

TABLE OF CONTENTS

TABLE OF CONTENTS.....	1
Section 100	161615
General Provisions	161615
SECTION 101 - ABBREVIATIONS AND DEFINITIONS OF TERMS	161615
101-01 Abbreviations of Terms.....	161615
101-02 Definitions of Terms.....	171716
SECTION 102 - BIDDING REQUIREMENTS AND CONDITIONS	262624
102-01 Location of Regional Offices.....	262624
102-02 Examining the Contract Documents and the Work Site.....	272725
102-03 Cooperation Between Contractors.....	282826
102-04 Proposal Content.....	282827
102-05 Proposal Submission.....	292928
102-06 Bid Deposit.....	302928
102-07 Modification or Withdrawal of Proposal.....	303028
102-08 Standard Clauses for All New York State Contracts.....	313029
102-09 Standard Clauses for Non Federal-Aid New York State Contracts.....	353433
102-10 Labor and Employment.....	373634
102-11 Equal Employment Opportunity Requirements.....	393837
102-12 D/M/WBE Utilization.....	434241
102-13 State and Local Sales Tax Exemption.....	494847
102-14 Form of Contract and Bid Bond.....	494847
102-15 Sample Form of Bid Bond.....	504947
102-16 Sample Contract Pay Item Format.....	515149
102-17 Sample Form of Itemized Proposal/Jurat.....	525150
SECTION 103 - CONTRACT AWARD AND EXECUTION	585755
103-01 Contract Award.....	585755
103-02 Execution of Contract.....	595856
103-03 Contract Bonds.....	595856
103-04 Canceling Award.....	605957
103-05 Partnering.....	605957
103-06 Sample Form of Contract Agreement.....	616058
103-07 Sample Form of Faithful Performance Bond.....	656462
103-08 Sample Form of Labor and Material Bond.....	686765
SECTION 104 - SCOPE OF WORK	706967
104-01 Work Required.....	706967
104-02 Changes, Contingencies, Extra Work and Deductions.....	706967
104-03 Differing Site Conditions.....	706967
104-04 Significant Changes in the Character Of Work.....	717068
104-05 Suspensions of Work Directed by the Engineer.....	737270
104-06 Notice and Recordkeeping.....	747371
104-07 Site Housekeeping.....	757472
104-08 Maintaining Traffic.....	757472
104-09 Contractor's Retention of Records.....	767572
104-10 Value Engineering Change Proposal (VECP).....	767573
SECTION 105 - CONTROL OF WORK	828179
105-01 Engineer's Authority.....	828179
105-02 Character of Workers.....	838179
105-03 Methods and Equipment.....	838280
105-04 Interpretation of Contract Documents.....	838280

CONTENTS

105-05 Reasonable Close Conformity with Contract Documents.....	84 8280
105-06 Cooperation with Utilities and Other Contractors.....	84 8381
105-07 Termination.....	85 8381
105-08 Removal of Unacceptable and Unauthorized Work.....	85 8482
105-09 Work Affecting Railroads.....	86 8482
105-10 Survey and Stakeout.....	89 8785
105-11 Inspection.....	91 8886
105-12 Load Restrictions.....	91 8987
105-13 Maintenance and Protection of Traffic for Mobile Operations.....	92 8987
105-14 Disputed Work and Dispute Resolution.....	92 8987
105-15 Furnishing Right Of Way.....	97 9592
105-16 Shop Drawing Approval.....	98 9593
105-17 Contract Records.....	98 9593
105-18 Manufacturer Warranties and Guarantees.....	98 9693
105-19 Contractor Warranties.....	98 9693
105-20 Opening Highway to Traffic Prior to Acceptance.....	99 9694
105-21 Civil Rights Monitoring and Reporting.....	99 9694
SECTION 106 - CONTROL OF MATERIAL.....	1019997
106-01 Sources of Supply.....	102 9997
106-02 Quality Requirements.....	102 9997
106-03 Plant Inspected Materials.....	103 10098
106-04 Material Certification and Approved List.....	104 10199
106-05 Recycled Materials.....	105 102100
106-06 Storage and Handling of Materials.....	105 102100
106-07 Basis for Measurement.....	105 102100
106-08 Rejected Materials.....	105 103100
106-09 Equivalents.....	105 103100
106-10 Independent Assurance Sampling and Testing.....	105 103100
106-11 Buy America.....	106 103101
SECTION 107 - LEGAL RELATIONS AND RESPONSIBILITY TO PUBLIC.....	107104102
107-01 Laws, Rules, Regulations and Permits.....	107 104102
107-02 Patented Devices, Materials and Processes.....	107 105102
107-03 Federal Aid Participation.....	108 105103
107-04 Sanitary Code.....	108 105103
107-05 Safety and Health Requirements.....	108 105103
107-06 Insurance.....	120 117114
107-07 Protection of Underground Facilities.....	122 119115
107-08 Protection and Restoration of Property and Landscape.....	128 121117
107-09 Damage.....	130 122118
107-10 Managing Surplus Material and Waste.....	132 124120
107-11 Air Quality Protection.....	137 127123
107-12 Water Quality Protection.....	137 128124
SECTION 108 - PROSECUTION AND PROGRESS.....	138129125
108-01 Progress Schedule.....	139 129125
108-02 Completion Date.....	139 130126
108-03 Failure to Complete Work on Time.....	140 130126
108-04 Delay Provisions.....	141 132128
108-05 Subletting or Assigning the Contract.....	142 133129
108-06 Commencement of Actions on State Public Works Contracts.....	144 134130
108-07 Seasonal Shut-Down.....	144 135131
SECTION 109 - MEASUREMENT AND PAYMENT.....	144135131
109-01 Measuring Quantities.....	144 135131
109-02 Compensation for Altered Quantities.....	144 135131
109-03 Scope of Payment.....	145 135131

CONTENTS

109-04 Partial Payments.....	145 136 132
109-05 Extra Work and Time Related Compensation.....	146 137 133
109-06 Contract Payments.....	152 143 139
109-07 Prompt Payments by the Contractor.....	153 143 139
109-08 Eliminated Materials.....	153 144 139
109-09 Final Acceptance and Final Payment.....	154 144 140
109-10 Uncompleted Work Agreements.....	155 145 141
Section 200	157 148 143
Earthwork	157 148 143
Section 201 - Clearing and Grubbing.....	157 148 143
Section 202 - Removal of Structures and Obstructions.....	159 150 145
Section 203 - Excavation and Embankment.....	170 161 156
Section 204 - Controlled Low Strength Material (CLSM).....	213 182 176
Section 205 - Contaminated Soil.....	216 184 178
Section 206 - Trench, Culvert and Structure Excavation.....	224 192 186
Section 207 - Geotextiles and Prefabricated Composite Drains for Structures.....	228 196 189
Section 208 (Vacant).....	233 201 192
Section 209 - Soil Erosion and Sediment Control.....	233 201 192
Section 210 - Removal and Disposal of Asbestos-Containing Material (Buildings, Bridges and Highways).....	243 210 200
Sections 211 Thru 299 (Vacant).....	246 214 204
Section 300	273 215 205
Bases and Subbases	273 215 205
Section 301 (Vacant).....	273 215 205
Section 302 - Bituminous Stabilized Course.....	273 215 205
Section 303 - Optional Flexible Shoulder.....	276 218 208
Section 304 - Subbase Course.....	277 219 209
Sections 305 and 306 (Vacant).....	283 223 213
Section 307 - Hydrated Lime Stabilized Subgrade.....	283 223 213
Section 308 - Soil Cement Course.....	286 226 216
Sections 309 Thru 399 (Vacant).....	290 229 219
Section 400	292 231 221
Hot Mix Asphalt	292 231 221
Section 401 - Plant Production.....	292 231 221
Section 402 - Hot Mix Asphalt (HMA) Pavements.....	321 253 243
Section 403 - Hot Mix Asphalt (HMA) Pavements for Municipalities.....	339 272 261
Section 404 (Vacant).....	345 278 266
Section 405 - Cold Mix Bituminous Pavement (Open Graded).....	345 278 266
Section 406 (Vacant).....	348 280 269
Sections 408 and 409 (Vacant).....	349 281 270
Section 410 - Bituminous Surface Treatment - Single Course.....	349 281 270
Section 411 - Stabilized Gravel Surface Course.....	355 287 276
Sections 412 Thru 489 (Vacant).....	357 289 277
Section 490 - Cold Milling.....	357 289 278
Sections 491 Thru 499 (Vacant).....	359 291 279
Section 500	361 293 281

CONTENTS

Portland Cement Concrete	361 293281
Section 501 - Portland Cement Concrete - General	361 293281
Section 502 - Portland Cement Concrete Pavement	381 313298
Section 503 - Portland Cement Concrete Foundation for Pavement	401 333318
Sections 504 Thru 549 (Vacant)	403 335319
Section 550	405 337321
Structures	405 337321
Section 551 - Piles and Pile Driving Equipment	405 337321
Section 552 - Support and Protection Systems	410 342326
Section 553 - Cofferdams and Waterway Diversion Structures	413 346329
Section 554 - Mechanically Stabilized Earth System	416 348332
Section 555 - Structural Concrete	433 354338
Section 556 - Reinforcing Steel for Concrete Structures	447 368352
Section 557 - Superstructure Slabs, Sidewalks on Bridges, and Structural Approach Slabs	452 373356
Section 558 - Longitudinal Sawcut Grooving of Structural Slab Surface	468 384368
Section 559 (Vacant)	469 386369
Section 560 - Masonry	469 386369
Section 561 (Vacant)	476 393376
Section 562 - Reinforced Concrete Three-Sided Structures	476 393376
Section 563 - Prestressed Concrete Units (Structural)	479 396379
Section 564 - Structural Steel	480 397380
Section 565 - Bridge Bearings	484 401384
Section 566 - Modular Expansion Joint Systems	491 408391
Section 567 - Bridge Joint Systems	495 412394
Section 568 - Bridge Railing	502 419402
Section 569 - Permanent Concrete Traffic Barrier for Structures	506 423405
Section 570 - Paint Removal Operations	513 430412
Section 571 - Treatment and Disposal of Paint Removal Waste	524 440422
Section 572 - Structural Steel Painting: Shop Applied	527 444425
Section 573 - Structural Steel Painting: Field Applied - Total Removal	532 449430
Section 574 - Structural Steel Painting: Overcoating and Localized	538 455437
Section 575 (Vacant)	544 461442
Section 576 - Bridge Drainage System	544 461442
Section 577 (Vacant)	548 464445
Section 578 - Bonded Concrete Overlay for Structural Slabs	548 464446
Section 579 - Structural Slab Reconstruction Preparation	549 466447
Section 580 - Structural Concrete Removal	553 469451
Section 581 - Removal of Bridge Overlays	556 472453
Section 582 - Removal and Replacement of Structural Concrete	556 473454
Section 583 - Shotcrete	559 476457
Section 584 - Specialized Overlays for Structural Slabs	564 481462
Section 585 - Structural Lifting Operations	570 486467
Section 586 - Miscellaneous Structural Reconstruction	572 489469
Section 587 - Bridge Railing Reconstruction	579 496472
Section 588 (Vacant)	581 498475
Section 589 - Removal of Existing Steel	581 498475
Section 590 - Adjustment of Bridge Appurtenances	583 500476
Sections 591 Thru 593 (Vacant)	584 501477

CONTENTS

Section 594 - Timber and Lumber.....	584 501478
Section 595 (Vacant).....	586 503479
Section 596 - Open Steel Floor.....	586 503479
Section 597 - Timber Bridge Railing and Transitions.....	587 503480
Sections 598 and 599 (Vacant).....	590 506482
Section 600.....	590506483
Incidental Construction.....	590506483
Section 601 (Vacant).....	590 506483
Section 602 - Rehabilitation of Culvert and Storm Drain Pipe.....	590 506483
Section 603 - Culverts and Storm Drains.....	595 511488
Section 604 - Drainage Structures.....	602 518495
Section 605 - Underdrains.....	607 523499
Section 606 - Guide Railing.....	610 527503
Section 607 - Fences.....	631 547523
Section 608 - Sidewalks, Driveways and Bicycle Paths.....	635 551527
Section 609 - Curb and Curb & Gutter.....	644 560536
Section 610 - Turf and Wildflower Establishment.....	649 566541
Section 611 - Planting.....	659 575546
Section 612 - Sodding.....	668 584551
Section 613 - Placing Topsoil.....	670 586552
Section 614 - Care, Thinning and Removal of Trees.....	671 587553
Section 615 - Landscape Miscellaneous.....	673 590556
Sections 616 and 617 (Vacant).....	674 590556
Section 618 - Bituminous Material.....	674 590556
Section 619 - Work Zone Traffic Control.....	676 592558
Section 620 - Bank and Channel Protection.....	721 637601
Sections 621 and 622 (Vacant).....	726 642606
Section 623 - Screened Gravel, Crushed Gravel, Crushed Stone, Crushed Slag.....	728 642606
Section 624 - Paved Gutters.....	729 642606
Section 625 - Survey Operations, Row Markers, and Permanent Survey Markers.....	609
Sections 626 Thru 629 (Vacant).....	747 650614
Section 630 - Barricades.....	751 655614
Section 631 (Vacant).....	752 656615
Section 632 - Cribbing.....	752 656615
Section 633 - Conditioning Existing Pavement Prior to Hot Mix Asphalt (HMA) Overlay.....	757 661617
Section 634 (Vacant).....	760 663620
Section 635 - Cleaning and Preparation of Pavement Surfaces for Pavement Markings.....	760 663620
Section 636 (Vacant).....	762 665622
Section 637 - Engineer's Field Office, Laboratory and Equipment.....	762 665622
Section 638 - White Synthetic Resin Binder Concrete.....	779 682639
Section 639 (Vacant).....	782 685641
Section 640 - Reflectorized Pavement Marking Paints.....	782 685642
Sections 641, 642 and 643 (Vacant).....	784 687643
Section 644 - Overhead Sign Structures.....	784 687643
Section 645 - Signs.....	794 696652
Section 646 - Delineators, Reference Markers and Snowplowing Markers.....	803 705661
Section 647 - Removing, Storing and Relocating Signs.....	805 707663

CONTENTS

Section 648 - Subsurface Explorations	807709665
Section 649 (Vacant)	814716671
Section 650 - Trenchless Installation of Casing	814716672
Section 651 - Communication Facilities	823725680
Section 652 - Furnishing and Applying Salts	823725681
Section 653 (Vacant)	824726681
Section 654 - Impact Attenuators	824726681
Section 655 - Frames, Grates and Covers	831733688
Section 656 - Miscellaneous Metals	833734690
Section 657 - Painting Galvanized and Aluminum Surfaces	834735690
Section 658 (Vacant)	837738694
Section 659 - Telecommunication Utilities	837738694
Section 660 - Utilities	838739694
Section 661 - Electric Utilities	838739695
Section 662 - Gas, Oil & Steam Utilities	839740695
Section 663 - Water Supply Utilities	839740696
Section 664 - Sanitary Sewer Utilities	850751706
Section 665 - Waterways	850751707
Section 666 (Vacant)	850751707
Section 667 - Local Road Gravel Surface, Base, and Subbase Courses	850752707
Sections 668 and 669 (Vacant)	853754709
Section 670 - Highway Lighting System	853754709
Sections 671 Thru 679 (Vacant)	864765720
Section 680 - Traffic Signals	864765720
Sections 681 Thru 684 (Vacant)	882783738
Section 685 - Epoxy Reflectorized Pavement Markings	882783738
Section 686 (Vacant)	885786741
Section 687 - Thermoplastic Reflectorized Pavement Markings	885786741
Section 688 - Preformed Reflectorized Pavement Markings	889790744
Sections 689 Thru 696 (Vacant)	892793748
Section 697 - Field Change Payment	893794748
Section 698 - Price Adjustments	894795749
Section 699 - Mobilization	898799753
Section 700	901801755
Materials and Manufacturing	901801755
SECTION 701 - HYDRAULIC CEMENTS	901801755
701-01 Portland Cement	901801755
701-02 Masonry and Mortar Cement	902802756
701-03 Blended Portland Cement	902802756
701-04 Concrete Repair Material	904804758
701-05 Concrete Grouting Material	904804758
701-06 Cement Based Grout Materials for Shear Keys	905805759
701-07 Anchoring Materials - Chemically Curing	906806760
701-08 Vertical and Overhead Patching Material	907807761
701-09 Rapid Hardening Concrete Repair Material (Normal Weather)	908808762
701-10 (Vacant)	908808762
701-11 Elastomeric Concrete	909809762
SECTION 702 - BITUMINOUS MATERIALS	909809763
SECTION 703 - AGGREGATES	917817770
703-01 Fine Aggregate	917817770

CONTENTS

703-02 Coarse Aggregate.....	919819772
703-03 Mortar Sand	923823776
703-04 Grout Sand	923823776
703-05 Fine Aggregate For White Portland Cement Concrete	923823776
703-06 Cushion Sand	924824777
703-07 Concrete Sand	924824777
703-08 Mineral Filler	924824777
703-09 Reclaimed Asphalt Pavement (RAP).....	925825778
703-10 Lightweight Aggregates.....	927827780
SECTION 704 - MASONRY UNITS	928828781
704-01 Common Brick.....	928828781
704-02 Concrete Brick	928828781
704-03 Precast Concrete - General.....	929829782
704-04 Concrete Block (Slope Paving).....	935835788
704-05 Precast Concrete Barrier	936836789
704-06 Precast Concrete Cribbing	937837790
704-07 Segmental Retaining Wall Blocks	938838790
704-08 Brick Sidewalk and Driveway Pavers.....	939839791
704-09 Stone Blocks	939839791
704-10 Split-Faced Concrete Brick.....	939839792
704-11 Precast Concrete Coping.....	940840792
704-12 Decorative Concrete Block.....	941841793
704-13 Precast Concrete Driveway and Sidewalk Pavers.....	941841794
704-14 Precast Concrete Panel Units (Mechanically Stabilized Earth System)	942842794
704-15 Precast Concrete Pavement Slab Systems	943843796
704-16 Thru 704-22 (Vacant)	946846798
704-23 Precast Concrete Street Pavers.....	946846798
SECTION 705 - JOINT MATERIALS.....	948848799
705-01 Preformed Cork Joint Filler	948848799
705-02 Highway Joint Sealants.....	948848799
705-03 Preformed Rubber Joint Filler.....	948848800
705-04 Armorless Bridge Joints.....	948848800
705-05 Silicone Joint Sealants for Pavements	949849800
705-06 Caulking Compound for Structures	949849801
705-07 Premoulded Resilient Joint Filler.....	949849801
705-08 Preformed, Closed-Cell Foam Material	950850801
705-09 Preformed Elastic Bridge Joint Sealer	950850802
705-10 Preformed Elastic Longitudinal Joint Seal.....	951851803
705-11 Polyvinyl Chloride Extruded Shapes and Sheet Material	952852804
705-12 Preformed Elastic Transverse Contraction and Expansion Joint Seal	953853805
705-13 Lubricant for Preformed Elastic Joint Sealer	954854806
705-14 Longitudinal Joint Ties	955855806
705-15 Transverse Joint Supports	958858809
705-16 Concrete Pipe Joint Sealing Compound.....	961861813
705-17 Concrete Pipe Joint Elastomeric Gaskets.....	962862813
705-18 Thru 705-20 (Vacant)	962862813
705-21 Masonry Mortar	962862813
705-22 Portland Cement Mortar Bonding Grout	963863814
SECTION 706 - CONCRETE, CLAY AND PLASTIC PIPE.....	963863815
706-01 Non-Reinforced Concrete Pipe	963863815
706-02 Reinforced Concrete Pipe Classes II, III, IV, V.....	964864815
706-03 Reinforced Concrete Elliptical Pipe; Classes HE-II, HE-III, HE-IV, VE-IV, VE-V and VE-VI.....	968868819
706-04 Precast Concrete Drainage Units	968868820
706-05 Porous Concrete Pipe Underdrain.....	971871822

