated Flexible require a 180° mandrel bend test @ 80°F with no breaking as part of the accelerated weathering testing.

BASIS OF ACCEPTANCE. Applications for approval of Roadway Loop Embedding Sealer shall be submitted to the Materials Bureau by the manufacturer accompanied by a 1 gallon sample of the product and all pertinent sealer information including, but not limited to, manufacturer's sealant test results, sealant application procedures and safety precautions. Upon approval by the Materials Bureau, the name of the product will be placed on an "approved list" of Roadway Loop Embedding Sealers for use on asphalt and/or concrete pavements based on the compatibility of the sealer with the pavement material. The product may then be accepted on the basis of the name brand labeled on the container.

724-23 PEDESTRIAN PUSH BUTTON AND SIGN

SCOPE. This specification covers the material requirements for pedestrian push button and sign.

MATERIAL AND CONSTRUCTION. The push button unit shall be a direct push type having a cast aluminum housing. The unit shall be strongly constructed, rugged, abuse and tamper proof and suitable for operation under all weather conditions. It shall be provided with one normally-opened contact with ample contact area. The contacts shall be a material which will provide low contact resistance throughout the life of the device. The housing shall be of a design or be provided with adaptors to facilitate mounting on poles of different diameters. The unit shall have a convenient means of wiring.

The sign may be either reflectorized or non-reflectorized, with legend as specified on the plans and in accordance with Chapter 2B of the MUTCD.

BASIS OF ACCEPTANCE. Pedestrian push button and sign shall be accepted upon the manufacturer's certification of compliance with these specification requirements.

SECTION 725 - MISCELLANEOUS METALS AND PLASTICS

725-01 COPPER FLASHING

SCOPE. This specification covers the material requirements for copper flashing.

MATERIAL REQUIREMENTS. Sheet copper for flashing shall be rolled from copper fulfilling the requirements of ASTM B5. This sheet metal shall be cold rolled soft copper.

BASIS OF ACCEPTANCE. Acceptance of this material will be based on the manufacturer's certification that the material meets the specification requirements.

725-02 STEPS FOR MANHOLES

SCOPE. This specification covers the material requirements for steps used in manholes.

§725

GENERAL. The minimum design live load, for steps, appurtenances and fastenings, shall be a single concentrated load of 800 pounds. The live loads imposed by persons occupying the steps shall be considered to be concentrated at such points as will cause the maximum stress in the structural member being considered.

Steps shall be designed so a worker's foot cannot slide off the end. The minimum length of the rungs shall be 10 inches.

Whenever a combination of dissimilar types of metals are used in the manufacture of steps, appurtenances and fastenings, the materials shall be treated to prevent deleterious effects.

MATERIALS. Manhole steps shall be fabricated from one of the following:

Ferrous Metal. Steps shall conform to one of the following requirements:

Iron Castings	Class 25A, 715-05
Malleable Iron Castings	Grade 35018, 715-09
Steel	ASTM A575, Grade M 1020 galvanized in accordance with §719-01, Type 1.

The steps shall have a minimum cross sectional dimension of 1 inch exclusive of any coatings placed on them.

Non-Ferrous Metal. Steps shall conform to the following requirements:

Aluminum Castings	Alloy 356-T6, 715-03.
Wrought Aluminum	6061-T6, 6005-T5, or 6351-T6, 715-04

When aluminum steps are used, the portion of the step which will be in direct contact with cement concrete or concrete mortar, shall be coated with a zinc chromate primer or bituminous material approved by the Materials Bureau.

Reinforced Plastic. Steps shall consist of polypropylene or other plastic material completely covering a steel core. The plastic may be extruded, cast, or molded into the standard size and shape manhole steps, and provide corrosion protection.

The plastic material shall have the following characteristics:

A. Resistance to Salt and Caustic Solutions. Resistance to the following solutions when submerged for 30 days:

- 10% Sodium Chloride
- 10% Hydrochloric Acid
- 10% Sodium Hydroxide
- 10% Sulfuric Acid

B. Flow Point. A flow point of 320°F or greater.

C. Flexibility. It shall remain flexible over a temperature range of -22°F to +248°F upon long aging.

D. Fire Resistance. It shall be non-burning, self-extinguishing, or very slow burning.

The steel core shall be not less than 1/2 inch diameter and shall have the following physical characteristics:

- Tensile Yield, Minimum 40,000 psi
- Tensile Strength, Minimum 70,000 psi

The plastic step, when cast into a concrete block the proper depth, shall withstand a minimum load of 800 pounds applied on 1 square inch area in the center of the step without cracking or breaking the plastic coating, loosening the step in the concrete or permanently deforming the step.

BASIS OF ACCEPTANCE. Manhole steps shall be accepted on the basis of the manufacturer's certification of compliance with this specification. However, the Department reserves the right to take random samples at any time for testing for compliance with the requirements of this specification.

SECTION 726 - DETECTABLE WARNING UNITS

726-01 SURFACE-APPLIED DETECTABLE WARNING UNITS

SCOPE. This specification covers the material and quality requirements for surface-applied detectable warning units.

MATERIAL REQUIREMENTS. Surface-applied detectable warning units shall conform to the dimensions shown on the current standard sheet for detectable warnings.

Units shall be composed of cementitious materials, steel, iron, plastics, polymeric materials, resins, pigments, or as approved by the Director, Materials Bureau. The units shall be an approximate visual match to the color specified in the Contract Documents. Units shall provide the required contrast (light-on-dark or dark-on-light) with the adjacent curb ramp or other applicable walkway. The units shall be uniform in color and texture, be free of cracks or other defects, and have clean-cut and well-defined edges.

Units shall adhere to hot mix asphalt (HMA) or Portland cement concrete (PCC) surfaces at a minimum air temperature of 60°F, and a minimum surface substrate temperature of 70°F. They shall be weather resistant and durable to normal pedestrian wear and maintenance activities, and show no appreciable fading, lifting, or shrinkage. The units shall be capable of molding or fitting itself to the contours, breaks, and faults of HMA or PCC surfaces, and show no significant tearing, rollback, lifting, or other signs of poor adhesion. The units shall have friction characteristics similar to a broomed PCC surface.

The detectable warning units shall meet the following physical properties:

Standard	Property	Results
ASTM C501	Wear Resistance	Wear Index: >15
ASTM C1028	Slip Resistance	Dry Coefficient of friction 0.8 minimum
ASTM E96	Water Vapor Transmission	10 grams/square foot/24 hours
Various	Adhesion/Bonding Strength	See Note*

*Note: Due to the various types of materials available, the Manufacturer shall certify, through independent laboratory testing, that the type of material used for detectable warnings will bond to a prepared surface.

PACKAGING AND SHIPMENT. Preformed, surface-applied, detectable warning units shall be shipped and packaged in accordance with commercially accepted standards. The following information shall be marked on each package or on the shipping invoice: the name of the product, the name and address of the manufacturer, and the quantity of material.

BASIS OF ACCEPTANCE. Acceptance of this material for placement on the Approved List will be based on the manufacturer's certification of compliance with these requirements and in accordance with procedural directives of the Materials Bureau. Contract acceptance will be based on the manufacturer's name appearing on the Department's Approved List.

726-02 EMBEDDED DETECTABLE WARNING UNITS

§726

SCOPE. This specification covers the material and quality requirements for embedded detectable warning units.

MATERIAL REQUIREMENTS. Embedded detectable warning units shall conform to the dimensions shown on the current standard sheet for detectable warnings.

Units shall be composed of cementitious materials, steel, iron, clay, shale, plastics, polymeric materials, resins, pigments, or as approved by the Director, Materials Bureau. The units shall be an approximate visual match to the color specified in the Contract Documents. Units shall provide the required contrast (light-on-dark or dark-on-light) with the adjacent curb ramp or other applicable walkway. The units shall be uniform in color and texture, be free of cracks or other defects, and have clean-cut and well-defined edges.

Where applicable, the units shall adhere to hot mix asphalt (HMA) or Portland cement concrete (PCC) surfaces at a minimum air temperature of 60°F, and a minimum surface substrate temperature of 70°F. They shall be weather resistant and durable to normal pedestrian wear and maintenance activities, and show no appreciable fading, lifting, or shrinkage. The units shall have friction characteristics similar to a broomed PCC surface.

The detectable warning units shall meet the following physical properties:

Property	Results
Compressive Strength, Min., 28 days	8000 psi Minimum
Freeze-thaw Loss (25 Cycles, one per day, 10% NaCl solution) in accordance with NY Test Method 502-3P	1.0 % Maximum

PACKAGING AND SHIPMENT. Embedded detectable warning units shall be shipped and packaged in accordance with commercially accepted standards. The following information shall be marked on each package or on the shipping invoice: the name of the product, the name and address of the manufacturer, and the quantity of material.

BASIS OF ACCEPTANCE. Acceptance of this material for placement on the Approved List will be based on the manufacturer's certification of compliance with these requirements and in accordance with procedural directives of the Materials Bureau. Contract acceptance will be based on the manufacturer's name appearing on the Department's Approved List.

SECTION 727 - PAVEMENT MARKING MATERIALS

727-01 EXTRUDED THERMOPLASTIC

SCOPE. This specification covers thermoplastic reflectorized pavement striping material that is extruded, in a molten state, onto the pavement surface. Following a surface application of reflective beads and upon cooling to normal pavement temperatures, the resultant marking is an adherent reflectorized stripe that is capable of resisting deformation by traffic.

MATERIAL REQUIREMENTS. Unless otherwise noted, all samples are to be prepared and tested at an ambient temperature of 73° ± 3°F.

General.

Formulated for application at temperatures greater than 400°F.

Show no significant breakdown or deterioration at 475°F.

Pigment, beads and filler uniformly dispersed in the binder resin.

Be free from all skins, dirt and foreign objects.

Comply with the following requirements:

TABLE 727-01-1 MATERIAL PROPERTIES		
Component	% by Weight	
	White	Yellow
Binder	17.0 min	17.0 min.
Titanium Dioxide	10.0 min	---
Reflective Beads	30-40	30-40
Calcium Carbonate & Inert Fillers	43.0 max	*
Yellow Pigments	---	*
* Amount and type of yellow pigment, calcium carbonate and inert fillers at the option of the manufacturer, providing the other composition requirements of this specification are met and the yellow pigment is lead chromate free.		

Physical Properties.

A. Color. (ASTM D1535) When viewed under North Standard Daylight:
 White: Approximate visual color match to Munsell Book Notation N 9.5/0.
 Yellow: Approximate visual match to Munsell Book Notation 10YR8/14.

B. Yellowness Index. (ASTM D1925 at 2° Observer angle and C Illuminate)
 White thermoplastic: 0.12 maximum

C. Softening Point. (ASTM E28) Softening point: 194°F minimum.

D. Specific Gravity. Between 1.8 and 2.2 as determined by a water displacement method at 77°F.

E. Field Drying Time. At 70°F, and thickness between 1/8 and 3/16 inch: Completely solid and showing no damaging effect from traffic after ten (10) minutes.

Thermoplastic Primer.

Specifically designed to enhance the bond of thermoplastic pavement markings to HMA and/or PCC pavements.

Be either a one-component or two-component, cold- or hot-applied material of the type recommended by the manufacturer.

Conform to current Federal, State and Local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. EPA, and the NYSDEC.

PACKAGING AND SHIPPING. Shipped to the job site in strong, substantial containers, clearly marked with the following and including:

Manufacturer's Name

Name of Product

Material Specification Number

Lot/Batch Number

Manufacture Date

Expiration Date

Quantity

Two-component primer containers clearly identified as "Part A" and "Part B"

Primers accompanied with written instructions for use

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white and yellow) of the product and applicable glass beads as per §727-05 Glass Beads For Pavement Markings, independent lab test results in

§727

accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and a certification that the product conforms to this specification.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Extruded Thermoplastic will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

727-02 REMOVABLE RAISED PAVEMENT MARKERS

SCOPE. This specification covers removable raised pavement markers.

MATERIAL REQUIREMENTS

General. Raised pavement markers shall be:

- Designed as single units consisting of an acrylic plastic or another type of durable casing, containing one or two reflective faces.
- Approximately square in shape.
- Provide daytime delineation.
- Adhered to HMA or PCC surfaces using adhesives and/or methods recommended by the manufacturer.
- Removable from HMA and PCC pavements, intact or in substantially large pieces, either manually or by the use of a mechanical roll-up device, and without the use of heat, solvents, grinding or blasting. After removal, permanent marks, scars or damage to the pavement surface shall be minimal.
- Free from dirt or any other contaminants.

Physical Properties.

- A. Color.** (ASTM D1535) When viewed under North Standard Daylight:
 White: Approximate visual color match to Munsell Book Notation N 9.5/0
 Yellow: Approximate visual color match to Munsell Book Notation 10YR8/14

- B. Size.**
 1. Casing. Minimum: 4 x 4 x 3/4 inch.
 2. Reflective Lens. Minimum area of the reflective lens: 0.38 square inches.

C. Reflectance. Initial average reflectance values, when measured with incident light parallel to the base of the marker, at an observation angle of 0.2°.

TABLE 727-02-1 REFLECTIVE MARKER LENSES REFLECTANCE				
Color	White		Yellow	
Entrance Angle	0°	20°	0°	20°
Specific Intensity (cd/ft ²)	1.0	0.4	0.6	0.24

- NOTES:**
1. Observation Angle: The angle at the reflector between the observer's line of sight and the direction of light incident on the reflector.
 2. Entrance Angle: The angle in the horizontal plane between the direction of incident light and the normal to the leading edge of reflective marker.
 3. Specific Intensity: The luminous intensity (candelas) of returned light at the chosen observation and entrance angles for each footcandle of illumination at the reflector on a plane perpendicular to the incident light.
 4. Photometric Test Procedure: The reflective marker to be tested shall be located with the center of the reflective lens at a distance of 5 feet from a uniformly bright light source, having an effective diameter of 0.2 in. The return of light shall be measured using an annular ring photocell (3/8 inch I.D. x 1/2 inch O.D.). The photocell shall be shielded to eliminate stray

light. The distance from the light source center to the photocell center shall be 0.21 inches. If a test distance of other than 5 feet is used, the source and receiver shall be modified in the same proportion as the test distance.

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white and yellow) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Removable Raised Pavement Markers will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same material that appears on the Approved List and that it conforms to this specification.

727-03 EPOXY PAINT

SCOPE. This specification covers durable epoxy pavement marking material that is sprayed onto the pavement. Following a surface application of reflective beads and upon drying, the resultant marking is a reflectorized stripe of specified thickness and width.

MATERIAL REQUIREMENTS

General.

Formulated for use as a pavement marking material and for hot-spray application at elevated temperatures.

Be two-component (Part A and Part B), 100% solids type system formulated and designed to provide a simple volumetric mixing ratio (e.g., two volumes of Part A to one volume of Part B).

Be VOC compliant and lead chromate free.

Yellow paints shall use organic yellow pigments, Color Index Pigment Yellow 65 (C.I. 11740) and/or 74 (C.I. 11741).

Have a consistent target value of epoxy in Part A, based on ASTM D1652. Tested on a pigment free basis and calculated as the weight per epoxy equivalent (WPE).

Have a consistent total amine value of Part B based on ASTM D2074. The manufacturer may specify an alternate test method for determining the amine value subject to the approval of the Director, Materials Bureau.

Display no bleeding on the surface upon which the paint is applied.

Conform to current Federal, State and Local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. EPA and the NYSDEC.

Physical Properties.

A. % Pigment - Part A. (ASTM D2371) Yellow: 23% minimum
White: 18% minimum
% TiO₂ (100% Purity) (NYS Test Method 727-20C) White: 16.5% minimum

B. % Resin – Part A. (ASTM D2371) Yellow: 70% - 77%
White: 75% - 82%

C. Color. (ASTM D1535) When viewed under North Standard Daylight, at a 15 ± 1 mil wet film thickness with no glass beads applied:

White: Approximate visual color match to Munsell Book Notation N 9.5/0

Yellow: Reasonable visual color match to Munsell Book Notation 10YR8/14

and

Be within the following chromaticity coordinate limits when tested under ASTM E1347.

TABLE 727-03-1 CHROMATICITY COORDINATES				
Coordinate	1	2	3	4
x	0.485	0.526	0.504	0.468
y	0.426	0.472	0.481	0.450

D. Directional Reflectance. (ASTM E1347) White: 84% minimum
Yellow: 54% minimum

E. Yellowness Index. (ASTM D1925 at 2° Observer angle and C Illuminate)
White Epoxy Paint: 0.12 maximum

F. Drying Time – Laboratory. (ASTM D711) Dry to no-pick-up time in 30 minutes maximum.
Application rate of 15 ± 1 mil wet-film thickness and glass-sphere application rate of 25 lb/gal.

G. Hardness. (ASTM D2240) Samples cured for 72 to 96 hours prior to testing.
Shore D Hardness: 75 - 100.

H. Infrared Spectrophotometer Analysis. (ASTM D2621) The spectrum of each component will be analyzed and maintained as a base record. Any subsequent samples taken from a Department contract must be a reasonable match to the original formulation spectrum accepted by the Materials Bureau for the Approved List of Materials.

Placement Properties. The material shall be placed using standard epoxy-pavement-marking equipment and have a maximum Field No Track Time of 30 minutes when installed at 77°F.

PACKAGING AND SHIPPING. Shipped to the job site in strong, substantial containers, clearly marked with the following information:

Manufacturer's Name

Name of Product

Material Specification Number

Lot/Batch Number

Date of Manufacture

Expiration Date

The Statement (as appropriate): "Part A Contains Pigment and Epoxy Resin," or "Part B Contains Catalyst"

Quantity

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by two (2) 1/2 pint samples of each color (white and yellow) of Part A and one (1) 1/2 pint of Part B for each color, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Epoxy Paint will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same material that appears on the Approved List and that it conforms to this specification.

727-04 PERMANENT PAVEMENT TAPE

SCOPE. This specification covers preformed pavement marking tape that is applied to the pavement, resulting in a durable marking that is capable of resisting deformation by traffic.

GENERAL.

- Designed to provide immediate and continuous retroreflection.
- Meet all the requirements of ASTM D4505.
- Composed of a mixture of plastics or polymeric materials, resins, pigments, and reflective beads that are uniformly distributed throughout the thickness of the material.
- Have a layer of reflective beads bonded to, or embedded in the top surface.
- Be pre-coated, on its bottom side, with a pressure-sensitive adhesive for adherence to HMA or PCC surfaces.
- Be of the specified dimension and shape with clean-cut, well-defined edges, of good appearance, and free of cracks or other defects.
- Be weather resistant and through normal traffic wear shall show no appreciable fading, lifting or shrinkage.
- Be capable of molding itself to the contours, breaks and faults of HMA or PCC surfaces.
- Show no significant tearing, rollback, lifting or other signs of poor adhesion.
- Be free from dirt and any other contaminants.

MATERIAL REQUIREMENTS. Unless otherwise noted, all samples are to be prepared and tested at an ambient temperature of $73^{\circ} \pm 3^{\circ}\text{F}$.

A. Color. (ASTM D1535) When viewed under North Standard Daylight:

- White: Approximate visual color match to Munsell Book Notation N 9.5/0
- Yellow: Approximate visual color match to Munsell Book Notation 10YR8/14

B. Thickness. Preformed pavement marking tape shall be:

- Uniform Cross Section: 60 mils minimum thickness
- Patterned (Variable Cross Section): 20 mils minimum thickness at the thinnest portions
60 mils minimum thickness at the thickest portions

The patterned top surface shall have approximately 50% of the surface area raised, and its design shall provide immediate and continuing retroreflection.

C. Tensile Strength. (ASTM D638) 40 psi minimum

Test specimens shall be Type II prepared by die cutting with Die C as specified in ASTM D412, Test Method A. The testing machine shall operate at a speed of 0.2 inches per minute. For calculating the tensile strength of patterned type material, the thickness measurements shall be taken in the thinnest portions of the cross sectional area.

D. Elongation. (ASTM D638) When tested in accordance with the conditions as specified for Tensile Strength: 15% minimum elongation

Primer. Be recommended by the manufacturer of the permanent tape and be compatible with the marking and surface the marking is being applied to.

Specifically designed to enhance the bond of the permanent tape to HMA and/or PCC pavements. Conform to current Federal, State and Local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. EPA and the NYSDEC.

PACKAGING AND SHIPPING. Shipped to the job site in strong, substantial containers, clearly marked with the following and including:

- Manufacturer's Name
- Name of Product
- Material Specification Number
- Lot/Batch Number
- Manufacture Date
- Quantity
- Primers accompanied with written instructions for use
- Expiration Date

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white and yellow) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional laboratory analysis and field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Permanent Tape and primer will be accepted on the basis of the products appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

727-05 GLASS BEADS FOR PAVEMENT MARKINGS

SCOPE. This specification covers reflectorized beads for application to pavement marking materials for the production of a reflective surface.

MATERIAL REQUIREMENTS.

Composed of glass that is highly resistant to traffic wear and to the effects of weathering. Be colorless, clean, transparent, free from milkiness or excessive air bubbles, and essentially free from surface scarring or scratching.
 Silica content (ASTM C169): 60% minimum.
 Refractive index: 1.50 when tested by the liquid immersion method at 77°F.
 Show no tendency to absorb moisture in storage and shall remain free of clusters and hard lumps.
 Flow freely from the dispensing equipment at any time when surface and atmospheric conditions are satisfactory for painting.

A. Sphericity. (ASTM D1155 Procedure A) Spherical in shape - 70% minimal, true spheres. Wet/Night Visibility Beads shall be tested for roundness according to the procedural directives of the Materials Bureau.

B. Gradation. (ASTM D1214).

TABLE 727-05-1 GLASS SPHERE GRADATION (Standard Bead)				
Percent Passing by Weight				
Marking Type	Sieve Size			
	#20	#30	#50	#80
Epoxy	100	80-95	9-42	0-10
Traffic Paint	100	80-95	9-42	0-10
Thermoplastic	100	79-95	15-60	0-15

TABLE 727-05-2 GLASS SPHERE GRADATION (Wet/Night Visibility Bead)						
Percent Passing by Weight						
Marking Type	Sieve Size					
	#10	#12	#14	#16	#18	#20
Epoxy Wet/Night Reflective	100	95-100	75-95	10-47	0-7	0-2

C. Coating.

TABLE 727-05-3 GLASS SPHERE COATINGS	
Marking Type	Coating Type

Epoxy (Wet/Night Visibility Bead)	Silane Type adherence coating designed to interact with and adhere to epoxy pavement markings.
Epoxy (Standard Bead)	Moisture-resistant coating or a dual purpose type coating (moisture-resistant and adherence).
Traffic Paint	
Thermoplastic (Drop on)	

D. Moisture Resistance. Place two pounds of spheres in a washed cotton bag, having a thread count of approximately 50 per square inch (warp and woof) and immerse the bag in a container of water for 30 seconds. Remove the bag and force excess water from the sample by squeezing the bag. Suspend and allow to drain for two hours at room temperature ($73^{\circ} \pm 3^{\circ}\text{F}$). Then, mix the sample in the bag by shaking thoroughly. Transfer sample slowly to a clean, dry glass funnel having a stem 4 inches in length, with a $3/8$ inch stem entrance inside diameter opening and a minimum exit opening of $1/4$ inch. The entire sample shall flow freely through the funnel without stoppage. When first introduced into the funnel, if the spheres clog, it is permissible to lightly tap the funnel to initiate the flow.

PACKAGING AND SHIPPING. Shipped to the job site in waterproof plastic lined burlap or plastic lined paper bags with the following information clearly marked on the packages:

Manufacturer's Name
Name of Product
Size/Type/Coating
Material Specification Number
Lot/Batch Number
Manufacture Date
Quantity/Weight of Material

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by one 60 lb bag sample of the product, independent lab test results in accordance to this specification and certification that the product conforms to this specification.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Glass Beads for Pavement Markings will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

727-06 REMOVABLE PAVEMENT TAPE

SCOPE. This specification covers the material and performance requirements for removable pavement marking tape and masking tape.

MATERIAL REQUIREMENTS.

General.

Composed of a mixture of plastics or polymeric materials, resins, pigments.
Have on its bottom side, a pre-applied, pressure-sensitive adhesive for adherence to HMA or PCC surfaces.
Be of the specified dimension and shape with clean-cut, well defined-edges, of good appearance, and free of cracks or other defects.
Be weather resistant and through normal traffic wear shall show no appreciable fading, lifting or shrinkage.
Be capable of molding itself to the contours, breaks and faults of HMA or PCC surfaces.
Show no significant tearing, rollback, lifting or other signs of poor adhesion.

Be easily removable from HMA, PCC and/or existing pavement markings in substantially intact or large pieces with out damage to the underlying surface and without the use of heat, solvents, grinding or blast cleaning.
 Be free from dirt and any other contaminants.

Reflective Tape.

Designed to provide immediate and continuous retroreflection.
 Composed of a mixture of plastics or polymeric materials, resins, pigments, and reflective beads that are uniformly distributed throughout the thickness of the material.
 Have a layer of reflective beads bonded to, or embedded in the top surface.
 Meet the following requirements:

A. Color: (ASTM D1535) When viewed under North Standard Daylight:

White: Approximate visual color match to Munsell Book Notation N 9.5/0

Yellow: Approximate visual color match to Munsell Book Notation 10YR 8/14
 and

Be within the following chromaticity coordinate limits when tested under ASTM E1347.

TABLE 727-06-1 CHROMATICITY COORDINATES				
Coordinate	1	2	3	4
x	0.485	0.526	0.504	0.468
y	0.426	0.472	0.481	0.450

B. Reflectance:

TABLE 727-06-2 PREFORMED TAPE REFLECTANCE REQUIREMENTS				
Color	White		Yellow	
Observation Angle	0.2°	0.5°	0.2°	0.5°
Specific Luminance (mcd/ft ² /fc)	1770	1270	1310	810

Masking Tape.

Specifically designed for use to temporarily cover existing pavement markings.
 Consist of durable, nonreflective, pliant polymer tape on a reinforced, conformable backing, pre-coated with a pressure-sensitive adhesive
 Capable of adhering to existing pavement markings, asphalt pavement and Portland cement concrete pavement without the use of heat, solvents, additional adhesives or other means.
 Be substantially similar in color to the pavement surface with a flat matte finish and textured, skid-resistant surface.

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white, yellow, black/grey) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional laboratory analysis and field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Removable Pavement Tape will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

1172 **727-07 REMOVABLE WET-NIGHT REFLECTIVE TAPE**

SCOPE. This specification covers the material and performance requirements for removable wet-night reflective pavement marking tape.

MATERIAL REQUIREMENTS.

General.

- Designed to provide immediate and continuous retroreflection in day and night as well as dry and wet conditions.
- Composed of a mixture of durable plastics or polymeric materials, resins, pigments, and reflective beads that are uniformly distributed throughout the thickness of the material.
- Be pre-coated, on its bottom side, with a pressure-sensitive adhesive.
- Capable of adhering to existing pavement markings, asphalt pavement and Portland cement concrete pavement without the use of heat, solvents, additional adhesives or other means.
- Be of the specified dimension and shape with clean-cut, well-defined edges, of good appearance, and free of cracks or other defects.
- Be weather resistant and through normal traffic wear shall show no appreciable fading, lifting or shrinkage.
- Be capable of molding itself to the contours, breaks and faults of HMA or PCC surfaces.
- Show no significant tearing, rollback, lifting or other signs of poor adhesion.
- Be easily removable from HMA, PCC and/or existing pavement markings in substantially intact or large pieces with out damage to the underlying surface and without the use of heat, solvents, grinding or blast cleaning.
- Have a layer of reflective beads bonded to, or embedded in the top surface.
- Be free from dirt and any other contaminants.
- Meet the following requirements:

Physical Properties.

A. Color: (ASTM D1535) When viewed under North Standard Daylight:

White: Approximate visual color match to Munsell Book Notation N 9.5/0

and

Be within the following daytime chromaticity coordinates (dry) when tested under ASTM E1347.

Dry: ASTM E1710

TABLE 727-07-3 MINIMUM INITIAL RETROREFLECTANCE	
[mcd/ft²/fc]	
White	Yellow
750	450

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white and yellow) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional laboratory analysis and field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Removable Wet-Night Reflective Tape will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

727-08 PERMANENT WET-NIGHT REFLECTIVE TAPE

SCOPE. This specification covers the material and performance requirements for permanent wet-night pavement marking tape.

MATERIAL REQUIREMENTS. Unless otherwise noted, all samples are to be prepared and tested at an ambient temperature of 73° ± 3°F.

General.

- Designed to provide immediate and continuous retroreflection in day and night as well as dry and wet conditions.
- Composed of a mixture of plastics or polymeric materials, resins, pigments, and reflective beads that are uniformly distributed throughout the thickness of the material.
- Have a layer of reflective beads bonded to, or embedded in the top surface.
- Be pre-coated, on its bottom side, with a pressure-sensitive adhesive for adherence to HMA or PCC surfaces.
- Be of the specified dimension and shape with clean-cut, well-defined edges, of good appearance, and free of cracks or other defects.
- Be weather resistant and through normal traffic wear shall show no appreciable fading, lifting or shrinkage.
- Be capable of molding itself to the contours, breaks and faults of HMA or PCC surfaces.
- Show no significant tearing, rollback, lifting or other signs of poor adhesion.
- Be free from dirt and any other contaminants.

Physical Properties.

A. Color: (ASTM D1535) When viewed under North Standard Daylight:

B. Retroreflectivity. Wet: ASTM E2176 and ASTM E2177
 Dry: ASTM E1710

TABLE 727-08-3 MINIMUM INITIAL RETROREFLECTANCE [mcd/ft ² /fc]	
White	Yellow
750	450

C. Thickness. Preformed pavement marking tape shall be a
 Uniform Cross Section: 60 mils minimum thickness
 Patterned (Variable Cross Section): 20 mils minimum thickness at the thinnest portions
 60 mils minimum thickness at the thickest portions
 The patterned top surface shall have approximately 50% of the surface area raised, and its design shall provide immediate and continuing retroreflection.

D. Friction Resistance. (ASTM E303) Friction resistance: 45 BPN minimum

E. Tensile Strength. (ASTM D638) Tensile strength: 40 psi minimum
 Test specimens shall be Type MII prepared by die cutting with Die C as specified in ASTM D412, Test Method A. The testing machine shall operate at a speed of 0.2 inches per minute. For calculating the tensile strength of patterned type material, the thickness measurements shall be taken in the thinnest portions of the cross sectional area.

F. Elongation. (ASTM D638) 15% minimum elongation when tested in accordance with the conditions as specified for Tensile Strength.

Primer.

Be recommended by the manufacturer of the preformed pavement marking and be compatible with the marking and surface the marking is being applied to.
 Specifically designed to enhance the bond of the preformed pavement markings to HMA and/or PCC pavements.
 Conform to current Federal, State and Local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. EPA and the NYSDEC.

PACKAGING AND SHIPPING. Shipped to the job site in strong, substantial containers, clearly marked with the following and including:

- Manufacturer's Name
- Name of Product
- Material Specification Number
- Lot/Batch Number
- Manufacture Date
- Quantity
- Primers accompanied with written instructions for use
- Expiration Date

§727

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by samples of each color (white and yellow) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Additional laboratory analysis and field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Permanent Wet Night Reflective Tape and primer will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

727-09 TRAFFIC PAINT

SCOPE. This specification covers waterborne and solventborne paints that are sprayed onto the pavement. Following a surface application of glass beads and upon drying, the resultant marking is a reflectorized stripe of specified thickness and width.

MATERIAL REQUIREMENTS.

General.

Formulated for use as a pavement marking material.

Be VOC compliant and lead chromate free.

Yellow paints must use organic yellow pigments Color Index Pigment Yellow 65 (C.I. 11740) and/or 74 (C.I. 11741).

Display no bleeding on the surface upon which the paint is applied.

Conform to current Federal, State and Local air pollution regulations, including those for the control (emission) of volatile organic compounds (VOC) as established by the U.S. EPA, and the NYSDEC.

Physical Properties.

A. Composition.

% Pigment. (ASTM D3723)	58.0% – 62.0%
% Total Solids. (ASTM D3723)	76.0 % minimum
% Vehicle Non-Volatile. (ASTM D3723)	43.0 % minimum

The manufacturers certified organic yellow pigment content shall be used to determine the final laboratory test results for: total pigment (%), and for nonvolatile vehicle (%). The Department reserves the right to validate the manufacturers "certified" organic yellow pigment content through outside, independent laboratory testing.

B. Color. (ASTM D1535) When viewed under North Standard Daylight at a 15 ± 1 mils wet film thickness with no glass beads applied:

White: Approximate visual color match to Munsell Book Notation N 9.5/0.

Yellow: Approximate visual color match to Munsell Book Notation 10YR 8/14.

and

Be within the following chromaticity coordinate limits when tested under ASTM E1347.

TABLE 727-09-1 CHROMATICITY COORDINATES				
Coordinate	1	2	3	4
x	0.485	0.517	0.492	0.468
y	0.426	0.462	0.471	0.450

C. Directional Reflectance (ASTM E1347) White: 84% minimum

Yellow: 54% minimum

D. Yellowness Index. (ASTM D1925 at 2° Observer angle and C Illuminate)
White Traffic Paint: 0.12 maximum.

E. Drying Time (Laboratory) (ASTM D711) Dry to no-pick-up time in 3 minutes maximum.
Application rate of 15 ± 1 mils wet-film thickness and glass-sphere application rate of 25 lb/gal.

F. Viscosity. (ASTM D562 Procedures B) 75 – 95 Kreb Units at 77°F

G. Dry Opacity. (ASTM D2805) 0.95 minimum contrast ratio
Application at 3 1/2 inches wide, wet-film thickness of 5 mils to white and black contrast panels matching Lenta Form 5C or equivalent. Dry time of 1 hour minimum.

H. Abrasion Resistance. (ASTM D4060) Average weight loss: 3/4 grain, maximum

I. Flexibility. (Federal Specification TT-P-858, Section 4.4.5) No cracking or flaking visible.

J. Freeze-Thaw Stability. (Federal Specification TT-P-1952b, Section 4.5.7)
No coagulation or change in consistency greater than 15 Kreb Units.

K. Heat Stability. (Federal Specification TT-P-1952b, Section 4.5.8) Waterborne only.
No coagulation, discoloration or change in consistency greater than 15 Kreb Units when tested in an oven at $120^\circ \pm 2^\circ\text{F}$.

L. Infrared Spectrophotometer Analysis. Waterborne: (ASTM D3168)
Solventborne: (ASTM D2621)

The spectrum of the paint will be analyzed and maintained as a base record. Any subsequent samples taken from a Department contract must be a reasonable match to the original formulation spectrum accepted by the Materials Bureau for the Approved List.

Placement Properties.

The material shall be placed using standard traffic paint application equipment and have a maximum Field No Track Time of 3 minutes when installed at 77°F.

PACKAGING AND SHIPPING. Shipped to the job site in strong, substantial containers. Individual containers plainly marked with the following information:

- Manufacturer's Name
- Name of Product
- Material Specification Number
- Lot/Batch Number
- Test Number
- Manufacture Date
- Expiration Date
- Quantity

BASIS OF APPROVAL. Application for approval shall be submitted to the Materials Bureau by the manufacturer, accompanied by eight (8) 1 pint samples of each color (white and yellow) of the product, independent lab test results in accordance to this specification or in conjunction with the National Transportation Product Evaluation Program (NTPEP), and certification that the product conforms to this specification. Addition field tests will be carried out in accordance to Materials Bureau Directives.

Upon approval by the Materials Bureau, the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Traffic Paint will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

SECTION 728 - COMPRESSIVE LOAD TRANSMITTING DEVICES

728-01 RUBBER IMPREGNATED WOVEN COTTON-POLYESTER FABRIC

SCOPE. This specification covers the material requirements, tests and basis of acceptance for rubber impregnated, woven, cotton-polyester fabric.

MATERIAL REQUIREMENTS. Rubber impregnated woven cotton-polyester fabric shall be composed of multiple layers of prestressed cotton-polyester duck with a minimum mass of 8 oz/sy, impregnated and bound with high quality rubber compound, containing rot and mildew inhibitors and anti-oxidants. The duck warp count shall be 50 ± 1 threads per inch and the filling count shall be 40 ± 2 threads per inch. Each thread shall contain 2 yarns. The material shall contain 64 plies per inch. The number of piles in the furnished material shall be such as to produce the specified thickness.

TEST. This material shall exhibit a maximum load deflection of 10% at 1000 psi when tested in accordance with MIL-C-882.

BASIS OF ACCEPTANCE. This material will be accepted on the basis of the manufacturer's certification of compliance with these specification requirements.

728-02 RUBBER IMPREGNATED RANDOM FIBER PAD

SCOPE. This specification covers the material requirements, tests and basis of acceptance for rubber impregnated random fiber pads.

MATERIAL REQUIREMENTS. Rubber impregnated random fiber pad shall be composed of a high quality elastomer with a random distribution of non-asbestos fibers.

BASIS OF ACCEPTANCE. Rubber impregnated random fiber pad shall be accepted under an Approved List.

728-03 PLAIN RUBBER PAD

SCOPE. This specification covers the material requirements, tests and basis of acceptance for plain rubber pads.

MATERIAL REQUIREMENTS. Plain rubber vertical load transmitting devices shall contain only polychloroprene as the raw elastomer polymer. The physical properties of the cured material shall comply with ASTM D2000 Line Call Out M2BC514A14B34. The rubber pads shall be cast in a mold under pressure and heat, or may be furnished to Department projects if they have been carefully cut from a larger piece of fully molded material. Shape factors of each device, i.e., net load area divided by the area free to bulge, must exceed twelve (12).

TEST. One plain rubber pad sample per size shall be submitted by the Engineer to the Materials Bureau for destructive test.

BASIS OF ACCEPTANCE. The presence of the appropriate form, validated by the Materials Bureau, shall constitute evidence of acceptability at the job site for plain rubber pads.

728-04 SHEET LEAD

SCOPE. This specification covers the material requirements and basis of acceptance for sheet lead.

MATERIAL REQUIREMENTS. Sheet lead shall be lead plate of nominal 1/8 inch thickness, meeting the standard specification for Pig Lead, ASTM B29.

BASIS OF ACCEPTANCE. This material shall be accepted on the basis of a manufacturer's certification of compliance with this specification.

728-05 (VACANT)

728-06 SHEET GASKET (TREATED BOTH SIDES)

SCOPE. This specification covers the material requirements for sheet gasket, treated both sides with a parting agent to prevent adhesion to working surfaces. This material is used as a bond breaker and sliding surface in bridge construction.

MATERIAL REQUIREMENTS. The sheet gasket shall have a nominal 1/16 inch thickness and shall be treated on both sides with a parting agent. The material shall meet the following requirements:

TABLE 728-06-1 SHEET GASKET REQUIREMENTS		
Property	ASTM Test Method	Requirement
Water absorption, maximum	C642	6.7%
Coefficient of static friction, maximum	D1894	0.36
Coefficient of kinetic friction, maximum	D1894	0.24
Tensile strength, psi min., in the weakest direction	F152, Type 2	1200

BASIS OF ACCEPTANCE. Application for approval of sheet gasket (treated both sides) shall be submitted to the Director, Materials Bureau. Upon approval, the name and manufacturer of the product shall be placed on the Department's Approved List.

SECTION 729 – TEMPORARY TRAFFIC CONTROL DEVICES

729-01 DRUMS

SCOPE. This specification covers the material, fabrication, and performance requirements for traffic drums. Drums are defined by NCHRP 350 as a Category I device.

MATERIAL REQUIREMENTS. Drums shall conform to the requirements of the MUTCD, shall be NCHRP 350 approved and shall be orange plastic, one-piece or two-piece construction, with a closed top. Drums shall be a minimum of 18 inches in diameter (visible from all directions), and 36 inches in height. Drums shall have a maximum weight of 75 lbs., including ballast. Two-piece drums shall consist of a base no more than 4 inches in height and an upper section. The base and upper section of two-piece drums shall be designed as a unit. One-piece drums shall include a base ring or elongation designed to hold ballast. The base and/or any nonflexible portion of the drum shall not extend more than 2 inches above the pavement surface.

Drums shall have 4 horizontal circumferential stripes of reflective sheeting a minimum of 4 inches wide, of alternating orange and white, starting with orange on the top. The top edge of the upper band shall be a maximum of 2 inches from the top edge of the drum. The space between stripes shall not exceed 2 inches.

§729

Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III. Reflective sheeting shall be firmly bonded to the drum with an adhesive; mechanical fasteners to bond reflective sheeting to the drum will not be allowed.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-02 CONES

SCOPE. This specification covers the material, fabrication, and performance requirements for traffic cones. Cones are defined by NCHRP 350 as a Category I device.

MATERIAL REQUIREMENTS. Cones shall conform to the requirements of the MUTCD, shall be NCHRP 350 approved and shall be orange rubber or plastic. Cones shall have a maximum weight of 20 lbs, including ballast.

Standard cones shall be approximately 28 inches in height with a minimum conical bottom width of 10 inches. Standard cones shall have two horizontal circumferential stripes of white reflective sheeting, the upper a minimum of 6 inches wide, with the upper edge 3 to 4 inches from the top of the cone, and the lower a minimum of 4 inches wide with the upper edge approximately 2 inches below the upper stripe.

Tall cones shall be approximately 36 inches in height with a minimum conical bottom width of 10 inches. Tall cones shall have two horizontal circumferential stripes of white reflective sheeting, the upper a minimum of 6 inches wide, with the upper edge 3 to 4 inches from the top of the cone, and the lower a minimum of 4 inches wide with the upper edge approximately 2 inches below the upper stripe.

Extra tall cones shall be a minimum of 42 inches in height with a minimum conical bottom width of 7 inches. Extra tall cones shall have a minimum of four horizontal circumferential stripes of reflective sheeting from 4 to 6 inches wide, of alternating orange and white starting with orange on the top. The upper edge of the sheeting shall be 4 inches from the top of the cone. Nonreflective spaces between the stripes shall not exceed 3 inches wide.

Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III. Reflective sheeting shall be firmly bonded to the cone with adhesive.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-03 TEMPORARY TUBULAR MARKERS

SCOPE. This specification covers the material, fabrication, and performance requirements for tubular markers. Tubular markers are defined by NCHRP 350 as a Category I device.

MATERIAL REQUIREMENTS. Tubular markers shall conform to the requirements of the MUTCD, shall be NCHRP 350 approved and shall be orange, with a minimum height of 36 inches and a minimum outside diameter of 2 inches. Tubular markers shall be circular or elliptical in cross section. Tubular markers shall have a maximum weight of 12 lbs, not including a mounting base.

The markers shall have two horizontal circumferential stripes of white reflective sheeting a minimum of 3 inches wide. The top edge of the upper band shall be a maximum of 2 inches from the top of the marker. The space between shall not exceed 6 inches.

Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III. The sheeting shall be bonded to the post with a pre-coated, pressure-sensitive adhesive or a tack-free, heat-activated adhesive. Mechanical fasteners to bond reflective sheeting to the post will not be allowed.

For free-standing tubular markers, the base and/or any nonflexible portion of the marker shall not be more than 2 inches in height.

For tubular markers fastened to pavement, the bonding system used to shall be a fast-setting chemical compound, mastic-type material, or mechanical fastener capable of fixing the tubular marker to either

concrete or asphalt pavement. The bonding system shall not present a hazard to traffic if the tubular marker or base unit becomes unfixd from the pavement.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-04 VERTICAL PANELS

SCOPE. This specification covers the material, fabrication, and performance requirements for vertical panels. Vertical panels are defined by NCHRP 350 as a Category II device.

MATERIAL REQUIREMENTS. Vertical panels shall conform to the requirements of the MUTCD, shall be NCHRP 350 approved and shall be constructed of plastic, aluminum, or other lightweight materials. Vertical panels shall be supported by a base capable of maintaining the panel in an upright position and in the proper position and orientation.

Vertical panels shall have 4 to 6 inches wide diagonal stripes of alternating orange and white reflective sheeting, sloping downward at an angle of 45° toward the side on which traffic is to pass. Vertical panels which are 36 inches and larger shall have 6 inch wide diagonal stripes.

Standard vertical panels shall be a minimum of 24 inches in height and a minimum of 8 inches in width. The top of the panel shall mounted a maximum of 36 inches high. Support posts for standard vertical panels shall not be located on the traffic face of the panel.

Oversized vertical panels shall be a minimum of 36 inches in height and have a minimum reflective area of 2.0 square feet.

Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-05 STOP/SLOW PADDLES

SCOPE. This specification covers the material requirements for stop/slow paddles.

MATERIAL REQUIREMENTS. Stop/slow paddles shall conform to the requirements of the MUTCD and shall be constructed of plastic, aluminum, or other lightweight materials. Stop/slow paddles shall be a minimum of 24 inches wide and shall be mounted on a support staff with a minimum height of 6 feet to the bottom of the panel. Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type IX.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-06 TYPE I CONSTRUCTION BARRICADES

SCOPE. This specification covers the material, fabrication, and performance requirements for Type I construction barricades. Type I construction barricades are defined by NCHRP 350 as a Category II device.

MATERIAL REQUIREMENTS. Type I construction barricades shall conform to the requirements of the MUTCD and shall be NCHRP 350 approved. Type I construction barricades shall be constructed of an A-frame with a single rail panel 8 to 12 inches wide and a minimum of 24 inches long. Rails on barricades used on expressways and other high-speed roadways shall have an area of at least 2.0 square feet. The top of the upper panel shall be mounted at a minimum height of 36 inches. Barricade frames shall be designed to maintain the proper orientation and location of the device during windy conditions. Nonrigid ballast may be placed on the frame, close to the ground, to hold the barricade in position, and shall not obscure the view of the rail panels to approaching traffic.

§729

Barricade rail panels shall have 4 inch wide reflective, alternating orange and white diagonal stripes sloping at an angle of 45°. Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-07 TYPE II CONSTRUCTION BARRICADES

SCOPE. This specification covers the material, fabrication, and performance requirements for Type II construction barricades. Type II construction barricades are defined by NCHRP 350 as a Category II device.

MATERIAL REQUIREMENTS. Type II construction barricades shall conform to the requirements of the MUTCD and shall be NCHRP 350 approved. Type II construction barricades shall be constructed of a frame with two rail panels 8 to 12 inches wide and a minimum of 24 inches long. Rails on barricades used on expressways and other high-speed roadways shall have an area of at least 2.0 square feet. The top of the upper panel shall be mounted at a minimum height of 36 inches. Barricade frames shall be designed to maintain the proper orientation and location of the device during windy conditions. Nonrigid ballast may be placed on the frame, close to the ground, to hold the barricade in position, and shall not obscure the view of the rail panels to approaching traffic.

Barricade rail panels shall have 4 to 6 inch wide reflective, alternating orange and white diagonal stripes sloping at an angle of 45°. Barricade rail panels 36 inches and longer shall have 6 inch wide stripes. Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-08 TYPE III CONSTRUCTION BARRICADES

SCOPE. This specification covers the material, fabrication, and performance requirements for Type III construction barricades. Type III construction barricades are defined by NCHRP 350 as a Category II device.

MATERIAL REQUIREMENTS. Type III construction barricades shall conform to the requirements of the MUTCD and shall be NCHRP 350 approved. Type III construction barricades shall be constructed of a frame with three rail panels 8 to 12 inches wide and a minimum of 48 inches long. The top of the upper panel shall be mounted at a minimum height of 60 inches. Barricade frames shall be designed to maintain the proper orientation and location of the device during windy conditions. Nonrigid ballast may be placed on the frame, close to the ground, to hold the barricade in position, and shall not obscure the view of the rail panels to approaching traffic.

Barricade rail panels shall have 6 inch wide reflective alternating orange and white diagonal stripes sloping at an angle of 45°. Reflective sheeting shall conform to §730-05 *Reflective Sheeting* ASTM Type I or ASTM Type III.

Warning lights, when used, shall be securely mounted directly to the barricade frame, above the top rail, using a bolt, nut, and washer of sufficient strength to ensure that the light does not detach if impacted by a vehicle, and no part of the light or wiring shall cover the face of the rail. Batteries shall be placed at ground level, except that integral batteries weighing a maximum of 7 lbs may be mounted on the barricade frame. Warning lights shall not be attached to the barricade rail.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

1182 729-09 TEMPORARY SIGN SUPPORTS

SCOPE. This specification covers the material, fabrication, and performance requirements for temporary sign supports. Temporary sign supports are defined by NCHRP 350 as a Category II device.

MATERIAL REQUIREMENTS. Temporary sign supports shall conform to the requirements of the MUTCD and shall be constructed in accordance with the Standard Sheets or shall be commercially manufactured, temporary sign supports that are NCHRP 350 approved.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-10 TEMPORARY IMPACT ATTENUATORS - REDIRECTIVE

SCOPE. This specification covers the material and performance requirements for temporary impact attenuators. Temporary impact attenuators are defined by NCHRP 350 as a Category III device.

MATERIALS REQUIREMENTS. Temporary impact attenuators shall be NCHRP 350 approved as a redirective, non-gating device. Temporary impact attenuators that use liquid or other materials as a filler or to provide ballast will be evaluated for potential environmental impacts and/or seasonal limitations. Temporary impact attenuators meeting the requirements of NCHRP 350 Test Level 2 are acceptable only as Test Level 2 devices. A Temporary impact attenuator accepted as a Test Level 3 device is also acceptable as Test Level 2 device. Temporary impact attenuators will be approved for use in shielding an object of a maximum width as specified in the Approved List, and specific configurations may be approved for maximum speeds. Approach ends of Temporary impact attenuators shall have impact attenuator markings in accordance with the MUTCD.

Concrete Grouting Material	701-05
Anchoring Materials - Chemically Curing	701-07

If a temporary foundation slab is required, concrete shall be Class A concrete conforming to Section 501 *Portland Cement Concrete - General*; reinforcing steel shall conform to §709-01 *Bar Reinforcement, Grade 60*.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have Test Level 2 or Test Level 3 temporary impact attenuators approved shall prepare and submit copies of drawings, specifications, test reports, and Federal acceptance letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Test Level 2 or Test Level 3 temporary impact attenuators will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

729-11 TEMPORARY IMPACT ATTENUATORS - GATING

SCOPE. This specification covers the material and performance requirements for temporary impact attenuators. Temporary impact attenuators are defined by NCHRP 350 as a Category III device.

MATERIALS REQUIREMENTS. Temporary impact attenuators shall be NCHRP 350 approved as a gating device. Temporary impact attenuators that use liquid or other materials as a filler or to provide ballast will be evaluated for potential environmental impacts and/or seasonal limitations. Temporary impact attenuators meeting the requirements of NCHRP 350 Test Level 2 are acceptable only as Test Level 2 devices. A Temporary impact attenuator accepted as a Test Level 3 device is also acceptable as

§729

Test Level 2 device. Temporary impact attenuators will be approved for use in shielding an object of a maximum width as specified in the Approved List, and specific configurations may be approved for maximum speeds. Approach ends of Temporary impact attenuators shall have impact attenuator markings in accordance with the MUTCD.

Concrete Grouting Material 701-05
Anchoring Materials - Chemically Curing 701-07

If a temporary foundation slab is required, concrete shall be Class A concrete conforming to Section 501 *Portland Cement Concrete - General*; reinforcing steel shall conform to §709-01 *Bar Reinforcement, Grade 60*.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have Test Level 2 or Test Level 3 temporary impact attenuators approved shall prepare and submit copies of drawings, specifications, test reports, and Federal acceptance letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Test Level 2 or Test Level 3 temporary impact attenuators will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

729-12 TRUCK MOUNTED IMPACT ATTENUATORS

~~**SCOPE.** This specification covers the material and performance requirements for Truck Mounted Impact Attenuators (TMAs) mounted on the rear of work vehicles. Impact attenuators are defined by NCHRP 350 as a Category III device.~~

~~**MATERIALS REQUIREMENTS.** Truck Mounted Impact Attenuators shall be NCHRP 350 approved. TMAs meeting the requirements of NCHRP 350 Test Level 2 are acceptable only as Test Level 2 devices. A TMA accepted as a Test Level 3 device is also acceptable as a Test Level 2 device. Approach ends of TMAs shall have impact attenuator markings in accordance with the MUTCD.~~

~~**BASIS OF APPROVAL.** Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.~~

~~**BASIS OF ACCEPTANCE.** Test Level 2 or Test Level 3 TMAs will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.~~

729-12 TRUCK MOUNTED AND TRAILER MOUNTED IMPACT ATTENUATORS

SCOPE. This specification covers the material and performance requirements for truck mounted impact attenuators or trailer mounted impact attenuators (TMAs) mounted on the rear of work vehicles and barrier trailers. Impact attenuators are defined by NCHRP 350 as a Category III device.

MATERIALS REQUIREMENTS. TMAs shall be NCHRP 350 approved. TMAs meeting the requirements of NCHRP 350 Test Level 3 are also acceptable as a Test Level 2 device. TMAs meeting the requirements of NCHRP 350 Test Level 2 are acceptable only as Test Level 2 devices. Approach ends of TMAs shall have impact attenuator markings in accordance with the MUTCD.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Test Level 2 or Test Level 3 TMIA's will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

Comment [cjt144]:
EI08036

729-13 TEMPORARY SAND BARRELS

SCOPE. This specification covers the material and performance requirements for sand barrels. Sand barrels are defined by NCHRP 350 as a Category III device.