CONTENTS

706-06 Polyester Formed in Place Pipe Liner	972872823
706-07 Reinforced Concrete Pipe End Sections	973873824
706-08 and 706-09 (Vacant)	973873824
706-10 Polyvinyl Chloride Pipe (Relining).....	973873824
706-11 High Density Polyethylene Pipe (Relining).....	973873825
706-12 Smooth Interior Corrugated Polyethylene Pipe	974874825
706-13 Perforated Corrugated Polyethylene Underdrain Tubing	974874825
706-14 Corrugated Interior Polyethylene Pipe.....	974874826
706-15 PVC Plastic Drain Pipe System	975875826
706-16 Cellular Polystyrene Protective Cover	975875827
706-17 Precast Concrete Box Culverts	976876827
706-18 Perforated Polyvinyl Chloride Underdrain Pipe	978878829
SECTION 707 - METAL PIPE	978878829
707-01 (Vacant)	978878829
707-02 Corrugated Steel Pipe	978878829
707-03 Ductile Iron Pipe (Non-Pressure).....	981881832
707-04 Ductile Iron Pipe (Pressure).....	982882833
707-05 Tunnel Liner Plate (Relining)	982882833
707-06 Thru 707-08 (Vacant)	983883834
707-09 Corrugated Structural Steel Plate for Pipe, Pipe Arches and Underpasses	983883834
707-10 Galvanized Steel End Sections	983883834
707-11 Aluminum End Sections	984884835
707-12 (Vacant)	984884835
707-13 Corrugated Aluminum Pipe	984884835
707-14 Corrugated Aluminum Structural Plate for Pipe and Pipe Arches.....	986886837
707-15 Thru 707-19 (Vacant)	986886837
707-20 Anchor Bolts for Corrugated Culverts	986886837
SECTION 708 - PAINTS	987887838
708-01 Structural Steel Paints Class 1	987887838
708-02 Structural Steel Paints Class 2	987887838
708-03 (Vacant)	988888839
708-04 Zinc Chromate Primer.....	988888839
708-05 Standard Paint Colors	989889840
708-06 Paint for Galvanized Surfaces.....	989889840
708-07 Paint for Aluminum Surfaces.....	990890841
708-08 Thru 708-29 (Vacant)	990890841
708-30 Wood Preservative - Creosote Oil	990890841
708-31 Wood Preservative - Waterborne	990890841
708-32 Wood Preservative - Oil Borne.....	991891842
SECTION 709 - REINFORCING STEEL.....	991891842
709-01 Bar Reinforcement, Grade 60	991891842
709-02 Wire Fabric For Concrete Reinforcement.....	991891842
709-03 (Vacant)	992892842
709-04 Epoxy-Coated Bar Reinforcement.....	992892843
709-05 Stud Shear Connectors	995895846
709-06 Low-Relaxation Prestressing Steel, Grade 270.....	995895846
709-07 Stone Curb Anchor Bars	995895846
709-08 Epoxy Coated Wire Fabric Reinforcement.....	996896846
709-09 Cold-Drawn Wire for Concrete Reinforcement.....	998898848
709-10 Mechanical Connectors for Reinforcing Bar Splices.....	998898849
709-11 Galvanized Bar Reinforcement.....	999899849
709-12 Stainless-Clad Bar Reinforcement.....	1000900850
709-13 Stainless Steel Bar Reinforcement.....	1001900851
709-14 Bar Reinforcement, Grade 75	1001901851

CONTENTS

SECTION 710 - FENCE AND GUIDE RAIL	1002901852
710-01 Aluminum Fence Fabric	1002901852
710-02 Galvanized Steel Fence Fabric.....	1002901852
710-03 Vinyl Coated Steel Fence Fabric	1002902852
710-04 Aluminum Coated Steel Fence Fabric	1003902853
710-05 Coated Steel Fence Fabric, (95% Zinc 5% Aluminum - Mischmetal Alloy)	1003903853
710-06 Thru 710-09 (Vacant)	1004903854
710-10 Steel and Iron Posts, Rails, Braces, and Fittings for Chain Link Fence.....	1004903854
710-11 Aluminum Posts, Rails, Braces and Fittings for Chain Link Fence.....	1007905856
710-12 Plastic Coated Posts, Rails, Braces and Fittings for Chain Link Fence.....	1007906857
710-13 Wood and Timber Posts and Timber Blockouts	1008906857
710-14 Galvanized Steel Barrier Posts.....	1008907857
710-15 Thru 710-19 (Vacant)	1009907858
710-20 Corrugated Beam Guide Railing and Median Barrier.....	1009907858
710-21 Box Beam Guide Railing and Median Barrier.....	1010908859
710-22 Cable Guide Railing.....	1011909860
710-23 Steel Bridge Railing.....	1012910861
710-24 Box Beam Guide Rail End Assembly, Type III; and Box Beam Median Barrier End Assembly, Type C	1014913863
710-25 Guide Rail and Median Barrier Systems (Rustic).....	1016914864
710-26 Plastic and Synthetic Block-Outs for Heavy Post Guiderail Systems	1018917867
710-27 Thru 710-29 (Vacant)	1019917867
710-30 Right-Of-Way Fencing	1019917867
SECTION 711 - CONCRETE CURING MATERIALS AND ADMIXTURES	1021919869
711-01 Fibers for Concrete Reinforcement.....	1021919869
711-02 Quilted Covers (For Curing).....	1021919869
711-03 Plastic Coated Fiber Blankets (For Curing).....	1022920870
711-04 Polyethylene Curing Cover (White Opaque).....	1023921871
711-05 Membrane Curing Compound	1023921871
711-06 Burlap.....	1024922872
711-07 Form Insulating Materials for Winter Concreting	1024922872
711-08 Admixtures.....	1025923872
711-09 Emulsified Carbon Black	1028925875
711-10 Fly Ash.....	1028925875
711-11 Microsilica	1029926876
711-12 Ground Granulated Blast- Furnace Slag	1031928877
711-13 Calcium Nitrite Based Corrosion Inhibitors	1031928877
SECTION 712 - MISCELLANEOUS	1033930878
712-01 Water.....	1033930878
712-02 Calcium Chloride	1033931879
712-03 Sodium Chloride	1034932879
712-04 Hydrated Lime	1035932880
712-05 Precast Concrete Right-Of-Way Markers	1035932880
712-06 (Vacant)	1035933880
712-07 Inertial Barrier Modules.....	1035933881
712-08 Thru 712-11 (Vacant)	1036933881
712-12 Asphalt Roofing Felt.....	1036933881
712-13 Timber and Lumber	1036934881
712-14 Stress Graded Timber and Lumber	1036934882
712-15 Gabions	1037934882
712-16 Pigment for Colored Synthetic Resin Binder Concrete	1038935883
712-17 Wood Cross Ties.....	1038935883
712-18 Impact Attenuator, HDPE Cylinder and Cable Type.....	1042939887
712-19 Impact Attenuator, Quad Beam Type with Expendable Modules	1043940888
712-20 Impact Attenuator, Corrugated Beam Type with Metal Tearing Strips.....	1044942889

CONTENTS

712-21 Impact Attenuator, Thrie Beam Type with Expendable Modules	1045943890
712-22 Impact Attenuator, Hdpe Cylinders with Monorail and Diaphragms	1047945892
SECTION 713 - LANDSCAPE DEVELOPMENT MATERIALS	1048945893
713-01 Topsoil	1048945893
713-02 Limestone.....	1050947895
713-03 Fertilizer.....	1050948895
713-04 Seeds	1051949896
713-05 Wood Chips	1052950897
713-06 Trees, Shrubs and Vines	1053950898
713-07 Rolled Erosion Control Products and Soil Stabilizers	1055952900
713-08 Materials for Protection of Plants	1057954901
713-09 and 713-10 (Vacant)	1058955902
713-11 Wood Fiber Mulch.....	1058956902
713-12 Mulch Anchorage.....	1059956903
713-13 Pesticides.....	1059957903
713-14 Sod	1060957904
713-15 Organic Material	1060957904
713-16 and 713-18 (Vacant)	1062959906
713-19 Straw	1062959906
SECTION 714 - CURBING AND GUTTER.....	1062959906
714-01 Stone Curb	1062959906
714-02 and 714-03 (Vacant)	1064961908
714-04 Precast Concrete Curb.....	1064961908
714-05 (Vacant)	1065962909
714-06 Asphalt Concrete Curb.....	1065962909
714-07 Precast Concrete Gutter	1065963909
SECTION 715 - CASTINGS, FORGINGS AND METALS.....	1066963910
715-01 Structural Steel.....	1066963910
715-02 Steel Castings.....	1068965912
715-03 Aluminum Castings	1069966912
715-04 Wrought Aluminum	1070967914
715-05 Iron Castings	1071968915
715-06 Steel Forgings	1071969915
715-07 Proof Loaded Iron Castings	1071969915
715-08 (Vacant)	1073970917
715-09 Malleable Iron Castings	1073970917
715-10 (Vacant)	1073971917
715-11 Metal Bin Type Retaining Wall.....	1073971917
715-12 (Vacant)	1074972918
715-13 Prefabricated Adjustment Rings, Frames and Utility Valve Risers for Drainage Units, Manholes and Utilities	1074972918
715-14 High Strength Bolts, Nuts and Washers.....	1076973919
715-15 Pins and Rollers	1077974920
715-16 Stainless Steel Connecting Products	1077974921
SECTION 716 - BEARINGS AND EXPANSION PLATES	1078975921
716-01 Thru 716-04 (Vacant)	1078975921
716-05 Self-Lubricating Bronze Plates	1078975921
716-06 Disc-Design Structural Bridge Bearings.....	1079976922
716-07 Pot-Design Structural Bridge Bearings.....	1083981927
716-08 and 716-09 (Vacant)	1087985931
716-10 Plain Elastomeric Bridge Bearings	1087985931
716-11 Steel Laminated Elastomeric Bridge Bearings	1089986932
716-12 Elastomeric Bridge Bearings with External Load Plates	1091989935
SECTION 717 - CONCRETE PROTECTIVE COATINGS.....	1094991937

CONTENTS

717-01 and 717-02 (Vacant)	1094 99 1937
717-03 Penetrating Type Protective Sealers	1094 99 2937
717-04 Coating Type Protective Sealers	1095 99 2938
SECTION 718 - PRESTRESSED CONCRETE UNITS	1096993939
718-01 Prestressed Concrete Units (Structural)	1096 99 3939
718-02 Thru 718-04 (Vacant)	1104 100 1947
718-05 Prestressed Concrete Form Units	1104 100 1947
718-06 High Performance Concrete for Precast and Prestressed Bridge Beams	1106 100 3949
718-07 Diaphragms for Prestressed Concrete Beams	1108 100 6951
718-08 Thru 718-29 (Vacant)	1109 100 6952
SECTION 719 - METAL COATINGS	11091006952
719-01 Galvanized Coatings and Repair Methods	1109 100 6952
719-02 Aluminum Anodic Coatings	1110 100 8953
719-03 Aluminum Coating (Hot Dip)	1111 100 8954
SECTION 720 - PILES	11111009954
720-01 Untreated Timber Piles	1111 100 9954
720-02 Treated Timber Piles	1111 100 9954
720-03 Casings for Cast-In-Place Concrete Piles	1112 101 0955
720-04 Steel Bearing Piles	1113 101 0956
720-05 Pile Shoes	1113 101 0956
720-06 Mechanical Pile Splices	1113 101 0956
SECTION 721 - CONCRETE ADHESIVES AND REPAIR MATERIALS	11141011957
721-01 Epoxy Resin System	1114 101 1957
721-02 (Vacant)	1115 101 2958
721-03 Epoxy Polysulfide Grout	1115 101 2958
721-04 (Vacant)	1117 101 5960
721-05 Epoxy Repair Paste	1117 101 5960
721-06 Thru 721-19 (Vacant)	1119 101 6962
721-20 Rapid Hardening Polymer Concrete	1119 101 6962
SECTION 722 - WATER SUPPLY	11201017963
722-01 Ductile Iron Water Pipe, Fittings and Encasement	1120 101 7963
722-02 Steel Water Pipe and Fittings	1120 101 8963
722-03 Concrete Water Pipe	1121 101 9964
722-04 Water Valves and Hydrants	1122 101 9964
722-05 Plastic Water Pipe and Fittings	1122 101 9965
722-06 Water Service Pipe, Service Valves and Fittings	1122 102 0965
722-07 Wedge Type Mechanical Restraint Glands	1123 102 0966
722-08 Insulation for Water Mains	1123 102 0966
SECTION 723 - LIGHTING	11241021966
723-01 Aluminum Light Standards and Arms	1124 102 1966
723-02 High Mast Pole, Head Frame Assembly with Luminaire Ring and Lowering Device	1126 102 4969
723-03 Portable Power Drive for High Mast Luminaire Lowering System	1128 102 6971
723-04 Thru 723-09 (Vacant)	1129 102 6971
723-10 Anchor Base (Aluminum)	1129 102 6972
723-11 Thru 723-14 (Vacant)	1129 102 6972
723-15 Breakaway Transformer Base (Aluminum)	1129 102 6972
723-16 Thru 723-18 (Vacant)	1130 102 7973
723-19 Rigid Plastic Conduit	1130 102 7973
723-20 Metal Steel Conduit, Zinc Coated	1130 102 8973
723-21 And 723-22 (Vacant)	1131 102 8974
723-23 PVC Coated Galvanized Steel Conduit	1131 102 8974
723-24 Flexible Liquid-Tight Steel Conduit	1131 102 9974
723-25 and 723-26 (Vacant)	1131 102 9974

CONTENTS

723-27 High Pressure Sodium Vapor Luminaires (Standard Mount)	1131 1029974
723-28 Low Pressure Sodium Vapor Luminaires (Underdeck Mount)	1133 1030975
723-29 High Pressure Sodium Vapor Luminaires (Underbridge Mount)	1134 1031976
723-30 Mercury Vapor Luminaires (Standard Mount)	1135 1032977
723-31 Mercury Vapor Luminaires (Underbridge Mount)	1135 1032978
723-32 Thru 723-39 (Vacant)	1135 1033978
723-40 Cast-Iron Junction Box	1135 1033978
723-41 Thru 723-44 (Vacant)	1135 1033978
723-45 Precast Reinforced Concrete Foundations and Pullboxes	1136 1033978
723-46 Thru 723-49 (Vacant)	1136 1033979
723-50 Photoelectric Control	1136 1033979
723-51 Thru 723-59 (Vacant)	1137 1034979
723-60 Anchor Bolts	1137 1034979
723-61 Thru 723-69 (Vacant)	1137 1034980
723-70 Single Conductor Cable	1137 1034980
723-71 Single Conductor Direct Burial Cable	1137 1035980
723-72 Thru 723-74 (Vacant)	1138 1035980
723-75 Ground Wire	1138 1035980
SECTION 724 - TRAFFIC SIGNALS	1138 1035981
724-01 Signal Cable	1138 1035981
724-02 Span Wire	1138 1036981
724-03 Traffic Signal Poles	1139 1036981
724-04 Traffic Signal Heads	1144 1041986
724-05 Thru 724-07 (Vacant)	1158 10561001
724-08 Shielded Communication Cable	1158 10561001
724-09 Signal Cable With Integral Messenger	1159 10561001
724-10 Shielded Communication Cable with Integral Messenger	1159 10561001
724-11 Thru 724-14 (Vacant)	1159 10561001
724-15 Fire Pre-Emption Tell-Tale Light	1159 10561001
724-16 Thru 724-19 (Vacant)	1159 10571002
724-20 Inductance Loop Wire	1159 10571002
724-21 Shielded Lead-In Cable	1160 10571002
724-22 Roadway Loop Embedding Sealer	1160 10571002
724-23 Pedestrian Push Button and Sign	1161 10581003
SECTION 725 - MISCELLANEOUS METALS AND PLASTICS	1161 10581003
725-01 Copper Flashing	1161 10581003
725-02 Steps for Manholes	1161 10591004
SECTION 726 - DETECTABLE WARNING UNITS	1005
726-01 Surface-Applied Detectable Warning Units	1005
726-02 Embedded Detectable Warning Units	1006
SECTION 727 - PAVEMENT MARKING MATERIALS	1006
727-01 Extruded Thermoplastic	1006
727-02 Removable Raised Pavement Markers	1008
727-03 Epoxy Paint	1009
727-04 Permanent Pavement Tape	1011
727-05 Glass Beads for Pavement Markings	1012
727-06 Removable Pavement Tape	1013
727-07 Removable Wet-Night Reflective Tape	1015
727-08 Permanent Wet-Night Reflective Tape	1016
727-09 Traffic Paint	1018
SECTION 728 - COMPRESSIVE LOAD TRANSMITTING DEVICES	1178 10751020
728-01 Rubber Impregnated Woven Cotton-Polyester Fabric	1178 10751020
728-02 Rubber Impregnated Random Fiber Pad	1178 10751020
728-03 Plain Rubber Pad	1178 10751020
728-04 Sheet Lead	1179 10761020

CONTENTS

728-05 (Vacant)	1179	1076 1021
728-06 Sheet Gasket (Treated Both Sides)	1179	1076 1021
SECTION 729 – TEMPORARY TRAFFIC CONTROL DEVICES	1179	1076 1021
729-01 Drums	1179	1076 1021
729-02 Cones	1180	1077 1022
729-03 Temporary Tubular Markers	1180	1077 1022
729-04 Vertical Panels	1181	1078 1022
729-05 Stop/Slow Paddles	1181	1078 1023
729-06 Type I Construction Barricades	1181	1078 1023
729-07 Type II Construction Barricades	1182	1079 1023
729-08 Type III Construction Barricades	1182	1079 1024
729-09 Temporary Sign Supports	1182	1080 1024
729-10 Temporary Impact Attenuators - Redirective	1183	1080 1025
729-11 Temporary Impact Attenuators - Gating	1183	1080 1025
729-12 Truck-Mounted Impact Attenuators	1184	1081 1026
729-13 Temporary Sand Barrels	1185	1082 1026
729-14 Vehicle-Arresting Systems	1185	1082 1027
729-15 Arrow Panels	1185	1083 1027
729-16 Portable Variable-Message Signs (PVMS)	1189	1084 1028
729-17 Temporary Glare Screens	1190	1085 1029
729-18 Warning Lights	1191	1085 1030
SECTION 730 - SIGNS AND DELINEATORS	1191	1086 1030
730-01 Aluminum Sign Panels	1191	1086 1030
730-02 Temporary Plywood Sign Panels	1192	1087 1031

GENERAL PROVISIONS

SECTION 101 - ABBREVIATIONS AND DEFINITIONS OF TERMS

Wherever in these specifications or in other contract documents the following terms or pronouns in place of them are used, the intent and meaning shall be interpreted as follows:

101-01 ABBREVIATIONS OF TERMS.

Wherever the following abbreviations are used in these specifications or on the plans, they are to be construed the same as the respective expressions represented. Some of these abbreviations may be acronyms and some may appear with periods.

AAN	- American Association of Nurserymen
AASHTO	- American Association of State Highway and Transportation Officials
AISI	- American Iron and Steel Institute
ANSI	- American National Standards Institute, Inc
APA	- Adirondack Park Agency
AREA	- American Railway Engineering and Maintenance-of-Way Association
ASME	- American Society of Mechanical Engineers
ASTM	- American Society for Testing and Materials
AWPA	- American Wood-Preservers Association
AWWA	- American Water Works Association
AWS	- American Welding Society
CADD	- Computer Aided Design and Drafting
CPM	- Critical Path Method
CFR	- Code of Federal Regulations
CRU	- Contract Review Unit
DCED	- Deputy Chief Engineer for Design
DCES	- Deputy Chief Engineer for Structures Design and Construction
DCETS	- Deputy Chief Engineer for Technical Services
EEI	- Electrical Engineering Institute
EPA	- U.S. Environmental Protection Agency
FHWA	- Federal Highway Administration
MM	- Materials Method
MP	- Materials Procedure
MSDS	- Material Safety Data Sheet
MURK	- Manual for Uniform Record Keeping
MUTCD	- Manual on Uniform Traffic Control Devices
NEMA	- National Electrical Manufacturers Association
NYCRR	- Official Compilation of Codes, Rules and Regulations of the State of New York
NYSDEC	- New York State Department of Conservation
NYSDOL	- New York State Department of Labor
OSHA	- Occupational Safety and Health Administration, US Department of Labor
PCCM	- New York State Prestressed Concrete Construction Manual
PCCP	- Painting Contractor Certification Program
RME	- Regional Materials Engineer
SCM	- New York State Steel Construction Manual
SPN	- Std Plant Names adopted by The American Joint Committee on Horticultural Nomenclature
SSPC	- Steel Structures Painting Council
VECP	- Value Engineering Change Proposal
USACOE	- U.S. Army Corps of Engineers
USC	- United States Code

§101

101-02 DEFINITIONS OF TERMS.