MATERIAL REQUIREMENTS. Sand barrels of each size module shall be NCHRP 350 approved. Sand barrels shall be yellow, durable, waterproof, ultraviolet-stable plastic. The first barrel in the array shall have impact attenuator markings in accordance with the MUTCD.

Sand barrels shall resist deformation from dynamic loadings due to vibration in the placement area and long-term stresses induced by thermal expansion/contraction and fill settlement. Sand barrels shall be free draining with respect to residual moisture in the fill sand. Lids shall divert precipitation and prevent moisture from entering the module. Lids shall be fastened or otherwise secured to provide a closed, reasonably vandal-resistant barrel.

The fill sand shall conform to the requirements of either §703-06 *Cushion Sand* or §703-07 *Concrete Sand*. Sodium chloride, as dry rock salt, equal to 3-5 percent by weight of the sand, shall be thoroughly mixed into the sand. Sodium chloride shall meet the requirements of §712-03 *Sodium Chloride*.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days. Upon approval, the name of the manufacturer and the product will be placed on the Approved List.

BASIS OF ACCEPTANCE. Sand barrels will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

729-14 VEHICLE-ARRESTING SYSTEMS

SCOPE. This specification covers the material and performance requirements for vehicle-arresting systems. Vehicle-arresting systems are defined by NCHRP 350 as a Category III device.

MATERIAL REQUIREMENTS. Vehicle-arresting systems shall be NCHRP 350 approved.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days.

BASIS OF ACCEPTANCE. Vehicle-arresting systems will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

729-15 ARROW PANELS

SCOPE. This specification covers the material and performance requirements for arrow panels. Arrow panels are defined by NCHRP 350 as a Category IV device.

MATERIAL REQUIREMENTS. Arrow panels shall be signs with a matrix of illuminated elements capable of either flashing or sequential arrow displays that meets the requirements of the MUTCD. Arrow panels shall be equipped with a sign control console, mounted in a lockable, weather-resistant compartment.

Arrow panels shall not bear any advertising message or any other message that is not related to traffic control. A nonretroreflective logo or name and telephone number of the contractor or supplier may be located on the back of the arrow panel or on the arrow panel trailer. The logo shall not exceed 1 square foot. The name and telephone number shall not exceed 2 inch height. The rear face of the arrow panel shall contain one or more clear lamp(s) to indicate that the arrow board is operating properly.

Truck-Mounted Series B. Arrow panels consist of a 60 inch x 30 inch rectangular panel mounted at a minimum of 5 feet above the roadway. The arrow display shall be legible at a minimum distance of 3/4 mile on a bright, sunny day or a clear night when the sight line is unobstructed.

Trailer-Mounted or Truck-Mounted Series C. Arrow panels consist of a 96 inch x 48 inch rectangular panel mounted at a minimum of 7 feet above the roadway for trailer mounted arrow panels and 5 feet above the roadway for truck mounted arrow panels. Arrow panels shall be powered by self-contained engine-driven generator systems, capable of energizing the arrow displays for 72 hours unattended and shall be capable of being powered by 110V AC supply; solar-powered, capable of energizing the arrow displays continuously for 21 days unattended; or powered by a truck. Arrow panel operation controls shall be mounted in a lockable enclosure. The arrow display shall be legible at a minimum distance of 1.0 mi on a bright, sunny day or a clear night when the sight line is unobstructed.

TESTING. Manufacturers or material suppliers desiring to have Truck-Mounted Series B arrow panels considered for inclusion on the Approved List shall submit a material certification that the arrow panel conforms to this specification and the requirements of the MUTCD, and provide an arrow panel to the Director, Materials Bureau in Albany for initial field testing. Field testing will include evaluation of arrow panel operation during various light conditions for brightness, legibility, and angularity. The review process requires a minimum of 30 calendar days.

Manufacturers or material suppliers desiring to have Trailer-Mounted or Truck-Mounted Series C arrow panels considered for inclusion on the Approved List shall submit test results from the AASHTO National Transportation Product Evaluation Program (NTPEP), a material certification that the arrow panel conforms to this specification and the requirements of the MUTCD, and provide an arrow panel to the Director of the Materials Bureau in Albany for initial field testing. Field testing will include evaluation of arrow panel operation during various light conditions for brightness, legibility, and angularity. The review process requires a minimum of 30 calendar days.

BASIS OF APPROVAL. Truck-Mounted Series B arrow panels meeting the requirements of this specification and having satisfactory initial field test results will be placed on the Approved List.

Trailer-Mounted or Truck-Mounted Series C arrow panels meeting the requirements of this specification and satisfactory initial field test results, as well as satisfactory NTPEP test results will be placed on the Approved List. Trailer-Mounted or Truck-Mounted Series C arrow panels for which NTPEP test results have not been submitted may be provisionally placed on the Approved List for a maximum of one year. Arrow panels on the Approved List that have repeated poor evaluations will be removed from the Approved List.

BASIS OF ACCEPTANCE. Arrow panels will be accepted on the basis of the product appearing on the Approved List and a material certification that the product meets this specification and is the same as the one appearing on the Approved List.

729-16 PORTABLE VARIABLE-MESSAGE SIGNS (PVMS)

SCOPE. This specification covers the material and performance requirements for variable-message signs. Variable-message signs are defined by NCHRP 350 as a Category IV device.

MATERIAL REQUIREMENTS. Portable variable-message signs (PVMS) shall be tested by the National Transportation Product Evaluation Program (NTPEP) of the American Association of State and Highway Transportation Officials (AASHTO) demonstrating the arrow panel meets the requirements of this specification and the MUTCD. The PVMS shall be trailer mounted and equipped for use on public highways in accordance with NYS Vehicle and Traffic Law. The unit shall operate primarily from a solar-powered electrical system and shall be capable of energizing the message display for a minimum of 21 days without auxiliary charge. The electrical system shall consist of batteries and a solar array panel and on-board auxiliary charging system to enable the batteries to be recharged via a 110V AC connection.

The PVMS shall have a 3 line display with a minimum of 8 characters per line, and shall be capable of displaying 3 separate messages in a cyclical sequence. Characters shall be a minimum of 18 inches high. PVMS messages shall be legible from a distance of 900 feet or more in advance of the PVMS on highways with a posted pre-construction speed limit of 50 mph or greater. PVMS messages shall be legible from a distance of 680 feet or more in advance of the PVMS on highways with a posted pre-construction speed limit of 45 mph or less. PVMS shall not bear any advertising message or any other message that is not related to traffic control. A nonretroreflective logo or name and telephone number of the contractor or supplier may be located on the back of the PVMS or on the PVMS trailer. The logo shall not exceed 1 square foot. The name and telephone number shall not exceed 1/2 inch in height.

The PVMS shall be equipped with a sign control console, mounted in a lockable, weather-resistant compartment. The sign controller shall have programmable memory capable of storing messages pertinent to planned construction activities, including emergency messages. The controller shall be equipped with 14 day calendar programming capability, providing the ability to start and stop the display of a minimum of three (3) different messages on a repeating schedule without an operator present. The controller shall be capable of producing an accurate log of all messages and the times they were displayed. The controller shall have programmable messages, display rate, and display interval settings. The controller shall blank the sign if the output voltage drops below the manufacturer's recommended output level.

The PVMS shall be equipped with control software using a Microsoft Windows operating system. The Contractor shall supply the Engineer with two copies of operating instructions for the PVMS and the control software. Electronic copies of software instructions are acceptable.

A. Light-Emitting Diode (LED) Type. The LED type PVMS shall have light-emitting diodes arranged in arrays and the arrays shall be arranged in a matrix for each character to be 7 pixels high by 5 pixels wide. The LED display shall have the ability to display characters at a minimum height of 18 inches. The controller shall provide a means of dimming the pixels.

B. Hybrid Flip-Disk Type. The hybrid, flip-disk type PVMS shall have pixels consisting of individual electromagnetic disks with at least two (2) high-output amber LEDs. The disk face shall be covered with yellow prismatic retroreflective sheeting or an approved equal. The PVMS shall operate using both flip-disk and light-emitting diode (LED) during nighttime and low-light periods. The hybrid flip disk type shall be arranged in a matrix 7 disks high by 5 disks wide for each character at a minimum height of 18 inches.

C. Cellular Communications Option. The PVMS with cellular communications shall be equipped with a cellular telephone with cellular service and a modem capable of remotely operating the control software. The phone numbers for PVMS on a contract shall be sequential whenever possible to facilitate remote control of multiple devices. The unit shall accept a land line telephone connection mode without rewiring or modification. PVMS units with cellular communications shall be equipped with communications and control systems that are National Transportation Communications for ITS Protocol (NTCIP) compliant.

D. Radar Option. The PVMS with radar shall be equipped with a radar speed detection option, providing the system with the ability to determine the speed of an approaching vehicle and interrupt

the programmed sequence with a special default message displaying the vehicle's speed. The unit shall collect and store vehicle speed data for retrieval.

E. NTCIP Communication Protocol Option. PVMS units that will be operated by the Department, typically from a Transportation Management Center (TMC) shall be equipped with communications and control systems that are National Transportation Communications for ITS Protocol (NTCIP) compliant.

TESTING. Manufacturers or material suppliers desiring to have PVMS considered for inclusion on the Approved List shall submit test results from the AASHTO National Transportation Product Evaluation Program (NTPEP), a material certification that the PVMS conforms to this specification and the requirements of the MUTCD, and provide a PVMS to the Director, Materials Bureau in Albany for initial field testing. Field testing will include evaluation of PVMS operation during various light conditions for brightness, legibility, and angularity. The initial testing process requires a minimum of 30 calendar days.

BASIS OF APPROVAL. PVMS meeting the specification, having satisfactory NTPEP test results, and having satisfactory initial field test results will be placed on the Approved List.

PVMS meeting the specification and having satisfactory initial field test results, that do not have NTPEP test results may be provisionally placed on the Approved List for a maximum of one year. PVMS on the approved list that have repeated poor evaluations will be removed from the Approved List.

BASIS OF ACCEPTANCE. PVMS will be accepted on the basis of the product appearing on the Approved List and a material certification that the product meets this specification and is the same as the one appearing on the Approved List.

Comment [c145]:
EI09-015

729-15 ARROW PANELS

~~**SCOPE.** This specification covers the material and performance requirements for arrow panels. Arrow panels are defined by NCHRP 350 as a Category IV device.~~

~~**MATERIAL REQUIREMENTS.** Arrow panels shall be trailer-mounted or truck-mounted. The lamps shall flash at a rate of not less than 25 nor more than 40 flashes per minute with the lamp illuminated for at least 50 percent of the cycle. The lamps shall be recess mounted or alternatively equipped with an hood over the top half of the lamp that projects a minimum of 2 inches at top-center.~~

~~— The flashing arrow shall be sufficiently bright and with adequate lateral and vertical beam spread to attract the attention of approaching motorists and be clearly legible continuously from any point within the roadway (inclusive of shoulders) from the beginning of the lane closure taper to a distance 1500 feet in advance of the closure taper. Any arrow panel which cannot provide a sufficiently bright and clearly legible arrow display at any point within the roadway within the above distance shall be rejected.~~

~~— Diesel-powered arrow panels shall be powered by self-contained, engine-driven generator systems capable of energizing the arrow displays for 72 hours, unattended and shall be capable of being powered by 110V AC supply.~~

~~— Solar-powered arrow panels shall be capable of energizing the arrow displays continuously for 21 days, unattended.~~

~~— The lamps shall be equipped with an automatic, solar cell controlled dimming switch. Activation will be at a level of approximately 5 candelas. The solar cell shall be located and equipped with a delay to prevent undesirable actuation from vehicle lights. The dimming voltage to the lamps shall be manually controllable over an effective range of 5—12 volts.~~

~~— Arrow panels shall have flashing yellow lights arranged on a panel to operate in four different modes. The arrow display shall cover the entire area of the panel and be composed of lamp units with 5 lamps in the arrowhead and 5 lamps in the shaft. Lamps shall be arranged and controlled to provide the following mode selections: Left Arrow, Right Arrow, Left and Right Arrow, and Caution. In the 3-directional modes, the lamps in the shaft next to the arrow point shall not illuminate. The caution mode shall consist of either 2 pairs of alternately flashing lamps arranged in a pattern that does not indicate direction, or 4~~

lamps simultaneously flashing in each of the four corners of the board. The rear face of the arrow panel shall contain 1 or more clear lamps to indicate that the arrow board is operating properly.

~~**Trailer Mounted.** Arrow panels shall be transportable, self-contained units consisting of a 96 x 48 inch rectangular solid finished in nonreflective black, and shall be mounted so that the bottom of the panel is a minimum of 7 feet above the roadway. Arrow panel operation controls shall be mounted in a lockable enclosure.~~

~~—The arrow display shall be visible at a minimum distance of 1 mile and legible at a minimum distance of 1/2 mile on a bright, sunny day or a clear night when the sight line is unobstructed.~~

~~**Truck Mounted Series B.** Arrow panels shall be transportable, self-contained units consisting of a 60 x 30 inch rectangular solid finished in nonreflective black, and shall be mounted so that the bottom of the panel is a minimum of 5 feet above the roadway.~~

~~—The arrow display shall be visible at a minimum distance of 3/4 mile and legible at a minimum distance of 2,000 feet on a bright, sunny day or a clear night when the sight line is unobstructed.~~

~~**Truck Mounted Series C.** Arrow panels shall be transportable, self-contained units consisting of a 96 x 48 inch rectangular solid finished in nonreflective black, and shall be mounted so that the bottom of the panel is a minimum of 5 feet above the roadway.~~

~~—The arrow display shall be visible at a minimum distance of 1 mile and legible at a minimum distance of 1/2 mile on a bright, sunny day or a clear night when the sight line is unobstructed.~~

~~**BASIS OF APPROVAL.** Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days.~~

~~**BASIS OF ACCEPTANCE.** Arrow panels will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.~~

~~729-16 PORTABLE VARIABLE-MESSAGE SIGNS (PVMS)~~

~~**SCOPE.** This specification covers the material and performance requirements for variable message signs. Variable message signs are defined by NCHRP 350 as a Category IV device.~~

~~**MATERIAL REQUIREMENTS.** Solar powered, portable variable message signs (PVMS) shall meet the requirements of the MUTCD. The PVMS shall be trailer mounted and equipped for use on public highways in accordance with NYS Vehicle and Traffic Law. The trailer shall have four (4) leveling jacks capable of leveling the trailer on grades up to 1 on 6 and capable of stabilizing the trailer in winds up to 80 mph.~~

~~—The unit shall operate primarily from a solar powered electrical system and shall be capable of energizing the message display for a minimum of 21 days without auxiliary charge. The electrical system shall consist of batteries and a solar array panel and on-board auxiliary charging system to enable the batteries to be recharged via a 110V AC connection.~~

~~—The PVMS shall have a three line display with a minimum of eight, 18 inch high characters per line, shall be capable of displaying three (3) separate messages in a cyclical sequence. Messages shall be clearly legible from a distance of 900 feet and illumination intensity shall automatically adjust for all daytime and nighttime ambient conditions.~~

~~—The PVMS shall be equipped with a sign control console, mounted in a lockable, weather-resistant compartment. The sign controller shall have programmable memory capable of storing messages pertinent to planned construction activities, including emergency messages. The controller shall be equipped with 14 day calendar programming capability, providing the ability to start and stop the display of a minimum of three (3) different messages on a repeating schedule without an operator present. The controller shall be capable of producing an accurate log of all messages and times messages were~~

displayed. The controller shall have programmable messages, display rate, and display interval settings. The controller shall blank the sign if the output voltage drops below the manufacturer's recommended output level.

—The PVMS shall be equipped with control software using a Microsoft Windows operating system, Windows 98 or later. The Contractor shall supply the Engineer with two copies of operating instructions for the PVMS and the control software. Electronic copies of software instructions are acceptable.

A. Light-Emitting Diode (LED) Type. The LED type PVMS shall have light emitting diodes arranged in arrays and the arrays shall be arranged in a matrix for each character to be 7 pixels high by 5 pixels wide with a minimum of 3 LEDs per pixel. The LED display shall have the ability to display characters at a minimum height of 18 inches. The controller shall provide a means of dimming the pixels.

B. Hybrid Flip-Disk Type. The hybrid, flip-disk type PVMS shall have pixels consisting of individual electromagnetic disks with at least two (2) high-output amber LEDs. The disk face shall be covered with yellow prismatic retroreflective sheeting or an approved equal. The PVMS shall operate using both flip-disk and light-emitting diode (LED) during nighttime and low-light periods. The hybrid flip-disk type shall be arranged in a matrix 7 disks high by 5 disks wide for each character.

C. Cellular Communications Option. The PVMS with cellular communications shall be equipped with a cellular telephone with cellular service and a modem capable of remotely operating the control software. The phone numbers for PVMS on a contract shall be sequential whenever possible to facilitate remote control of multiple devices. The unit shall accept a land-line telephone connection mode without rewiring or modification.

D. Radar Option. The PVMS with radar shall be equipped with a radar speed-detection option, providing the system with the ability to determine the speed of an approaching vehicle and interrupt the programmed sequence with a special default message displaying the vehicle's speed. The unit shall collect and store vehicle speed data for retrieval.

E. NTCIP Communication Protocol Option. PVMS units that will be operated by the Department, typically from a Transportation Management Center (TMC) shall be equipped with communications and control systems that are National Transportation Communications for ITS Protocol (NTCIP) compliant.

BASIS OF APPROVAL. Manufacturers or material suppliers desiring to have products considered for inclusion on the Approved List shall prepare and submit copies of drawings, specifications, test reports, and Federal Acceptance Letters to the Director of the Materials Bureau. The review process requires a minimum of 30 calendar days.

BASIS OF ACCEPTANCE. Portable variable message signs will be accepted on the basis of the product appearing on the Approved List and a material certification that the product is the same as the one appearing on the Approved List and that it conforms to this specification.

729-17 TEMPORARY GLARE SCREENS

SCOPE. This specification covers the material and performance requirements for temporary glare screens. Glare screens are not defined separately by NCHRP 350, but rather are considered a system component.

MATERIAL REQUIREMENTS. Temporary glare screens shall consist of an opaque screen on a horizontal base which is, in turn, mounted on a concrete barrier. The system shall be modular to allow flexible use and ease of maintenance.

The screen shall be constructed of durable, lightweight, flexible, weather-resistant and impact-resistant materials of a single, uniform dark color. The minimum height of the screen shall be

approximately 24 inches. The screen shall be reflectorized at a uniform maximum spacing of 40 feet. If barrier delineation is blocked, the screen shall be reflectorized on both sides by a 3 inch wide by 6 inch high (minimum) piece of reflective sheeting, ASTM Type I or ASTM Type III. Yellow reflective sheeting shall be used facing traffic which is to pass to the right of the glare screen. White reflective sheeting shall be used facing traffic which is to pass to the left of the glare screen.

Individual temporary glare screen modules shall not span a joint between concrete barrier sections, and bases shall not overhang the face of the barrier. Temporary glare screens shall not have any horizontal rigid members that could potentially spear an impacting vehicle, or shall be NCHRP 350 approved if the system has horizontal rigid members.

The base shall have sufficient rigidity to facilitate ease of handling and proper screen support and position. The connection of the base to the vertical components shall prevent unintentional screen rotation or dislocation. The base shall be properly secured to prevent it from being dislodged upon impact.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

729-18 WARNING LIGHTS

SCOPE. This specification covers the material and performance requirements for warning lights. Warning lights are not defined separately by NCHRP 350, but rather are considered a system component.

MATERIAL REQUIREMENTS. Warning lights shall be NCHRP 350 certified as a part of the system to which they are attached. Warning lights shall be Type A (low-intensity flashing), Type B (high-intensity flashing), or Type C (steady-burning). Warning lights shall meet the requirements of the MUTCD, shall have a minimum nominal diameter of 7 inches and shall emit yellow light. Flashing warning lights shall flash between 55 and 75 times per minute. Flashing warning lights required to operate 24 hours per day shall be Type B. Steady-burning lights shall have a minimum beam intensity of two candelas maintained within an angle of 9° on each side of the vertical axis, and within an angle of 5° above and below the horizontal axis. The hours of operation of steady-burning warning lights shall be from one-half hour after sunset to one-half hour before sunrise. Warning lights shall be powered by batteries, line power, or solar cells adequate to maintain the required luminance during all periods of required operation.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

SECTION 730 - SIGNS AND DELINEATORS

730-01 ALUMINUM SIGN PANELS

SCOPE. These specifications cover aluminum sign panels used as the prepared surface backing in the application of reflective sheeting for location markers, delineators and traffic signs.

MATERIAL REQUIREMENTS. The panel material shall be either Aluminum Alloy 6061-T6, 5154-H38, 5052-H38 or 3004-H38 and shall conform to the requirements of material specification §715-04, Wrought Aluminum.

FABRICATION

Preparation of Panel Surface for Reflective Sheeting. The surface preparation of panels for the application of Reflective Sheeting, §730-05, shall be performed by Method I or Method II, in strict accordance with the recommendations of the manufacturer of the reflective sheeting.

A. Method I

1. Cleaning (Vapor or Alkaline cleaning)

a. Vapor Cleaning. By total immersion of the sheeting or sign panel in a saturated vapor of trichlorethylene or perchlorethylene. Trademark printing shall be removed with lacquer thinner. Follow with a thorough rinse.

b. Alkaline Cleaning. Sheeting shall be immersed in a tank containing alkaline solutions, controlled and titrated to the solution manufacturer's specifications. Immersion time shall depend upon the amount of soil present and the gage of the metal. Follow with a thorough rinse.

NOTE: After cleaning and rinsing and prior to etching, the aluminum sheeting shall be checked with a "Water Break Test" as follows: If the metal is clean, water will completely cover the surface with no breaks. Whenever water breaks, oil is present and the plate shall be recleaned until all traces of oil disappear. The surface near the edges shall be examined with extreme care for presence of oil.

2. Etching (Use Acid or Alkaline Etch)

a. Acid Etch. Etch in a 6% to 8% phosphoric acid solution at 100°F. Rinse thoroughly with running cold water followed by hot water tank rinse.

b. Alkaline Etch. Etch the pre-cleaned aluminum surface in alkaline etching material that is controlled by titration, use time, temperature and concentration specified by the solution manufacturer. Rinse thoroughly, remove smut with an acidic chromium compound type solution as specified by the solution manufacturer and then thoroughly rinse.

B. Method II

Cleaning and Etching. Use a chemical conversion treatment in accordance with the requirements of Military Specification MIL-C-5541A, Chemical Films and Chemical Film Materials for Aluminum and Aluminum Alloys, or later addenda. Following the etching and rinsing, panels shall be dried by a forced hot air dryer or by immersion for one minute, in circulating hot water at 180°F and allowed to air dry.

Application of Reflective Sheeting. The metal shall not be handled between all cleaning operations and applications of the reflective sheeting except by device or clean canvas gloves.

Immediately prior to the application of the reflective sheeting, the aluminum panel shall be prepared as specified in Method I or Method II. The reflective sheeting shall be adhered to the aluminum panel by the vacuum applicator process or mechanical process in strict accordance with the recommendations of the manufacturer of the reflective sheeting.

BASIS OF ACCEPTANCE. Aluminum panels may be accepted on the basis of the manufacturer's certification that his/her product conforms to all of the above specifications. However, the Department reserves the right to conduct tests, upon aluminum panels supplied. When tests are to be made, all test samples without reflective sheeting applied shall be submitted to the Materials Bureau. The number of samples shall comprise approximately one percent of the number of panels. Each sample shall contain a minimum area of 1 square foot for each thickness of panel used. Failure of the samples to meet all the requirements of the above specifications shall be cause for rejection of the aluminum panels represented by such samples.

730-02 TEMPORARY PLYWOOD SIGN PANELS

SCOPE. These specifications cover plywood sign panels used for temporary signs in work zones.

MATERIAL REQUIREMENTS. Temporary plywood sign panels shall be fabricated from exterior type plywood with a medium density overlay. Plywood shall be a minimum of 1/2 inch thick. The backs and edges of temporary plywood sign panels shall be painted white.

The surface of temporary plywood sign panels to be overlaid with reflective sheeting shall be prepared in accordance with the manufacturer's requirements.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

730-03 TEMPORARY RIGID LIGHTWEIGHT SIGN PANELS

SCOPE. This specification covers the material requirements for rigid lightweight sign panels used in the fabrication of temporary construction signs no larger than 4 x 4 feet.

MATERIAL REQUIREMENTS. Temporary rigid lightweight plastic sign panels shall consist of at least two parallel surfaces of plastic, aluminum or composite separated by plastic foam, filler or stiffeners/spacers; a single piece of plastic extrusion simulating this construction; or other lightweight composites to be overlaid with reflective sheeting. External stiffeners may be used to provide strength or to attach the panel to posts. Sign panels shall not deflect from the flat surface plane more than 1/4 inch at any point. Sign panels shall not warp and flex in a manner that reduces the required sign legibility and/or conspicuity.

If through bolting is used to attach the panel to the stiffeners, or to attach the panel directly to the posts, the bolt heads shall be provided with clear washers to minimize obscuring the legend. The backs of temporary rigid lightweight plastic sign panels shall be a uniform light color or shall be painted white.

The surface of temporary rigid lightweight sign panels to be overlaid with reflective sheeting shall be prepared in accordance with the manufacturer's requirements.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

730-04 (VACANT)

730-05 REFLECTIVE SHEETING

SCOPE. These specifications cover reflective sheeting for use in the fabrication of highway and construction signs, delineators and other traffic control devices.

GENERAL. The reflective sheeting supplied shall be colored, flexible, weather resistant, and shall have a smooth outer surface. If the reflective sheeting contains spherical lens elements, the lens elements shall be embedded within a transparent plastic, so as to produce a smooth, flat outer surface. All sheeting shall be of good appearance, free from ragged edges, cracks, scales, blisters, or other defects.

The back of the reflective sheeting shall be protected by a removable liner and shall include a precoated pressure-sensitive or a heat-activated adhesive, either of which may be applied without the necessity of additional adhesive tack coats on the reflective sheeting or application surface.

Reflective sheeting shall be one of the following ASTM D4956 types:

730-05.01 - ASTM Type I (Class A). A medium-intensity reflective sheeting often referred to as engineer grade. It is recommended for highway signs, except where high reflectivity is required, and for construction barricades, panels, and other work zone devices.

730-05.02 - ASTM Type III (Class B). A high-intensity reflective sheeting often referred to as high intensity. It is recommended for highway signs, construction signs, delineators, and other work zone devices.

730-05.03 - ASTM Type V (Class C). A super-high-intensity reflective sheeting recommended for delineators, construction barricades, and vertical panels. This material is not recommended for highway or construction zone sign faces.

730-05.04 - Fluorescent Orange (Class D). A fluorescent orange-colored sheeting with reflective properties similar to Class B high intensity. This sheeting is only recommended for use on orange-colored

§730

construction signs, and for the orange portions of construction barricades, vertical panels, and other work zone devices with rigid substrates, when a high level of conspicuity or visibility is needed.

730-05.05 - ASTM Type IX (Class E). A very-high-intensity retroreflective sheeting having highest retroreflective characteristics at short road distances. Recommended for permanent signs, delineators, construction zone devices, and vertical panels, when a high level of conspicuity or visibility is needed.

Fluorescent Color	Luminance Factor (Y %) Min.		Maximum Spectral Radiance Factor (%)	Color Specification Limits ¹							
				1		2		3		4	
				x	y	x	y	x	y	x	y
Orange	Y _t 25	Y _f 15	110.0	0.583	0.416	0.535	0.400	0.595	0.351	0.645	0.355
Yellow	45	20	-----	0.479	0.520	0.446	0.483	0.512	0.421	0.557	0.442
Yellow Green	60	20	-----	0.387	0.610	0.369	0.546	0.428	0.496	0.460	0.540

NOTE: 1. Four pairs of chromaticity coordinates determine acceptable color in terms of the CIE, 1931 Standard Colorimetric System measured with Standard Illuminant D₆₅.

MATERIAL REQUIREMENTS. Reflective sheeting shall meet the requirements of ASTM D4956 and the following:

1. Fluorescent Colors. Shall conform to the requirements of Table 730-05-1.

2. Fluorescent Orange Class D - 730-05.04. Class D fluorescent orange reflective sheeting:

A. Coefficient of Retroreflection (R_A). The coefficient of retroreflection shall meet or exceed the reflectivity requirements indicated in Table 730-05-2.

Observation Angle (°)	Entrance Angle (°)	Minimum R _A (cd/ft ²)
0.2	- 4	100.0
0.2	+ 30	34.0
0.5	- 4	64.0
0.5	+ 30	22.0

B. Daytime Color. The color shall conform to the requirements for luminance factor, maximum spectral radiance factor (peak reflectance), and color specification limits indicated in Table 730-05-1. Color measurements shall be determined in accordance with ASTM E991, using instrumentation which has circumferential viewing (illumination). Calculations shall be performed in accordance with ASTM E308 for the CIE 1931 2° standard observer.

C. Artificial Weathering. After 1500 hours of artificial weathering performed in accordance with ASTM G 26, Method A, using a Type B weatherometer, the following requirements shall be met:

- The minimum coefficient of retroreflection shall be 55.0 cd/ft² at 0.2 degree observation angle; - 4 degree entrance angle.
- The luminance factor (Y Percent) shall be from 20.0 to 45.0.
- The maximum spectral radiance factor (peak reflectance) shall not be less than 60.0 percent.
- The color specification limits shall conform to the requirements shown above in Class D, *B. Daytime Color*.

3. Type IX (Class E) - 730-05.05. All colors shall conform to the requirements of ASTM D4956, except fluorescent colors. Fluorescent colors shall conform to the requirements of Table 730-05-1 and Table 730-05-3 of this specification.

	Entrance Angle (°)	Observation Angle (°)			
		0.1	0.2	0.5	1.0
Fluorescent Orange	- 4°	200	115	72	24
	+ 30°	110	34	22	14
Fluorescent Yellow	- 4°	400	240	165	45
	+ 30°	250	150	75	24
Fluorescent Yellow-Green	- 4°	540	325	235	65
	+ 30°	380	200	105	35

FABRICATION. The reflective sheeting shall be so fabricated as to allow easy cutting to specified sizes and shapes.

The sheeting surface shall be solvent resistant and shall permit solvent cleaning. All solvents used for cleaning operations shall be as recommended by the sheeting manufacturer and shall comply with all Federal, State, and Local air quality regulations.

To ensure uniform appearance and brilliance under both nighttime and daytime conditions, the reflective sheeting shall be cut, matched and positioned on the prepared sign panel or other substrate in strict accordance with the recommendations of the sheeting manufacturer. Backgrounds, characters, delineators, etc., shall be coated and/or edge sealed in accordance with the recommendations of the sheeting manufacturer. When performed, coating operations shall be done in a workmanlike manner so as to create an even, clear, uniform coat which shall be free of streaks, drops or other defects which might affect reflectivity.

Reflective sheeting shall be furnished in both rolls and sheets. Rolls shall be packed individually and contain not more than four splices per 150 feet linear measurement. Cut sheets shall be packaged flat and in such a manner as to minimize any damage or defacement that may occur to the sheeting during shipment or storage. The sheeting surface shall be capable of being readily processed and be compatible with recommended transparent and opaque process inks. The finished sheeting surface shall show no loss of the color with normal handling, cutting and application.

TESTING. Outdoor test specimen panels shall include both unprocessed reflective sheeting and reflective sheeting processed with the manufacturer's recommended transparent and opaque inks. Type I (Class A), Type III (Class B), and Type IX (Class E), except Type IX fluorescent orange, reflective sheetings shall be exposed outdoors on a test deck for a minimum 3-year continuous time period. Class D and Type IX (Class E) fluorescent orange sheeting shall be exposed outdoors on a test deck for a minimum 1 year continuous time period. Outdoor exposure testing will not be required for Type V (Class C) reflective sheeting.

Outdoor testing shall consist of exposing reflective sheeting test specimen panels, facing south, and inclined at an angle of 45° from a horizontal position. The test deck facility shall be located in a climate similar to that in which the material is intended to be used, or at a site approved by the Materials Bureau. Testing shall be performed by an independent testing agency or in conjunction with the National Transportation Product Evaluation Program (NTPEP).

Following the specified outdoor exposure time period, all weathered test panels of reflective sheeting shall meet the following performance requirements. The sheeting on the test panels shall show no appreciable adhesion loss, cracking, blistering, crazing, dimensional change, or color change. The minimum percent retained coefficient of retroreflection (R_A) shall be as specified below when compared to a control unexposed

§730

specimen counterpart. The control specimen reflectivity values (R_A) shall be measured at the start of outdoor exposure testing. Measurements shall be taken at 0.2 degree observation angle; - 4 degree entrance angle.

TABLE 730-05-4 MINIMUM PERCENT RETAINED COEFFICIENT OF RETROREFLECTION (R_A)	
Type I (Class A) Materials Designation 730-05.01	50%
Type III (Class B) Materials Designation 730-05.02	80%
Class D (Materials Designation 730-05.04)	50%
Type IX (Class E) Materials Designation 730-05.05	60%

BASIS OF ACCEPTANCE. Approvals will be based upon independent laboratory analysis and outdoor exposure testing conducted in accordance with this specification. If the reflective sheeting passes the requirements for laboratory and outdoor exposure testing, the product will then be placed on the Department's "Approved List" of materials. Detailed requirements and procedures for approval are available from the Materials Bureau.

Contract acceptance of Type I (Class A), Type III (Class B), Type IX (Class E), and Class D reflective sheetings will be based on the inclusion of the sheeting material on the Department's "Approved List" of reflective sheeting materials and the manufacturer's certification of compliance with this specification.

Contract acceptance of Type V (Class C) reflective sheeting will be based on the manufacturer's certification of compliance with this specification.

730-06 THRU 730-09 (VACANT)

730-10 ACRYLIC PLASTIC REFLEX REFLECTORS

SCOPE. This specification covers acrylic plastic prismatic reflectors for delineators.

MATERIAL REQUIREMENTS

Delineator Reflector Lens. Delineator reflectors shall consist of a clear and transparent acrylic plastic face, herein referred to as the lens, with a heat plastic or plastic coated foil back fused to the lens under heat and pressure around the entire perimeter of the lens, and the central mounting hole, to form a unit permanently sealed against dust, water, and water vapor. The lens shall consist of a smooth front surface, free from projections or indentation, other than a central mounting hole and identification, with a rear surface bearing a prismatic configuration such that it will effect total internal reflection of light. The manufacturer's trademark shall be molded legibly into the reflector.

Definitions and Optical Requirements

A. Entrance Angle. Shall mean the angle at the reflector between the direction of light incident on it and the direction of reflector axis.

B. Observation Angle. Shall mean the angle at the reflector between observers line of sight and direction of light incident on the reflector.

C. Specific Intensity. Shall mean luminous intensity (candelas) returned at the chosen observation angle by a reflector for each footcandle of illumination at the reflector.

Optical Test Procedure. The reflex reflector to be tested shall be located at a distance of 100 feet from a single uniformly bright light source having an effective diameter of 2 inches the light source shall be operated at approximately normal efficiency. The return light from the reflector shall be measured by means of a photo-electric photometer having a minimum sensitivity of 1×10^{-7} footcandles per scale division.

The photometer shall have a receiver aperture 1/2 inch diameter shielded to eliminate stray light. The distance from light source center to aperture center shall be 2 inches for 1/10 degree observation angle, and 7 inches for a degree observation angle.

If a test distance other than 100 feet is used, the source and aperture dimensions and the distance between source and aperture shall be modified accordingly.

Seal Test. Submerge 50 samples in water bath at room temperature. Subject the submerged samples to a vacuum of 5 inch gage for five minutes. Restore atmospheric pressure and leave sample submerged for five minutes, then examine the samples for water intake. Evidence of moisture or water intake on more than two (2) samples shall be cause for rejection of the lot represented by the samples.

Heat Resistance. Three reflectors shall be tested for four hours in a circulating air oven at $175 \pm 5^{\circ}\text{F}$. The test specimens shall be placed in a horizontal position on a grid or perforated shell permitting free air circulation. At the conclusion of the test the samples shall be removed from the oven and permitted to cool to room temperature. The samples after exposure to heat shall show no significant change in shape and general appearance when compared with unexposed control standards. No failures will be permitted.

TABLE 730-10-1 OPTICAL REQUIREMENTS					
Observation Angle Degrees	Entrance Angle Degrees	Specific Intensity, Candela/footcandle			
		Crystal	Yellow	Red	Green
1/10	0	119	71	29	29
1/10	20	47	28	11	11
1/3	0	20	12	5	5
1/3	20	8	5	2	2

NOTE: Failure of reflectors to equal or exceed the minimum specific intensity value shall constitute failure of the reflector being tested; failure of more than 2 reflectors out of 50 begin subjected to test shall constitute failure to the lot represented by the samples. The specific intensity of delineator reflectors shall meet the above noted values, regardless of reflector orientation.

BASIS OF ACCEPTANCE. Acrylic plastic reflex reflectors will be accepted on the basis of the manufacturer's certification that their product conforms to all of the above detailed specifications. However, when the Department requires that tests be made, samples shall be submitted to the Materials Bureau. Fifty-three (53) samples will be selected at random from each shipment received from the reflector manufacturer. Each shipment may contain more than one lot. These samples shall be tested as specified above. Failure of the samples to meet all the requirements of the above specifications shall be cause for rejection of delineators represented by such samples.

730-11 (VACANT)

730-12 REFLECTORIZED SHEETING SIGN CHARACTERS (TYPE IV)

SCOPE. These specifications cover the material requirements for Type IV reflectORIZED sheeting sign characters.

MATERIAL REQUIREMENTS. Type IV characters shall consist of cutout reflective sheeting material meeting the requirements of §730-05 Reflective Sheeting, Materials Designation 730-05.02 (Class B).

Characters or borders shall be applied directly to clean, dust-free reflective sheeting background panels. Characters or borders shall be applied mechanically with equipment and in a manner specified by the sheeting manufacturer. Borders shall be cut neatly and butt-joined at corners and panel joints.

TESTING. The Department reserves the right to conduct tests on samples taken by a representative of the Department as follows: 2% or a minimum of five (5) characters (whichever is the greater) for each size character used; and 2% or a minimum of 2 ft of border (whichever is greater) for each width of border used.

When performed, tests will be conducted in accordance with §730-05 Reflective Sheeting.

BASIS OF ACCEPTANCE. Type IV characters will be accepted on the basis of a material certification that the product conforms to this specification. ~~730-12 REFLECTORIZED SHEETING AND SIGN CHARACTERS (TYPE IV)~~

Comment [c146]:
Ei09-004

~~**SCOPE.** These specifications cover the material requirements for Type IV, reflectorized sheeting sign characters.~~

~~**MATERIAL REQUIREMENTS.** Type IV characters shall consist of cutout reflective sheeting material meeting the requirements of §730-05, Reflective Sheeting, Materials Designation 730-05.02 (Class B).~~

~~Characters or borders shall be applied directly to clean, dust free reflective sheeting background panels. Characters or borders shall be applied mechanically with equipment and in a manner specified by the sheeting manufacturer. Borders shall be cut neatly and butt joined at corners and panel joints.~~

~~After the sign has been completed the entire sign face area shall be clear coated (sprayed or dipped) and/or edge sealed with a clear coating as specified by the sheeting manufacturer.~~

~~**BASIS OF ACCEPTANCE.** The requirements of §730-11 shall apply.~~

730-13 REFLECTORIZED SHEETING SIGN CHARACTERS (TYPE V)

SCOPE. These specifications cover the material requirements for Type V reflectorized sheeting sign characters.

MATERIAL REQUIREMENTS. Type V characters shall consist of a painted, screened, or reverse-screened application of paint, paste, or transparent color of a type and in a manner recommended by the manufacturer of the reflective material.

Reflective material used for reverse-screened signs shall meet the requirements of §730-05 Reflective Sheeting, Materials Designation 730-05.02 (Class B).

TESTING. The Department reserves the right to conduct tests on samples taken by a representative of the Department as follows: 2% or a minimum of five (5) characters (whichever is the greater) for each size character used; and 2% or a minimum of 2 ft of border (whichever is greater) for each width of border used.

When performed, tests will be conducted in accordance with §730-05 Reflective Sheeting.

BASIS OF ACCEPTANCE. Type V characters will be accepted on the basis of a material certification that the product conforms to this specification. ~~730-13 REFLECTORIZED SHEETING SIGN CHARACTERS (TYPE V)~~

Comment [c147]:

~~**BASIS OF ACCEPTANCE.** The requirements of §730-11 shall apply.~~

730-14 THRU 730-18 (VACANT)

730-19 TEMPORARY WOODEN SIGN POSTS

SCOPE. This specification covers the material requirements for temporary wooden sign posts.

MATERIAL REQUIREMENTS. Wooden sign posts shall be untreated surface dried redwood, red cedar, cypress or black locust; or pressure treated spruce, pine, fir, oak, birch, maple or beech. Posts shall be pressure treated in accordance with §708-31 Wood Preservative - Water Borne.

All 4 x 6 inch posts shall have two 1 1/2 inch diameter breakaway holes drilled through the center of the post parallel to the sign face 4 inches and 18 inches above grade and filled with flexible caulk. All 6 x 8 inch posts shall have two 3 inch diameter breakaway holes drilled through the center of the post parallel to the sign face 4 inches and 18 inches above grade and filled with flexible caulk.

BASIS OF ACCEPTANCE. Upon request, the Contractor shall provide a material certification that the product conforms to this specification.

730-20 DELINEATOR, REFERENCE MARKER AND SNOWPLOWING MARKER POSTS

SCOPE. These specifications cover the material requirements for steel posts used to support delineators, reference markers, and snowplowing markers.

MATERIAL REQUIREMENTS.

Posts shall be fabricated of steel meeting the requirements of §715-01 Structural Steel or any of the following steel types:

- ASTM A1
- ASTM A36
- ASTM A499 (Grade 60, Grade 70, Grade 80SP)
- ASTM A500 (Grade B)
- ASTM A570 (Grade 60)
- ASTM A653 (Grade 55)
- ASTM A1011

After fabrication (punching, drilling, etc.) all steel posts shall be galvanized, and all damage to the galvanized surfaces due to handling, shipment, erection, etc., shall be repaired, in accordance with the applicable requirements of §719-01 Galvanized Coatings and Repair Methods.

BASIS OF ACCEPTANCE. Posts will be accepted on the basis of a material certification that the product conforms to this specification.

730-21 FLEXIBLE DELINEATOR POSTS

SCOPE. This specification covers the material, fabrication, and performance requirements for flexible delineator posts.

MATERIAL REQUIREMENTS. Flexible delineator posts shall be supplied with reflective sheeting of a size and color as required by the contract documents. The color of the posts shall match the color of the reflective sheeting unless otherwise specified in the contract documents. Where double unit reflectors are specified, elongated reflective sheeting may be substituted as in accordance with the MUTCD.

Reflective sheeting shall be fabricated of a material conforming to the requirements of §730-05 Reflective Sheeting, Class B or Class C. Sheeting shall be applied in accordance with the sheeting manufacturer's written instructions.

TESTING. Flexible delineator posts shall meet the requirements in the procedural directives of the Materials Bureau.

BASIS OF ACCEPTANCE. Application for approval of flexible delineator posts shall be submitted to the Materials Bureau. The procedural directives outlining detailed requirements and procedures for

§730

approval are available from the Materials Bureau. Upon approval the name of the flexible delineator post will be placed on an Approved List.

Project acceptance will be based on the manufacturer's name and type of flexible delineator post appearing on the Department's Approved List titled 'Flexible Delineator Posts.'

730-22 STIFFENERS, OVERHEAD BRACKETS AND MISCELLANEOUS HARDWARE

SCOPE. These specifications cover the material requirements for stiffeners, overhead brackets and miscellaneous hardware used for signs.

MATERIAL REQUIREMENTS

Aluminum Components. Horizontal sign panel stiffeners (Z bars) and overhead panel brackets shall be fabricated of aluminum alloy 6061-T6.

Other miscellaneous hardware including vertical stiffeners, bolts, nuts, washers, screws, rivets, pull-type lockbolts and serrated or knob stem blind rivets shall be fabricated of the materials and in the manner shown on the plans or standard sheets and shall meet the requirements of §715-04, Wrought Aluminum.

Components designated as Alloy 2024-T4 shall be given a Type 205 coating in accordance with §719-02, Aluminum Anodic Coatings.

Certification, Sampling, Testing and Inspection of aluminum components shall be handled as noted in §715-04.

Steel Components. Steel bolts, nuts and washers referenced to this specification shall conform to the requirements of Table 730-22-1 unless otherwise specified.

Bolts, nuts and washers to be used in contact with aluminum shall be coated with cadmium or cadmium/tin combination.

All cadmium and cadmium/tin coatings shall be given a chromate treatment in or with an aqueous solution of salts, acids or both to produce a protective chromate coating. The chromate coating shall be distinctly colored iridescent yellow to bronze for cadmium. Cadmium/tin coatings, when given this iridescent chromate treatment, may remain silver colored. Usual chromic and nitric acid bright dips are not chromate treatments.

- Z > 7/16": ASTM A153, class C
 Z ≤ 7/16": ASTM A153, class D
 3. ANSI B18.16.1M

BASIS OF ACCEPTANCE. Acceptance will be based on the manufacturer's certification that its product conforms to these specifications.

730-23 FIBERGLASS REINFORCED PLASTIC SIGN PANELS

SCOPE. This specification covers the material requirements for fiberglass reinforced plastic for use as a sign panel substrate.

GENERAL. The fiberglass reinforced plastic sign panel shall be fiberglass reinforced thermoset polyester laminate. The panel shall be acrylic modified and UV stabilized for outdoor weatherability. The panel shall be stabilized so as not to release migrating constituents (i.e., solvents, monomers, etc.) over time, and shall contain no residual release agents on the surface of the laminate that will interfere with any subsequent bonding operations. The panel shall not contain visible cracks, pinholes, foreign inclusions, or surface wrinkles that would affect implied performance, alter the specific dimensions of the panel or otherwise affect its serviceability.

MATERIALS REQUIREMENTS

Physical Requirements. The fiberglass reinforced plastic sign panel materials shall conform to the physical requirements in Table 730-23-1:

Property	ASTM Test Method	Requirement	
		Min.	Max.
Tensile Strength	D638	10.0x10 ³ psi	--
Tensile Modulus	D638	1.2x10 ⁶ psi	--
Flexural Strength	D790	20.0x10 ³ psi	--
Flexural Modulus	D790	1.2x10 ⁶ psi	--
Compression Strength	D695	32.0x10 ³ psi	--
Compression Modulus	D695	1.4x10 ⁶ psi	--
Punch Shear	D732	13.0x10 ³ psi	--
Weatherability — Grade II	D3841	26	44
Impact Resistance	D3841	60 ft	--

Panel Flatness Test. Panel flatness shall be determined by supporting a 30 x 30 inch panel at two opposite corners, the maximum deflection measured diagonally, parallel and perpendicular to the panel by lines drawn through the center of the panel, shall not exceed 1/2 inch. The panel shall then be supported in a like manner in an oven for 48 hours at 180°F. The maximum deflection shall again be measured as previously noted, and shall not exceed 1/2 inch. All measurements shall be made when the panels are at ambient temperature.

The fiberglass reinforced plastic panel shall have a maximum Coefficient of Thermal Expansion of 1.8x10⁻⁵ in/in/°F and maintain its strength and impact resistance qualities over a temperature range of -65°F to 212°F.

Application of Reflective Sheeting. The reflective sheeting shall be adhered to the fiberglass reinforced plastic panel in strict accordance with the recommendations of the manufacturer of the reflective sheeting.

BASIS OF ACCEPTANCE. Application for approval of fiberglass reinforced plastic sign panel by the producer shall be submitted to the Materials Bureau accompanied by a 80 square feet sample of the

§730

product. Upon approval by the Materials Bureau, the name of the product will be placed on the Department's Approved List entitled "Fiberglass Reinforced Plastic Sign Panels 730-23.

730-24 TYPE A SIGN SUPPORTS

SCOPE. This specification covers the material and fabrication requirements for breakaway supports used for roadside signs.

MATERIAL, FABRICATION AND PERFORMANCE REQUIREMENTS. Post material, fabrication and performance requirements shall be in accordance with the standard sheets, the appropriate Materials Details and the procedural directives of the Materials Bureau.

BASIS OF ACCEPTANCE. Type A Sign Supports shown on the standard sheets shall be accepted based on the manufacturer's certification that its product conforms to these specifications and the appropriate standard sheets.

All other Type A Sign Supports will be accepted on the basis of their listing on the Department's Approved List of Type A Sign Supports. In addition, the manufacturer or supplier shall provide two copies of the approved Materials Details through the Contractor to the Engineer as part of the evidence of acceptability for the material at least ten days prior to the use of the product.

730-25 TYPE B SIGN POSTS

SCOPE. This specification covers the material requirements for Type B Sign Posts and Rustic Type B Sign Posts. These sign posts shall be equipped with breakaway bases and hinge assemblies per §730-26, Breakaway Bases and Hinge Assemblies, if installed at a location subject to vehicle impact.

MATERIALS AND FABRICATION REQUIREMENTS

Steel Sign Posts. Steel for sign posts and attachments to or components of sign posts shall be ASTM A36, A242, A572 Grade 50 and A588 and shall conform to §715-01 Structural Steel. Rustic Type B Sign Posts shall be ungalvanized weathering steel, ASTM A588 or A242, meeting the requirements of §715-01 Structural Steel.

Sign posts, except Rustic Type B Sign Posts, shall be galvanized after fabrication (punching, drilling, welding, cutting, etc.) in accordance with §719-01, Galvanized Coatings and Repair Methods. Damage to galvanized surfaces of steel posts due to handling, shipment, erection, etc. shall be repaired as described in Repair of §719-01, when directed by the Engineer.

Sign posts with breakaway bases shall be of weldable quality, and all welding shall be in accordance with the provisions of the section on 'Fabrication' of the New York State Steel Construction Manual.

FABRICATION. Sign posts shall be fabricated as indicated on the standard sheets. Breakaway bases shall conform to the requirements of §730-26, Breakaway Bases and Hinge Assemblies.

BASIS OF ACCEPTANCE. Acceptance shall be based on the manufacturer's certification that the product conforms to these specifications.

730-26 BREAKAWAY BASES AND HINGE ASSEMBLIES

SCOPE. This specification covers the material and fabrication requirements for bi-directional and omni-directional breakaway bases and hinge assemblies for use on Type B Sign Posts and for use on Rustic Type B Sign Posts.

Bi-Directional Breakaway Bases and Hinge Assemblies are intended for use when the expected impact angle is within 30 degrees of the axis of the base from the front and rear.

Omni-Directional Breakaway Bases and Hinge Assemblies are intended for use whenever the expected impact angle may be greater than 30 degrees, measured as described above.

MATERIAL AND FABRICATION REQUIREMENTS. Breakaway bases and hinge assemblies shown on standard sheets shall satisfy the following requirements:

Steel for breakaway bases and hinge assemblies shall be A-36, A242, A572 Grade 50, A588 and shall meet the requirements of §715-01, Structural Steel. Steel shall be of weldable quality. Fasteners shall be of the size and shape shown on the Standard Sheets and meet the requirements of §730-22, Stiffeners, Overhead Brackets and Miscellaneous Hardware. Breakaway bases and hinge assemblies shall be galvanized in accordance with §719-01, Galvanized Coatings and Repair Methods, after the base is welded to the post. Welding shall be in accordance with the provisions of the section on 'Fabrication' of the 'New York State Steel Construction Manual.' Fabrication details shall be in accordance with the standard sheets.

Breakaway bases and hinge assemblies for use in conjunction with rustic sign posts shall meet the above requirements with the following exceptions:

- The upper slip base plate and attached post shall be ungalvanized weathering steel, ASTM A588 or A242, meeting the requirements of §715-01, Structural Steel. The lower slip base plate, and the attached stub portion of the post, shall be galvanized steel. The remainder of the slip base shall be as shown on the contract drawings.
- When used on one-way, divided roadways, the back flange hinge plate shall be ungalvanized A588 or A242 steel installed as shown on the contract drawings. When used on two-way, undivided roadways, the back flange hinge plate shall meet the requirements, below, of the front flange hinge plate.
- The front flange hinge plate shall be galvanized steel, except that an additional galvanized steel flat washer meeting the requirements of ASTM F436 shall be installed on all four bolts between the post and the hinge plate to assure proper slippage.

All exposed galvanized surfaces, except in the vicinity of the slots in the hinge plates, shall be painted in accordance with §657 *Painting Galvanized and Aluminum Surfaces*.

BASIS OF ACCEPTANCE. Breakaway bases and hinge assemblies fabricated as shown on the standard sheets shall be accepted based on the manufacturer's certification that the complete assembly conforms to these specifications.

730-27 PERMANENT VARIABLE MESSAGE SIGNS

SCOPE. This specification gives minimum material, fabrication, fatigue and strength requirements of variable message signs for permanent installation. Other requirements are in the Contract Documents.

Within this specification, "overhead" shall mean to be mounted over the traveled way, or what the plans indicate will become the traveled way.

MATERIAL REQUIREMENTS

Housing. The enclosure housing shall be constructed of aluminum alloy 3003-H14, 6061-T6, 5154-H38 or as specified on approved shop drawings. The minimum thickness shall be 1/8 inch. Seams shall be continuously welded by an inert gas process only in the shop.