Wherever the following terms are used in these specifications or on the plans, they are to be construed the same as the respective definitions represented.

A+B Bidding. A+B Bidding is a time-related form of bidding used by the Department for contracts that are time sensitive, either in overall contract duration, or the duration of a task or tasks. The total contract bid price consists of the amount bid that will be paid for the work (the “A portion”), plus the number of days for completion of the specified work multiplied by the user cost specified in the contract documents, (the “B portion”).

Addenda. Supplemental additions, deletions, and modifications to the provisions of the Standard Specifications which are in effect on the date of advertisement for receipt of bids.

Amendment. A formal alteration by addition, deletion or modification of a proposed contract, issued subsequent to the initiation of the sale of proposals and prior to the opening of bids.

Approved List. List of materials, equipment, Manufacturers, Fabricators or Material Suppliers approved by the Materials Bureau under a particular specification. The Approved Lists are published periodically and are available from the Materials Bureau or on the Department web site.

Award. The decision of the Department to accept the proposal of the lowest responsible bidder for the work, subject to the execution and approval of a satisfactory contract therefore and bond to secure the performance thereof, and to such other conditions as may be specified or otherwise required by law.

Base Line Data. The relevant contract specific information and engineering data used to develop the contract plans and proposal. The relevant information and data will be listed as available on Form CONR-9 *Supplemental Information Available to Bidders* included in the contract proposal.

Bid Deposit. The security furnished by the bidder with their proposal for a contract, as guarantee the bidder will enter into a contract for the work if their proposal is accepted.

Bidder. An individual, firm or corporation formally submitting a proposal for the work contemplated acting directly or through a duly authorized representative.

Bridge. The term “bridge” shall apply to any structure whether single or multiple span construction with a clear span in excess 20 feet when measurement is made horizontally along the center line of roadway from face to face of abutments or sidewalls immediately below the copings or fillets; or, if there are no copings or fillets, at 6 inches below the bridge seats or immediately under the top slab, in the case of frame structures. In the case of arches, the span shall be measured from spring line to spring line. All measurements shall include the widths of intervening piers or division walls, as well as the width of copings or fillets.

Calendar Day. Every day shown on the calendar. The calendar day begins at 12:00AM (Midnight).

CFR. Code of Federal Regulations published by the U.S. Office of the Federal Register, written TT CFR PPP.SS. TT refers to the Title, PPP refers to the Part and SS refers to the section. For example: 29 CFR 1926.1 refers to Title 29, Code of Federal Regulations, Part 1926, Section 1. Code of Federal Regulations are available on the internet at <http://www.gpoaccess.gov/cfr/index.html>

Chief Engineer. The Chief Engineer of the New York State Department of Transportation.

Closed Drainage System. A collection system of enclosed channels for stormwater runoff which carries water to a discharge point. Typically has drainage structures for inlet(s) and may include intermediate drainage structures at junction points.

Commissioner. The Commissioner of the New York State Department of Transportation.

Comptroller. The head of the New York State Office of the State Comptroller.

Contract. A binding agreement between the Department and a contractor to complete a specified scope of work. The contract includes, but is not limited to an executed contract agreement, a set of contract documents and contract bonds.

Contract Agreement. The agreement covering the performance of the work and furnishing of labor and materials in the construction of the work in conformance with the requirements of the contract documents.

Contract Bond. The approved form of security, executed by the Contractor and its Surety or Sureties, guaranteeing complete execution of the contract and all supplemental agreements pertaining thereto and the payment of all legal debts pertaining to the construction of the contract.

Contract Documents. The contract documents shall include the advertisement for proposals; the contract proposal, including Special Notes and Special Specifications contained therein; the Contractor's proposal; the Disadvantaged/Minority/Women's Business Enterprise (D/M/WBE) participation goals; the equal employment opportunity (EEO) participation goals; the contract agreement; the Base Line Data; Standard Specifications, including all addenda thereto identified in the contract proposal; the Standard Sheets; the plans; any amendments to the contract proposal or the contract plans issued prior to the date of receipt of proposals; and all provisions required by law to be inserted in the contract whether actually inserted or not.

Whenever separate publications are referenced in the Contract Documents it shall mean those, as amended, which are current on the date of advertisement for bids.

Contract Limits. The limits shown in the contract documents, in which all work occurs, including advanced signing and detours covered under an individual contract. The Contractor shall be responsible for the highway within the contract limits. For contracts with multiple sites, this may be defined as a single larger limit if the sites are in close proximity, or as multiple sets of contract limits if the sites are widely separated. On-site contract work cannot be conducted outside the contract limits.

Contract Pay Item. A specifically described unit of work for which a price is provided in the contract.

The basic format of a standard specification contract pay item number is a three digit root number, a decimal point, and then either a two, four, or six digit extension number (XXX.XX, XXX.XXXX, or XXX.XXXXXX). The three digit root number denotes the standard specifications section to which the contract pay item relates (i.e. 564 – Structural Steel).

The format of a special specification contract pay item is the same as the standard specification contract pay item number, but a two digit origin code number is added as a suffix. The special specifications will be contained in the contract proposal. The origin code number (RR) denotes the NYSDOT Region, Division, or Group that originate the special specification. Regardless of the length of the extension number, the suffix is always in the seventh and eighth decimal place after decimal point.

Contractor. The individual, firm, or corporation undertaking the execution of the work under the terms of the contract and acting directly or through his, her, their, or its agents or employees.

Culvert. An enclosed channel open at both ends carrying water from a stream or water course through an artificial barrier such as a roadway embankment. The term "culvert" shall apply to any structure whether of single or multiple span construction with an interior width of 20 feet or less when measurement is made horizontally along the center line of roadway from face to face of abutments or sidewalls immediately below the copings or fillets, or, if there are no copings or fillets, at points 6 inches below the bridge seats or immediately under the top slab in the case of frame structures.

In the case of arches, the span shall be measured from spring line to spring line. All measurements shall include the widths of intervening piers or division walls, as well as the widths of copings or fillets.

§101

Day. A calendar day unless otherwise defined or modified.

Department. The New York State Department of Transportation, including staff and managers who have been delegated certain contractual and technical authority by the Commissioner. The Department maintains a web site at *www.nysdot.gov*.

Departmental Geotechnical Engineer. The Regional Geotechnical Engineer or his/her authorized representative, or a Geotechnical Engineer of the Geotechnical Engineering Bureau acting at the request of the Regional Geotechnical Engineer.

Departmental Engineering Geologist. An Engineering Geologist of the Geotechnical Engineering Bureau authorized by the Director of Geotechnical Engineering Bureau to perform the duties required under these specifications.

Director, Office of Construction-Division. The Director of the Office of Construction ~~Division~~ of the Department of Transportation.

Division. Any of the divisions of the New York State Department of Transportation.

Drainage Structure. A structure that collects and/or redirects stormwater runoff, including catchbasins, manholes, leaching basins and similar structures, but not structures for sanitary sewers.

Employee. Any person working on the project mentioned in the contract documents, and who is under the direction or control, or receives compensation from the Contractor or Subcontractor.

Engineer OR Engineer-In-Charge. The Engineer representing the Department of Transportation having direct supervision of the execution of the contract under the direction of the Regional Director.

Equipment. All machinery and equipment, together with the necessary supplies for upkeep and maintenance, and also tools and apparatus necessary for the proper construction and acceptable completion of the work.

Erosion and Sediment Control. Erosion and sediment control is any action taken or item used as part of a contract or as a separate action to minimize the destructive effects of wind and water on surface soil. The use and placement of berms and dams, rolled erosion control products, grasses, sod, mulches, slope drains, sediment basins and drainage systems may be temporary and used throughout construction, or permanent and installed for the anticipated life of the facility.

Extra Work. Work not provided for in the contract as awarded but found essential to the satisfactory completion of the contract within its intended scope.

Fabricator. A Fabricator assembles, constructs or otherwise substantially alters materials or supplies into assemblies, components or finished items for inclusion into the work prior to resale.

Federal-Aid. Joint cooperative construction or reconstruction of State highways and bridges or grade crossing elimination work with monies contributed to the State by the Federal Government under Title 23, United States Code, Highways, and amendments thereto.

Federal-Aid Project. An identification applied to federally aided work for the purpose of the records of the FHWA. Federal-Aid contracts are denoted "F.A. Project" on the proposal cover and on the title page.

Field Change Payment (FCP). A contract contingency that allows for the timely payment of authorized extra work that is necessary to fulfill the intent of the plans and specifications without the

preparation of an order-on-contract during construction. A “clean-up” order-on-contract is processed after contract final acceptance to reconcile all FCO payments.

Final Agreement. Agreement between the State of New York, Department of Transportation and the Contractor, stating the net increase or decrease of the cost of work completed from the total cost of work authorized under the contract. The Final Agreement includes the Final Estimate as an attachment.

Geotechnical Engineering Bureau. The Department’s Geotechnical Engineering Bureau has the responsibility for providing all Geotechnical Engineering Services including laboratory testing of earthwork materials.

Highway. The whole strip of land bounded by the right of way lines.

Incentive/Disincentive (I/D). Predetermined adjustment to the total contract amount for each day or portion thereof that the work is completed ahead of or behind a specific milestone, phase or contract completion date.

Inspector. The Department of Transportation representative assigned to inspect methods and materials relating to work both on and off the site of the contract.

Land Surveyor. A Land Surveyor licensed or otherwise authorized to practice surveying under Article 145 and registered or otherwise authorized under Article 130 of the New York State Education Law.

Landscape Development. Landscape development is any development or item used as part of a project or as a separate action through the use, placement and management of land and elements for aesthetic enhancement, such as decorative surfaces and wall faces, benches, waste receptacles, tables, etc., and plant materials consistent with a specific landscape architectural design plan.

Landscaping. Landscaping is the use and placement of plant materials (trees, shrubs, vines and certain ground covers) consistent with a landscape architectural design plan. Planting vegetation for screening and erosion control purposes does not constitute landscaping.

Lane Rental. An amount identified as the value of a lane or lanes to be occupied by the Contractor in performance of the contract. The total amount bid for lane rental is the total value that can be used by the Contractor in performance of the contract. If additional value is used by the Contractor, that amount will be deducted from the payments to be made to the Contractor.

Laying Length of Pipe. Feet (laying length) of pipe shall be measured by multiplying the number of whole units by the nominal length of each unit and adding thereto the length of any fractional units incorporated in the work. The nominal length of a unit or fractional unit shall be the inside measured length from butt end to butt end and exclusive of the bell or groove on the female end.

Major Item. Any contract pay item for which the original unit bid price multiplied by the original item quantity exceeds the following minimum major item value based on total contract bid price or 2% of the total contract bid price, whichever is greater:

Total Contract Bid Price	Minimum Major Item Value
≤ \$1,000,000.	\$20,000
> \$1,000,000 - \$5,000,000	\$50,000
> \$5,000,000 - \$20,000,000	\$200,000
> \$20,000,000	\$500,000

NOTE: The total contract bid price shall not include the value of any Field Change Order item. For contracts subject to A+B Bidding, the total contract bid price will include only the “A” portion of the bid. For contracts containing Incentive/Disincentive provisions, Lane Rental provisions, or any similar provisions, the total contract bid price will exclude any incentive/disincentive, lane rental, or similar items.

Manual for Uniform Record Keeping on Construction Contracts (MURK). Manual(s) containing uniform contract record keeping forms and procedures to be followed by the Engineer, current on the date of contract award. MURK Part 1A is the Contract Administration Manual (CAM), Part 1B is the Construction Inspection Manual (CIM), Part 1C is the Safety and Health Program Manual, and Part 2A is the Materials Inspection Manual (MIM). The MURK manuals are guidance documents, and are not a part of the contract documents.

Manual on Uniform Traffic Control Devices (MUTCD). Consists of the Manual on Uniform Traffic Control Devices for Streets and Highways (approved by the FHWA) and the New York State Supplement to the National Manual on Uniform Traffic Control Devices for Streets and Highways. These documents prescribe standards for the design, location, use, and operation of traffic control devices.

Manufacturer. A Manufacturer operates or maintains a factory or establishment that produces, on the premises, materials or supplies of the general character described by the specifications.

Material. Any approved material acceptable to the Commissioner and conforming to the requirements of the specifications.

Material Supplier. A Material Supplier, also known as a regular dealer, is a firm that owns, operates, or maintains a store, warehouse, or other establishment in which the materials or supplies required for the performance of the contract are bought, kept in stock, and regularly sold to the public in the usual course of business. A Material Supplier is a firm that engages in, as its principal business, and in its own name, the purchase and sale of the products in question. A Material Supplier who deals in bulk items such as steel, cement, gravel, stone and petroleum products need not keep such products in stock, if it owns or operates distribution equipment. Packagers, brokers, manufacturer’s representatives or other persons who arrange or expedite transactions are not Material Suppliers.

Materials Bureau. The Department’s Materials Bureau has a responsibility in the quality assurance program for materials to be used on the contract and maintains a testing facility in Albany, New York.

Materials Details. That information, unique to a particular product, that is necessary to adequately identify it or to describe the proper handling, installation, or use of that product.

Minor Item. Any contract pay item that does not meet the definition of a Major Item.

NCHRP 350. National Cooperative Highway Research Program Report 350 *Recommended Procedures for the Safety Performance Evaluation of Highway Features*. NCHRP 350 presents procedures for the evaluation of roadside safety features and appurtenances, by vehicle crash testing or in-service evaluation.

Near. When used in reference to an underground facility, within 15 feet of the outside perimeter or diameter of an underground facility or its encasement.

NYCRR. Official Compilation of Codes, Rules and Regulations of the State of New York, written TT NYCRR PPP. TT refers to the Title, and PPP refers to the Part of the official compilation.

One-Call Notification System. Organization(s) whose purpose is to establish and carry out procedures to protect underground facilities from damage due to excavation and demolition, including receiving notices of intent to perform excavation and/or demolition and transmit the notices to the operators of underground facilities in the specified area.

Order on Contract. Written order issued by the Commissioner covering contingencies, extra work, deductions, increases or decreases and additions, alterations or omissions to the plans or specifications.

Owner/Operator. A single individual who operates a vehicle or other piece of equipment as an independent contractor and does not have any employees. The Owner/Operator is responsible for all costs incurred in the ownership and operation of the vehicle/equipment including, but not limited to: licensing/registration, insurance, taxes, permits, repairs and fuel. Payments to the Owner/Operator are for both the vehicle/equipment and an operator, and may be made on a time, distance, load or other basis.

Partial or Monthly Contract Payments. Payments to the Contractor for work satisfactorily performed, prescribed by subdivision 7, section 38 of the Highway Law.

Payment Limit. A payment limit defines the boundary beyond which no quantities will be measured for payment. Whenever payment limits are indicated, only the work which is actually directed and completed within these limits will be measured and computed for payment. Payment limits may be revised in writing by the Engineer prior to performing the work.

Payment Line. Defines the exact line from which the work quantity will be computed. Whenever payment lines are indicated, quantities representing work completed will be computed from these lines only. No other lines or locations will be used to compute quantities. Payment lines may be revised with the recommendation of the Engineer through an approved order-on-contract prior to performing the work.

Plans. The official contract drawings and applicable standard sheets, which show the location, character, dimensions and details of the work to be performed.

Prestressed Concrete Construction Manual (PCCM). The New York State Prestressed Concrete Construction Manual published by the Office of Structures Design and Construction ~~Division~~, which is current on the date of advertisement for bids. The Prestressed Concrete Construction Manual is a mandatory supplement to the contract documents for contracts which include Prestressed Concrete Units (Structural).

Professional Engineer. A Professional Engineer licensed or otherwise authorized to practice engineering under Article 145 and registered or otherwise authorized under Article 130 of the New York State Education Law.

Project. The construction work to be performed under one or more construction contracts to complete an undertaking.

Project Limits. The limits in which the improvements associated with a specific project have been designed.

Proposal. The offer of the bidder for the work, when executed and submitted on the prescribed form.

Proposal Form. The approved form on which the Department requires formal bids to be prepared and submitted for the work.

Reasonable Close Conformity. Reasonable close conformity means compliance with reasonable and customary manufacturing and construction tolerances where working tolerances are not specified. Where working tolerances are specified, reasonably close conformity means compliance with such tolerances. Without detracting from the complete and absolute discretion of the Engineer to insist upon such tolerances, the Engineer may accept variations beyond such tolerances as reasonable close conformity where they will not materially affect the value or utility of the work and the interests of the State.

Region. One of eleven geographical subdivisions of the State used to designate or identify the location of the proposed work.

Regional Director. The Director, acting through the Commissioner, who is delegated the authority and responsibility to execute the total Department prescribed work plans for his/her respective region.

§101

Right of way or R.O.W. A general term denoting land, property or interest therein, usually in a strip, acquired for or devoted to a highway.

Roadbed. The graded portions of a highway within top and side slopes, prepared as a foundation for the pavement structure and shoulders.

Roadway. The portion of a highway included between the outside edges of the shoulders.

Road Section. That portion of a highway included between the top of the slope in cut and the bottom of slope in fill.

Service. For the purposes of determining whether subcontractor approval is required, and for determining reimbursement for extra work, a Service is specialized work consisting of less than an entire contract pay item, conducted for an aggregate of less than 5 days, provided to the Contractor for a fee or other basis not generally accounted for through labor, materials and equipment billing. Services include, but are not limited to professional fees, testing fees, dumping fees, utility charges, fuel supply delivery, vehicle towing called out for the public, and crane lifting operations.

Shoulder. The portion of the roadway contiguous with the traveled way for accommodation of stopped vehicles, for emergency use, and for lateral support of base and surface courses.

Site. The specific area adjacent to and including the area upon which construction work is to be performed. Generally such area may be considered as defined by the right of way or property made available to the Contractor for construction operations.

Special Notes. Special directions, provisions, or requirements peculiar to the contract under consideration.

Specifications. The body of directions, requirements, etc., contained in this present volume, together with all special specifications and documents of any description and agreements made (or to be made), pertaining to the methods (or manner) of performing the work or to the quantities and quality as shown by the test records of accepted materials to be furnished under a contract.

Within these specifications there are two formats for numbering. One is used for the specification sections and subsections portion and the other for contract pay items. (See definition - Contract Pay Item.)

A specification section is written using the word Section xxx *Section Title* (e.g., Section 564 *Structural Steel*) and subsections are written with a subsection symbol, the core section number, a dash, another and may include a decimal (e.g., §107-05 *Safety and Health Requirements* or §608-3.03E.2.).

Standard Sheets. The standard drawings, issued by the Department, approved for repetitive use, showing details to be used where appropriate. Applicable standard sheets are referenced on the Contract Plan Title Sheet, and comprise a part of the Contract Documents. Standard sheets are available on the NYSDOT web site in both Adobe Acrobat (pdf) and Bentley Systems MicroStation (dgn) formats.

State. When used, means the State of New York, represented by the Department of Transportation through the Commissioner of Transportation.

Steel Construction Manual (SCM). The New York State Steel Construction Manual published by the Office of Structures Design and Construction ~~Division~~, which is current on the date of advertisement for bids. The Steel Construction Manual is a mandatory supplement to the contract documents for contracts which include contract pay items which require the Contractor to furnish or rehabilitate structural metals.

Structures. Bridges, culverts, retaining walls, cribbing, manholes, drainage structures, endwalls, buildings, sewers, service pipes, underdrains, foundation drains and other features which may be encountered in the work and not otherwise classed herein.