The housing shall be completely sealed to prevent the entry of water, insects, dust, dirt and corrosion. Neoprene gaskets shall be utilized as necessary.

Readily-available, changeable filtration devices shall be provided at drain holes and at all points where forced air enters the enclosure.

All hinged access panels and windows shall be equipped with hold-open devices which shall not release accidentally or by the action of wind. The hold-open devices shall not interfere with the operation of the display, nor with the repair or replacement of user serviceable components.

Stiffeners, Hardware and Mounting Brackets. Hardware, framing members and mounting brackets shall meet the requirements of §730-22, unless indicated otherwise on the manufacturer's shop drawings approved by the Engineer.

Framing structural members shall be made of aluminum alloy 6061-T6 or an approved equivalent. All hardware shall be corrosion-resistant steel or protected from corrosion by suitable plating. Fasteners for securing access panels shall be captive.

MANUFACTURING

General. Fabrication shall be such that performance will not be impaired after the equipment has been subjected to shock and vibration caused by normal installation, transportation and maintenance handling. Particular attention shall be given to neatness and thoroughness of soldering, wiring, welding, plating, riveting, finishes and machine operations. All parts shall be free from burrs and sharp edges or any other defect that could make the part or equipment unsatisfactory for the operation or function intended in this specification.

Modules shall be designed such that major portions may easily be replaced. Modules of unlike functions shall be mechanically keyed to prevent insertion into the wrong socket or connector. All modules and assemblies shall be clearly identified with name, model number, serial number and any other pertinent information required to facilitate equipment maintenance. They shall be readily accessible for inspection and maintenance, using simple hand-held tools and standard meters.

Housing. The sign enclosure including doors and access panels shall be designed and constructed so as to present a clean, neat appearance; be smooth with exterior corners rounded; be weatherproof and vandal-resistant; and be free of burrs, blemishes and unspecified holes.

Drainage holes shall be drilled near each corner of the base of the enclosure.

The enclosure shall have internal lighting sufficient for all maintenance activity requirements of the VMS and 120 volt power receptacles every 10 feet mounted on the rear interior panels.

If the variable message sign is designated as "walk-in," then its access door shall be a minimum of 24 inches wide x 60 inches high.

Environmental

A. Temperature. Internal temperature shall be continuously monitored whenever electric power is applied to the sign. The internal temperature of the enclosure shall be reported to the local and central controller upon request. Ventilation shall be automatically turned on and off at internal temperatures specified in the Proposal. Exhaust and intake ports shall be protected by filter screens against moisture, dust and insect intrusion. The ventilation system shall be sufficient to circulate three times the volume of air inside the enclosure per minute. Multiple fans or blowers shall be used to provide the specified venting and shall be located within the enclosure to minimize heat stratification.

B. Adverse Conditions. The equipment shall meet all of its specified functions during and after subjection to any combination of the following conditions:

1. **Ambient Temperature.** Range of -22°F to +145°F.
2. **Temperature Shock.** 60°F per hour, during which the relative humidity shall not exceed 95%.
3. **Relative Humidity Range.** 0 to 95% over the temperature range of 40°F to 110°F.
4. **Moisture Condensation.** On all surfaces.

C. Ambient Light. The variable message sign shall be equipped with light sensors so that the display shall be able to automatically adapt its level of light output to maintain readability under varying ambient light conditions. There shall be a minimum of eight (8) levels of dimming, linearly spaced from nighttime to daylight brightness. The sign's automatic dimming control shall be overridable by central control. The dimming circuitry shall automatically compensate for variations in the AC line voltage to maintain the light output constant for the selected brightness level. The levels of lighting shall produce luminance measured on the optic axis, as follows:

1. Daylight. A minimum of 14 candela per pixule for typical daylight environment.

2. Nighttime. Between 1.5 and 2 candela per pixule for nighttime environment.

Electrical Protection. The equipment shall contain readily-accessible, normally resettable or replaceable circuit protection devices (such as circuit breakers or fuses) for equipment and power source protection.

Electronic Components. All components shall be UL listed. All printed circuit boards shall be FR4 or G10 fiberglass epoxy material, with 2 oz. copper, double-sided with plated through-holes.

All etched connector fingers are to be plated with a minimum thickness of 100 micro-inches of gold over nickel.

Board connectors that are not an integral part of the printed circuit are to be plated with a minimum thickness of 15 micro-inches of gold over nickel.

Sign Face. In order to increase contrast, the pixules shall be arranged on a black, non-glossy background. All electronic components visible from outside the sign shall be of black color or coated with black, non-glossy paint.

The front of the sign shall be enclosed by a protective, weathertight face, 1/4 inch thick.

Variable spacing between letters shall approximate the recommended spacing for 18 inch Series E sign text found in the Federal Highway Administration Standard Alphabets for Highway Signs.

DESIGN CRITERIA

All Permanent Variable Message Signs. The equipment shall be designed such that the failure of one part shall not cause the failure of any other part. In the event of a power failure of 500 milliseconds or less, proper operation of the equipment shall commence after restoration of power, without creating false information.

Shop drawings and calculations that show the sign's ability to withstand the design loads shall be submitted to the Office of Traffic ~~Engineering and Highway Safety Division~~ Safty and Mobility for approval, and shall be signed by a Professional Engineer licensed and registered to practice in New York State. If the drawings and calculations are approved by the Department, the manufacturer will be notified, and the manufacturer's name and drawing numbers will be placed on the Approved List.

Approved shop drawings shall be submitted to the Engineer prior to delivery of any variable message signs. The Contractor shall develop and deliver shop drawings signed by a licensed New York State Professional Engineer which illustrate in detail, how to mount and connect the variable message sign enclosure to the structure shown on the Plans.

All variable message signs covered by this specification shall be designed to withstand the following loads, combined in groups in accordance with the latest AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals. Each member and connection shall be designed for the maximum stress of all the different combinations, with the allowable stress increased as indicated in the AASHTO Group Loading table. Unless noted otherwise, "Ice" load in the table shall mean "Ice and Snow loads simultaneously."

Non-Overhead Permanent Variable Message Signs

A. Dead Load. The weight of the variable message sign including all components, plus consideration of loads imposed during maintenance.

B. Live Load. Variable message signs designated as "walk-in," or otherwise intended to support personnel in service, shall be designed to support a live load of 100 psf applied to the service platform.

C. Ice Load. The ice load shall be 3 psf, unless historical accretion data for the location the variable message sign will be installed, the slope of a panel, or shielding hoods and the like indicate a different load. This load shall be considered on individual panels and the members and connections supporting only one panel. The load on members and connections supporting more than one panel shall be designed to support an ice load on:

1. The one end panel, and
2. Either the front or back panel, after considering panel slope and/or shielding hoods, which produces the largest load in the member or connection.

D. Snow Load. The snow load shall be 40 psf, unless historical accretion data for the location the variable message sign will be installed, or the shape of a panel indicate that a different load is appropriate. This load shall be applied to the top panel and any hood or other nearly horizontal projection.

E. Wind Load. The Base Wind Load shall be as specified in § 645-3.01 A., including adjustments for drag, height and the gust factor. Drag coefficients shall be from the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals. "Wind Drag Coefficients" table.

1. Individual nonhorizontal panels. Panels, members and connections carrying loads from only one nonhorizontal panel shall be designed for 100% of the Base Wind Load acting normal to the panel along with 20% of the Base Wind Load acting transverse to the panel.

2. Adjacent nonhorizontal panels. Panels, members and connections carrying wind loads from two adjacent, nonhorizontal panels perpendicular to each other shall be designed to withstand a wind load acting on both panels. For the purposes of determining direction of forces, the term "paramount" refers to the panel contributing the greatest load, and the adjacent panel termed the "adjoining" panel. If it is not clear which panel will contribute the greatest load, then analyze with one panel assumed to be paramount, and the adjacent one adjoining, then do a separate analysis with the roles reversed. The center of action of the wind loads shall be the centroid of the panel on which it acts. The magnitude of the components shall be:

a. Normal to the paramount panel. 100% of the Base Wind Load on the paramount panel, plus 30% of the base wind load on the adjoining panel;

b. Transverse to the paramount panel. 20% of the Base Wind Load on the paramount panel, plus 60% of the base wind load on the adjoining panel.

Members and connections carrying wind loads from adjacent, nonhorizontal panels at angles other than perpendicular to each other shall be designed to withstand an appropriate wind load coming from the direction producing the greatest stress in the member or connection.

Overhead Permanent Variable Message Signs. Variable message signs to be mounted over a traveled way, or over what the contract documents indicate will become a traveled way, shall be designed for the fatigue loads and using the allowable stresses given in the current version of the NYSDOT Standard Specifications for Overhead Sign Structures.

DELIVERY AND INSTALLATION

The contractor shall deliver, store, handle, and install all materials and equipment in such a manner as not to degrade quality, serviceability or appearance. Material to be stored shall be stored in a clean and dry location free from construction dust, precipitation, and condensing moisture. Any part of the equipment damaged during transportation, handling, or installation shall be repaired, or if determined by the Engineer as unfit for use in the finished work, shall be removed from the site and replaced by the Contractor at no additional cost.

All materials shall be delivered and stored in the manufacturer's original unopened protective packages and protected against soiling, physical damage, or wetting, before and during installation. Unloading and unpacking of all materials shall be done in a manner to prevent misalignment or damage.

The installation shall be performed by factory certified personnel. Installation shall be complete in all respects, including all framing and all related fastenings and anchors required for a complete installation. Equipment shall be placed in accordance with the general arrangement as shown on the Drawings. The general arrangement may be modified only as required to suit specific equipment. Modifications shall not affect the design of components. Layout dimensions as shown on the Drawings may be modified to improve operating efficiency.

MARKING. The contract number, pay-item number, and month and year of installation shall be marked using permanent ink, paint, or stamping into the wall. Characters shall be 1 to 1 3/4 inches high, horizontal when the variable message sign is in its final position, and be located in the following locations:

- The end panel of the vms, so as to be visible from the shoulder closest to the variable message sign.
- On the inside of a "walk-in" variable message sign, near the middle of the panel opposite the door.

Also, the manufacturer's name, product name, model number, serial number, and city and state or province of manufacture shall be permanently marked on the outside and an easily accessible location inside the variable message sign.

These markings shall not be visible when viewing the front of the variable message sign straight-on.

TESTS

Design Approval. In order to get on the Approved list, design approval tests shall be conducted by the fabricator on one (1) or more samples of each equipment type, as approved by the Traffic Engineering and Highway Safety Director, to determine if the design of the equipment meets the requirements of this specification. In the case of standard product line equipment, the Traffic Engineering and Highway Safety Director may waive the design approval tests if:

- The manufacturer's written specifications (functional and environmental) are equal to or better than those specified in the contract documents and the manufacturer so states in writing; or
- The manufacturer provides certification by an independent testing laboratory that these design approval tests have been previously satisfactorily completed.

Performance. If specified in the Contract Documents, each variable message sign shall pass these performance tests both alone and fully integrated in the system:

- Factory Tests
- Installation Tests
- Pre-Acceptance Tests
- Project Acceptance Tests

A complete list of all equipment and system tests to be performed, including the testing plan and detailed testing procedures for each type of equipment, shall be submitted to the Engineer for approval. Test procedures shall be in accordance with the manufacturer's recommendations and shall demonstrate all functional requirements.

A minimum of two (2) weeks written notification will be provided for the witnessing of all testing, after approval of the testing plan and the appropriate testing procedures.

If a unit has been modified as a result of a test failure, a report shall be prepared and delivered to the Engineer prior to re-testing of the equipment. The report shall describe the nature of the failure and the corrective action taken. If the Engineer determines that a failure pattern exists, then design and construction modifications shall be made to all equipment without additional cost to the State or extension of the contract period. The Engineer will forward copies of the reports of modifications to the Regional Traffic and Safety Engineer, and to the Materials Bureau.

§730

Rejected equipment may be offered again for retest provided all non-compliances have been corrected and retested by the Contractor. The contractor shall submit evidence that the sign(s) have passed, to the Engineer with the request and the schedule to rewitness the performance tests.

BASIS OF ACCEPTANCE. Variable message signs will be accepted based on the following:

- The manufacturer's name, product name or model number, and drawing number and date, appearing on the Department's Approved List.
- Submission of approved shop drawings, for each different variable message sign supplied.
- Manufacturer's written certification of compliance to these specifications and the approved shop drawings.
- If required by the Engineer or the approved shop drawings, submission of mill certifications for structural materials.
- Passing all performance tests in the specification.

Final inspection and acceptance of equipment shall be made after installation at the locations specified on the plans.

SECTION 731 – SUBSURFACE TENSILE ELEMENTS

731-01 SOIL NAIL TENDON ASSEMBLY

SCOPE. This specification covers the material requirements for the components for assembling a soil nail tendon generally used in a Soil Nail Wall System (SNWS) to internally stabilize a cut and/or underpin a structure.

MATERIAL REQUIREMENTS.

A. SNWS Solid Bar Nail Tendons. Provide clean, straight, rust-free bar tendons meeting AASHTO M31 of Grade 60 or 75, ASTM A722 for Grade 150. The deformed bar, continuous without splices or welds, undamaged, bare or epoxy coated or encapsulated (as shown on the approved Working Drawings), shall be threaded a minimum of 6 in. on the wall anchorage end to allow proper attachment of bearing plate and nut. Threading may be continuous spiral, deformed ribbing provided by the bar deformations (continuous threadbars) or may be cut into a reinforcing bar. If threads are cut into a reinforcing bar, the bar shall be sized based on the net throat of the threads.

B. SNWS Epoxy Coating. Provide epoxy coating conforming to the requirements of §709-04 *Epoxy-Coated Bar Reinforcement*. The Bend Test requirements are waived.

C. SNWS Encapsulation. Provide a minimum 40 mil thick corrugated HDPE tube conforming to AASHTO M252 or corrugated PVC tube conforming to ASTM D1784, Class 13464-B. Encapsulation shall provide at least 3/16 in. of grout cover over the nail bar and be resistant to ultraviolet light degradation, normal handling stresses, and grouting pressures. Factory fabrication of the encapsulation is preferred. Upon the Engineer's approval, the encapsulation may be field fabricated if done in strict accordance with the manufacturer's recommendations.

D. SNWS Centralizers. Provide centralizers manufactured from Schedule 80 PVC pipe or tube, steel, or any material not detrimental to the nail steel, except that wood shall not be used, and approved by the Engineer.

E. SNWS Bar Couplers. Provide bar couplers capable of developing 100% of the Guaranteed Ultimate Tensile Strength (GUTS) of the bar as certified by the manufacturer.

BASIS OF APPROVAL. Soil Nail Tendons will be approved based on the evaluation of the design submittal detailing the requirements of the assembly.

BASIS OF ACCEPTANCE. Soil nail centralizers, epoxy coating or encapsulation will be accepted on the basis of a material certification that the product conforms to this specification. Solid bar nail tendons and bar couplers (if allowed) will be accepted on the basis of a material certification that the product conforms to this specification and certified mill test results from each heat specifying the ultimate strength, yield strength, elongation, and composition indicating conformance to the design submittal and specification.

731-02 GROUDED TIEBACK ASSEMBLY

SCOPE. This specification covers the material requirements for the components for assembling a grouted tieback generally used in a Grouted Tieback System (GTS) to internally stabilize and supplement the resisting force of an external support system retaining a cut and/or underpinning a structure.

MATERIAL REQUIREMENTS.

A. GTS Tendons. Provide clean, straight, rust-free tendons meeting the following:

1. "Uncoated Seven-Wire Stress Relieved Strand for Prestressed Concrete" - ASTM A416, or "Uncoated Seven-Wire Compacted Stress Relieved Strand for Prestressed Concrete" - ASTM A779, or
2. Continuously threaded "Uncoated High-Strength Steel Bar for Prestressing Concrete" - ASTM A722.

The tendons shall be of such size that the design load does not exceed 53% of the Guaranteed Ultimate Tensile Strength (GUTS) of the tendons.

B. GTS Couplers. Provide couplers for tendons capable of developing 100% of the GUTS.

C. GTS Sheath. Provide a sheath for corrosion protection encasing the entire stressing length of the tendon. Acceptable sheaths for the stressing length shall be one of the following:

1. A polyethylene (PE) tube applied over a corrosion inhibiting grease coated strand. The polyethylene shall be Type II, III or IV as defined by ASTM D1248. The tubing shall have a minimum wall thickness of 60 mils.
2. A hot-melt extruded polypropylene tube applied over a corrosion inhibiting grease coated strand. The polypropylene shall PP 210 B55542-11 as defined as ASTM D4101. The tubing shall have a minimum wall thickness of 60 mils.
3. A corrugated PVC tube applied over a corrosion inhibiting grease coated strand. The PVC tube shall conform to ASTM D1784 Class 13464-B. The tubing shall have a minimum wall thickness of 60 mils.
4. A heat shrinkable tube coated with an elastic adhesive applied over bar tendons. Prior to shrinking the tube shall have a nominal wall thickness of at least 24 mils and the elastic adhesive inside the tube shall have a nominal thickness of 20 mils. A smooth bond breaker shall be placed around the heat shrinkable tube in the free length.

D. GTS Grease. Provide a grease compound for corrosion inhibiting and lubricating properties to completely cover the steel in the stressing length. Provide grease for the stressing length meeting the requirements shown in Table 731-02-1 *Grease Properties*:

TABLE 731-02-1 GREASE PROPERTIES		
Property	Test Method	Acceptance Criteria
Dropping Point	ASTM D566	Minimum 300° F
Oil Separation @ 160° F	FTMS 791B Method 321.2	0.5% Maximum by mass
Water Content	ASTM D95	0.1% Maximum
Flash Point	ASTM D92	Minimum 300° F

TABLE 731-02-1 GREASE PROPERTIES			
Accelerated Corrosion Test: 5% Salt Fog @ 100° F @ 5 mil, min. hrs, Q Panel Type S		ASTM B117	Rust Grade 7 or better after 1000 hrs. of exposure according to ASTM D610
Water Soluble Ions	Chlorides	ASTM D512	10 ppm Maximum
	Sulfides	ASTM D4500-S ² E	10 ppm Maximum
	Nitrates	ASTM D3867	10 ppm Maximum
Soak Test: 5% Salt Fog @ 100° F @ 5 mil coating, Q Panel Type S. (Immerse panels 50% in a 5% salt solution and expose to salt fog).		ASTM B117 (modified)	No emulsification of the coating after 720 hrs. of exposure.
Sheathing	Hardness Change	ASTM D4289	15% Change
Compatibility: 40 days @ 150° F	Volume Change	ASTM D4289	10% Change
	Tensile Strength Change	ASTM D638	30% Change

E. GTS Encapsulation. Provide encapsulation consisting of a tube of corrugated PVC, high density polyethylene or steel. The encapsulation shall have sufficient thickness to resist damage due to shipping, handling and installation.

F. GTS Centralizers and Spacers. Provide centralizers and spacers consisting of plastic, steel or any material not detrimental to the tendon. Wood shall not be used. Centralizers and spacers shall permit free flow of grout. Combination centralizer/spacers will be permitted.

G. GTS Trumpet. Provide a trumpet integral with the bearing plate. The trumpet shall consist of an epoxy coated steel pipe or tube conforming to the requirements of ASTM A53 for pipe or ASTM A500 for tubing. The trumpet shall have an inside diameter equal to or larger than the hole in the bearing plate, and shall be long enough to accommodate movements of the structure during loading and testing. For encapsulated strand tendons, the trumpet shall be long enough to enable the tendon to make a transition from the diameter of the tendon in the stressing length to the diameter of the tendon at the anchor head without damaging the encapsulation. A seal to retain grease or grout within the trumpet shall be provided between the trumpet and the stressing length corrosion protection. If grout is used to fill the trumpet, then the seal shall be a deformable seal. If grease is used to fill the trumpet, a description of the seal shall be submitted to the Engineer for approval.

BASIS OF APPROVAL. Grouted Tiebacks will be approved based on the evaluation of the design submittal detailing the requirements of the assembly.

BASIS OF ACCEPTANCE. Grouted Tieback Assembly will be accepted on the basis of a Material Certification for the grouted tieback centralizers and spacers, encapsulation, sheath, trumpet, and grease compound.

Grouted tieback tendons and couplers (if allowed) will be accepted on the basis of a material certification and certified mill test results from each heat specifying the ultimate strength, yield strength, elongation, and composition indicating conformance to the design submittal and this [specification](#).

Comment [c148]:
EI08047

731-03 - ROCK BOLT ASSEMBLY

SCOPE. This specification covers the material requirements for the components for assembling a rock bolt generally used in reinforcing a rock slope or as part of a rock catchment system. The following materials are evaluated in this specification:

731.0301 – Rock Bolt Assembly, 1 in. Diameter Steel Bar

731.0302 – Rock Bolt Assembly, 1 ¼ in. Diameter Steel Bar

MATERIAL REQUIREMENTS.

A. Bolts. Provide bolts of at least Grade 150 (ASTM A722) prestressing steel of the diameter shown in the contract documents. Bolts must have rolled thread-like deformations over the entire length.

B. Appurtenances. Provide appurtenances as recommended by the bolt manufacturer for the size and grade bolt supplied, consisting of a steel bearing plate, a hardened washer, if required, and a convex bottom anchor nut. Two beveled or wedge washers per bolt may be required. The upper, or bearing washer, shall be countersunk on the side opposite the bevel to match the bottom of the anchor nut.

C. Resin. Provide resin of the two-component type, and of two different setting times, specifically manufactured for rock bolting. Use only resin that is within the unexpired shelf life designated on the package by the manufacturer.

Provide cartridges of the appropriate diameter as recommended by the manufacturer for the bolt/drill hole/cartridge diameter combination used. Furnish sufficient fast setting resin to fill 3 ft. of annular space in the bottom of the hole. Greater amounts of fast setting resin will be necessary in some rock types to meet the pull test requirements. Furnish slower setting resin with a setting time of no less than fifteen minutes. Install enough slow setting resin in the remainder of the hole to fully encapsulate the bolt.

BASIS OF ACCEPTANCE. Rock bolts and appurtenances will be accepted on the basis of a material certification that the product conforms to this specification and certified mill test results from each heat specifying the ultimate strength, yield strength, elongation, and composition indicating conformance to the specification. Larger diameter bolts are acceptable if supplied at no additional cost to the State.

Rock bolt resin will be accepted on the basis of a material certification that the product conforms to this specification.

EI10005

Comment [c150]:
EI08-047

~~SECTION 731 (VACANT)~~

SECTION 732 - DRILLING

732-01 DRILL RIGS

SCOPE. This specification covers the equipment and performance requirements for drill rigs.

GENERAL. Drill rigs shall be specifically designed and manufactured for drilling, coring and sampling soil and rock.

EQUIPMENT. Drill rigs shall have adequate capacity and power to accomplish the required work. Each rig shall be supplemented with the necessary auxiliaries, appurtenances, tools and other equipment required for proper operation.

BASIS OF ACCEPTANCE. The rigs and all necessary auxiliaries, appurtenances, tools, barges, platforms, support vessels and equipment shall be acceptable to the Engineer. Drill rigs that are not adequate, as determined by the Engineer, will not be permitted for use. Drill rigs required under the items for furnishing equipment including drive hammers, all necessary auxiliaries, appurtenances, tools, barges, platforms, support vessels and other equipment must be on site, inspected and approved by the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau before any work is done by that rig. Each rig shall be complete and sharing of equipment between rigs will not be permitted.

732-02 DRIVE PIPE

SCOPE. This specification covers the material and quality requirements for drive pipe used in subsurface explorations.

§732

MATERIAL REQUIREMENTS. Drive pipe shall be extra strong steel pipe, 2 1/2 inch or 4 inch nominal diameter as specified, with threaded ends in random 5 foot lengths and shall conform to the requirements of ASTM A120, Schedule 80.

BASIS OF ACCEPTANCE. Drive pipe shall be subject to inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-03 CASING

SCOPE. This specification covers the material and quality requirements for casing used in subsurface explorations.

MATERIAL REQUIREMENTS. The casing shall be diamond drill flush-joint or flush coupled type, fabricated from high quality seamless steel tubing conforming to the requirements of the Diamond Core Drill Manufacturer's Association (DCDMA) Standards. The design shall permit any size casing to telescope into the next larger size.

BASIS OF ACCEPTANCE. Casing shall be subject to inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-04 SAMPLERS

SCOPE. This specification covers the material requirements for split barrel samplers.

MATERIAL REQUIREMENTS. Samplers shall be equipped with a ball check in the head section and have a minimum inside length of 20 inches. Samplers shall conform to the following sizes:

Sampler Diameter (Inches)	Outside Diameter (Inches)	Cutting Shoe Opening (Inches)
2	2	1 ³ / ₈
2½	2½	1 ⁷ / ₈
3	3	2 ³ / ₈
3½	3½	2 ⁷ / ₈

~~**MATERIAL REQUIREMENTS.** Samplers shall be equipped with a ball check in the head section and have a minimum inside length of 20 inches. For 2 inch diameter samplers, the outside diameter shall be 2 inches and the cutting shoe opening shall be 1 3/8 inches. For 2 1/2 inch samplers the outside diameter shall be 2 1/2 inches and the cutting shoe opening shall be 1 3/8 inches. For 3 inch samplers the outside diameter shall be 3 inches and the cutting shoe opening shall be 2 3/8 inches. For 3 1/2 inch diameter samplers, the outside diameter shall be 3 1/2 inches and the cutting shoe opening shall be 2 7/8 inches.~~

BASIS OF ACCEPTANCE. Samplers shall be subject to the inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-05 THIN WALL SAMPLE TUBES

SCOPE. This specification covers the material and quality requirements for thin wall sample tubes.

MATERIAL REQUIREMENTS. Thin walled sample tubes shall be fabricated from Type 304 stainless steel tubing meeting the requirements of ASTM A276 as specified for a nominal 3 1/2 inch O.D. seamless or welded tubing with nominal 0.065 inch wall thickness. Specific dimensions and fabrication details shall comply with the current Geotechnical Engineering Bureau Drawing entitled "Stainless Tube for 3 1/2 inch Undisturbed Soil Samples." Liners for 3 1/2 inch samplers shall have an outside diameter of 3 inches and shall be 18 inches long. Liners shall be fabricated of brass or stainless steel only.

BASIS OF ACCEPTANCE. Sample tubes shall be subject to the inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-06 CORING BITS

SCOPE. This specification covers the material requirements for coring bits used in Subsurface explorations.

MATERIAL REQUIREMENTS. Coring bits shall be four sizes: AX, BX, NX and HX. The bits shall meet the outside diameter requirements specified by the National Bureau of Standards and the Diamond Core Drill Manufacturer's Association.

BASIS OF ACCEPTANCE. Coring bits shall be subject to inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-07 SAMPLE STORAGE BAGS

SCOPE. This specification covers the material requirements for sample storage bags used for containing soil samples.

MATERIAL REQUIREMENTS. Sample storage bags shall be moisture-proof, transparent, plastic bags with minimum dimensions of 8 inches long, 10 inches wide and 2 mils thick.

BASIS OF ACCEPTANCE. Sample storage bags shall be subject to inspection and approval of the Engineer.

732-08 SAMPLE JARS

SCOPE. This specification covers the material requirements for sample jars used for containing soil samples.

MATERIAL REQUIREMENTS. Sample jars shall be glass, or plastic, wide-mouthed jars of one-quart capacity with air-tight screw covers fitted with rubber compo-lined caps.

BASIS OF ACCEPTANCE. Sample jars shall be subject to inspection and approval of the Engineer.

732-09 JAR CARTONS

SCOPE. This specification covers the material and fabrication requirements for jar cartons used to contain soil sample jars.

MATERIAL AND FABRICATION REQUIREMENTS. Jar cartons shall consist of corrugated Kraft paper cardboard fabricated into a box with overall nominal dimensions of 12 inches wide, 16 inches ~~±~~ ~~3/4 inches~~ long and 7 inches deep. The box shall be partitioned and have sufficient strength to safely support twelve (12) sample jars conforming to §732-08 in a 3 x 4 array.

BASIS OF ACCEPTANCE. Jar cartons shall be subject to inspection and approval of the Engineer.

732-10 BOULDER AND ROCK CORE BOXES

SCOPE. This specification covers the material and fabrication requirements for boxes used to contain core samples of boulders and rock.

MATERIAL AND FABRICATION REQUIREMENTS. Boxes shall be fabricated of white pine, Grade No. 2 common or better, 1 inch stock (finished $\frac{3}{4}$ inch) thickness or an approved equal material and conform to the overall box dimensions given below:

Core Box Size	Length (Inches)	Width (Inches)	Height (Inches)
"AX"	61½	9⅝	2¾
"BX"	61½	10¾	3¼
"NX"	61½	10⅞	3¾
"HX"	61½	11⅞	4⅞

Core rows shall be separated by wooden or tempered hardboard, $\frac{1}{8}$ inch thick strips recessed to $\frac{3}{8}$ inch depth and glued with waterproof glue at the bottom and ends of the box. ~~**MATERIAL AND FABRICATION REQUIREMENTS.** Boxes shall be fabricated of white pine, Grade No. 2 common or better, 1 inch stock (finished $\frac{3}{4}$ inch) thickness or an approved equal material. Overall box dimensions for "AX" cores shall be 61 1/2 inches long, 9 5/8 inches wide and 2 3/4 inches high. Dimensions for "BX" core boxes shall be 61 1/2 inches long, 10 7/8 inches wide and 3 1/4 inches high. Dimensions for "NX" core boxes shall be 61 1/2 inches long, 10 7/8 inches and 3 3/4 inches high. Dimensions for "HX" core boxes shall be 61 1/2 inches long, 11 1/8 inches wide and 4 5/8 inches high. Core rows shall be separated by wooden or tempered hardboard, 1/8 inch thick strips recessed to 3/8 inch depth and glued with waterproof glue at the bottom and ends of the box.~~

Box covers shall be hinged with two, 2 inch steel butt hinges recessed and fastened with flat head wood screws. Box covers shall be secured in a closed position by two 1 1/2 inch hook and eye fasteners. All boxes shall be coated with weatherproof wood preservative. Details are specified on the current Geotechnical Engineering Bureau Drawing entitled "Core Box AX, BX, NX and HX Sizes."

BASIS OF ACCEPTANCE. Core boxes shall be subject to inspection and approval of the Engineer in conjunction with a representative of the Geotechnical Engineering Bureau.

732-11 OPEN WELL PIEZOMETER

SCOPE. This specification covers the material requirements for open well piezometers.

MATERIAL REQUIREMENTS. Monitoring pipe-riser pipe shall be 1 inch (nominal diameter) threaded PVC schedule 40 pipe. Slotted screen pipe shall be 5 feet long and be 1 inch (nominal diameter) threaded PVC schedule 40 pipe. Caps shall be 1 inch (nominal diameter) PVC schedule 40 threaded male cap for the top, and 1 inch (nominal diameter) PVC schedule 40 threaded female cap for the bottom.

Sand. Provide well rounded, uniformly graded silica sand, which is correctly sized to the slotted screen. Ottawa sand is acceptable.

Bentonite pellets. Provide 1/4 inch (nominal diameter) bentonite pellets.

Manhole. Provide a 8 inch (inside diameter) steel flush mount manhole with a 8 inch skirt.

Cement. The material shall meet the requirements of §701-01 Portland Cement Type 1 or 2.

Water. The water for the mix shall conform to the requirements of §712-01 Water.

Bentonite Powder. There are no material requirements for the bentonite, except it shall be supplied in powder form from a reputable manufacturer and pass a No. 200 sieve.

BASIS OF ACCEPTANCE. Materials used for the installation of open well piezometers shall be subject to inspection and approval of the Engineer.

732-12 GROUT

SCOPE. This specification covers the material requirements for the grouting of bore holes.

MATERIAL REQUIREMENTS.

Cement. The material shall meet the requirements of §701-01 Portland Cement Type 1 or 2.

Water. The water for the mix shall conform to the requirements of §712-01 Water.

Bentonite Powder. There are no material requirements for the bentonite, except it shall be supplied in powder form from a reputable manufacturer and pass a No. 200 sieve. ~~**MATERIAL REQUIREMENTS. For cement, the material shall meet the requirements of §701-01.**~~

~~**Portland Cement Type 1 or 2.** Water for the mix shall conform to the requirements of §712-01.~~

~~**Water.** There are no material requirements for the bentonite, except it shall be supplied in powder form from a reputable manufacturer and pass a No. 200 sieve.~~

BASIS OF ACCEPTANCE. The grout shall be subject to inspection and approval of the Engineer.

SECTION 733 – EARTHWORK MATERIALS

Comment [c151]:
EI09027

733-01 – CONTROLLED LOW STRENGTH MATERIAL (CLSM)

SCOPE. This specification covers the material requirements and methods of testing CLSM generally used as a replacement for compacted soil backfill in sites where performing compaction is difficult and labor intensive.

GENERAL. Provide CLSM with a mix design based on the unconfined compressive strength requirements of the specification. Design the CLSM mix so that it sets within the time stated in the contract documents. If no set time is required, design the set time to meet Contractor’s operational requirements.

MATERIAL REQUIREMENTS.

A. MATERIAL. Provide CLSM containing cement and water. At the Contractor’s option, it may also contain fly ash (unless the No Fly Ash item is specified), aggregate, or chemical admixtures in any proportions such that the final product meets the strength and flow consistency requirements included in this specification.

Provide materials meeting the requirements of Table 733-01A *CLSM Material Requirements*:

TABLE 733-01A CLSM MATERIAL REQUIREMENTS	
Material	Subsection
Portland Cement, Type 1 or Type 2	§701-01
Water	§712-01

If used, provide materials meeting Table 733-01B *Requirements for Optional CLSM Material*:

TABLE 733-01B REQUIREMENTS FOR OPTIONAL CLSM MATERIAL	
Material	Subsection
Aggregate Gradation	§703-07 <i>Concrete Sand</i>
Fly Ash	Provide fly ash that complies with the requirements of §711-10 <i>Fly Ash</i> . Waive the loss on ignition requirement.

TABLE 733-01B REQUIREMENTS FOR OPTIONAL CLSM MATERIAL	
Chemical Admixtures	Provide admixtures that comply with §711-08 <i>Admixtures</i> . The mix may include high air generators manufactured for CLSM.

B. UNCONFINED COMPRESSIVE STRENGTH. Provide CLSM with a mix design generating an unconfined compressive strength in Table 733-01C *CLSM Unconfined Compressive Strength*:

TABLE 733-01C CLSM UNCONFINED COMPRESSIVE STRENGTH	
Test Age	Unconfined Compressive Strength
28 days	40 psi ≤ q_u ≤ 150 psi

SAMPLING AND TESTING.

A. SPREAD DIAMETER. Provide CLSM that has, at the time of placement, a minimum diameter spread of 8 in. as determined by a Department Representative in accordance with ASTM D6103 *Standard Test Method for Flow Consistency of Controlled Low Strength Material (CLSM)*.

B. CYLINDER CAST. A Department Representative will cast three (3) specimens (cylinders) for each batch of CLSM for QA testing.

BASIS OF APPROVAL. Mix designs will be approved based on certification of the unconfined compressive strength meeting the requirements of the specification.

BASIS OF ACCEPTANCE. CLSM material will be accepted on the jobsite upon submission of an approved mix design to the Engineer.

CLSM material will be accepted as part of the contract quantities upon successful completion of the field tests and Quality Assurance (QA) program indicating the material conforms to the specification. In addition to the requirements of Section 106 *Control of Material*, the Department will sample and test CLSM to assure quality. Three (3) specimens (cylinders) will be cast for each batch in accordance with this specification and tested for unconfined compressive strength. A batch is defined as the amount of material that can be mixed at one time.

733-02 – MECHANICALLY STABILIZED EARTH SYSTEM BACKFILL MATERIAL

SCOPE. This specification covers the material requirements and methods of testing backfill material generally used for the construction of a MSES.

SAMPLING. Perform material tests and assurance methods pertaining to the backfill requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

GENERAL. Provide backfill material for any MSES from a single source unless prior approval for use of designated multiple sources is obtained from the Director, GEB.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile the backfill material in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide backfill material of one of the following types:

- 1. Type A.** Material consisting of any mineral (inorganic) soil, blasted or broken rock, or similar materials of natural origin, including mixtures thereof, and having a gradation in accordance with TABLE 733-02A *Backfill Gradation*.

TABLE 733-02A BACKFILL GRADATION

TABLE 733-02A BACKFILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
4 in.	100
¼ in.	30-100
No. 40	0-60
No. 200	0-15

2. Type B. Material consisting of crushed stone conforming to §703-02 *Coarse Aggregate*, Size Designation 2.

3. Type C. Material consisting of recycled Portland Cement Concrete Aggregate (RCA). Type C backfill consists of at least 95%, by weight, of RCA and is free from organic and other deleterious material. Material may contain up to 5% by weight asphalt and/or brick. Gradation for Type C backfill conforms to Table 733-02A *Backfill Gradation*.

4. Type D. Material consisting of recycled Portland Cement Concrete Aggregate (RCA). Type D backfill consists of at least 95%, by weight, of RCA and is free from organic and other deleterious material. Material may contain up to 5% by weight asphalt and/or brick. Gradation for Type D backfill conforms to §703-02 *Coarse Aggregate*, Size Designation 2.

C. PLASTICITY INDEX. Provide material having a Plasticity Index not exceeding 5.

D. DURABILITY. Provide material having a Magnesium Sulfate Soundness loss less than 30 percent.

E. CORROSION POTENTIAL (METAL REINFORCING AND/OR CONNECTORS ONLY).

The Department will test for the corrosion potential of any system with exposed metal in the backfill. Stockpiled materials will be tested for resistivity and pH, and may be tested for sulfides at the Department's discretion. Material failing to meet the following requirements of Table 733-02B *Resistivity, Soluble Salts and pH Requirements*, will be rejected except as specified below:

Material failing to meet the resistivity criterion may be tested for sulfate and chlorides. Material meeting the criteria for both sulfates and chlorides and having a resistivity greater than 10 ohm-m will be acceptable. Chemical testing (i.e. resistivity, sulfate ion content, sulfide ion content, and chloride ion content) is not required for Type B backfill or for Type D backfill.

TABLE 733-02B RESISTIVITY, SOLUBLE SALTS AND pH REQUIREMENTS		
Property	Test Method	Acceptance Criteria
Resistivity	AASHTO T288	$\rho \geq 30$ ohm-m
Chlorides	AASHTO T291 Method A	$Cl^- \leq 100$ mg/kg
Sulfates	AASHTO T290 Method A, gravimetric	$SO_4^{2-} \leq 200$ mg/kg
	AASHTO T290 Method B, turbidmetric	
Sulfides	NYSDOT Test Method 711-12C	$S^{2-} \leq 300$ mg/kg
pH	Type A or C	$5 \leq pH \leq 10$
	Type B or D	$5 \leq pH \leq 12.5$

BASIS OF APPROVAL. Stockpiles of MSES backfill material will be approved by the GEB in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*” and the procedural directives of the GEB.

BASIS OF ACCEPTANCE. Backfill material from approved stockpiles will be accepted on the contract site by delivery ticket. Each delivery ticket shall identify the Suppliers name, date, NYSDOT contract number, stockpile number, item number and quantity.

Backfill material from approved stockpiles will be accepted as part of the MSES upon confirmation that the material gradation type provided by the Contractor, outlined in §733-02B *Gradation*, conforms to the MSES submittal provided by the wall system designer-supplier and upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. In addition to the requirements of Section 106 *Control of Material*, the Department will sample and test backfill taken from behind the newly-constructed wall to assure quality. The number of samples and their locations (plan and elevation) will be determined by the quantity of material to be used in each MSES structure. Results from chemical testing (i.e. resistivity, sulfate ion content, sulfide ion content, and chloride ion content) can take several weeks to obtain.

733-03 – GEOSYNTHETIC REINFORCED EARTH SYSTEM SLOPE BACKFILL MATERIAL

SCOPE. This specification covers the material requirements and methods of testing backfill material generally used for the construction of over steepened slopes utilizing Geosynthetic Reinforced Earth System (GRES).

SAMPLING. Obtain a representative sample of the source for the performance of a gradation analysis in accordance with the procedures contained in the geotechnical test method “*Test Method for the Grain-Size Analysis of Granular Soil Materials*”.

MATERIAL REQUIREMENTS. Any mineral (inorganic) soil, blasted or broken rock, or similar materials of natural origin, including mixtures thereof, may be suitable materials subject to the following:

A. GRADATION. Provide backfill material conforming to the following:

1. Gradation Spread. Provide backfill material having a gradation in accordance with TABLE 733-03A *Backfill Gradation*.

TABLE 733-03A BACKFILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
6 in.	100
No. 40	0-60
No. 200	0-40

2. Gradation Ratio. Provide backfill material having a gradation ratio in accordance with the following formula:

$$\frac{\text{Percent Pass. No.200 sieve}}{\text{Percent Pass. No.40 sieve}} \times 100 \leq 70$$

The gradation is evaluated at the contract level.

BASIS OF APPROVAL. Sources will be approved upon successful completion of the gradation tests indicating that the material conforms to the specification.

BASIS OF ACCEPTANCE. Backfill material will be accepted based upon successful completion of the gradation tests indicating that the material conforms to the specification.

733-04 – SUBBASE COURSE

SCOPE. This specification covers the material requirements and methods of testing subbase material generally used in the construction of a pavement structure. The following subbase types are evaluated in this specification:

- 733.0401 – Subbase Course, Type 1
- 733.0402 – Subbase Course, Type 2
- 733.0403 – Subbase Course, Type 3
- 733.0404 – Subbase Course, Type 4

Subbase course types are based on the gradation of the material as outlined in Table 733-04A *Subbase Gradation*.

SAMPLING. Perform material tests and assurance methods pertaining to subbase requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

GENERAL. Provide suitable material conforming to the requirements of Section 203 *Excavation and Embankment* and to the requirements contained herein.

MATERIAL REQUIREMENTS. For Types 1, 3 and 4 furnish materials consisting of approved Blast Furnace Slag, Stone, Sand, and Gravel, or blends of these materials.

For Type 2, furnish materials consisting of approved Blast Furnace Slag or of Stone which is the product of crushing or blasting ledge rock, or a blend of Blast Furnace Slag and of Stone.

A. STOCKPILE. Stockpile subbase material in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*” except as noted herein.

1. Type 3. Material furnished under Type 3 will not be required to be stockpiled unless it contains RCA, glass, or Corian®.

2. Recycled Materials, Alternate C. Stockpiling of the Reclaimed Asphalt Pavement (RAP) for Alternate C is not required.

B. GRADATION. Provide subbase material having a gradation in accordance with TABLE 733-04A *Subbase Gradation*.

TABLE 733-04A SUBBASE GRADATION				
Sieve Size Designation	Percentage Passing by Weight			
	Type 1	Type 2	Type 3	Type 4
4 in.	-	-	100	-
3 in.	100	-	-	-
2 in.	90-100	100	-	100
¾ in.	30-65	25-60	30-75	30-65
No. 40	5-40	5-40	5-40	5-40
No. 200	0-10	0-10	0-10	0-10

C. PLASTICITY INDEX. Provide material having a Plasticity Index based on the material passing the No. 40 mesh sieve equal to or less than 5.0.

D. DURABILITY.

1. Types 1, 2 and 4. Provide material for Types 1, 2 and 4 having a Magnesium Sulfate Soundness loss less than 20% after four (4) cycles, unless material meeting the requirements of *Alternate C* (F. Recycled Materials) is used.

2. Type 3. Provide material for Type 3 having a Magnesium Sulfate Soundness loss less than 30% after four (4) cycles.

E. ELONGATED PARTICLES. A flat or elongated particle is defined herein as one which has its greatest dimension more than three (3) times its least dimension. Provide material consisting of particles where not more than 30%, by weight, of the particles retained on a ½ in. sieve is flat or elongated. When the State elects to test for this requirement, material with a percentage greater than 30 will be rejected. Acceptance for this requirement will normally be based on a visual inspection by the Regional Geotechnical Engineer.

F. RECYCLED MATERIALS. The following materials are an acceptable replacement for Types 1, 3 and 4. Only one alternate shall be selected for use per stockpile.

- **Alternate A.** Recycled Portland Cement Concrete Aggregate (RCA) meeting the requirements of §733-07 Recycled Portland Cement Concrete Aggregate, Alternate A.
- **Alternate B.** Recycled Portland Cement Concrete Aggregate (RCA) meeting the requirements of §733-07 Recycled Portland Cement Concrete Aggregate, Alternate B.
- **Alternate C.** Reclaimed Asphalt Pavement (RAP) meeting the requirements of §733-06 Reclaimed Asphalt Pavement for Earthwork and Subbase.
- **Alternate D.** Blends of Blast Furnace Slag, Stone, Sand, and Gravel, with not more than 30% by weight of glass. Glass shall meet the requirements of §733-05 Glass Backfill.
- **Alternate E.** Blend of Alternate A with not more than 5% by weight of Corian®. Corian® shall meet the requirements of §733-19 Corian® Backfill.
- **Alternate F.** Blend of Alternate B with not more than 5% by weight of Corian®. Corian® shall meet the requirements of §733-19 Corian® Backfill.

G. MATERIAL FOR TEMPORARY WORK. Material used as a subbase for the construction of temporary work may be approved by a Departmental Geotechnical Engineer by visual inspection in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”. Do not permanently incorporate material so approved into the work without following the appropriate acceptance procedure.

BASIS OF APPROVAL. Stockpiles of subbase material will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

BASIS OF ACCEPTANCE. Subbase material from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, subbase material will be accepted upon the basis of the stockpile approval.

733-05 – GLASS BACKFILL

SCOPE. This specification covers the material requirements and methods of assessing glass backfill material generally used as fill material.

SAMPLING. Perform material tests and assurance methods pertaining to the glass backfill requirements in conformance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile glass backfill material in accordance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide glass crushed to a maximum particle size of 3/8 in. The material shall be subject to visual inspection by the Regional Geotechnical Engineer.

C. CHARACTERISTICS. Glass may contain up to a maximum of 5% by volume of china, ceramics, plate glass products, paper, plastics or other deleterious materials.

BASIS OF APPROVAL. Glass backfill will be approved in accordance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

The material shall be subject to visual inspection by the Regional Geotechnical Engineer.

BASIS OF ACCEPTANCE. Approved glass backfill material will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, glass backfill material will be accepted upon the basis of the stockpile approval.

733-06 – RECLAIMED ASPHALT PAVEMENT FOR EARTHWORK AND SUBBASE

SCOPE. This specification covers the material requirements and methods of assessing Reclaimed Asphalt Pavement (RAP) generally used as fill material.

SAMPLING. Perform material tests and assurance methods pertaining to the RAP requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide written documentation that the reclaimed bituminous material originated on a Department project. Include an identifier, such as State Highway number, construction contract number or Department Project Identification Number (PIN).

B. GRADATION.

1. Gradation Spread. Provide RAP having a maximum top size of 2 in. at the time of placement.

2. Elongated Particles. A flat or elongated particle is defined herein as one which has its greatest dimension more than three (3) times its least dimension. Provide material consisting of particles where not more than 30%, by weight, of the particles retained on a ½ in. sieve are flat or elongated. When the State elects to test for this requirement, material with a percentage greater than 30 will be rejected. Acceptance for this requirement will normally be based on a visual inspection by the Regional Geotechnical Engineer.

C. CHARACTERISTICS. Bituminous material that is well-graded from coarse to fine and free from organic or other deleterious material, including tar. This material is at least 95%, by weight, reclaimed bituminous material. No soundness or Plasticity Index testing will be required.

BASIS OF APPROVAL. RAP will be approved based upon a visual inspection by the Regional Geotechnical Engineer.

BASIS OF ACCEPTANCE. If this material becomes unstable during construction, it may be necessary to add a mixture of natural suitable material to the RAP. Acceptance of the final product will be based on an evaluation by the Engineer.

Approved RAP will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, RAP will be accepted upon the basis of the visual inspection by the Regional Geotechnical Engineer.

733-07 – RECYCLED PORTLAND CEMENT CONCRETE AGGREGATE

SCOPE. This specification covers the material requirements and methods of testing Recycled Portland Cement Concrete Aggregate (RCA) generally used as fill material. The following RCA types are evaluated in this specification:

733.0701 – Recycled Portland Cement Concrete Aggregate

733.0702 – Recycled Portland Cement Concrete Aggregate Mixture

SAMPLING. Perform material tests and assurance methods pertaining to the RCA requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile RCA in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

If RCA comes from other than a Department project, provide documentation showing that the material obtained is from a NYSDEC registered or permitted construction and demolition (C&D) debris processing facility as specified in Section 360-16.1 of 6NYCRR Part 360, “Solid Waste Management Facilities”.

B. GRADATION.

1. Gradation Spread. Provide RCA meeting the gradation requirements for the appropriate item of use.

2. Elongated Particles. A flat or elongated particle is defined herein as one which has its greatest dimension more than three (3) times its least dimension. Provide material consisting of particles where not more than 30%, by weight, of the particles retained on a ½ in. sieve are flat or elongated. When the State elects to test for this requirement, material with a percentage greater than 30 will be rejected. Acceptance for this requirement will normally be based on a visual inspection by the Regional Geotechnical Engineer.

C. CHARACTERISTICS.

1. Alternate A. At least 95%, by weight, of Recycled Portland Cement Concrete Aggregate (RCA), and free from organic and other deleterious material. This material may contain up to 5% by weight asphalt and/or brick.

2. Alternate B. A mixture of Recycled Portland Cement Concrete Aggregate (RCA) conforming to Alternate A above mixed with stone, sand, gravel or blast furnace slag. This material may contain up to 5% by weight asphalt and/or brick.

BASIS OF APPROVAL. Stockpiles of RCA will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

BASIS OF ACCEPTANCE. RCA from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, RCA will be accepted upon the basis of the stockpile approval.

733-08 – EMBANKMENT IN PLACE

SCOPE. This specification covers the material requirements and methods of assessing material generally used for embankment construction.

MATERIAL REQUIREMENTS. In general, any mineral (inorganic) soil, blasted or broken rock and similar materials of natural or man made (i.e. recycled) origin, including mixtures thereof, are considered suitable materials.

A. GRADATION. Provide suitable backfill material having no particles with a dimension in excess of two-thirds of the loose lift thickness controlled by the compaction equipment supplied by the Contractor.

Glass incorporated into embankments shall be thoroughly mixed with other suitable material so that Glass constitutes no more than 30% by weight anywhere in the embankment.

The material shall be subject to visual inspection by the Engineer.

BASIS OF ACCEPTANCE. Embankment material will be accepted upon visual inspection by the Engineer.

733-09 – SELECT BORROW

SCOPE. This specification covers the material requirements and methods of testing select borrow material generally used for backfilling in areas beneath the watertable.

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures for non-stockpiled materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide backfill material from a source approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide material consisting of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles having no particles greater than 3 ft. in maximum dimension. Of the portion passing the 4 in. square sieve, the material shall have a gradation in accordance with TABLE 733-09A *Select Borrow Gradation*.

TABLE 733-09A SELECT BORROW GRADATION	
Sieve Size Designation	Percentage Passing by Weight
No. 40	0-70
No. 200	0-15

The gradation is evaluated at the project level.

C. DURABILITY. Provide material having a Magnesium Sulfate Soundness loss less than 35%.

D. COMPOSITION. RAP shall not be used.

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved select borrow backfill material from approved sources will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved select borrow material will be accepted upon successful completion of the gradation tests.

733-10 – SELECT FILL

SCOPE. This specification covers the material requirements and methods of testing select fill material generally used for backfilling in areas beneath the watertable.

SAMPLING. The sampling procedure contained in §733-09 *Select Borrow* shall apply.

MATERIAL REQUIREMENTS. The material requirements contained in §733-09 *Select Borrow* shall apply.

BASIS OF APPROVAL. The basis of approval contained in §733-09 *Select Borrow* shall apply.

BASIS OF ACCEPTANCE. The basis of acceptance contained in §733-09 *Select Borrow* shall apply.

733-11 – SELECT GRANULAR FILL

SCOPE. This specification covers the material requirements and methods of testing select granular fill material generally used for backfilling around pipes. The following materials are evaluated in this specification:

- 733.1101 – Select Granular Fill (Typical)
- 733.1102 – Select Granular Fill for Corrugated Aluminum Pipe

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures for non-stockpiled materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide backfill material from an approved source in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide material consisting of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles and conforming to the following requirements:

1. **Typical.** Except when used as backfill material for aluminum pipe with Type IR corrugations (Spiral Rib Pipe), the material shall have a gradation in accordance with TABLE 733-11A *Select Granular Fill Gradation*.

TABLE 733-11A SELECT GRANULAR FILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
4 in.	100
No. 40	0-70

TABLE 733-11A SELECT GRANULAR FILL GRADATION	
No. 200	0-15

2. Exception. When used as backfill for Corrugated Aluminum Pipe, Type 1R (Spiral Rib Pipe) 100% of the material shall also pass the 2 in. sieve.

The gradation is evaluated at the project level.

C. DURABILITY. Provide materials substantially free of shale and soft, poor durability particles. Provide material having a Magnesium Sulfate Soundness loss less than 30%.

D. COMPOSITION. RAP shall not be used.
When used as backfill for aluminum pipe, the material shall be free of Portland cement or Portland cement concrete.