Subcontractor. Any individual, firm or corporation to whom the Contractor, with the written consent of the Department, sublets any part of the contract.

Surety. The corporate body bound with and for the Contractor, guaranteeing the full and complete performance of the contract, and for the payment of all debts pertaining to the work.

Test. Methods adopted by the Commissioner to ascertain the quality, character and acceptability of materials and processes utilized in performing the contract.

Tolerance Zone. When used in reference to an underground utility, the tolerance zone shall be a distance of 2 feet on either side of the designated centerline, plus one-half of the utility diameter, if the utility diameter is known.

Traveled Way. Portion of the roadway for the movement of vehicles, exclusive of the shoulders. Through traveled way is the portion of the roadway for the movement of vehicles, exclusive of shoulders and auxiliary lanes.

Utility. Person, corporation, municipality or public authority engaged in the distribution of electricity, gases, petroleum products, water, steam, the collection of wastewater, the operation of traffic control systems, or the provision of telecommunication service. For the purposes of these Specifications, the term Utility will apply to organizations that operate utilities owned by others.

Work. Work shall be understood to mean the furnishing of all labor, materials, equipment, and other incidentals necessary or convenient to the successful completion of the contract and the carrying out of all the duties and obligations imposed by the contract.

Work Day. A calendar day, on which weather and other conditions not under the control of the Contractor, will permit construction operations on the principal item or items of work which would normally be in progress at that time to proceed for the major part of the day. Work days exclude Sundays, and days on which the Contractor is specifically prohibited from working, as identified in the contract documents. Days on which the Contractor is prohibited from closing a lane or lanes or impeding traffic are considered work days unless otherwise noted in the contract documents.

For the purposes of determining allowable time periods for submittals, reviews and approvals, State recognized public holidays are not considered work days. The public holidays observed by the State are as follows:

New York State Public Holidays	
New Years Day	January 1
Martin Luther King Day	3rd Monday in January
President’s Day	3rd Monday in February
Memorial Day	Last Monday in May
Independence Day	July 4
Labor Day	1st Monday in September
Columbus Day	2nd Monday in October
Veteran’s Day	November 11
Thanksgiving Day	4th Thursday in November
Christmas Day	December 25

If the holiday occurs on a Saturday, it will be observed the Friday before. If the holiday occurs on a Sunday, it will be observed the Monday after.

SECTION 102 - BIDDING REQUIREMENTS AND CONDITIONS

102-01 LOCATION OF REGIONAL OFFICES.

The Regional Offices and counties covered are located as follows:

Region Number	Including Counties:			Regional Office Address
1	Albany Rensselaer Warren	Essex Saratoga Washington	Columbia Greene Schenectady	NYS Office Building 328 State Street Schenectady, N.Y. 12305 (518) 388-0388
2	Fulton Madison	Hamilton Montgomery	Herkimer Oneida	NYS Office Building 207 Genesee Street Utica, N.Y. 13501 (315) 793-2447
3	Cayuga Oswego	Cortland Seneca	Onondaga Tompkins	NYS Office Building 333 E. Washington St. Syracuse, N.Y. 13202 (315) 428-4351
4	Genesee Ontario Wayne	Livingston Orleans	Monroe Wyoming	1530 Jefferson Road Rochester, N.Y. 14623 (585) 272-3310
5	Cattaraugus Niagara	Chautauqua	Erie	NYS Office Building 100 Seneca Street Buffalo, N.Y. 14203 (716) 847-3238
6	Allegany Steuben	Chemung	Schuyler Yates	NYS Office Building 107 Broadway Street Hornell, N.Y. 14843 (607) 324-8404
7	Clinton Lewis	Franklin St. Lawrence	Jefferson	NYS Office Building 317 Washington Street Watertown, N.Y. 13601 (315) 785-2333
8	Putnam Westchester	Dutchess Rockland	Orange Ulster	NYS Office Building 4 Burnett Boulevard Poughkeepsie, N.Y. 12603 (845) 431-5750
9	Broome Otsego	Chenango Schoharie	Delaware Sullivan Tioga	NYS Office Building 44 Hawley Street Binghamton, N.Y. 13901 (607) 721-8116
10	Nassau	Suffolk		NYS Office Building 250 Veterans Memorial Highway Hauppauge, N.Y. 11788 (631) 952-6632

11	Bronx Richmond	Kings Queens	New York	Hunters Point Plaza 4740 21st Street Long Island City, N.Y. 11101 (718) 482-4526
----	-------------------	-----------------	----------	---

102-02 EXAMINING THE CONTRACT DOCUMENTS AND THE WORK SITE.

Detailed plans of the work, standard sheets and contract proposals may be examined at the office of the NYS Department of Transportation, Plan Sales Unit, 50 Wolf Road, Albany, New York 12232 (518) 457-2124 and at the Regional Office where the work is located.

The attention of persons intending to make proposals is specifically called to Article 3, *Examination of Documents and Site* of the contract agreement wherein the bidder agrees that it has examined the contract documents and the site of the work and has fully informed itself from personal examination of the same regarding the quantities, character, location and other conditions affecting the work to be performed including the existence of poles, wires, pipes, ducts, conduits, and other facilities and structures of municipal and other public service corporations on, over or under the site. Particular attention is called to contract plans and the contract proposal, which contains special notes and special specifications, which may contain contract requirements at variance with standard specifications and standard sheets and may include information concerning the existence of poles, wires, pipes, ducts, conduits, and other facilities and structures of municipal and other Utilities on, over or under the site.

The Bidder agrees that its proposed contract prices include all costs arising solely from existing conditions shown, or specified in the contract documents including the Base Line Data, and/or readily observable from a site inspection during the bidding period available under this contract, and/or generally recognized as inherent in the nature of the work. The Bidder shall take no advantage of any apparent error or omission in the contract documents.

A. Base Line Data. The Department will make available relevant project specific information and engineering data that were used to develop the contract documents. The material will be listed as available on a form in the contract proposal entitled "Supplemental Information Available to Bidders". The supplemental information could include, for example, earthwork cross section sheets, various subsurface information, record plans, special reports and other pertinent project data. The information or data listed as available on the form can be accessed by the Contractor for inspection or reproduction at the Regional Office where the work is located. This material will be the Base Line Data and together with other contract documents will be used to determine changes to the work. Base Line Data will be consistently provided in all Department projects.

B. Contract Document Components. The following components of the contract documents complement one another in the declining order of precedence listed below. The intent of the contract documents is to include all items/aspects of the work that are necessary for the proper initiation, execution, and completion of the work.

1. Plans.
2. Proposal - Special Notes.
3. Proposal - Special Specifications.
4. Standard Specifications.
5. Standard Sheets.
6. Base Line Data.

C. Subsurface Information. Boring logs and other subsurface information made available for the inspection of bidders were obtained with reasonable care and recorded in good faith by the Department. The subsurface information shown was obtained for State design and estimate purposes. It is made available to bidders so that they may have access to the same information available to the State. It is presented in good faith, but as with all subsurface information it represents only a small fraction of the total volume of material at the site.

The soil and rock descriptions shown are as determined by a visual inspection of the samples from the various explorations unless otherwise noted. The observed water levels and/or water

§102

conditions indicated thereon are as recorded at the time of the exploration. These levels and/or conditions may vary considerably, with time, according to the prevailing climate, rainfall and other factors. Interpolation between data points may not be indicative of the actual material to be encountered.

The locations of utilities or other underground man-made features were ascertained with reasonable care and recorded in good faith from various sources, including the records of municipal and other public service corporations, and therefore the location of known utilities may only be approximate. Subsurface utility quality level designations shown in the contract documents are defined in accordance with §107-07E. *Quality Level Designations*.

102-03 COOPERATION BETWEEN CONTRACTORS.

The Department reserves the right to let other contracts in connection with this work. The Contractor acknowledges that, from the contract documents and Base Line Data, it has been informed of such other contracts in the work area. The Contractor has carefully reviewed the contract documents and all other pertinent information made available by the Department that relate to the nature and scheduling of these other contracts that may be awarded and will submit a progress schedule that takes into account the need to coordinate its work with those other contractors. The Contractor shall coordinate its work with the work of these other contractors. There may be other contractors, subcontractors, utilities, or employees of the Department and its authorized representatives working at or adjacent to the work site during the performance of the contract by the Contractor. The Contractor may not have exclusive access to or occupancy of the territory within or adjacent to the limits of the contract. To the extent indicated in the Base Line Data and contract documents, the Department may also require that certain facilities and areas be used concurrently by the Contractor and others. Consistent with that indicated in the Base Line Data and contract documents, the Department will advise the Contractor of the schedules of others. The Contractor should anticipate that its work may be interrupted or delayed from time to time due to the concurrent activities of others.

The Contractor shall cooperate with other Contractors and Utilities and coordinate and arrange the sequence of its work to conform with the work operations of other parties indicated in the Base Line Data. Cooperation and adjustments with the Contractors already engaged and to be engaged upon the site is essential to properly coordinate the construction efforts of all contractors, Utilities, and Subcontractors engaged in the work within and adjacent to the construction area of this contract.

In the event that utility facility adjustments are to be made by a Utility's forces in connection with and during the life of the contract, the Contractor will be required to cooperate with the Utilities and to coordinate and arrange the sequence of its work to conform with the progressive operations of the Utility's work or proposed work.

102-04 PROPOSAL CONTENT.

Each proposal shall specify the correct gross sum, in the manner hereafter described for which the work will be performed according to the plans and specifications and any amendment to the specifications if the same are issued prior to the date of receipt of the proposal, together with a unit price for each of the specified separate items. The bidder's attention is directed to the fact that it cannot exceed three (3) decimal positions in the cents column under unit bid price.

A. Fixed Price Items. Some of the contract pay items may be designated as Fixed Price or Dollars-Cents Items, for which the fixed prices are published in the proposal. These items can be identified in the Itemized Proposal by the words, "Fixed Price: See Specification and §102-04" appearing beneath the description of the item, and preprinted entries in the "Unit Price" and "Bid Amount" columns. The bidder shall not change these entries. Should the amount shown be altered, the altered figures will be disregarded and the preprinted price and amount will be used to determine the total amount bid for the contract.

Some Fixed Price Items indicate the price that will be paid for certain work. These have been prepared taking into account the cost of all labor, materials, and equipment necessary to complete the work including an allowance for overhead and profit. Other Fixed Price Items indicate an estimate of payments, with actual payments to be based on actual costs and provisions of the controlling

specification. In either case, payments made under Fixed Price Items shall be in accord with the provisions for the specification for that item.

B. Minimum/Maximum Bid Items. Similarly, one or more contract pay items may be designated as MINIMUM PRICE ITEMS or MAXIMUM PRICE ITEMS. When this is the case, the minimum (or maximum) prices are published in the proposal. These contract pay items can also be identified in the Itemized Proposal by the words "Minimum Bid ___" or "Maximum Bid ___" appearing beneath the description of the item. The price bid for Minimum Price Items shall not be less than the minimum price shown in the Itemized Proposal, but it may exceed that price.

Conversely, the price bid for Maximum Price Items shall be less than, or equal to, the maximum price shown in the Itemized Proposal. In the event a bid is less than the Minimum Price (or more than the Maximum Price) indicated in the Itemized Proposal, the Department will substitute the appropriate minimum (or maximum) price and make the necessary adjustments to determine the total amount bid.

C. A+B Bidding. The itemized contract proposal provides space to individually list the number of consecutive calendar days for each stage or phase of work subject to A+B Bidding. The Contractor shall enter the number of consecutive calendar days bid for each phase or stage of work subject to A+B bidding individually in the space provided. Bids showing time for completion of B-portion work in excess of the maximum total number of calendar days that can be bid as specified in the Special Note entitled *Description of B-Portion Work* will be adjusted by the Department to the maximum time allowed.

102-05 PROPOSAL SUBMISSION.

Each proposal shall be submitted on the proposal form or electronic bid file prepared by the Department for that individual contract. The deadline for submitting a proposal is found in the published notice calling for proposals. Any proposal received after the time specified in the published notice, as modified by any Amendment, will not be accepted. All blank spaces in the proposal form shall be filled in as noted, and no change shall be made in the phraseology of the proposal or in the items mentioned therein. Proposals that are illegible or that contain any omission, erasures, alterations, additions, or items not called for in the itemized proposal or that contain irregularities of any kind, may be rejected as informal. Any proposal which does not contain prices set opposite each of the items for which there is a quantity exhibited in the itemized proposal, or which shall in any manner fail to conform to the conditions of the published notice inviting proposals, may be deemed informal.

The State is responsible for providing Amendments only to those persons or firms listed as having purchased plans and/or proposals from the Department, and those that made a specific request of the Department for Amendments. Persons or firms that obtain contract documents from sources other than the Department bear the sole responsibility for obtaining any Amendments issued by the Department.

For proposals submitted on the proposal form, the Bidder shall sign in the space provided in the proposal form, with its signature. An officer of a corporation or a member of a partnership signing for the bidder, shall place his or her signature and title after the word "By" under the name of the Contractor. The same procedure shall apply to the proposal of a joint venture by two or more bidders; however, if the signature is by an agent or attorney-in-fact for the joint venturers, then the proposal shall be accompanied by an authenticated copy of the evidence of its authority to act on behalf of all of the joint venturers.

For proposals submitted as electronic bid files over the internet, the Bidder shall submit and digitally sign the electronic bid file in the manner prescribed by the Department.

If the proposal is made by an individual, the individual's address shall be given. If the proposal is made by a corporation, the names and addresses of the president, secretary and treasurer shall be given. If the proposal is made by a partnership, the names and addresses of the partners shall be given.

~~102-05 PROPOSAL SUBMISSION.~~

~~Each proposal shall be submitted on the proposal form prepared by the Department for that individual contract. The deadline for submitting a proposal is found in the published notice calling for proposals. Any proposal received after the time specified in the published notice, as modified by any Amendment, will not be accepted. All blank spaces in the proposal form shall be filled in as noted, and no change shall be made in the phraseology of the proposal or in the items mentioned therein. Bidders shall use either~~

102-06 BID DEPOSIT.

THE BIDDER MUST SUBMIT A BID SECURITY WITH EACH BID. Every proposal shall be accompanied by (1) a bid bond or (2) a certified check or (3) a bank cashier's check payable to the State of New York. If the Bidder elects to submit a bid bond, it SHALL be on the Department's Bid Bond Form (CONR 391, a sample of which is included in §102-15, *Sample Form of Bid Bond*) that already contains language representing 25% of the total bid. If the Bidder elects to submit a certified check or bank cashier's check for a bid deposit, it shall be in the amount specified in the bid proposal. The retention and disposition of such bid bond or certified check or bank cashier's check by the Department shall be pursuant to and in conformity with §38(2) of the Highway Law, as amended.

102-07 MODIFICATION OR WITHDRAWAL OF PROPOSAL.

Permission will not be given to modify or explain by e-mail, telephone, letter or otherwise, any proposal or bid after it has been deposited with the Department. No proposal shall be withdrawn or canceled before the time designated for opening such proposals publicly except upon such conditions as the Commissioner may deem to be necessary.

No proposal shall be withdrawn or canceled after the time designated for opening such proposals publicly, except to exercise the option as provided herein. Any bidder or its duly authorized agent who is physically present at the letting and who has submitted proposals on more than one project of any one letting may, at its option and upon written request to an authorized Department representative at the letting, withdraw any or all of its additional proposals after the person who opens and reads the bids has announced that such bidder has submitted the lowest proposal on a project for which bids have last been read. When this option is exercised, the proposals for other projects in the letting will be returned to the bidder unopened or, if the bid was submitted electronically, the Department will delete the bid(s) and the bid will not be made public. No returned proposals will be considered after the bidder has exercised its privilege to withdraw the same. Any bidder exercising the privilege of so withdrawing its bid or bids waives all claims that may arise should it be found that its opened proposal is informal or for any other reason is unacceptable to the Department. The Department will open and read proposals in the order in which they are drawn and not in the order in which the projects are advertised.

102-07 MODIFICATION OR WITHDRAWAL OF PROPOSAL.

102-08 STANDARD CLAUSES FOR ALL NEW YORK STATE CONTRACTS.

The parties to the attached contract, license, lease, amendment or other agreement of any kind (hereinafter, "the contract" or "this contract") agree to be bound by the following clauses which are hereby made a part of the contract (the word "Contractor" herein refers to any party other than the State, whether a contractor, licensor, licensee, lessor, lessee or any other party):

1. EXECUTORY CLAUSE. In accordance with Section 41 of the State Finance Law, the State shall have no liability under this contract to the Contractor or to anyone else beyond funds appropriated and available for this contract.

2. NON-ASSIGNMENT CLAUSE. In accordance with Section 138 of the State Finance Law, this contract may not be assigned by the Contractor or its right, title or interest therein assigned, transferred, conveyed, sublet or otherwise disposed of without the previous consent, in writing, of the State and any attempts to assign the contract without the State's written consent are null and void. The Contractor may, however, assign its right to receive payment without the State's prior written consent unless this contract concerns Certificates of Participation pursuant to Article 5-A of the State Finance Law.

3. COMPTROLLER'S APPROVAL. In accordance with Section 112 of the State Finance Law (or, if this contract is with the State University or City University of New York, Section 355 or Section 6218 of the Education Law), if this contract exceeds \$15,000 (or the minimum thresholds agreed to by the Office of the State Comptroller for certain S.U.N.Y. and C.U.N.Y. contracts), or if this is an amendment for any amount to a contract which, as so amended, exceeds said statutory amount, or if, by this contract, the State agrees to give something other than money when the value or reasonably estimated value of such consideration exceeds \$10,000, it shall not be valid, effective or binding upon the State until it has been approved by the State Comptroller and filed in his office. Comptroller's approval of contracts let by the Office of General Services is required when such contracts exceed \$30,000 (State Finance Law Section 163.6.a).

4. WORKERS' COMPENSATION BENEFITS. In accordance with Section 142 of the State Finance Law, this contract shall be void and of no force and effect unless the Contractor shall provide and maintain coverage during the life of this contract for the benefit of such employees as are required to be covered by the provisions of the Workers' Compensation Law.

5. NON-DISCRIMINATION REQUIREMENTS. To the extent required by Article 15 of the Executive Law (also known as the Human Rights Law) and all other State and Federal statutory and constitutional non-discrimination provisions, the Contractor will not discriminate against any employee or applicant for employment because of race, creed, color, sex, national origin, sexual orientation, age, disability, genetic predisposition or carrier status, or marital status. Furthermore, in accordance with Section 220-e of the Labor Law, if this is a contract for the construction, alteration or repair of any public building or public work or for the manufacture, sale or distribution of materials, equipment or supplies, and to the extent that this contract shall be performed within the State of New York, Contractor agrees

that neither it nor its Subcontractors shall, by reason of race, creed, color, disability, sex or national origin: (a) discriminate in hiring against any New York State citizen who is qualified and available to perform the work; or (b) discriminate against or intimidate any employee hired for the performance of work under this contract. If this is a building service contract as defined in Section 230 of the Labor Law, then, in accordance with Section 239 thereof, Contractor agrees that neither it nor its Subcontractors shall, by reason of race, creed, color, national origin, age, sex or disability: (a) discriminate in hiring against any New York State citizen who is qualified and available to perform the work; or (b) discriminate against or intimidate any employee hired for the performance of work under this contract. Contractor is subject to fines of \$50.00 per person per day for any violation of Section 220-e or Section 239 as well as possible termination of this contract and forfeiture of all moneys due hereunder for a second or subsequent violation.

6. WAGE AND HOURS PROVISIONS. If this is a public work contract covered by Article 8 of the Labor Law or a building service contract covered by Article 9 thereof, neither Contractor's employees nor the employees of its Subcontractors may be required or permitted to work more than the number of hours or days stated in said statutes, except as otherwise provided in the Labor Law and as set forth in prevailing wage and supplement schedules issued by the State Labor Department. Furthermore, Contractor and its Subcontractors must pay at least the prevailing wage rate and pay or provide the prevailing supplements, including the premium rates for overtime pay, as determined by the State Labor Department in accordance with the Labor Law.