E. pH. Where the State elects to test for this requirement, the material shall have a pH in accordance with TABLE 733-11B *Select Granular Fill pH Requirement*.

TABLE 733-11B SELECT GRANULAR FILL pH REQUIREMENT		
Property	Test Method	Acceptance Criteria
pH	NYSDOT GTM-24	$5 \leq pH \leq 10$

When RCA is used as backfill in a non-aluminum pipe application, the pH requirements are waived.

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved select granular fill backfill material from approved sources will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved select granular fill backfill material will be accepted upon successful completion of the gradation tests.

733-12 – SELECT GRANULAR FILL SLOPE PROTECTION

SCOPE. This specification covers the material requirements and methods of testing select granular fill slope protection material generally used for stabilizing sloughing slopes. The following materials are evaluated in this specification:

- 733.1201 – Select Granular Fill Slope Protection (Blasted Rock)
- 733.1202 – Select Granular Fill Slope Protection (Typical)

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures for non-stockpiled materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide backfill material from an approved source in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide material consisting of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles.

1. Broken or blasted unweathered rock used for this item shall be well graded, having no particles greater than 24 in. in maximum dimension, and be substantially free from particles greater than 12 in. in maximum dimension, containing little or no material passing the No. 10 mesh sieve.

2. All materials, other than broken or blasted unweathered rock, shall have a gradation in accordance with TABLE 733-12A *Select Granular Fill Slope Protection Gradation*.

TABLE 733-12A SELECT GRANULAR FILL SLOPE PROTECTION GRADATION	
Sieve Size Designation	Percentage Passing by Weight
24 in. maximum dimension	100
6 in. maximum dimension	90-100
2 in. square sieve	0-30
¼ in. sieve	0-10

The gradation is evaluated at the project level.

C. DURABILITY. Provide material having a Magnesium Sulfate Soundness loss less than 35%.

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved select granular fill slope protection backfill material from approved sources will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved select granular fill slope protection backfill material will be accepted upon successful completion of the gradation tests.

733-13 – SELECT GRANULAR SUBGRADE

SCOPE. This specification covers the material requirements and methods of testing select granular subgrade material generally used for backfilling undercuts. The following materials are evaluated in this specification:

- 733.1301 – Select Granular Subgrade (Blasted Rock)
- 733.1302 – Select Granular Subgrade (Typical)
- 733.1303 – Select Granular Subgrade (RCA)
- 733.1304 – Select Granular Subgrade (RCA Mixture)
- 733.1305 – Select Granular Subgrade (RAP)

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures for non-stockpiled materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide backfill material from an approved source in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide material consisting of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles.

1. Well graded rock may be used for this item. Particles shall not exceed 12 in. in greatest dimension nor $\frac{2}{3}$ of the loose lift thickness, whichever is less.
2. All materials, other than well graded rock, furnished under this item shall have no particles greater than 6 in. in maximum dimension. Of the portion passing the 4 in. square sieve, the material shall have a gradation in accordance with TABLE 733-13A *Select Granular Subgrade Gradation*.

TABLE 733-13A SELECT GRANULAR SUBGRADE GRADATION	
Sieve Size Designation	Percentage Passing by Weight
¼ in.	30-100
No. 40	0-50
No. 200	0-10

The gradation is evaluated at the project level.

C. DURABILITY. Provide material having a Magnesium Sulfate Soundness loss less than 35%.

D RECYCLED MATERIALS. The following materials are an acceptable replacement for natural material:

- **Alternate A.** Recycled Portland Cement Concrete Aggregate (RCA) meeting the requirements of §733-07 Recycled Portland Cement Concrete Aggregate, Alternate A.
- **Alternate B.** Recycled Portland Cement Concrete Aggregate (RCA) meeting the requirements of §733-07 Recycled Portland Cement Concrete Aggregate, Alternate B.
- **Alternate C.** Reclaimed Asphalt Pavement (RAP) meeting the requirements of §733-06 Reclaimed Asphalt Pavement for Earthwork and Subbase.

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved select granular subgrade backfill material from approved sources will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved select granular subgrade backfill material will be accepted upon successful completion of the gradation tests.

733-14 – SELECT STRUCTURAL FILL

SCOPE. This specification covers the material requirements and methods of testing select granular fill material generally used for backfilling behind structures.

SAMPLING. The sampling procedure contained in §733-11 *Select Granular Fill* shall apply.

MATERIAL REQUIREMENTS. The material requirements contained in §733-11 *Select Granular Fill* shall apply.

BASIS OF APPROVAL. The basis of approval contained in §733-11 *Select Granular Fill* shall apply.

BASIS OF ACCEPTANCE. The basis of acceptance contained in §733-11 *Select Granular Fill* shall apply.

733-15 – SAND BACKFILL

SCOPE. This specification covers the material requirements and methods of testing sand backfill generally used for backfilling around utilities.

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures for non-stockpiled materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide backfill material from an approved source in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide material have a gradation in accordance with TABLE 733-15A *Sand Backfill Gradation*.

TABLE 733-15A SAND BACKFILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
½ in.	100
¼ in.	90-100
No. 200	0-5

The gradation is evaluated at the project level.

C. DURABILITY. Provide materials substantially free of shale and soft, poor durability particles.

D. pH. Where the State elects to test for this requirement, the material shall have a pH in accordance with TABLE 733-15B *Sand Backfill pH Requirement*.

TABLE 733-15B SAND BACKFILL pH REQUIREMENT		
Property	Test Method	Acceptance Criteria
pH	NYSDOT GTM-24	$5 \leq pH \leq 10$

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved sand backfill material from approved sources will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved sand backfill material will be accepted upon successful completion of the gradation tests.

733-16 – WINTER EARTHWORK

SCOPE. This specification addresses the material requirements and methods of assessing earthwork materials placed during construction operations between November 1st and April 1st. The following materials are evaluated in this specification:

- 733.1601 – Winter Earthwork Material for Embankment In Place
- 733.1602 – Winter Earthwork Material for Select Borrow
- 733.1603 – Winter Earthwork Material for Select Fill
- 733.160401 – Winter Earthwork Material for Select Granular Fill (Typical)
- 733.160402 – Winter Earthwork Material for Select Granular Fill for Corrugated Aluminum Pipe
- 733.160501 – Winter Earthwork Material for Select Granular Subgrade (Blasted Rock)
- 733.160502 – Winter Earthwork Material for Select Granular Subgrade (Typical)
- 733.160503 – Winter Earthwork Material for Select Granular Subgrade (RCA)
- 733.160504 – Winter Earthwork Material for Select Granular Subgrade (RCA Mixture)
- 733.1606 – Winter Earthwork Material for Select Structural Fill
- 733.1607 – Winter Earthwork Material for GRES Slope Backfill

SAMPLING. Perform material tests and quality assurance methods pertaining to the backfill requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. SOURCE. Provide unfrozen backfill material from an approved source in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION.

1. Winter Earthwork Material for Embankment In Place. Provide material consisting of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles. The material shall have no particles greater than 12 in. in maximum dimension. The material shall have a gradation in accordance with TABLE 733-16A Gradation of Winter Earthwork Material.

TABLE 733-16A GRADATION OF WINTER EARTHWORK MATERIAL	
Sieve Size Designation	Percentage Passing by Weight
Maximum Dimension	100
0.5(Maximum Dimension)	0-50
¼ in.	0-10
No. 200	0-4

The gradation is evaluated at the project level.

2. Winter Earthwork Material for Select Borrow. Provide material meeting the requirements of §733-09 *Select Borrow* with the following gradation adjustment:

The material shall have no particles greater than 3 ft. in maximum dimension. The material shall have a gradation in accordance with TABLE 733-16A Gradation of Winter Earthwork Material. The gradation is evaluated at the project level.

3. Winter Earthwork Material for Select Fill. The material requirements contained in §733-16 B.2. *Winter Earthwork Material for Select Borrow* shall apply.

4. Winter Earthwork Material for Select Granular Fill. Provide material meeting the requirements of §733-11 *Select Granular Fill* with the following gradation adjustment:

The material shall have no particles greater than 4 in. in maximum dimension. The material shall have a gradation in accordance with TABLE 733-16A Gradation of Winter Earthwork Material. The gradation is evaluated at the project level.

5. Winter Earthwork Material for Select Granular Subgrade. Provide material meeting the requirements of §733-13 *Select Granular Subgrade* with the following material and gradation adjustment:

The material shall have no particles greater than 6 in. in maximum dimension. The material shall have a gradation in accordance with TABLE 733-16A Gradation of Winter Earthwork Material. RAP shall not be used. The gradation is evaluated at the project level.

6. Winter Earthwork Material for Select Structure Fill. The material requirements contained in §733-16 B.4. *Winter Earthwork Material for Select Granular Fill* shall apply.

7. Winter Earthwork Material for GRES Slope Backfill. The material requirements contained in §733-16 B.5. *Winter Earthwork Material for Select Granular Subgrade* shall apply.

C. CHARACTERISTICS.

1. No frozen material is to be incorporated into or be allowed to remain in any of the work.
2. Material of silt, clay, or high moisture content will not be permitted under any circumstances.

BASIS OF APPROVAL. Sources will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A preceding source evaluation will be valid for the time identified in the manual. For sources without a current evaluation, samples shall be obtained under the direction of the Departmental Geotechnical Engineer and will be tested and evaluated by the Geotechnical Engineering Bureau.

BASIS OF ACCEPTANCE. Approved winter earthwork material from approved sources for the substitution of embankment in place, select borrow, select fill, select granular fill, select granular subgrade, select structural fill, or GRES slope backfill will be accepted upon successful completion of the gradation tests and Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, approved winter earthwork material will be accepted upon successful completion of the gradation tests.

733-17 – SURFACE SETTLEMENT GAUGE

SCOPE. This specification covers the material requirements and methods of installation of the embankment construction control device surface settlement gauge generally used for monitoring embankment construction. The following materials are evaluated in this specification:

- 733.1701 – Surface Settlement Gauge (Pipe Gauge)
- 733.1702 – Surface Settlement Gauge (Manometer Gauge)

MATERIAL REQUIREMENTS. Provide material in conformance with the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” including:

A. PIPE GAUGE.

1. **Pipe.** Provide a minimum 2 ½ in. diameter metal pipe with steel flange meeting the requirements of §732-02 *Drive Pipe*. Provide a sufficient amount of pipe extensions to meet the rise requirements identified in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*”.
2. **Base.** Provide either of the following:
 - a. **Steel.** Provide a minimum ¼ in. thick steel plate meeting the requirements of §715-01 *Structural Steel*.
 - b. **Wood.** Provide wood to the sizes shown in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” conforming to the requirements of §712-14 *Stress Graded Timber and Lumber*. Treat wood in accordance with §708-31 *Wood*

Preservative - Waterborne and applied in conformance with American Wood Preservers Association (AWPA) Use Category Designation UC4B.

B. MANOMETER GAUGE. Provide materials specified for A. *Pipe Gauge* with the exception of the pipe extensions. To obtain readings from the buried device, provide the following connection:

1. Interconnection.

a. Tubing. Provide ½ in. O.D. polyethylene tubing indicated in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*”.

b. Sand. Provide sand conforming to the requirement of §703-07 *Concrete Sand*.

c. Fluid. Provide a 50-50 mixture of ethylene glycol and water.

2. Readout Box. Provide wood to the sizes shown in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” conforming to the requirements of §712-14 *Stress Graded Timber and Lumber*. Treat wood in accordance with §708-31 *Wood Preservative - Waterborne* and applied in conformance with American Wood Preservers Association (AWPA) Use Category Designation UC4B.

3. Base. Provide wood to the sizes shown in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” conforming to the requirements of §712-14 *Stress Graded Timber and Lumber*. Treat wood in accordance with §708-31 *Wood Preservative - Waterborne* and applied in conformance with American Wood Preservers Association (AWPA) Use Category Designation UC4B.

BASIS OF APPROVAL. The material shall be approved on the basis of manufacturer’s certification that the material conforms to the specification.

BASIS OF ACCEPTANCE. Approved material will be accepted upon successful assemblage and installation in accordance with the geotechnical control procedure “*Settlement Gauges and Settlement Rods*”.

733-18 – SETTLEMENT ROD

SCOPE. This specification covers the material requirements and methods of installation of the embankment construction control device settlement rod generally used for monitoring embankment construction.

MATERIAL REQUIREMENTS. Provide material in conformance with the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” including:

A. ROD. Provide a minimum ½ in. diameter steel rod meeting the requirements of §709-01 *Bar Reinforcement, Grade 60*.

B. PIPE. Provide a minimum 3 in. diameter metal pipe and cap meeting the requirements of §732-02 *Drive Pipe*.

BASIS OF APPROVAL. The material shall be approved on the basis of manufacturer’s certification that the material conforms to the specification.

BASIS OF ACCEPTANCE. Approved material will be accepted upon successful assemblage and installation in accordance with the geotechnical control procedure “*Settlement Gauges and Settlement Rods*”.

733-19 – CORIAN® BACKFILL

SCOPE. This specification covers the material requirements and methods of assessing Corian® backfill material generally used as fill material.

SAMPLING. Perform material tests and assurance methods pertaining to the Corian® backfill requirements in conformance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile Corian® backfill material in accordance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide Corian® crushed to a maximum particle size of 2 in. The material shall be subject to visual inspection by the Regional Geotechnical Engineer.

BASIS OF APPROVAL. Corian® backfill will be approved in accordance with the procedures for stockpiled granular materials contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

The material shall be subject to visual inspection by the Regional Geotechnical Engineer.

BASIS OF ACCEPTANCE. Approved Corian® backfill material will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, Corian® backfill material will be accepted upon the basis of the stockpile approval.

733-20 – UNDERDRAIN FILTER MATERIAL

SCOPE. This specification covers the material requirements and methods of testing underdrain filter material generally used in drainage systems. The following underdrain filter types are evaluated in this specification:

- 733.2001 – Underdrain Filter, Type 1
- 733.2002 – Underdrain Filter, Type 2

Underdrain filter types are based on the gradation of the material as outlined in Table 733-20A *Underdrain Filter Material Gradation*.

SAMPLING. Perform material tests and assurance methods pertaining to underdrain filter material requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile underdrain filter material in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*” except as noted herein.

B. GRADATION. Provide material consisting of crushed stone, sand, gravel, or screened gravel having a gradation in accordance with TABLE 733-20A *Underdrain Filter Material Gradation*.

TABLE 733-20A UNDERDRAIN FILTER MATERIAL GRADATION	
Sieve Size	Percentage Passing by Weight

Designation	Type 1	Type 2
1 in.	100	-
½ in.	30-100	100
¼ in.	0-30	20-100
No. 10	0-10	0-15
No. 20	0-5	0-5

C. DURABILITY. Provide material meeting the soundness requirements of §703-02 *Coarse Aggregates* or §703-10 *Lightweight Aggregates*. When electing to use material from sources not approved under §703-02 or §703-10, provide material having a Magnesium Sulfate Soundness loss less than 20%.

BASIS OF APPROVAL. Stockpiles of underdrain filter material will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

BASIS OF ACCEPTANCE. Underdrain filter material from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, underdrain filter material will be accepted upon the basis of the stockpile approval.

733-21 – STONE FILLING

SCOPE. This specification covers the material requirements and methods of testing stone filling generally used in stream bank channel protection. The following stone filling types are evaluated in this specification:

- 733.2101 – Stone Filling, Fine
- 733.2102 – Stone Filling, Light
- 733.2103 – Stone Filling, Medium
- 733.2104 – Stone Filling, Heavy

Stone filling types are based on the gradation of the material as outlined in Table 733-21A *Stone Filling Gradation* and Table 733-21B *Stone Filling Approximate Shape*.

SAMPLING. Perform material tests and assurance methods pertaining to stone filling requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

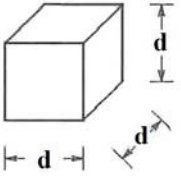

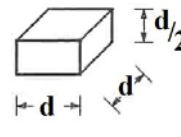

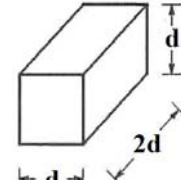

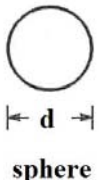

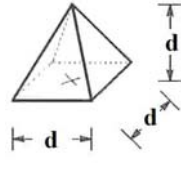

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile stone filling in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*” except as noted herein.

B. GRADATION. Provide material having a gradation in accordance with TABLE 733-21A *Stone Filling Gradation* and Table 733-21B *Stone Filling Approximate Shape*.

TABLE 733-21A STONE FILLING GRADATION			
Stone Filling Item	See Notes	Stone Size	Percent of Total by Weight
Fine	2, 3, 4	Smaller than 8 in.	90-100
		Larger than 3 in.	50-100
		Smaller than No. 10 sieve	0-10
Light	2, 3, 4	Lighter than 100 lbs.	90-100
		Larger than 6 in.	50-100

		Smaller than ½ in.	0-10
Medium	2, 4	Heavier than 100 lbs.	50-100
		Smaller than 4 in.	0-10
Heavy	2, 4, 5	Heavier than 600 lbs.	50-100
		Smaller than 6 in.	0-10

TABLE 733-21B STONE FILLING APPROXIMATE SHAPE					
Specified Weights and Sizes					
600 lbs.	d=18 in.	d=23 in.	d=15 in.	d=23 in.	d=27 in.
300 lbs.	d=15 in.	d=18 in.	d=12 in.	d=18 in.	d=21 in.
150 lbs.	d=12 in.	d=15 in.	d=9 in.	d=15 in.	d=17 in.
100 lbs.	d=10 in.	d=13 in.	d=8 in.	d=13 in.	d=15 in.
d = 8 in.	50 lbs.	25 lbs.	100 lbs.	25 lbs.	16 lbs.
d = 6 in.	20 lbs.	10 lbs.	40 lbs.	10 lbs.	7 lbs.

Notes:

1. Stone sizes, other than weights, refer to the average of the maximum and minimum dimensions of a stone particle as estimated by the Engineer.
2. Materials shall contain less than 20% of stones with a ratio of maximum to minimum dimension greater than three.
3. Air-cooled blast furnace slag, cobbles or gravel having at least one fractured face per particle are acceptable substitutes for stone under these items, provided that the soundness and gradation requirements are met.
4. Materials shall contain a sufficient amount of stones smaller than the average stone size to fill in the spaces between the larger stones.
5. Heavier gradings of this item may be required on some projects, in which case the requirements will be stated in the contract documents.

C. DURABILITY. The soundness of all material used for stone filling shall be approved on the basis of a geologic evaluation in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

Where the State elects to conduct soundness tests, stone filling shall have a Magnesium Sulfate Soundness loss less than 10%, by weight, after 10 cycles.

BASIS OF APPROVAL. Stockpiles of stone filling will be approved in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

BASIS OF ACCEPTANCE. Stone filling from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, stone filling will be accepted upon the basis of the stockpile approval.

733-22 – RIP-RAP

SCOPE. This specification covers the material requirements and methods of testing rip-rap generally used in stream bank channel protection. The following rip-rap types are evaluated in this specification:

- 733.2201 – Dry Rip-Rap
- 733.2202 – Grouted Rip-Rap

SAMPLING. Perform material tests and assurance methods pertaining to rip-rap requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile rip-rap in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*” except as noted herein.

B. GRADATION. Provide material consisting of stones shaped as nearly as practicable in the form of right rectangular prisms having a gradation in accordance with TABLE 733-22A *Rip-Rap Gradation*. One dimension of each of the stones furnished shall be at least equal to the thickness of the rip-rap shown in the contract documents.

TABLE 733-22A RIP-RAP GRADATION	
Stone Weight	Gradation Spread
Heavier than 300 lbs.	50-100 percent of total by weight
100 lbs. $\leq \gamma \leq$ 300 lbs.	Remainder of stones

C. DURABILITY. The soundness of all material used for rip-rap shall be approved on the basis of a geologic evaluation in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

Where the State elects to conduct soundness tests, rip-rap shall have a Magnesium Sulfate Soundness loss less than 10%, by weight, after 10 cycles.

D. GROUT. Provide grout manufacture materials conforming to Table 733-22B *Grouted Rip-Rap Grout Requirements*:

TABLE 733-22B GROUTED RIP-RAP GROUT REQUIREMENTS		
Material	Subsection	Grout Mix
Portland Cement Type 2	§701-01	1 part
Concrete Sand	§703-07	3 parts

BASIS OF APPROVAL. Stockpiles of rip-rap will be approved in accordance with the geotechnical control procedure “*Procedure for the Control of Stone Filling and Rip-Rap Items*”.

The material shall be subject to visual inspection by the Regional Geotechnical Engineer.

BASIS OF ACCEPTANCE. Rip-rap from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, rip-rap will be accepted upon the basis of the stockpile approval

733-23 – BEDDING MATERIAL

SCOPE. This specification covers the material requirements and methods of testing bedding material generally used as a foundation material prior to placing stone filling or rip-rap.

SAMPLING. Perform material tests and assurance methods pertaining to bedding material requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile bedding material in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*” except as noted herein.

B. GRADATION. Provide material consisting of crushed stone, crushed air-cooled blast furnace slag, or gravel, free of soft, non-durable particles, organic material, and thin or elongated particles having a gradation in accordance with TABLE 733-23A *Bedding Material Gradation*.

TABLE 733-23A BEDDING MATERIAL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
4 in.	100
1 in.	15-60
¼ in.	0-25
No. 40	0-10

BASIS OF APPROVAL. Stockpiles of bedding material will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

BASIS OF ACCEPTANCE. Bedding material from approved stockpiles will be accepted upon successful completion of the Quality Assurance (QA) program indicating that the material conforms to the specification. If the QA program is not introduced, bedding material will be accepted upon the basis of the stockpile approval.

Comment [c152]:

SECTION 733 – EARTHWORK MATERIALS

733-01 CONTROLLED LOW STRENGTH MATERIAL (CLSM)

QUALITY ASSURANCE PROGRAM. The Department maintains a Quality Assurance (QA) program instituted by the Geotechnical Engineering Bureau (GEB) for controlled low strength material (CLSM). The Department will sample and test CLSM and, if the material is found to not meet specification requirements, reject said material.

— Three (3) specimens (cylinders) will be cast for each batch in accordance with this specification and tested for unconfined compressive strength. A batch is defined as the amount of material that can be mixed at one time.

SCOPE. This specification covers the material requirements and methods of testing CLSM generally used as a replacement for compacted soil backfill in sites where performing compaction is difficult and labor intensive.

GENERAL. Provide CLSM with a mix design based on the unconfined compressive strength requirements of the specification. Design the CLSM mix so that it sets within the time stated in the contract documents. If no set time is required, design the set time to meet Contractor’s operational requirements.

MATERIAL REQUIREMENTS.

A. MATERIAL. Provide CLSM containing cement and water. At the Contractor’s option, it may also contain fly ash (unless the No Fly Ash item is specified), aggregate, or chemical admixtures in any proportions such that the final product meets the strength and flow consistency requirements included in this specification.

Provide materials meeting the requirements of Table 733-01A *CLSM Material Requirements*:

TABLE 733-01A CLSM MATERIAL REQUIREMENTS

TABLE 733-01A CLSM MATERIAL REQUIREMENTS	
Material	Subsection
Portland Cement, Type 1 or Type 2	§701-01
Water	§712-01

If used, provide materials meeting Table 733-01B Requirements for Optional CLSM Material:

TABLE 733-01B REQUIREMENTS FOR OPTIONAL CLSM MATERIAL	
Material	Subsection
Aggregate Gradation	§703-07 Concrete Sand
Fly Ash	Provide fly ash that complies with the requirements of §711-10 Fly Ash. Waive the loss on ignition requirement.
Chemical Admixtures	Provide admixtures that comply with §711-08 Admixtures. The mix may include high air generators manufactured for CLSM.

B. UNCONFINED COMPRESSIVE STRENGTH. Provide CLSM with a mix design generating an unconfined compressive strength in Table 733-01C CLSM Unconfined Compressive Strength:

TABLE 733-01C CLSM UNCONFINED COMPRESSIVE STRENGTH	
Test Age	Unconfined Compressive Strength
28 days	40 psi ≤ q_u ≤ 150 psi

SAMPLING AND TESTING.

A. SPREAD DIAMETER. Provide CLSM that has, at the time of placement, a minimum diameter spread of 8 in. as determined by a Department Representative in accordance with ASTM D6103 Standard Test Method for Flow Consistency of Controlled Low-Strength Material (CLSM).

B. CYLINDER CAST. A Department Representative will cast three (3) specimens (cylinders) for each batch of CLSM for QA testing.

BASIS OF APPROVAL. Mix designs will be approved based on certification of the unconfined compressive strength meeting the requirements of the specification.

BASIS OF ACCEPTANCE. CLSM material will be accepted on the jobsite upon submission of an approved mix design to the Engineer. For CLSM batched through a batch plant, material will also be accepted on the jobsite by delivery ticket. Each delivery ticket shall identify the Supplier's name, date, NYSDOT contract number, item number and quantity.

CLSM material will be accepted as part of the contract quantities upon successful completion of the field tests and QA program indicating the material conforms to the specification.

733-02 MECHANICALLY STABILIZED EARTH SYSTEM BACKFILL MATERIAL

Comment [c153]:
E108-038

QUALITY ASSURANCE PROGRAM. The Department maintains a Quality Assurance (QA) program instituted by the Geotechnical Engineering Bureau (GEB) for backfill material used in a Mechanically Stabilized Earth System (MSES). The Department will sample and test backfill taken from behind the newly constructed wall and, if the material is determined to not meet specification requirements, reject said material.

The number of samples and their locations (plan and elevation) will be determined by the quantity of material to be used in each MSES structure. Results from chemical testing (i.e. resistivity, sulfates, sulfides, chlorides) can take several weeks to obtain.

SCOPE. This specification covers the material requirements and methods of testing backfill material generally used for the construction of a MSES.

SAMPLING. Perform material tests and assurance methods pertaining to the backfill requirements in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

GENERAL. Provide backfill material for any MSES from a single source unless prior approval for use of designated multiple sources is obtained from the Director, GEB.

MATERIAL REQUIREMENTS.

A. STOCKPILE. Stockpile the backfill material in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

B. GRADATION. Provide backfill material of one of the following types:

1. Type A. Material consisting of any mineral (inorganic) soil, blasted or broken rock, or similar materials of natural origin, including mixtures thereof, and having a gradation in accordance with TABLE 733-02A *Backfill Gradation*.

TABLE 733-02A BACKFILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
4 in.	100
¼ in.	30-100
No. 40	0-60
No. 200	0-15

2. Type B. Material consisting of crushed stone conforming to §703-02 *Coarse Aggregate*, Size Designation 2.

3. Type C. Material consisting of recycled Portland Cement Concrete Aggregate (RCA). Type C backfill consists of at least 95%, by weight, of RCA and is free from organic and other deleterious material. Material may contain up to 5% by weight asphalt and/or brick. Gradation for Type C backfill conforms to Table 733-02A *Backfill Gradation*.