7. NON-COLLUSIVE BIDDING REQUIREMENT. In accordance with Section 139-d of the State Finance Law, if this contract was awarded based upon the submission of bids, Contractor warrants, under penalty of perjury, that its bid was arrived at independently and without collusion aimed at restricting competition. Contractor further warrants that at the time Contractor submitted its bid, an authorized and responsible person executed and delivered to the State a non-collusive bidding certification on Contractor's behalf.

8. INTERNATIONAL BOYCOTT PROHIBITION. In accordance with Section 220-f of the Labor Law and Section 139-h of the State Finance Law, if this contract exceeds \$5,000, the Contractor agrees, as a material condition of the contract, that neither the Contractor nor any substantially owned or affiliated person, firm, partnership or corporation has participated, is participating, or shall participate in an international boycott in violation of the Federal Export Administration Act of 1979 (50 USC App. Sections 2401 et seq.) or regulations thereunder. If such Contractor, or any of the aforesaid affiliates of Contractor, is convicted or is otherwise found to have violated said laws or regulations upon the final determination of the United States Commerce Department or any other appropriate agency of the United States subsequent to the contract's execution, such contract, amendment or modification thereto shall be rendered forfeit and void. The Contractor shall so notify the State Comptroller within five (5) business days of such conviction, determination or disposition of appeal (2 NYCRR 105.4).

9. SET-OFF RIGHTS. The State shall have all of its common law, equitable and statutory rights of set-off. These rights shall include, but not be limited to, the State's option to withhold for the purposes of set-off any moneys due to the Contractor under this contract up to any amounts due and owing to the State with regard to this contract, any other contract with any State department or agency, including any contract for a term commencing prior to the term of this contract, plus any amounts due and owing to the State for any other reason including, without limitation, tax delinquencies, fee delinquencies or monetary penalties relative thereto. The State shall exercise its set-off rights in accordance with normal State practices including, in cases of set-off pursuant to an audit, the finalization of such audit by the State agency, its representatives, or the State Comptroller.

10. RECORDS. The Contractor shall establish and maintain complete and accurate books, records, documents, accounts and other evidence directly pertinent to performance under this contract (hereinafter, collectively "the Records"). The Records must be kept for the balance of the calendar year in which they were made and for six (6) additional years thereafter or three (3) years after final payment, whichever is later. The State Comptroller, the Attorney General and any other person or entity authorized to conduct

and examination, as well as the agency or agencies involved in this contract, shall have access to the Records during normal business hours at an office of the Contractor within the State of New York or, if no such office is available, at a mutually agreeable and reasonable venue within the State, for the term specified above for the purposes of inspection, auditing and copying. The State shall take reasonable steps to protect from public disclosure any of the Records which are exempt from disclosure under Section 87 of the Public Officers Law (the "Statute") provided that: (i) the Contractor shall timely inform an appropriate State official, in writing, that said records should not be disclosed; and (ii) said records shall be sufficiently identified; and (iii) designation of said records as exempt under the Statute is reasonable. Nothing contained herein shall diminish, or in any way adversely affect, the State's right to discovery in any pending or future litigation.

11. IDENTIFYING INFORMATION AND PRIVACY NOTIFICATION:

(A) Federal Employer Identification Number And/or Federal Social Security Number.

All invoices or New York State standard vouchers submitted for payment for the sale of goods of services or the lease of real or personal property to a New York State agency must include the payee's identification number, i.e., the seller's or lessor's identification number. The number is either the payee's Federal employer identification number or Federal social security number, or both such numbers when the payee has both such numbers. Failure to include this number or numbers may delay payment. Where the payee does not have such number or numbers, the payee, on his invoice or New York State standard voucher, must give the reason or reasons why the payee does not have such number or numbers.

(B) Privacy Notification.

(1) The authority to request the above personal information from a seller of goods or services or a lessor of real or personal property, and the authority to maintain such information, is found in Section 5 of the State Tax Law. Disclosure of this information by the seller or lessor to the State is mandatory. The principal purpose for which the information is collected is to enable the State to identify individuals, businesses and others who have been delinquent in filing tax returns or may have understated their tax liabilities and to generally identify persons affected by the taxes administered by the Commissioner of Taxation and Finance. The information will be used for tax administration purposes and for any other purpose authorized by law.

(2) The personal information is requested by the purchasing unit of the agency contracting to purchase the goods or services or lease the real or personal property covered by this contract or lease. The information is maintained in New York State's Central Accounting System by the Director of State Accounts, Office of the State Comptroller, 110 State Street, Albany, New York 12236.

12. EQUAL EMPLOYMENT OPPORTUNITIES FOR MINORITIES AND WOMEN:

In accordance with Section 312 of the Executive Law, if this contract is: (i) a written Agreement or purchase order instrument, providing for a total expenditure in excess of \$25,000.00, whereby a contracting agency is committed to expend or does expend funds in return for labor, services, supplies, equipment, materials or any combination of the foregoing, to be performed for, or rendered or furnished to the contracting agency; or (ii) a written Agreement in excess of \$100,000.00 whereby a contracting agency is committed to expend or does expend funds for the acquisition, construction, demolition, replacement, major repair or renovation of real property and improvements thereon; or (iii) a written Agreement in excess of \$100,000.00 whereby the owner of a State assisted housing project is committed to expend or does expend funds for the acquisition, construction, demolition, replacement, major repair or renovation of real property and improvements thereon for such project, then:

(a) The Contractor will not discriminate against employees or applicants for employment because of race, creed, color, national origin, sex, age, disability or marital status, and will undertake or continue existing programs of affirmative action to ensure that minority group members and women are afforded equal employment opportunities without discrimination. Affirmative action shall mean recruitment, employment, job assignment, promotion, upgrading, demotion, transfer, layoff, or termination and rate of pay or other forms of compensation;

§102

(b) At the request of the contracting agency, the Contractor shall request each employment agency, labor union, or authorized representative of workers with which it has a collective bargaining or other Agreement or understanding, to furnish a written statement that such employment agency, labor union or representative will not discriminate on the basis of race, creed, color, national origin, sex, age, disability or marital status and that such union or representative will affirmatively cooperate in the implementation of the Contractor's obligations herein; and

(c) The Contractor shall state, in all solicitations or advertisements for employees, that, in the performance of the State contract, all qualified applicants will be afforded equal employment opportunities without discrimination because of race, creed, color, national origin, sex, age, disability or marital status.

Contractor will include the provisions of "a", "b" and "c", above, in every subcontract over \$25,000.00 for the construction, demolition, replacement, major repair, renovation, planning or design of real property and improvements thereon (the "Work") except where the Work is for the beneficial use of the Contractor. Section 312 does not apply to: (i) work, goods or services unrelated to this contract; or (ii) employment outside New York State; or (iii) banking services, insurance policies or the sale of securities. The State shall consider compliance by a Contractor or Subcontractor with the requirements of any Federal law concerning equal employment opportunity which effectuates the purpose of this section.

The contracting agency shall determine whether the imposition of the requirements of the provisions hereof duplicate or conflict with any such Federal law and if such duplication or conflict exists, the contracting agency shall waive the applicability of Section 312 to the extent of such duplication or conflict. Contractor will comply with all duly promulgated and lawful rules and regulations of the NYS Department of Economic Development's Division of Minority- and Women-Owned Business Development pertaining hereto.

13. CONFLICTING TERMS. In the event of a conflict between the terms of the contract (including any and all attachments thereto and amendments thereof) and the terms of this subsection, the terms of this subsection shall control.

14. GOVERNING LAW. This contract shall be governed by the laws of the State of New York except where the Federal supremacy clause requires otherwise.

15. LATE PAYMENT. Timeliness of payment and any interest to be paid to Contractor for late payment shall be governed by Article XI-A of the State Finance Law to the extent required by law.

16. NO ARBITRATION. Disputes involving this contract, including the breach or alleged breach thereof, may not be submitted to binding arbitration (except where statutorily authorized) but must, instead, be heard in a court of competent jurisdiction of the State of New York.

17. SERVICE OF PROCESS. In addition to the methods of service allowed by the State Civil Practice Law & Rules ("CPLR"), Contractor hereby consents to service of process upon it by registered or certified mail, return receipt requested. Service hereunder shall be complete upon Contractor's actual receipt of process or upon the State's receipt of the return thereof by the United State Postal Service as refused or undeliverable. Contractor must promptly notify the State, in writing, of each and every change of address to which service of process can be made. Service by the State to the last known address shall be sufficient. Contractor will have thirty (30) calendar days after service hereunder is complete in which to respond.

18. PROHIBITION ON PURCHASE OF TROPICAL HARDWOODS. The Contractor certifies and warrants that all wood products to be used under this contract award will be in accordance with, but not limited to, the specifications and provisions of State Finance Law Section 165. (Use of Tropical Hardwoods) which prohibits purchase and use of tropical hardwoods, unless specifically exempted, by the State or any governmental agency or political subdivision or public benefit corporation. Qualification for an exemption under this law will be the responsibility of the contractor to establish to meet with the approval of the State. In addition, when any portion of this contract involving the use of woods, whether

supply or installation, is to be performed by any Subcontractor, the prime Contractor will indicate and certify in the submitted bid proposal that the Subcontractor has been informed and is in compliance with specifications and provisions regarding use of tropical hardwoods as detailed in Section 165 State Finance Law. Any such use must meet with the approval of the State; otherwise, the bid may not be considered responsive. Under bidder certifications, proof of qualification for exemption will be the responsibility of the Contractor to meet with the approval of the State.

19. PURCHASES OF APPAREL. In accordance with State Finance Law §162 (4-a), the State shall not purchase any apparel from any vendor unable or unwilling to certify that: (i) such apparel was manufactured in compliance with all applicable labor and occupational safety laws, including, but not limited to, child labor laws, wage and hours laws and workplace safety laws, and (ii) vendor will supply, with its bid (or, if not a bid situation, prior to or at the time of signing a contract with the State), if known, the names and addresses of each Subcontractor and a list of all manufacturing plants to be utilized by the bidder.

20. CONTRACT TERMINATION PROVISION. The State reserves the right to terminate this contract in the event it is found that the certification filed by the Contractor in accordance with the requirements contained in State Finance Laws §139j and §139k was intentionally false or intentionally incomplete. Upon such finding, the State may exercise its termination right by providing written notification to the Contractor in accordance with the written notification terms of the contract.

102-09 STANDARD CLAUSES FOR NON FEDERAL-AID NEW YORK STATE CONTRACTS.

A. MacBride Act Fair Employment Principles. Chapter 807 of the Laws of 1992 require employers doing business in Northern Ireland to employ principles relating to nondiscrimination in employment and freedom of workplace opportunity which would:

- Increase the representation of individuals from underrepresented religious groups in the work force, including managerial, supervisory, administrative, clerical and technical jobs;
- Take steps to promote adequate security for the protection of employees from underrepresented religious groups both at the workplace and while traveling to and from work;
- Ban provocative religious or political emblems from the workplace;
- Publicly advertise all job openings and make special recruitment efforts to attract applicants from underrepresented religious groups;
- Establish layoff, recall and termination procedures which do not in practice favor a particular religious group;
- Abolish all job reservations, apprenticeship restrictions and differential employment criteria which discriminate on the basis of religion;
- Develop training programs that will prepare substantial numbers of current employees from underrepresented religious groups for skilled jobs, including the expansion of existing programs and the creation of new programs to train, upgrade and improve the skills of workers from underrepresented religious groups;
- Establish procedures to assess, identify and actively recruit employees from underrepresented religious groups with potential for further advancement;
- Appoint a senior management staff member to oversee affirmative action efforts and develop a timetable to ensure their full implementation.

Whenever the lowest responsible bidder has not agreed to stipulate to the conditions set forth in the MacBride Act, and another bidder who has agreed to stipulate to such conditions has submitted a bid within five percent of the lowest responsible bid for a contract to supply goods, services or construction of comparable quality, the Department will refer such bids to the Commissioner of General Services, who may determine, in accordance with applicable law and rules, that it is in the best interest of the state that the contract be awarded to other than the lowest responsible bidder.

If the bidder conducts business operations in Northern Ireland and DOES NOT agree to stipulate to the conditions set forth in the MacBride Act, so indicate by crossing out Item #5 on the signature page of this bid proposal.

B. Omnibus Procurement Act. It is the policy of New York State to maximize opportunities for the participation of New York State business enterprises, including minority and women-owned business enterprises as bidders, subcontractors and suppliers on its procurement contracts.

1. New York State Contractor Participation. Information on the availability of New York State subcontractors and suppliers is available from the Empire State Development Corporation, Small Business Division, 30 S. Pearl Street, Albany, NY 12245 (800) 782-8369. Companies requesting lists of potential subcontractors and suppliers are encouraged to identify the SIC code, size and location of vendors.

A directory of certified minority and women-owned business enterprises is available from the Empire State Development Corporation, Office of Minority and Women's Business Development (M/WBD), 30 S. Pearl Street, Albany, NY 12245 (800) 782-8369. The Empire State Development Corporation maintains a web site at www.empire.state.ny.us.

Bidders located in foreign countries are hereby notified that New York State may seek to obtain and assign or otherwise transfer offset credits created by this procurement contract to third parties located in New York State. The successful contractor shall agree to cooperate with the state in efforts to get foreign countries to recognize offset credits created by the procurement contract.

The Omnibus Procurement Act of 1992 requires that by signing this bid proposal, contractors certify that whenever the total bid amount is greater than \$1 million:

a. The successful contractor shall document efforts to encourage the participation of New York State business enterprises as material suppliers and subcontractors on this project, and has retained the documentation of these efforts to be provided upon request to the State.

b. Documented efforts by a successful contractor shall consist of and be limited to showing that such contractor has:

1. Solicited bids, in a timely and adequate manner, from New York State business enterprises including certified minority and women-owned businesses, or
2. Contacted the Empire State Development Corporation to obtain listings of New York State business enterprises, or
3. Placed notices for subcontractors and material suppliers in newspapers, journals and other trade publications distributed in New York State, or
4. Participated in bidder outreach conferences.
5. If the contractor determines that New York State business enterprises are not available to participate on the contract as subcontractors or suppliers, the contractor shall provide a statement indicating the method by which such determination was made.
6. If the contractor does not intend to use subcontractors on the contract, the contractor shall provide a statement verifying such intent.

c. The contractor has complied with the Federal Equal Opportunity Act of 1972 (P.L. 92-261), as amended.

d. The contractor agrees to make reasonable efforts to provide notification to New York State residents of employment opportunities on this project through listing any such positions with the Community Services Division of the New York State Department of Labor, or providing such notification in such manner as is consistent with existing collective bargaining contracts or agreements. The contractor agrees to document these efforts and to provide said documentation to the State upon request.

2. Reciprocity and Sanctions Provisions. Bidders are hereby notified that if their principal place of business is located in a country, nation, province, state or political subdivision

that penalizes New York State vendors, and if the goods or services they offer will be substantially produced or performed outside New York State, the Omnibus Procurement Act 1994 and 2000 amendments (Chapter 684 and Chapter 383, respectively) require that they be denied contracts which they would otherwise obtain. NOTE: As of May 15, 2002, the list of discriminatory jurisdictions subject to this provision includes the states of South Carolina, Alaska, West Virginia, Wyoming, Louisiana and Hawaii. Contact NYS Department of Economic Development for a current list of jurisdictions subject to this provision.

102-10 LABOR AND EMPLOYMENT.

The provisions of NYS Labor Law, as amended, and referred to in §102-08, *Standard Clauses for All New York State Contracts*, shall be applicable. On contracts financed with Federal-Aid, any provisions of NYS Labor Law that are in conflict with mandatory Federal-Aid construction contract compliance requirements, as contained in 23 CFR 635.117 are superseded. Any provisions of NYS Labor Law that are not in conflict with mandatory Federal-Aid construction contract compliance requirements or the Davis-Bacon Act, but are more restrictive, shall apply.

The Contractor shall directly employ those members of its own organization. Employee leasing and other similar arrangements under which workers are employed by another organization will only be considered under a subcontract approved in accordance with §108-05, *Subletting or Assigning the Contract*.

A. Wages. The Department will provide the Contractor with prevailing wage rate schedules. When both State and Federal wage rate schedules are provided, the Contractor shall pay the higher of the two wages and supplemental (fringe) benefits. If prevailing wage rate schedules are attached, all on-site work shall be paid prevailing wages. The Contractor shall ensure that workers are paid the appropriate wages and supplemental (fringe) benefits. The Contractor shall obtain periodic wage rate schedule updates from the NYS Department of Labor (NYSDOL). Wage rate amendments and supplements are available on the NYSDOL web site at www.labor.state.ny.us. All changes or clarification of labor classification(s) and applicability of prevailing wage rates shall be obtained in writing from the Office of the Director, NYSDOL Bureau of Public Work. The Contractor shall include the cost of changes in wage rate schedules and supplements (fringes) over the contract duration in the contract bid prices.

On-site Contractor or Subcontractor employees shall be paid prevailing wages required under the Davis-Bacon Act. In accordance with 29 CFR 5.2(1), "site of the work" is defined as the physical place or places where the construction called for in the contract will remain when work on it has been completed. Facilities such as fabrication plants, mobile factories, batch plants, borrow pits, etc. are part of the site of the work provided that they are dedicated exclusively to the performance of the contract. Not included in the site of the work are facilities whose continuance in operation are determined wholly without regard to a particular contract. Such permanent, previously established facilities are not a part of the "site of the work," even where the operations for a period of time may be dedicated exclusively to the performance of a contract.

In accordance with NYS Labor Law, Sections 220 and 220-d:

1. No laborer, worker, or mechanic, in the employ of the Contractor, Subcontractor or other person doing or contracting to do the whole or any part of the work contemplated by the contract shall be permitted or required to work more than eight (8) hours in any one calendar day or more than five days in any one week, except in the emergencies set forth in the Labor Law.
2. The wages paid for a legal day's work shall be not less than the prevailing rate of wages as defined by law.
3. The minimum hourly rate of wages to be paid shall not be less than that stated in the contract documents, and any redetermination of the prevailing rate of wages after the contract is approved shall be deemed to be incorporated herein by reference as of the effective date of redetermination and shall form a part of these contract documents.
4. The contract may be forfeited and no sum paid for any work done thereunder on a second conviction for willfully paying less than:
 - a. the stipulated wage scale as provided in Labor Law, §220 (3), as amended, or;

b. the stipulated minimum hourly wage scale as provided in Labor Law, §220-d, as amended.

B. Overtime Dispensation. All bidders, in submitting their bids, should base their bids and work progression on the assumption that Overtime Dispensation pursuant to Article 8 of the New York State Labor Law, for any workers, laborers, and mechanics to work more than 8 hours in any one calendar day or more than 5 days in any one week will not be granted for any operation for the contract duration. Regardless of approval or disapproval of overtime by the NYSDOL, no adjustment will be made in any bid prices.

Subsequent to award, where the contract proposal has imposed specific scheduling and/or phasing requirements or where it is determined by the Department to be in the best interest of the public, the Department may process, for approval by the NYSDOL, requests for overtime dispensation on certain specific operations.

The Contractor shall submit requests for overtime dispensation to the Department on Form PW-30, Application for Dispensation for Hours, which will be provided by the Engineer upon request. The Department will review applications for overtime dispensation submitted by the Contractor associated with contracts subject to (A+B) Bidding, Incentive/Disincentive (I/D) or Lane Rental work favorably, but the application should not request more than 60 hours per week. The 60 hours per week may be either 6 - 10 hour days or 5 - 12 hour days. Overtime dispensations will be supported by the Department to advance Department goals and priorities, subject to specific circumstances and conditions associated with each contract.

The Department cannot guarantee that the NYSDOL will grant dispensation from restrictions pursuant to the provisions of Article 8 of the State Labor Law, however with the Department's certification, it is anticipated that they will act favorably, provided that the Contractor is in compliance with Labor Law requirements at the time of application.

C. Payrolls. The Contractor shall furnish the Engineer, each week, a certified payroll and statement of compliance with respect to the wages paid each of its employees, (including apprentices, trainees, watch persons and guards) and a certified payroll from each Subcontractor engaged on work during the preceding weekly payroll period.