4. Type D. Material consisting of recycled Portland Cement Concrete Aggregate (RCA). Type D backfill consists of at least 95%, by weight, of RCA and is free from organic and other deleterious material. Material may contain up to 5% by weight asphalt and/or brick. Gradation for Type D backfill conforms to §703-02 *Coarse Aggregate*, Size Designation 2.

C. PLASTICITY INDEX. Provide material having a Plasticity Index not exceeding 5.

D. DURABILITY. Provide material having a Magnesium Sulfate Soundness loss less than 30 percent.

E. CORROSION POTENTIAL (METAL REINFORCING AND/OR CONNECTORS ONLY).

The Department will test for the corrosion potential of any system with exposed metal in the backfill. Stockpiled materials will be tested for resistivity and pH, and may be tested for sulfides at the Department's discretion. Material failing to meet the following requirements of Table 733-02B *Resistivity, Soluble Salts and pH Requirements*, will be rejected except as specified below:

Material failing to meet the resistivity criterion may be tested for sulfate and chlorides. Material meeting the criteria for both sulfates and chlorides and having a resistivity greater than 10 ohm-m will be acceptable. Chemical testing is not required for Type B backfill or for Type D backfill.

TABLE 733-02B RESISTIVITY, SOLUBLE SALTS AND pH REQUIREMENTS		
Property	Test Method	Acceptance Criteria
Resistivity	AASHTO T288	$\rho \geq 30 \text{ ohm-m}$
Chlorides	AASHTO T291 Method A	$Cl^- \leq 100 \text{ mg/kg}$
Sulfates	AASHTO T290 Method A, gravimetric	$SO_4^{2-} \leq 200 \text{ mg/kg}$
	AASHTO T290 Method B, turbidmetric	
Sulfides	NYSDOT Test Method 711-12C	$S^{2-} \leq 300 \text{ mg/kg}$
pH	Type A or C	$5 \leq pH \leq 10$
	Type B or D	$5 \leq pH \leq 12.5$

BASIS OF APPROVAL. Stockpiles of MSES backfill material will be approved in accordance with the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

BASIS OF ACCEPTANCE. Backfill material from approved stockpiles will be accepted on the contract site by delivery ticket. Each delivery ticket shall identify the Suppliers name, date, NYSDOT contract number, stockpile number, item number and quantity.

Backfill material from approved stockpiles will be accepted as part of the MSES upon confirmation that the material gradation type provided by the Contractor, outlined in §733-02B *Gradation*, conforms to the MSES submittal provided by the wall system designer-supplier and upon successful completion of the QA program indicating that the material conforms to the specification.

733-03 GEOSYNTHETIC REINFORCED EARTH SYSTEM SLOPE BACKFILL MATERIAL

SCOPE. This specification covers the material requirements and methods of testing backfill material generally used for the construction of over-steepened slopes utilizing Geosynthetic Reinforced Earth System (GRES).

SAMPLING. Obtain a representative sample of the source for the performance of a gradation analysis in accordance with the procedures contained in the geotechnical test method “*Test Method for the Grain-Size Analysis of Granular Soil Materials*”.

MATERIAL REQUIREMENTS. Any mineral (inorganic) soil, blasted or broken rock, or similar materials of natural origin, including mixtures thereof, may be suitable materials subject to the following:

A. GRADATION. Provide backfill material conforming to the following:

1. Gradation Spread. Provide backfill material having a gradation in accordance with TABLE 733-03A *Backfill Gradation*.

TABLE 733-03A BACKFILL GRADATION	
Sieve Size Designation	Percentage Passing by Weight
6 in.	100
No. 40	0-60
No. 200	0-40

2. Gradation Ratio. Provide backfill material having a gradation ratio in accordance with the following formula:

$$\frac{\text{Percent Pass. No.200 sieve}}{\text{Percent Pass. No.40 sieve}} \times 100 \leq 70$$

~~The gradation is evaluated at the contract level.~~

~~**BASIS OF APPROVAL.** Sources will be approved upon successful completion of the gradation tests indicating that the material conforms to the specification.~~

~~**BASIS OF ACCEPTANCE.** Backfill material from a source not within the contract limits will be accepted on the contract site by delivery ticket. Each delivery ticket shall identify the Suppliers name, date, NYSDOT contract number, item number, and quantity.~~

~~Backfill material will be accepted based upon successful completion of the gradation tests indicating that the material conforms to the specification.~~

Comment [c154]:
E108035

SECTION 734 – CONCRETE SLAB OVERLAYS

734-01 THIN POLYMER (EPOXY) OVERLAY WEARING SURFACE FOR STRUCTURAL SLABS

SCOPE. This specification covers the Thin Polymer (Epoxy) Overlay System used as a wearing surface for Structural Slabs

GENERAL. The thin polymer (epoxy) overlay system will restore friction and protect the structural slab from further deterioration. The aggregate source(s) used with these systems will be evaluated by Main Office Geology for friction classification and approval.

MATERIAL REQUIREMENTS. The manufacturer will provide Materials Details Sheet for acceptance to the Department.

The details will provide the following:

1. **Product Information:**
 - Identify Components
 - Storage and handling requirements
2. **Surface Preparation:**
 - Describe the method of cleaning
 - Identify the required level of cleanliness
 - Identify the bond strength
 - Moisture and temperature requirements (Limitation)
 - Address any structural repairs needed
3. **Application Procedures:**
 - Describe all procedures in mixing, preparation and application
4. **Curing:**
 - Describe curing procedure and anticipated cure times vs. temperature.

PACKAGING. All components shall be shipped in appropriate containers, bearing the manufacturer's label specifying date of manufacture, batch number, brand name, quantity, and date of expiration or shelf life.

BASIS OF APPROVAL. Each system supplier/manufacturer must undergo a two year field performance evaluation on two preapproved sites and provide Materials Details for approval.

BASIS OF ACCEPTANCE. Thin Polymer (Epoxy) Overlays systems will be accepted based on the product name appearing on the Departments Approved List for Thin Polymer (Epoxy) Overlays.

~~SECTION 734 (VACANT)~~

~~SECTION 733 AND 734 (VACANT)~~

Comment [c156]:
E108-035

SECTION 735 - CONCRETE CYLINDER CURING BOX

735-01 CONCRETE CYLINDER CURING BOX

SCOPE. This specification covers the material requirements, tests and basis of acceptance for a Concrete Cylinder Curing Box.

MATERIAL REQUIREMENTS. The Concrete Cylinder Curing Box shall be constructed of noncorroding materials. A moisture proof seal shall be provided between the lid and body of the box. Provision for automatic control of water temperature to $72^{\circ}\text{F} \pm 5^{\circ}\text{F}$ shall be made when the box is located in an uncontrolled environment. A bimetallic thermometer shall be installed with its sensing element in the storage water. The thermometer shall be capable of being read from the outside without opening the box. The thermometer shall have minimum gradations of 2°F and shall be protected from damage. Electric utility connections shall be made in a lockable switch box securely attached to the outside of the curing box.

A rustproof wire or metal rack shall be set above the bottom of the box to support cylinders in an upright position. This rack and all temperature control elements shall be positioned to allow free circulation of water around the cylinders. A combination hose connection and drain shall be provided at the lower front edge of the box so that it may be drained or water may be circulated. A drain shall also be provided on the box in such a position that when open will drain water to within 1 inch over the top of the cylinders. All areas of the box shall be easily drained and accessible for cleaning.

Test. The Concrete Cylinder Curing Box shall be capable of maintaining the required water temperature through an ambient air temperature range of -10°F to $+100^{\circ}\text{F}$. The box shall be capable of holding a minimum of nineteen 6 x 12 inch cylinders. When filled with water, the box shall not leak.

BASIS OF ACCEPTANCE. The Concrete Cylinder Curing Box shall be accepted upon approval of the Engineer.

SECTION 736 - PERMANENT CORRUGATED METAL FORMS FOR BRIDGE SLABS

736-01 PERMANENT CORRUGATED METAL FORMS FOR BRIDGE SLABS

SCOPE. This specification covers the material requirements, method of manufacturer, tests and basis of acceptance for Permanent corrugated Metal Forms for Bridge Slabs for use as described under §555, Structural Concrete.

MATERIALS. Forms and form supports shall conform to the latest specification for ASTM A653/A653M, Grades A thru E, Coating Designation G165. Fabrication shall be in conformance with ASTM A924/A924M.

Prior to fabrication of forms the Contractors shall submit to the Engineer certification for conformity of steel and galvanizing to ASTM A653/A653M.

DESIGN REQUIREMENTS. The following shall govern the design of permanent corrugated metal stay-in place (S. I. P.) forms:

- Design Span shall be the clear span of form plus 2 inches measured parallel to the form flutes.
- Design Load shall be the sum of the weights of form, bar reinforcement, plastic concrete and 50 psf for construction loads.

§737

- Unit Working Stress shall not exceed 0.725 of the specified minimum yield strength of the material. In no case shall the unit working stress exceed 36 ksi.
- Dead Load Deflection shall not exceed 1/180 of the form span or 1/2 inch, whichever is less.
- Physical Design Properties shall be computed with the requirements of the American Iron and Steel Institute Specifications for the Design of Cold Formed Steel Structural Members, latest published edition.

Certification. For acceptance, the Contractor shall submit Manufacturer certification to the Engineer that all forms meet all design requirements stated in this section and all detail requirements shown on the plans.

TEST. No testing will be required.

BASIS OF ACCEPTANCE. All forms delivered to the job site must be accompanied by the manufacturer's certification that the materials used conform to ASTM A653/A653M as required by this section. Any forms delivered to the job site without such certification or which do not conform to the approved shop drawings shall be rejected by the Engineer.

SECTION 737 – GEOSYNTHETICS

QUALITY ASSURANCE PROGRAM. The Department maintains a Quality Assurance (QA) program for geosynthetics. The Geotechnical Engineering Bureau will test a sample of the geosynthetic material delivered to the project site. The results of the QA testing will not effect the use of a material on the project for which it is supplied. It is for the purpose of monitoring any changes in manufacturing processes which may affect the original properties that were determined at the time of initial approval.

Several scenarios may develop as a result of the QA testing.

1. The properties are shown to be the same as originally determined within the statistical validity of the test. No action will be taken.
2. The properties are shown to be significantly different than originally determined.
 - a. If the results are within the acceptable minimum for approval, contact with the manufacturer will be made by the Geotechnical Engineering Bureau to determine what has changed.
 - b. If the results are below the minimum acceptable for approval, the product's status on the Approved List will be re-evaluated. The manufacturer will be notified of the review.

737-01 GEOTEXTILES

SCOPE. This specification covers the material requirements and methods of testing geosynthetic materials used in highway construction. The following Geotextile Structure Types are evaluated in this specification:

737.0101 – Needle-Punched - Non-Woven	(NP - NW)
737.0102 – Heatbonded - Non-Woven	(HB - NW)
737.0103 – Monofilament - Woven	(MF - W)
737.0104 – Multifilament – Woven	(MuF - W)
737.0105 – Slit Film – Woven	(SF – W)
737.0106 – Combination Monofilament/Fibrillated Yarn – Woven	(C – W)
737.0107 – Circular – Woven	(Cir – W)

GENERAL. The Department's evaluation of geotextiles submitted will be based on the following tests:

1. Soil Retention - The test to evaluate this characteristic will be performed in accordance with the Apparent Opening Size Test, ASTM D4751.

2. Flow Capacity - The test to evaluate this characteristic will be performed in accordance with the Permittivity Test, ASTM Method D4491.
3. Tensile Strength - The tests to evaluate this characteristic will be performed in accordance with the following:
 - a. Grab Test Method, ASTM D4632
 - b. Trapezoid Tear Test Method, ASTM D4533
 - c. Static Puncture Strength Using a 2-inch Probe, ASTM D6241

Applications. Based on the above tests and criteria that follow, the Geotextiles may be accepted for the following:

- Geotextile Bedding
- Geotextile Separation
- Geotextile Drainage
- Geotextile Slope Protection
- Geotextile Stabilization
- Turbidity Curtains
- Silt Fence

MATERIAL REQUIREMENTS. Following is a table of the requirements for acceptance to the Approved List for the pay items established in the specifications. The pay items are identified by applications:

A. Geotextile Bedding. Geotextile bedding shall meet the requirements of Table 737-01A.

Table 737-01A Bedding Geotextile Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Bedding Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum) Sieve Size (inch)	Sieve Designation	Minimum Permittivity (sec ⁻¹)
Geotextile Bedding	C - W	1	< 50%	315	112	618	A	0.0165	No. 40	0.7
			≥ 50%	202	79	433	B	0.0098	No. 60	0.2
	MF - W	2	< 50%	247	56	495	C	0.0083	No. 70	0.1
			≥ 50%	157	56	309				

B. Geotextile Separation. Geotextile separation shall meet the requirements of Table 737-01B.

Table 737-01B Separation Geotextile Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Separation Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum) Sieve Size (inch)	Sieve Designation	Minimum Permittivity (sec ⁻¹)
Geotextile Separation	Any type listed in §737-01 Scope	2	< 50%	247	90 ¹	495	NA (X)	0.0234	No. 30	0.02
			≥ 50%	157	56	309				

Table 737-01B Notes:

¹ For woven monofilament geotextiles the minimum average value is 56 lbf.

C. Geotextile Drainage. Geotextile drainage shall meet the requirements of Table 737-01C.

Table 737-01C Drainage Geotextile Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Drainage Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum)		Minimum Permittivity (sec ⁻¹)
								Sieve Size (inch)	Sieve Designation	
Geotextile Drainage	Non-Woven	2	< 50%	247	90	495	A	0.0165	No. 40	0.5
			≥ 50%	157	56	309	B	0.0098	No. 60	0.2
		C	0.0083	No. 70	0.1					

D. Geotextile Slope Protection. Geotextile slope protection shall meet the requirements of Table 737-01D.

Table 737-01D Slope Protection Geotextile Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Slope Protection Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum)		Minimum Permittivity (sec ⁻¹)
								Sieve Size (inch)	Sieve Designation	
Geotextile Slope Protection	NP - NW	1	< 50%	315	112	618	A	0.0165	No. 40	0.7
			≥ 50%	202	79	433	B	0.0098	No. 60	0.2
		C	0.0083	No. 70	0.1					

E. Geotextile Stabilization. Geotextile stabilization shall meet the requirements of Table 737-01E.

Table 737-01E Stabilization Geotextile Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Stabilization Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum)		Minimum Permittivity (sec ⁻¹)
								Sieve Size (inch)	Sieve Designation	
Geotextile Stabilization	Any type listed in §737-01 Scope	1	< 50%	315	112	618	NA (X)	0.0165	No. 40	0.05
			≥ 50%	202	79	433				

F. Turbidity Curtain. Turbidity curtains shall meet the requirements of Table 737-01F.

Table 737-01F Turbidity Curtain Requirements										
Application	Geotextile Structure	Minimum Strength Class Requirements					Turbidity Curtain Class Requirements			
		Class	Percent Elongation (%)	Grab Strength (lbf)	Tear Strength (lbf)	Puncture Strength (lbf)	Class	Apparent Opening Size (maximum)		Minimum Permittivity (sec ⁻¹)
								Sieve Size (inch)	Sieve Designation	
Turbidity Curtain	Any type listed in §737-01 Scope	2	< 50%	247	90 ¹	495	NA (X)	0.0117	No. 50	0.4
			≥ 50%	157	56	309				

Table 737-01F Notes:

¹ For woven monofilament geotextiles the minimum average value is 56 lbf.

§737

G. Silt Fence. Silt fences shall meet the requirements of Table 737-01G.

Table 737-01G Silt Fence Requirements											
Application	Geotextile Structure	Minimum Strength Class Requirements						Silt Fence Class Requirements			
		Max. Post Spacing (ft.)	Percent Elongation (%)	Grab Strength (lbf)	Orientation ³	Fence Between Posts	Designation	Class	Apparent Opening Size (maximum)		Minimum Permittivity (sec ⁻¹)
								Sieve Size (inch)	Sieve Desig.		
Silt Fence	Any type listed in §737-01 Scope	4.0	NA	90	MD	Supported ¹	s	NA (X)	0.0234	No. 30	0.05
					XD						
		4.0	≥ 50% ²	123	MD	Unsupported	us 4.0				
					XD						
		6.5	< 50% ²	123	MD	Unsupported	us 6.5				
					XD						

Table 737-01G Notes:

- ¹ Silt fence support shall consist of 14 gage steel wire with a mesh spacing of 6 inch x 6 inch or prefabricated polymeric mesh of equivalent strength.
- ² As measured in accordance with ASTM D4632.
- ³ MD = Machine Direction, XD = Cross-Machine Direction.

BASIS OF APPROVAL. All geotextiles, including those sold under a private label agreement, being submitted for testing and approval must be submitted through the American Association of State Highway and Transportation Officials (AASHTO) National Transportation Product Evaluation Program (NTPEP). The program has four submittal periods per calendar year. Information regarding submittal is available at the address shown below:

AASHTO-NTPEP Coordinator
444 N. Capitol St., NW, Suite 249
Washington, DC 20001

The approval criterion for geotextiles is based on AASHTO M-288 Specification for Geotextiles.

The approval/rejection of geotextiles for use on NYSDOT projects is based on the NTPEP Report and shown on the Approved List.

BASIS OF ACCEPTANCE. Properly labeled geotextiles shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for the intended application.

737-02 GEOMEMBRANES

A. Geomembranes. The Department's evaluation of geomembranes submitted will be based on the following tests:

1. Tensile Strength - Test in accordance with ASTM D4632, Grab Test Method.
2. Elongation - Test in accordance with ASTM D4632.
3. Trapezoidal Tear Resistance - Test in accordance with ASTM D4535, Trapezoid Tear Test Method.
4. Puncture - Test in accordance with ASTM D4833, Index Puncture Resistance.

Geomembranes shall meet the following requirements:

1. Ultimate Tensile Strength - 180 lbf⁽¹⁾
 2. Ultimate Elongation - 65%⁽¹⁾
 3. Trapezoid Tear Resistance - 60 lbf⁽¹⁾
 4. Puncture - 90 lbf⁽²⁾
- (1) Minimum value in weaker principal direction. The average of the test results in the weaker principal direction shall be equal to or greater than the stated values.
- (2) The average of the test results for puncture shall meet or exceed the stated value.

BASIS OF APPROVAL. Producers of geomembranes shall demonstrate the quality of their products before being placed on the Department's Approved List. The producer shall provide:

1. A completed New York State Department of Transportation Product Evaluation Form, Form Number SM 465.
2. A test data sheet identifying the geomembrane properties.
3. A 20 sq yd sample of geomembrane to allow for testing by the Department.

BASIS OF ACCEPTANCE. Properly labeled geomembranes shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for geomembranes.

737-03 PREFABRICATED VERTICAL DRAINS

A. Prefabricated Vertical Drains. The Department's evaluation of prefabricated vertical drains submitted will be based on the following tests:

1. Prefabricated Vertical Drain:
 - a. Equivalent Sand Drain Diameter - Test in accordance with NYSDOT - GEB Large Diameter Consolidation Test.
2. Cover Geotextile
 - a. The requirements listed in Geotextile Drainage (Table 737-01C).

Prefabricated Vertical Drains shall meet the following requirements:

1. Prefabricated Vertical Drain
 - a. Equivalent Sand Drain Diameters – 1 ½ inch minimum.⁽¹⁾
 2. Cover Geotextile Wrapping
 - a. The requirements listed in Geotextile Drainage (Table 737-01C).
- ⁽¹⁾ The average of the test results shall meet or exceed the stated values.

BASIS OF APPROVAL. Producers of prefabricated vertical drains shall demonstrate the quality of their products before being placed on the Department's Approved List. The producer shall provide:

1. A completed New York State Department of Transportation Product Evaluation Form, Form Number SM 465.
2. A test data sheet identifying the cover geotextile and core and their properties.
3. A 30 ft. long sample of the prefabricated vertical drain to allow for testing by the Department.

BASIS OF ACCEPTANCE. Properly labeled prefabricated vertical drains shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for prefabricated vertical drains.

737-04 PREFABRICATED COMPOSITE STRUCTURAL DRAINS

A. Prefabricated Composite Structural Drain⁽¹⁾. The Department's evaluation of Prefabricated Composite Structural Drains (PCSD's) submitted will be based on the following tests:

1. PCSD: Flow Capacity Under Load - Test in accordance with ASTM D4716, Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head.
2. Geotextile: The requirements listed in Geotextile Drainage (Table 737-01C).

The PCSD shall meet the following requirements:

1. PCSD:
 - a. Hydraulic Transmissivity
 - i. For impermeable cores, where flow is allowed on both sides, the hydraulic transmissivity shall be 4.0 gal./min./ft. of width under 1500 psf and a hydraulic gradient of 0.1⁽²⁾.
 - ii. For permeable cores, or one sided flow impermeable cores, the hydraulic transmissivity shall be 2.0 gal./min./ft. of width under 1500 psf and a hydraulic gradient of 0.1⁽²⁾.
- ⁽¹⁾ This includes prefabricated composite structural drains used as integral abutment drains.
⁽²⁾ The average of the test results shall meet or exceed the stated values.
2. Geotextile:
 - a. The requirements listed in Geotextile Drainage (Table 737-01C) Class A.

BASIS OF APPROVAL. Producers of PCSD's shall demonstrate the quality of their products before being placed on the Department's Approved List. The producer shall provide:

§737

1. A completed New York State Department of Transportation Product Evaluation Form, Form Number SM 465.
2. A test data sheet identifying the properties of the protective geotextile and the core.
3. A 16 sq ft. sample of the PCSD drain to allow for testing by the Department.

BASIS OF ACCEPTANCE. Properly labeled prefabricated composite structural drains shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for the intended application.

737-05 PREFABRICATED COMPOSITE INTEGRAL ABUTMENT DRAINS

A. Prefabricated Composite Integral Abutment Drain. The criteria for acceptance of Prefabricated Composite Integral Abutment Drains (PCIAD's) shall be same as for PCSD except that the minimum thickness of the PCIAD shall be 0.4 inch as measured by ASTM D5199.

BASIS OF APPROVAL. Producers of PCIAD's shall demonstrate the quality of their products before being placed on the Department's Approved List. The approval procedure for PCIAD's follows the approval procedure for PCSD's.

BASIS OF ACCEPTANCE. Properly labeled prefabricated composite integral abutment drains shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for the intended application.

737-06 PREFABRICATED COMPOSITE EDGE DRAINS

A. Prefabricated Composite Edge Drains. The Department's evaluation of Prefabricated Composite Edge Drains (PCED's) submitted will be based on the following tests:

1. PCED:
 - a. Flow Capacity - Test in accordance with ASTM D4716, Test Method for Determining the (In-plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head.
2. Cover Geotextile:
 - a. The requirements listed in Geotextile Drainage (Table 737-01C).

Prefabricated Composite Edge Drains shall meet the following requirements:

1. PCED:
 - a. Flow Capacity – 15 gal./min./ft. of width when tested at a 10 psi load after 100 hours, at a hydraulic gradient of 0.1. If the flow channel is separated into two or more parts, only the flow rate of the section facing the pavement will be considered.
2. Cover Geotextile:
 - a. The requirements listed in Geotextile Drainage (Table 737-01C).

BASIS OF APPROVAL. Producers of PCED's shall demonstrate the quality of their products before being placed on the Department's Approved List. The producer shall provide:

1. A completed New York State Department of Transportation Evaluation Form, Form Number SM 465.
2. A test data sheet identifying the cover geotextile and core and their properties.
3. A 16 sq ft. sample of the PCED.

BASIS OF ACCEPTANCE. Properly labeled prefabricated composite edge drains shall be accepted on the basis of manufacturer's certification along with the brand name and style appearing on the Department's Approved List for prefabricated composite edge drains.

737-07 GEOGRIDS. Geogrid reinforcing shall be tested and certified to meet the minimum requirements for geosynthetic products in accordance with AASHTO Specifications for Highway Bridges, Geosynthetic Reinforcement.

- A. T_D . Long Term Design Tensile Strength = T_{ULT}/RF .
- B. T_{ULT} . Ultimate Tensile Strength. Determined in the primary strength direction in accordance with ASTM D4595 or D6637, based on the Minimum Average Roll Value (MARV), per ASTM D4759, for the product.
- C. RF . Total Reduction Factor = $RF_{CR} \times RF_{ID} \times RF_{DU}$. The minimum RF value permitted is 3.0.
- D. RF_{CR} . Reduction Factor for Creep Deformation for 100 Year Design Life. Calculated in accordance with Geosynthetic Research Institute Standard Practice GRI-GG4 using ASTM D5262 to determine long term strength, T_{LT} , and ASTM D4595 to determine short term strength, T_{ST} .
- E. RF_{ID} . Reduction Factor For Installation Damage Calculated in Accordance with Geosynthetic Research Institute Standard Practice GRI-GG4. The minimum tested RF_{ID} value permitted is 1.1.
- F. RF_{DU} . Reduction Factor for Durability. Determined in Accordance with EPA9090 and ASTM D4595. The minimum tested RF_{DU} value permitted is 1.1.

Submit the geogrid manufacturer’s certification with the material. Include in the certification the geogrid manufacturer’s name, the geogrid name, the test lot number, the minimum average roll value for Ultimate Tensile Strength, the long-term design tensile strength, and the reduction factors used to calculate the long-term design tensile strength.

BASIS OF ACCEPTANCE. Properly labeled geogrids shall be accepted on the basis of the information on the manufacturer’s certification meeting the minimum requirements for the geogrids stated in the contract documents.

737-08 GEOCELLS. Geocells shall be made of High Density Polyethylene (HDPE) of the size(s) and dimensions shown on the plans. Geocells shall be tested and certified to meet the minimum requirements listed in Table 737-08.

TABLE 737-08		
Property	Test Method	Requirement
Thickness	ASTM D 5199	0.04 inch minimum
Cell Seam Peel Strength	Per U.S. Army Corps of Engineers Technical Report GL-86-19 Appendix A	56 lbf per inch of cell depth, minimum
Ultraviolet Stability	ASTM D 1603 or ASTM D 4218	1.5 % by weight carbon black minimum
Environmental Stress Crack Resistance	ASTM D 1693	2000 hrs minimum

Geocells will be perforated with the exception of the fascia, which will be solid and green in color.

Submit the geocell manufacturer’s certification with the material. Include in the certification the geocell manufacturer’s name, the geocell name, the test lot number, the minimum thickness, the cell seam peel strength, the ultraviolet stability, and the environmental stress crack resistance.

BASIS OF ACCEPTANCE. Properly labeled geocells shall be accepted on the basis of the information on the manufacturer’s certification meeting the minimum requirements for the geocells stated in Table 737-08 and the contract documents.