Certified payrolls shall contain work class, hours worked, wage rate, payroll taxes and withholdings. Certified payrolls shall be annotated by race and gender, and shall be submitted on Form WH-347 or Form HC-231-1 for Federal-Aid contracts, and on HC-231-1 for non Federal-Aid contracts. At the Contractor's option, computer printed payroll records, which supply the required data and certifications may be used.

D. Training. An apprentice is defined as an individual who is enrolled in an apprenticeship training program that is registered with the NYS Department of Labor. A trainee is defined as an individual who is enrolled in an On-the-Job Training (OJT) program that is approved by the Federal Highway Administration (FHWA).

A number of sources to obtain training for apprentices/trainees are available. These include:

- A NYSDOL-approved apprenticeship program sponsored by a union or a temporary project level agreement with a union which has a NYSDOL approved apprenticeship program.
- A NYSDOL-approved apprenticeship program sponsored by a contractor.
- A NYSDOL-approved apprenticeship program sponsored by a contractor signatory with an apprenticeship sponsor consortium for certain services.
- An FHWA-approved OJT program (where applicable).

Approved OJT Programs are currently limited to apprenticeable occupations as determined by NYSDOL or USDOL. A list of approved OJT programs can be found in the On-the-Job Training and Apprenticeship Program Construction Catalogue which is available through the Department's Office of Equal Opportunity Development and Compliance.

Training under Training Special Provisions, if required, will be shown in the contract documents. In order to fulfill training requirements required under Training Special Provisions and/or §102-11 *Equal Employment Opportunity Requirements*, training should begin as early as possible during a

construction contract. The Department recommends that all bidders have an approved apprenticeship or OJT program prior to bidding.

The Contractor shall furnish the apprentice/trainee a copy of the program to be followed in providing the training. The Contractor shall provide each apprentice/trainee with a certification showing the type and length of training satisfactorily completed.

When training is required under Training Special Provisions and/or §102-11 *Equal Employment Opportunity Requirements*, the Contractor shall designate to the Engineer, at the preconstruction meeting, a person (or persons) from its existing workforce as the Trainer and Training Coordinator for any apprentice(s)/ trainee(s).

The Trainer shall:

1. Be located on the contract site generally on a daily basis; and
2. Be responsible for the day-to-day supervision and training of persons on the contract; and
3. Be responsible for the preparation and submission of a monthly training progress report, after consultation with designated apprentices/trainees.

The Training Coordinator shall:

1. Be knowledgeable about the contract and the Apprenticeship/OJT programs to be used; and
2. Be responsible for ensuring on-the-job orientation of apprentice/trainees; and
3. Be responsible for ensuring meaningful and effective training for the duration of training.

E. Public Notices. Before commencing any work on the site, the Contractor shall provide a satisfactory weather resistant surface, and post, in a location accessible to all workers, a copy of the NYSDOL schedules of prevailing wages and supplements for this contract, a copy of all redeterminations of such schedules for the contract, the Workers' Compensation Law notice, required safety notices, and all other notices required by law to be posted at the site. The Contractor shall maintain such notices in a legible manner and shall replace any notice or schedule which is damaged, defaced, illegible or removed for any reason. The Notices shall be maintained until all work on the site is complete.

F. Federal-Aid Requirements. No procedures or requirement shall be imposed by any state which will operate to discriminate against the employment of labor from any other state, possession or territory of the United States, in the construction of a Federal-Aid project. The selection of labor to be employed by the Contractor on any Federal-Aid project shall be of its choosing.

The Contractor shall not use convict labor unless performed by convicts who are on parole, supervised release, or probation for construction, maintenance or any other purpose at the site or within the contract limits of any Federal-Aid highway construction project from the time of contract award or the start of work on force account until final acceptance of the work by the Department.

102-11 EQUAL EMPLOYMENT OPPORTUNITY REQUIREMENTS.

The Department seeks to ensure nondiscrimination in employment under all Department contracts. The Contractor shall comply with the following Equal Employment Opportunity (EEO) requirements. The goals for a specific contract are contained in the Special Note *Goals for Equal Opportunity Employment Participation* in the contract proposal. The covered area is the county or counties in which the work is located.

For Federal-Aid contracts, Equal Employment Opportunity provisions are also found on Form FHWA 1273 *Required Contract Provisions Federal-Aid Construction Contracts*, or Form FHWA 1316 *Required Contract Provisions Appalachian Development Highway System and Local Access Roads Construction Contracts*, one of which is incorporated in the contract proposal.

Nothing herein provided shall be construed as a limitation upon the application of other laws which establish different standards of compliance or upon the application of requirements for the hiring of local or other area residents (e.g., those under the Public Works Employment Act of 1977 and the Community Development Block Grant Program).

A. Statutory Authority. The Federal statutory authority for Equal Employment Opportunity provisions is contained in 23 U.S.C. 140(a), 23 CFR 230, 41 CFR 60-1 and 60-4, and Executive Order 11246. State statutory authority is contained in Section 85 of the Highway Law, Section 428 of the Transportation Law, NYS Executive Law Article 15-A, 5 NYCRR 140 et seq and the rules promulgated there under.

B. Definitions.

1. For Federal-Aid contracts, a minority group member is defined under this subsection as someone who is, and can demonstrate membership in, one of the following groups:
 - a. Black (all persons having origins in any of the Black African racial groups not of Hispanic origin);
 - b. Hispanic (all persons of Mexican, Puerto Rican, Cuban, Central or South American or other Spanish Culture or origin, regardless of race);
 - c. Asian and Pacific Islander (all persons having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or the Pacific Islands); and
 - d. American Indian or Alaskan Native (all persons having origins in any of the original peoples of North America and maintaining identifiable tribal affiliations through membership and participation or community identification).

2. For non Federal-Aid contracts, a minority group member is defined under this subsection as a United States citizen or permanent resident alien who is, and can demonstrate membership in, one of the following groups:
 - a. Black persons having origins in any of the Black African racial groups;
 - b. Hispanic persons of Mexican, Puerto Rican, Dominican, Cuban, Central or South American descent of either Indian or Hispanic origin, regardless of race;
 - c. Asian and Pacific Islander persons having origins in any of the Far East countries, South East Asia, the Indian subcontinent, or the Pacific Islands;
 - d. Native American or Alaskan native persons having origins in any of the original peoples of North America.

C. Employment Goals. A goal(s) for minorities and a separate goal(s) for women are presented in the contract documents. The Contractor shall provide equal employment opportunity and shall take affirmative action for all minority groups, both male and female; and women, both minority and non-minority. If the Contractor performs work outside of the covered area, it shall apply the goals established for the county where the work is actually performed. The Department will monitor the Contractor's attainments towards EEO goals in accordance with §105-21 *Civil Rights Monitoring and Reporting*.

The goal(s) set for the contract are expressed as percentages of the total hours of employment and training of minority and female utilization the Contractor should reasonably be able to achieve in each construction trade in which it has employees in the covered area. The Contractor is expected to make substantially uniform progress in meeting its goals in each trade. The hours of minority and female employment and training shall be substantially uniform throughout the length of the contract, and in each trade, and the Contractor shall make a good faith effort to employ minorities and women evenly on each of its contracts. The transfer of minority or female employees, apprentices, or trainees from contractor to contractor or from contract to contract for the sole purpose of meeting the Contractor's goals is a violation of the contract.

D. Contractor Obligations. The Contractor shall comply with all provisions of Federal Executive Order 11246 and the provisions of State and Federal laws and regulations. The Contractor shall furnish all information and reports required by Executive Order 11246 and by rules, regulations, and orders of the Secretary of Labor, or pursuant thereto, and will permit access to its books, records, and accounts by the Department and the U.S. Secretary of Labor for purposes of investigation to ascertain compliance with such rules, regulations, and orders. The Contractor shall develop and implement an EEO policy in accordance with Form FHWA 1273 *Required Contract Provisions Federal-Aid*

Construction Contracts for Federal-Aid contracts and in accordance with §102-08 *Standard Clauses for All New York State Contracts* for non Federal-Aid contracts.

1. Non-Discrimination. The Contractor shall not discriminate against any employee or applicant for employment because of race, color, religion, sex, national origin, age, disability or marital status. The Contractor shall take affirmative action to ensure that applicants are employed, and that employees are treated during employment, without regard to their race, color, religion, sex, national origin, age, disability or marital status. Such actions shall include, but not be limited to the following: employment, upgrading, demotion, or transfer; recruitment or recruitment advertising; layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. The Contractor shall post in conspicuous places, available to employees and applicants for employment, notices to be provided by the Department setting forth the provisions of this non-discrimination clause.

The Contractor shall not use the goals or affirmative action requirements to discriminate against any person because of race, color, religion, sex, national origin, age, disability or marital status.

2. Solicitations. The Contractor shall state in all solicitations or advertisements for employees placed by or on behalf of the Contractor, that all qualified applicants will receive consideration for employment without regard to race, color, religion, sex, national origin, age, disability or marital status.

3. Collective Bargaining Agreements. The contractor shall send to each labor union or representative of workers with which it has a collective bargaining agreement or other contract or understanding, a notice to be provided advising the said labor union or workers' representatives of the contractor's commitments to equal employment opportunities, and shall post copies of the notice in conspicuous places available to employees and applicants for employment.

Neither the provisions of any collective bargaining agreement, nor the failure by a union with whom the Contractor has a collective bargaining agreement, to refer either minorities or women shall excuse the Contractor's obligations.

4. Complaints of Alleged Discrimination. The Contractor shall promptly investigate all complaints of alleged discrimination made to the Contractor in connection with its obligations under this contract, shall attempt to resolve such complaints, and shall take appropriate corrective action within a reasonable time. If the investigation indicates that the discrimination may affect persons other than the complainant, corrective action shall include such other persons. Upon completion of each investigation, the Contractor shall inform every complainant of all available avenues of appeal.

5. Non-Compliance. In the event of the contractor's non-compliance with the nondiscrimination clauses of this contract or with any of such rules, regulations, or orders, this contract may be canceled, terminated or suspended in whole or in part and the contractor may be declared ineligible for further contracts in accordance with procedures authorized in Executive Order 11246, and such other sanctions may be imposed and remedies invoked as provided in Executive Order 11246, or by rule, regulation, or order of the U.S. Secretary of Labor, or as otherwise provided by law.

6. Subcontracts/Purchase Orders. The Contractor shall include the provisions of §102-11D *Contractor Obligations* in every subcontract or purchase order, so that such provisions will be binding upon each subcontractor or vendor. In the event a Contractor becomes involved in, or is threatened with, litigation with a subcontractor or vendor as a result of such direction by the Department, the Contractor may request the United States to enter into such litigation to protect the interests of the United States.

E. Affirmative Action Steps. The Contractor shall take specific affirmative actions to promote equal employment opportunity. The evaluation of the Contractor's compliance with these

specifications shall be based upon its effort to achieve maximum results from its actions. The Contractor shall document these efforts fully, and shall implement affirmative action steps at least as extensive as the following:

- 1.** Ensure and maintain a working environment free of harassment, intimidation, and coercion at all sites, and in all facilities at which the Contractor's employees are assigned to work. The Contractor, where possible, shall assign two or more women to each construction contract. The Contractor shall specifically ensure that all forepersons, superintendents, and other onsite supervisory personnel are aware of and carry out the Contractor's obligation to maintain such a working environment, with specific attention to minority or female individuals working at such sites or in such facilities.
- 2.** Establish and maintain a current list of minority and female recruitment sources, provide written notification to minority and female recruitment sources and to community organizations when the Contractor or its unions have employment opportunities available, and maintain a record of the organizations' responses.
- 3.** Maintain a current file of the names, addresses and telephone numbers of each minority and female off-the-street applicant and minority or female referral from a union, a recruitment source or community organization and of what action was taken with respect to each such individual. If such individual was sent to the union hiring hall for referral and was not referred back to the Contractor by the union or, if referred, not employed by the Contractor, this shall be documented in the file with the reason therefore, along with whatever additional actions the Contractor may have taken.
- 4.** Provide immediate written notification to the Department when the union or unions with which the Contractor has a collective bargaining agreement has not referred to the Contractor a minority person or woman sent by the Contractor, or when the Contractor has other information that the union referral process has impeded the Contractor's efforts to meet its obligations.
- 5.** Develop on-the-job training opportunities and/or participate in training programs for the area which expressly include minorities and women, including upgrading programs and apprenticeship and trainee programs relevant to the Contractor's employment needs, especially those programs funded or approved by either the NYS Department of Labor or the US Department of Labor. The Contractor shall provide notice of these programs to the sources compiled under E.2. above.
- 6.** Disseminate the Contractor's EEO policy by providing notice of the policy to unions and training programs and requesting their cooperation in assisting the Contractor in meeting its EEO obligations; by including it in any policy manual and collective bargaining agreement; by publicizing it in the company newspaper, annual report, etc.; by specific review of the policy with all management personnel and with all employees at least once a year; and by posting the company EEO policy on bulletin boards accessible to all employees at each location where construction work is performed.
- 7.** Review, at least annually, the company's EEO policy and affirmative action obligations under these specifications with all employees having any responsibility for hiring, assignment, layoff, termination or other employment decisions including specific review of these items with onsite supervisory personnel such as superintendents, forepersons, etc., prior to the initiation of construction work at any contract site. A written record shall be made and maintained identifying the time and place of these meetings, persons attending, subject matter discussed, and disposition of the subject matter.
- 8.** Disseminate the Contractor's EEO policy externally by including it in any advertising in the news media, specifically including minority and female news media, and providing written notification to and discussing the Contractor's EEO policy with other contractors and Subcontractors with whom the Contractor does or anticipates doing business.
- 9.** Direct its recruitment efforts, both oral and written, to minority, female and community organizations, to schools with minority and female students and to minority and female recruitment and training organizations serving the Contractor's recruitment area and employment needs. Not later than one month prior to the date for the acceptance of applications for apprenticeship or other training by any recruitment source, the Contractor shall send written

notification to organizations such as the above, describing the openings, screening procedures, and tests to be used in the selection process.

10. Encourage present minority and female employees to recruit other minority persons and women and, where reasonable, provide after school, summer and vacation employment to minority and female youth both on the site and in other areas of the Contractor's work force.

11. Validate all tests and other selection requirements in accordance with state and Federal laws, rules and regulations.

12. Conduct, at least annually, an inventory and evaluation of all minority and female personnel for promotional opportunities. Encourage these employees to seek or to prepare for promotional opportunities through appropriate training, etc.

13. Ensure that seniority practices, labor classifications, work assignments and other personnel practices, do not have a discriminatory effect by continually monitoring all personnel and employment related activities to ensure that the EEO policy and the Contractor's obligations under these specifications are being carried out.

14. Ensure that all facilities and company activities are non-segregated except that separate or single-user toilet and necessary changing facilities shall be provided to assure privacy between the sexes.

15. Document and maintain a record of all solicitations of offers for Subcontracts from minority and female construction contractors and suppliers, including circulation of solicitations to minority and female contractor associations and other business associations.

16. Conduct a review, at least annually, of all supervisors' adherence to and performance under the Contractor's EEO policies and affirmative action obligations.

F. Associations. Contractors are encouraged to participate in voluntary associations which assist in fulfilling one or more of their affirmative action obligations. The efforts of a contractor association, joint contractor-union, contractor-community, or other similar group of which the Contractor is a member and participant, may be asserted as fulfilling one or more of its obligations, provided that the Contractor actively participates in the group, makes every effort to ensure that the group has a positive impact on the employment of minorities and women in the industry, ensures that the benefits of the program are reflected in the Contractor's minority and female workforce participation, makes a good faith effort to meet its individual goals and timetables, and can provide access to documentation which demonstrates the effectiveness of actions taken on behalf of the Contractor. The obligation to comply, however, is the Contractor's and failure of such a group to fulfill an obligation shall not be a defense for the Contractor's noncompliance.

G. Hometown Plans (Federal-Aid Contracts Only). If a Contractor is participating (pursuant to 41 CFR 60-4.5) in a Hometown Plan approved by the USDOL in the covered area either individually or through an association, its affirmative action obligations on all work in the Plan area (including goals and timetables) shall be in accordance with that Plan for those trades which have unions participating in the Plan. Contractors participating in Hometown Plans shall be able to demonstrate their participation and document their compliance with the provision of the Hometown Plan. Each Contractor participating in an approved plan is individually required to comply with its obligation under the EEO clause and to make a good faith effort to achieve each goal under the plan in each trade in which it has employees. The overall good faith performance by other Contractors toward a goal in an approved plan does not excuse any covered Contractor's failure to take good faith efforts to achieve the Plan goals and timetables.

102-12 D/M/WBE UTILIZATION.

D/M/WBE is a general term that refers to a Disadvantaged Business Enterprise (DBE), a Minority Business Enterprise (MBE) or a Women's Business Enterprise (WBE). The DBE program applies to Federal-Aid contracts, and the MBE/WBE (M/WBE) program applies to non Federal-Aid contracts. The Department seeks to:

- Ensure nondiscrimination in award and administration of Department contracts;
- Ensure that only firms that fully meet D/M/WBE eligibility standards are permitted to participate in the Department's D/M/WBE programs;

§102

- Help remove barriers to the participation of D/M/WBEs in the performance of Department contracts;
- Create a level playing field on which D/M/WBEs can fairly compete for Department contracts; and
- Assist in the development of firms that can compete successfully in the construction industry outside the D/M/WBE programs.

The parties to this contract shall take all necessary and reasonable steps in accordance with the laws, rules and regulations cited in this subsection to promote the objectives outlined above. The Contractor shall comply with the applicable laws, rules and regulations and the D/M/WBE Program requirements stated below. The Contractor shall not discriminate on the basis of race, color, national origin, or sex in the award and performance of Department contracts. The Contractor shall not use the requirements of these specifications to discriminate against any qualified company or group of companies. These requirements shall be made a part of all subcontracts and agreements entered into as a result of this contract.

A. Statutory Authority.

1. Disadvantaged Business Enterprise (DBE) Program. The Federal statutory authority for the DBE Program is contained in the Surface Transportation Assistance Act of 1982 (Public Law 97-424, §105(f)), the Surface Transportation and Uniform Relocation Assistance Act of 1987 (Public Law 100-17, §106(c)), the Intermodal Surface Transportation Efficiency Act of 1991, and the Transportation Equity Act of the 21st Century. New York State has enacted Section 85 of the Highway Law and Section 428 of the Transportation Law. Regulations have been promulgated under 49 CFR 26 and 17 NYCRR 35.

2. Minority/Women's Business Enterprise (M/WBE) Program. The State statutory authority for the M/WBE Program is contained in Section 85 of the Highway Law, Section 428 of the Transportation Law, and Executive Law Article 15A. Regulations have been promulgated under 5 NYCRR 140. The parties to this contract shall comply with these laws, rules and regulations and the M/WBE Program requirements stated below.

B. D/M/WBE Goal(s). Federal-aid contracts have a single DBE goal. Non Federal-Aid contracts have two separate and distinct goals, one for MBEs and one for WBEs, which cannot be combined. The Department will monitor the Contractor's attainments towards D/M/WBE goals in accordance with §105-21 *Civil Rights Monitoring and Reporting*.

1. Established Goal(s). The Department may have established contract utilization goal(s) for D/M/WBEs, which are expressed as a percentage of the total contract price. The goal(s) are stated in the proposal and remain in effect throughout the life of the contract. In executing the contract or bid documents the Bidder declares that it subscribes to the utilization goal(s) and shall meet the goal(s) or demonstrate that it could not meet them despite its best efforts. Failure to provide commitments to meet the established goal(s) for the contract and failure to meet the good faith efforts may be grounds for rejection of the bid as non-responsive. When the contract is awarded with D/M/WBE commitment(s) that is less than the contract goal(s), the Contractor shall continue good faith efforts throughout the life of the contract.

2. Zero Percent Goal(s). When the Department has established zero goal(s) for participation by D/M/WBEs and the Bidder proposes the use of a Subcontractor, the purchase of materials, the use of a Service or the use of Trucking at any time during the life of the contract, the Contractor shall promote the objectives outlined in this subsection by providing opportunities for D/M/WBEs to participate in these areas, with such participation to be credited towards the race-neutral component of the Department's D/M/WBE Programs.

C. Eligibility.

1. DBE Eligibility. Only those DBE firms that are certified under the New York State Unified Certification Program are eligible to be used for goal attainment. DBE certification is not an endorsement of the quality or performance of the business but simply an acknowledgment of the firm's status as a DBE. A business directory is available on the NYS Unified Certification Program website at <http://biznet/nysucp.net>.

2. M/WBE Eligibility. Only those M/WBE firms that are certified by the NYS Department of Economic Development are eligible to be used for goal attainment. M/WBE certification is not an endorsement of the quality or performance of the business but simply an acknowledgment of the firm's status as an M/WBE. The participation of a firm that is certified as both an MBE and a WBE will only be counted toward one goal, and cannot be divided between the two goals. A business directory is available on the Empire State Development website at www.empire.state.ny.us.

D. Counting D/M/WBE Participation Towards the D/M/WBE Goal(s). The value of the work performed by a D/M/WBE, including that of a D/M/WBE prime contractor, with its own equipment, with its own forces, and under its own supervision will be counted toward the goal(s), provided the utilization is a commercially useful function. A D/M/WBE prime contractor shall still provide opportunities for participation by other D/M/WBEs. Work performed by D/M/WBEs working for the Contractor will be counted as set forth below. If the Department determines that some or all of the D/M/WBE's work does not constitute a commercially useful function, only the portion of the work considered to be a commercially useful function will be credited toward the goal(s).

1. Subcontractors. 100% of the value of the work to be performed by a D/M/WBE Subcontractor will be counted toward the D/M/WBE goal(s), including the cost of materials and supplies purchased by the D/M/WBE, except the cost of supplies or equipment leased from the Contractor or its affiliates will not be counted.

2. Manufacturers/Fabricators. 100% of the expenditure to a D/M/WBE Manufacturer or Fabricator will be counted toward the D/M/WBE goal(s).

3. Material Suppliers. 60% of the expenditure to a D/M/WBE Material Supplier will be counted toward the D/M/WBE goal(s). Packagers, brokers, manufacturer's representatives, or other persons who arrange or expedite transactions are not Material Suppliers within the meaning of this paragraph.

4. Brokers/Manufacturer's Representatives. The entire amount of fees or commissions charged for assistance in the procurement of the materials and supplies, or fees for transportation charges for the delivery of materials or supplies provided by a D/M/WBE Broker/manufacturer's Representative will be counted toward the D/M/WBE goal(s), provided they are determined by the Department to be reasonable and not excessive as compared with fees customarily allowed for similar services. The cost of the materials and supplies themselves will not be counted.

5. Services. The entire amount of fees or commissions charged by a D/M/WBE for providing a bona fide service, such as professional, technical, consultant, or managerial services, or for providing bonds or insurance specifically required for the performance of the contract will be counted toward the D/M/WBE goal(s), provided the fee is reasonable and not excessive as compared with fees customarily allowed for similar services.

6. Trucking Operations. The D/M/WBE trucking firm of record is the firm that is listed on the D/M/WBE Utilization Worksheet. The D/M/WBE shall own and operate at least one registered, insured, and fully operational truck used on the contract and shall be responsible for the management and supervision of the entire trucking operation for which it is responsible on a particular contract, and there cannot be a contrived arrangement for the purpose of meeting the D/M/WBE goal(s). The D/M/WBE trucking firm of record shall control the day-to-day

D/M/WBE trucking operations on the contract, and shall be responsible for (1) Negotiating and executing rental/leasing agreements; (2) Hiring and firing the work force; (3) Coordinating the daily trucking needs with the Contractor; and (4) Scheduling and dispatching trucks.

a. D/M/WBE Owned/Leased Trucks. 100% of the value of the trucking operations the D/M/WBE provides on the contract using trucks it owns or leases on a long-term basis that are registered, insured, and operated by the D/M/WBE using drivers it employs, will be counted toward the D/M/WBE goal(s).

b. D/M/WBE Short-Term Leased Trucks. The D/M/WBE may lease trucks on a short-term basis from another D/M/WBE, including an owner/operator who is certified as a D/M/WBE. 100% of the value of the trucking operations that the lessee D/M/WBE provides will be counted toward the D/M/WBE goal(s).

c. Non-D/M/WBE Trucks. The D/M/WBE may lease trucks on a short-term basis from a non-D/M/WBE, including an owner-operator. 100% of the fee or commission the D/M/WBE receives as a result of the lease arrangement will be counted toward the D/M/WBE goal(s). The value of the trucking operations provided by the lessee will not be counted toward the D/M/WBE goal(s).

E. Conditions of Participation. D/M/WBE participation will be counted toward meeting the D/M/WBE contract goal(s), subject to all of the following conditions:

1. Commercially Useful Function. A D/M/WBE is considered to perform a commercially useful function when it is responsible for the execution of a distinct element of work on a contract and carries out its responsibilities by actually performing, managing, and supervising the work involved in accordance with normal industry practice. Regardless of whether an arrangement between the Contractor and the D/M/WBE represent standard industry practice, if the arrangement erodes the ownership, control or independence of the D/M/WBE or in any other way does not meet the commercially useful function requirement, the Contractor shall receive no credit toward the goal(s) and may be required to backfill the participation. A D/M/WBE does not perform a commercially useful function if its role is limited to that of an extra participant in a transaction or contract through which funds are passed in order to obtain the appearance of D/M/WBE participation.

A DBE may rebut a determination by the Department that the DBE is not performing a commercially useful function to the Federal Highway Administration (FHWA) but the determination may not be appealed to USDOT. An M/WBE may rebut a determination by the Department that the M/WBE is not performing a commercially useful function to the NYS Department of Economic Development.

2. Work Force. The D/M/WBE must employ a work force, (including administrative and clerical) separate and apart from that employed by the Contractor, other Subcontractors on the contract, or their affiliates. This does not preclude the employment by the D/M/WBE of an individual that has been previously employed by another firm involved in the contract, provided that the individual was independently recruited by the D/M/WBE in accordance with customary industry practice. The routine transfer of work crews from another employer to the D/M/WBE shall not be allowed.

3. Supervision. All work performed by the D/M/WBE must be controlled and supervised by the D/M/WBE without duplication of supervisory personnel from the Contractor, other Subcontractors on the contract, or their affiliates. This does not preclude routine communication between the supervisory personnel of the D/M/WBE and other supervisors necessary to coordinate the contract work.

4. Equipment. D/M/WBE Subcontractors may supplement their equipment by renting or leasing additional equipment in accordance with customary industry practice. However, no more than 50% of the equipment required to perform the work of the Subcontractor may be obtained from the Contractor, other Subcontractors on the contract, or their affiliates. If the D/M/WBE obtains equipment from any of those sources, the D/M/WBE shall provide documentation to the Department demonstrating that similar equipment and terms could not be obtained at a lower cost from other customary sources of equipment. The required documentation shall include, but not be limited to, copies of the rental or leasing agreements, and the names, addresses, and terms quoted by other sources of equipment.

F. Requests For Waiver. A potential bidder, defined as one who has purchased the contract documents, may request a waiver of all or part of a contract's D/M/WBE goal(s) by submitting a written request to the Office of Construction Civil Rights Unit. The request shall be submitted no later than 25 calendar days prior to the contract letting, in order to allow sufficient time for a review and issuance of an amendment of the established goal(s), if necessary, in accordance with the Department's schedule for contract amendments. The request should contain sufficient justification as to why the goal(s) should be waived or reduced, and should at least address the following factors: the potential Bidder's method of accomplishing the work, the subcontracting opportunities associated with the proposed method, and the availability of certified D/M/WBEs for the work to be subcontracted.

G. Good Faith Efforts. To determine whether a bidder that has failed to meet the D/M/WBE contract goal(s) may receive the contract, the Department will decide whether the efforts the Bidder made to obtain D/M/WBE participation were "good faith efforts" to meet the goal(s). Efforts that are merely pro forma are not good faith efforts to meet the goal(s). Efforts to obtain D/M/WBE participation are not good faith efforts to meet the goal(s), even if they are sincerely motivated, if, given all relevant circumstances, they could not reasonably be expected to produce a level of D/M/WBE participation sufficient to meet the goal(s). In order to award a contract to a bidder that has failed to meet the D/M/WBE contract goal(s), the Department will determine that the Bidder's efforts were those that, given all relevant circumstances, a bidder actively and aggressively seeking to meet the goal(s) would make.

In order to evaluate the Bidder's conformance to this subsection, the Department will consider the quality, quantity, and intensity of the different kinds of efforts that the Bidder has made. Below is a list of the types of actions which the Department will consider as part of the Bidder's good faith efforts to obtain D/M/WBE participation. It is not a mandatory checklist, nor is it intended to be exhaustive or exclusive.

1. Securing participation by certified D/M/WBE firms for work that they are listed to perform that is in the contract. Only DBEs certified by the NYS Unified Certification Program (NYSUCP) shall be used to fulfill the established goal on Federal-Aid contracts. Only M/WBEs certified by the NYS Department of Economic Development shall be used to fulfill the established goal(s) on non Federal-Aid contracts.
2. Soliciting through all reasonable and available means (e.g., attendance at pre-bid meetings, advertising and/or written notices) the interest of all certified D/M/WBEs who have the capability to perform the work of the contract. The Bidder shall solicit this interest within sufficient time to allow the D/M/WBEs to respond to the solicitation. The Bidder shall determine with certainty if the D/M/WBEs are interested by taking appropriate steps to follow up on initial solicitations.
3. The Bidder shall, at a minimum, seek certified D/M/WBEs in the same geographic area where the contract is located. For work such as pavement markings, guide rail, signs, etc. the Bidder shall, at a minimum, solicit on an upstate or downstate basis.
4. Selecting portions of the work to be performed by D/M/WBEs in order to increase the likelihood that the D/M/WBE goal(s) will be achieved. This includes, where appropriate, either breaking down operations or combining like or related operations into logistically and economically feasible units to facilitate D/M/WBE participation, even when the Contractor might prefer to perform these work items with its own forces.

5. Providing interested D/M/WBEs with adequate information about the plans, specifications, and requirements of the contract in a timely manner to assist them in responding to a solicitation.
6. *a. Negotiating in good faith with interested D/M/WBEs.* It is the Bidder's responsibility to make a portion of the work available to D/M/WBE Subcontractors and material suppliers and to select those portions of the work or material needs consistent with the available D/M/WBE Subcontractors and material suppliers, so as to facilitate D/M/WBE participation. Evidence of such negotiation includes the names, addresses, and telephone numbers of D/M/WBEs that were considered; a description of the information provided regarding the plans and specifications for the work selected for subcontracting; and evidence as to why additional agreements could not be reached for D/M/WBEs to perform the work.

b. Additional Costs. The fact that there may be some additional costs involved in finding and using D/M/WBEs is not in itself sufficient reason for a bidder's failure to meet the contract D/M/WBE goal(s), as long as such costs are reasonable. The ability or desire of a bidder to perform the work of a contract with its own organization does not relieve the Bidder of the responsibility to make good faith efforts. Bidders are not, however, required to accept higher quotes from D/M/WBEs if the price difference is excessive or unreasonable.

7. Not rejecting D/M/WBEs as unqualified without sound reasons based on a thorough investigation of their capabilities.
8. Making efforts to assist interested D/M/WBEs in obtaining bonding, lines of credit or insurance as required by the Department.
9. Making efforts to assist interested D/M/WBEs in obtaining necessary equipment, supplies, materials, or related assistance.
10. Effectively using the services of available minority/women focused media, trade associations, and contractors' groups; local, state, and Federal minority/women business assistance offices; and other organizations as allowed on a case-by-case basis to provide assistance in the recruitment and placement of D/M/WBEs.
11. Keeping records of efforts to solicit and negotiate with D/M/WBEs as evidence of good-faith efforts, using the *Solicitation Log* as a continuing record of pre- and post-letting solicitation activity.
12. Promptly executing an agreement with D/M/WBE Subcontractors/vendors.

H. D/M/WBE Pre-Award Utilization Package. Within 7 calendar days after bid letting, the Apparent Low Bidder shall submit a complete D/M/WBE Pre-Award Utilization Package, as outlined below, to the ~~Office of~~ Office of Construction using the Department approved civil rights reporting software. Commitment amounts by contract pay item shall be entered for all Subcontractors. Apparent Low Bidders that do not have access to the Department approved civil rights reporting software shall contact the ~~Office of~~ Office of Construction for guidance on submission of the Utilization Package. As soon as practicable, but not later than prior to the first contract payment, the Contractor shall enter all current utilization data into the Department approved civil rights reporting software.

For each D/M/WBE Subcontractor, the Apparent Low Bidder shall indicate the contract pay item number(s) of the work to be performed. The Apparent Low Bidder shall explain, in writing, the scope of work to be performed by the D/M/WBE for any item which is not completely performed by the D/M/WBE Subcontractor. This does not include items for which the Contractor is performing less than the total contract quantity for that item.

For each D/M/WBE Manufacturer, Fabricator, Material Supplier, or Broker, the Apparent Low Bidder shall indicate the contract pay item number(s) of the material to be manufactured, fabricated, supplied, or otherwise provided. If the material, equipment or service does not correspond to a specific contract pay item, the Apparent Low Bidder shall use a contract pay item(s) to which the activity relates.

For each D/M/WBE Service, the Apparent Low Bidder shall indicate the contract pay item number(s) of the service to be provided. If the equipment or service does not correspond to a specific

Department contract pay item, the Apparent Low Bidder shall use a contract pay item(s) to which the activity relates.

For each D/M/WBE Trucking Operation, the Apparent Low Bidder shall indicate the contract pay item number(s) for which the trucking operations are to be performed. If the trucking operation does not correspond to a specific contract pay item, the Apparent Low Bidder shall use a contract pay item(s) to which the activity relates. The Apparent Low Bidder shall indicate the type of trucking operation to be performed, the number of trucks owned/leased, the number of trucks working on-site or off-site, rate per hour/ton/load/etc., duration or amount, and total dollar value of the proposed D/M/WBE commitment. The Apparent Low Bidder shall provide copies of all lease agreements utilized by the D/M/WBE.

If the Apparent Low Bidder has met or exceeded the established D/M/WBE goal(s) for the contract utilizing certified D/M/WBEs it is not necessary to submit documentation of good faith efforts.

If the Apparent Low Bidder has not met the D/M/WBE goal(s), it shall submit the *Solicitation Log*, together with other documentation that substantiates good faith efforts. Such documentation shall include, at a minimum, all envelopes of solicitation inquires that were returned as undeliverable and quotations submitted by D/M/WBEs that are not included in the *D/M/WBE Schedule of Utilization* with an explanation for the Bidder's action in each case.

After contract award, the Contractor shall execute subcontracts or agreements with the D/M/WBEs for the type and amount of work identified in the approved D/M/WBE Utilization Package.

I. Bidder's Failure to Comply. The Department's acceptance of the Apparent Low Bidder's proposal is conditioned upon the Apparent Low Bidder's fulfillment of the D/M/WBE utilization requirements. If the Apparent Low Bidder fails to submit a complete D/M/WBE utilization package within 7 calendar days after the bid opening and/or fails to attain the D/M/WBE utilization goal(s) and to satisfactorily document its good faith efforts, the bid may be declared incomplete and the deposit may be subject to forfeiture pursuant to §103-02 *Execution of Contract*. The Apparent Low Bidder, upon receipt of written notification of its failure to comply with the D/M/WBE utilization requirements shall have 5 work days to carry out the corrective action(s) described in the notification.

If the Department determines that the Apparent Low Bidder has failed to meet the good faith effort requirements, the Department will, before awarding the contract, provide the Apparent Low Bidder an opportunity for administrative reconsideration by an official who did not take part in the original determination that the Apparent Low Bidder failed to meet the goal(s) or make adequate good faith efforts to do so. As part of this reconsideration, the Apparent Low Bidder shall have the opportunity to provide written documentation or argument and to meet in person with the Department's reconsideration official concerning the issue of whether it met the goal(s) or made adequate good faith efforts to do so. The Department will send the Apparent Low Bidder a written decision on reconsideration, explaining the basis for finding that the Apparent Low Bidder did or did not meet the goal(s) or make adequate good faith efforts to do so.

102-13 STATE AND LOCAL SALES TAX EXEMPTION.

In accordance with Section 1115 of the Tax Law, in connection with capital improvement contracts all tangible personal property which will become an integral component of a structure, building or real property of the State, or any of its political subdivisions, is exempt from State and local retail sales tax and compensating use tax.

102-14 FORM OF CONTRACT AND BID BOND.

The form of contract and bid bond, if given, shall be that provided by the Department.

All of the following sections which have the word "Sample" in the title are samples of the contract documents executed by the Contractor as a part of the bidding and/or award process. The executed bid documents control and have precedence over the samples presented herein.

§102

A. Federal-Aid Contracts. Federal-Aid contracts are denoted "F.A. Project" on the proposal cover and on the title page. The following subsections of Section 102 apply to all Federal-Aid contracts:

- 1. §102-01 to §102-08
- 2. §102-10 to §102-14
- 3. §102-15 to §102-17 (Samples Only)

B. Non Federal-Aid Contracts. The following subsections of Section 102 apply to all Non Federal-Aid contracts:

- 1. §102-01 to §102-14
- 2. §102-15 to §102-17 (Samples Only)

102-15 SAMPLE FORM OF BID BOND.

KNOW ALL PERSONS BY THESE PRESENTS, That _____
(Name of Contractor)

(Address)
(hereinafter called the "Principal") and the _____
a corporation created and existing under the laws of the State of _____, having its principal office in the City of _____ (hereinafter called the "Surety"), are held and firmly bound unto The People of the State of New York (hereinafter called the "State"), in the full just sum of [*Twenty-Five Percent (25%) of Attached Bid*], good and lawful money of the United States of America, for the payment of which said sum of money, well and truly to be made and done, the said Principal binds themselves (himself/herself, itself), their (his/her, its) heirs, executors and administrators, successors and assigns, and the said Surety binds itself, its successors and assigns jointly and severally, firmly by these presents:

WHEREAS, the said Principal has submitted to the Commissioner of Transportation of the State of New York, a proposal for _____
(Project Description), and

WHEREAS, under the terms of the Laws of the State of New York as above indicated, the said Principal has filed or intends to file this bond to guarantee that the Principal will execute all required contract proposal documents and furnish such faithful performance or other bonds as may be required by law in accordance with the terms of the Principal's said proposal.

NOW, THEREFORE, the condition of the foregoing obligation is such, that if the said Principal shall promptly execute and submit, and the Commissioner of Transportation shall accept, all required contract proposal documents including such faithful performance bond or other bonds as may be required by law in accordance with the terms of the Principal's said proposal, then this obligation shall be null and void, otherwise to remain in full force and virtue.

IN TESTIMONY WHEREOF, the said Principal has hereunto set his/her (their, its) hand and the said Surety has caused this instrument to be signed by its authorized officer, the day and year above written.

102-17 SAMPLE FORM OF ITEMIZED PROPOSAL/JURAT.

ITEMIZED PROPOSAL

To the State Department of Transportation:

In submitting this bid the undersigned declares to be the only person or persons interested in the said bid; that it is made without any connection with any person making another bid for the same contract; that the bid is in all respects fair and without collusion, fraud or mental reservation; and that no official of the State, or any person in the employ of the State is directly or indirectly interested in said bid or in the supplies or work to which it relates, or in any portion of the profits thereof.

The undersigned also hereby declares to have carefully examined the plans, specifications and form of contract, and to have personally inspected the actual location of the work together with the local sources of supply, to be satisfied as to all the quantities and conditions, and understands that in signing this proposal waives all right to plead any misunderstanding regarding the same.

The undersigned further understands and agrees to furnish and provide for the respective item price bid all the necessary material, machinery, implements, tools, labor services and other items of whatever nature, and to do and perform all the work necessary under the aforesaid conditions, to complete the improvement of the aforementioned project in accordance with the plans and specifications for said improvement, which plans and specifications it is agreed are a part of this proposal, and to accept in full compensation therefore the amount of the summation of the products of the approximate quantities multiplied by the unit prices bid. This summation will hereinafter be referred to as the gross sum bid.

The undersigned further agrees to accept the aforesaid unit bid prices as compensations for any additions or deductions caused by variation in quantities due to more accurate measurement, and for use in the computation of the value of the work performed for monthly estimates.

The undersigned further agrees that at any time during the progress of work the State adds, alters or omits portions of the work it shall so perform such work and accept compensation in accordance with the Standard Specifications.

The undersigned further understands and agrees not to start any work until the contract agreement is signed by the Commissioner or the Commissioner's duly authorized representative. In case the undersigned voluntarily undertakes to start work, other than that expressly prohibited in this Subsection, after the contract agreement is signed by the Commissioner but prior to approval by the State Comptroller, the undersigned does so entirely at its own risk and without obligation or responsibility on the part of the State unless and until the awarded contract becomes effective pursuant to Section 112 of the State Finance Law by approval of the State Comptroller and filing in the Office of the State Comptroller; and hereby agrees and warrants that, as a prerequisite to the start of any such voluntary work, accepts, assumes and undertakes all of the provisions of this proposal and of the plans and specifications of the proposed contract, including all of the provisions and responsibilities thereof relative to (1) damage, indemnification and holding the State harmless as set forth in said contract documents, and (2) actually furnishing in advance of any contract operations, the required insurance policies of each and every kind and amount as called for in said contract documents, particularly with relation to workers' compensation and liability insurance policies as set forth in the related specifications; and also agrees and warrants that all of such policies will be in force and effect on the date of the start of any such contract operations, whether or not the contract documents have been executed and filed as aforesaid. In no event shall the undersigned start any contract work which involves a disturbance of the contract site prior to execution of the contract by the Comptroller.

Bid Deposit

Accompanying this proposal is a bid bond, certified check or bank cashier's check for the specified amount of deposit required. In the event this proposal is accepted by the Department of Transportation and the undersigned shall fail to execute the contract and in all respects comply with the provisions of Section 38 of the Highway Law, as amended, or where applicable, Section 30 of the Canal Law, as amended, the moneys represented by such bid bond, certified check or bank cashier's check shall be regarded as liquidated damages and shall be forfeited and become the property of the State of New York; otherwise to be returned to the depositor in accordance with the provisions of said Section 38 of the Highway Law, as amended, or where applicable with Section 30 of the Canal Law, as amended.

On acceptance of this proposal for said work the undersigned does or do hereby bind herself/himself or itself/themselves to enter into written contract, within ten days of date of notice of award, with the said Department of Transportation, and to comply in all respects with §38(6) of the Highway Law, as amended, or where applicable with §30(7) of the Canal Law, as amended, in relation to security for the faithful performance of the terms of said contract.

Non-Collusive Bidding Certifications (NYS Finance Law §139-D)

1. Every bid hereafter made to the state or any public department, agency or official thereof, where competitive bidding is required by statute, rule or regulation, for work or services performed or to be performed or goods sold or to be sold, shall contain the following statement subscribed by the bidder and affirmed by such bidder as true under the penalties of perjury:

(a) By submission of this bid, each bidder and each person signing on behalf of any bidder certifies, and in the case of a joint bid each party thereto certifies as to its own organization, under penalty of perjury, that to the best of his knowledge and belief:

§102

(1) The prices in this bid have been arrived at independently without collusion, consultation, communication, or agreement, for the purpose of restricting competition, as to any matter relating to such prices with any other bidder or with any competitor;

(2) Unless otherwise-required by law, the prices which have been quoted in this bid have not been knowingly disclosed by the bidder and will not knowingly be disclosed by the bidder prior to opening, directly or indirectly, to any other bidder or to any competitor; and

(3) No attempt has been made or will be made by the bidder to induce any other person, partnership or corporation to submit or not to submit a bid for the purpose of restricting competition.

(b) A bid shall not be considered for award nor shall any award be made where (a)(1)(2) and (3) above have not been complied with; provided however, that if in any case the bidder cannot make the foregoing certification, the bidder shall so state and shall furnish with the bid a signed statement which sets forth in detail the reasons therefore. Where (a)(1)(2) and (3) above have not been complied with, the bid shall not be considered for award nor shall any award be made unless the head of the purchasing unit of the state, public department or agency to which the bid is made, or his designee, determines that such disclosure was not made for the purpose of restricting competition.

The fact that a bidder (a) has published price lists, rates, or tariffs covering items being procured, (b) has informed prospective customers of proposed or pending publication of new or revised price lists for such items or (c) has sold the same items to other customers at the same prices being bid, does not constitute, without more, a disclosure within the meaning of subparagraph 1.(a).

2. Any bid hereafter made to the state or any public department, agency or official thereof by a corporate bidder for work or services performed or to be performed or goods sold or to be sold, where competitive bidding is required by statute, rule or regulation, and where such bid contains the certification referred to in subdivision one of this section, shall be deemed to have been authorized by the board of directors of the bidder and such authorization shall be deemed to include the signing and submission of the bid and the inclusion therein of the certificate as to non collusion as the act and deed of the corporation.

Non-Collusive Bidding Certification (49 CFR 29)

The Contractor to whom the above identified contract is to be awarded does hereby tender to the New York State Department of Transportation this sworn statement pursuant to Section 112(c) of Title 23 U.S. Code *Highways* and does hereby certify, in conformance with said 23 USC 112(c) that the said Contractor has not, either directly or indirectly, entered into any agreement, participated in any collusion, or otherwise taken any action in restraint of free competitive bidding in connection with the above identified contract.

The signatory to this proposal, being duly sworn, certifies that, **EXCEPT AS NOTED BELOW**, its company and any person associated therewith in then capacity of owner, partner, director, officer, or major stockholder (five percent or more ownership):

- 1) is not currently under suspension, debarment, voluntary exclusion, or determination of ineligibility by any federal agency;
- 2) has not been suspended, debarred, voluntarily excluded or determined ineligible by any federal agency within the past three years;
- 3) does not have a proposed debarment pending; and
- 4) has not been indicted, convicted, or had a civil judgment rendered against it by a court of competent Jurisdiction in any matter involving fraud or official misconduct within the past three years.

EXCEPTIONS - List any relevant information, attaching additional sheets if necessary. (Exceptions will not necessarily result in disapproval, but will be considered in determining responsibility. For any exception noted, indicate below to whom it applies, the initiating agency, and dates of action. Providing false information may result in criminal prosecution or administrative sanctions.)

Lobbying Activity Certification [For Federal-Aid Contracts Only]

The prospective participant certifies, by signing and submitting this bid or proposal, to the best of his or her knowledge and belief, that:

(1) No Federal appropriated funds have been paid or will be paid, by or on behalf of the undersigned, to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with the awarding of any federal contract, the making of any Federal grant, the making of any Federal loan, the entering into of any cooperative agreement, and the extension, continuation, renewal, amendment, or modification of any Federal contract, grant, loan, or cooperative agreement.

(2) If any funds other than Federal appropriated funds have been paid or will be paid to any person for influencing or attempting to influence an officer or employee of any Federal agency, a Member of Congress, an officer or employee of Congress, or an employee of a Member of Congress in connection with this Federal contract, grant, loan, or cooperative agreement, the undersigned shall complete and submit Standard Form-LLL, "Disclosure Form to Report Lobbying", in accordance with its instructions. (See Exhibit 1 annexed hereto)

This certification is a material representation of fact upon which reliance was placed when this transaction was made or entered into. Submission of this certification is a prerequisite for making or entering into this transaction imposed by Section 1352, Title 31, U.S. Code. Any person who fails to file the required certification shall be subject to a civil penalty of not less than \$10,000 and not more than \$100,000 for each such failure.

The prospective participant also agrees by submitting his or her bid or proposal that he or she shall require that the language of this certification be included in all lower tier subcontracts, which exceed \$100,000 and that all such subrecipients shall certify and disclose accordingly.

UNITED STATES DEPARTMENT OF TRANSPORTATION HOTLINE

Persons with knowledge of bid collusion (i.e., contractors, suppliers, work persons, etc.), or other questionable contract related practices (inadequate materials, poor workmanship, theft of materials, etc.), are encouraged to report such activities by calling the U.S. DOT HOTLINE. The HOTLINE number is 1-800-424-9071 and calls will be answered from 8:00 A.M. to 5:00 P.M. EST, Monday through Friday.

This HOTLINE is under the direction of the U.S. DOT's Inspector General. All information will be treated confidentially and the caller's anonymity will be respected.

NEW YORK STATE INSPECTOR GENERAL HOTLINE

Reports of New York State Governmental Misconduct may be made in strict confidence to the New York State Inspector General on the Toll Free Statewide HOTLINE or by writing to the Office of the State Inspector General. The Toll-Free Statewide HOTLINE telephone number is 1-800-367-4448 and calls will be answered between 9:00 A.M. and 5:00 P.M., Monday through Friday. The address of the Office of the Inspector General is P.O. Box 9, One Commerce Plaza, Albany, New York 12260.

CONTRACTOR MUST COMPLETE THE FORM BELOW

OFFERER DISCLOSURE OF PRIOR NON-RESPONSIBILITY DETERMINATIONS

1. Has any Governmental Entity made a finding of non-responsibility regarding the individual or entity seeking to enter into the Procurement Contract in the previous four years? (Please circle):

No Yes

If yes, please answer questions 2-4. If no, skip to question 5.

2. Was the basis for the finding of non-responsibility due to a violation of State Finance Law §139-j (Please circle):

No Yes

3. Was the basis for the finding of non-responsibility due to the intentional provision of false or incomplete information to a Governmental Entity? (Please circle):

No Yes

§102

4. If you answered yes to any of the above questions, please provide details regarding the finding of non-responsibility below.

Governmental Entity: _____

Date of Finding of Non-responsibility: _____

Basis of Finding of Non-Responsibility: _____

(Add additional pages as necessary)

5. Has any Governmental Entity or other governmental agency terminated or withheld a Procurement Contract with the individual or entity seeking to enter into the Procurement Contract due to the intentional provision of false or incomplete information? (Please circle):

No Yes

6. If yes, please provide details below.

Governmental Entity: _____

Date of Termination or Withholding of Contract: _____

Basis of Termination or Withholding: _____

(Add additional pages as necessary)

BY EXECUTING THIS PROPOSAL, THE CONTRACTOR AGREES TO:

1. Perform all work listed in accordance with the Contract Documents at the unit prices bid; subject to the Changed Conditions provisions if applicable;
2. All the terms and conditions of the non-collusive bidding certifications required by §139-d of the State Finance Law;
3. Certification of Specialty Items category selected, if contained in this proposal;
4. Certification of any other clauses required by this proposal and contained herein.
5. For Federal-Aid contracts only, Certification, under penalty of perjury, as to the current history regarding suspensions, debarments, voluntary exclusions, determinations of ineligibility, indictments, convictions or civil judgments required by 49 CFR, Part 29.
6. Contractor affirms that all information provided to the Department with respect to the requirements contained in State Finance Laws §139j and §139k is complete, true and accurate.

SECTION 103 - CONTRACT AWARD AND EXECUTION

103-01 CONTRACT AWARD. The award of contract will be made only to the lowest responsible bidder as will best promote the public interest as provided by Section 38 of the Highway Law. The lowest bid will be determined by the Commissioner on the basis of gross sum for which the entire work will be performed, arrived at by a correct computation of all contract pay items specified in the proposal, at the unit prices stated in the proposal. If there is any discrepancy in the itemized proposals published in hard copy and electronic formats, in either the contract pay items or quantities, the Department will evaluate the bids based only on that portion that is common to all formats. The Department reserves the right to reject any or all bids in the best interest of the State pursuant to Section 38 (4) of the Highway Law.

Comment [c3]:
E109-007

~~103-01 CONTRACT AWARD.~~

~~—The award of contract will be made only to the lowest responsible bidder as will best promote the public interest as provided by Section 38 of the Highway Law. The lowest bid will be determined by the Commissioner on the basis of gross sum for which the entire work will be performed, arrived at by a correct computation of all contract pay items specified in the proposal, at the unit prices stated in the proposal.~~

The Department reserves the right to reject any proposal deemed non-responsive, or any contractor deemed non-responsive, and then, pursuant to Section 38 of the Highway Law, award to other than the low bidder, or waive minor informalities if, in its opinion, the best interest of the State will thereby be promoted.

The Commissioner reserves the right to reject any proposal in which any of the bid prices are unbalanced to the potential detriment of the Department. An unbalanced bid is considered to be one containing lump sum or unit bid prices which do not reflect reasonable actual costs plus a reasonable proportionate share of the bidder's anticipated profit, overhead costs, and other indirect costs which are anticipated for the performance of the work in question.

As a condition of award, the Contractor shall submit a completed Form CCA-1, *New York State Uniform Contracting Questionnaire* to the Contract Management Bureau. If requested by the Department, the bidder shall present additional evidence of ownership, corporate structure, ability and financial standing, as well as a statement as to equipment.

For contracts subject to A+B Bidding, the lowest bid will be determined by the Commissioner on the basis of the gross sum, which will be arrived at by a correct computation of all contract pay items specified in the proposal at the unit prices stated in the proposal (A portion), plus the total number of calendar days proposed by the bidder to complete the portion of work to which the incentive/disincentive is applicable, times the unit cost (B portion).

For contracts containing steel and/or iron, award of the contract will be made to the lowest responsible bidder who submits the lowest total bid based on furnishing domestic steel unless such total bid exceeds the lowest total bid based on furnishing foreign steel by more than 25 percent, in which case award will be made to the lowest responsible bidder based on furnishing foreign steel. The Bidder shall submit a bid based on permanently incorporating only domestic steel and/or iron materials in the construction of the contract. The Bidder may also submit a bid based on being allowed to permanently incorporate foreign steel and/or iron materials into the work of the contract. If the Bidder chooses to

submit a bid based on the use of foreign steel and/or iron materials, the Bidder shall purchase an additional contract proposal and shall legibly print the following in ink on the proposal cover and at the bottom of the proposal sheet which contains the phrase "Total or gross sum written in words": TOTAL BID BASED ON USING FOREIGN STEEL AND/OR IRON MATERIALS. When bids are submitted based on domestic and foreign steel and/or iron materials, both bids shall be submitted in the same envelope.

For contracts containing structure paint removal and painting work except for: bridge superstructure removal and other demolition work under Section 202; paint removal that is incidental to the main work under an item; localized paint removal from structural steel necessary for safe progress of other work on the structural steel; localized painting of bare structural steel; and containment for localized steel repair and painting; as a condition of award, Contractors and/or Subcontractors performing structure paint removal and painting work shall be certified in accordance with the following requirements of the Painting Contractor Certification Program (PCCP), of the Steel Structures Painting Council (SSPC): QP-1, Standard Procedure for Evaluating Qualifications of Painting Contractors: Field Application to Complex Industrial Structures; QP-2, Standard Procedure for Evaluating Qualifications of Painting Contractors To Remove Hazardous Paint.

In lieu of SSPC/PCCP certification, the Contractor shall provide documentation that demonstrates that the low bidder has established equivalent processes and procedures conforming to the standards set forth in the procedures for SSPC/PCCP QP-1 and QP-2. The documentation shall be reviewed and approved by a Professional Engineer experienced in structural painting operations selected by the Contractor and approved by the Department. The cost for the review and approval shall be paid by the Contractor.

103-02 EXECUTION OF CONTRACT.

The person or persons whose proposal is accepted shall execute the contract and comply in all respects with the statutory provisions relating to the contract within ten days of the date of the delivery of the contract form. A sample of the standard contract agreement is shown in §103-06 *Sample Form of Contract Agreement*. In case of failure or refusal on the part of the bidder to deliver the duly executed contract to the Department within the ten day period herein mentioned, the amount of the deposit made may be forfeited and paid to the State of New York, Department of Transportation.

All of the following sections which have the word "Sample" in the title are samples of the contract documents executed by the Contractor as a part of contract award. The executed contract documents control and have precedence over the samples presented herein.

103-03 CONTRACT BONDS.

The Contractor shall provide the State with a Faithful Performance Bond and a Labor and Material Bond from a Surety Company listed on the US Department of the Treasury listing of Approved Sureties (Treasury Department Circular 570) and licensed to do business in New York State, and with a minimum rating by A.M. Best of (A-) in the "Best's Key Rating Guide." Treasury Department Circular 570 can be found on the US Department of the Treasury website at www.fms.treas.gov/c570/index.html. The Contractor shall procure and deliver bonds to the State and maintain them at its own expense and without expense to the State until contract final acceptance by the State. The Surety Company shall append a statement of its financial condition and a copy of the resolution authorizing the execution of Bonds by officers of the Company to the bond(s).

For contracts subject to A+B Bidding, the total contract bid price will include only the "A" portion of the bid. For contracts containing Incentive/Disincentive provisions, Lane Rental provisions, or any similar provisions, the total contract bid price will exclude any incentive/disincentive, lane rental, or similar items.

A. Faithful Performance Bond. The Contractor shall provide a bond in the form prescribed by the Commissioner, shown in §103-07 Sample Form of Faithful Performance Bond, with sufficient sureties, approved by said Commissioner, guaranteeing that the Contractor will perform the work in accordance with the terms of the contract documents, and that it will commence and complete the work within the time prescribed in the contract, and that it will provide against direct or indirect

damages that shall be suffered or claimed on account of such construction or improvement, during the time thereof, until the contract is accepted. The amount of the Faithful Performance Bond shall be 100% of the amount of the total contract bid price.

B. Labor And Material Bond. The Contractor shall provide a bond in the form prescribed by the Commissioner, shown in §103-08 Sample Form of Labor and Material Bond, with sufficient sureties, approved by said Commissioner, guaranteeing prompt payment of monies due all persons supplying the Contractor or Subcontractor with labor and materials employed and used in carrying out the contract, which bond shall inure to the benefit of the persons supplying such labor and materials. The amount of the Labor and Material Bond shall be 100% of the amount of the total contract bid price.

103-04 CANCELING AWARD.

The Department reserves the right to reject all proposals and advertise for new proposals, or proceed to do the work otherwise, if, in its opinion, the best interest of the State will thereby be promoted.

103-05 PARTNERING.

It is the Department's policy to use the principles of partnering to guide the management of construction contracts and the construction program, within the parameters covered by the laws, regulations and other policies that govern work in the public sector.

The partnering principles are intended to promote quality through continuous improvement at all stages of construction. The goal of the Department is to complete each contract in the most efficient, timely, safe, and cost effective manner, to the mutual benefit of the Contractor and the Department, meaning a quality contract delivered on time, within budget, and without significant disputes.

Partnering is defined as those actions taken to include all parties with an appropriate and vested interest in the management of a transportation project such that it is completed in the most efficient, timely, safe, and cost effective manner for the mutual benefit of all concerned. Those actions include, but are not limited to, communication, organization, establishing goals, continuous improvement, problem identification, conflict resolution, and managing change. Interested parties may include, but are not limited to, the Department, the Contractor, Subcontractors, Fabricators, Material Suppliers, the community within which the project is constructed, the community served by the project, Federal, State and local government or other public agencies, and utilities.

None of the actions identified as part of, or taken in the course of partnering shall be construed to alter, modify, delete or waive any of the provisions or requirements of the Department's Specifications or any applicable laws or regulations.

The Department with the Contractor will manage each contract in a cooperative manner utilizing the following principles of partnering:

- establish communications with all involved parties early in the partnering process;
- establish a relationship of shared trust, equity, and commitment;
- develop strategies for identifying mutual goals;
- develop strategies for timely communications and decision making;
- establish process for timely response to changes or variations in field conditions;
- solve potential problems, at the lowest level, before they create a negative impact;
- encourage the use of products, technology and processes that provide a demonstrated level of improved quality; and
- develop a plan for periodic joint evaluation based on mutually agreed goals.

The specifications are to be implemented in an equitable fashion that recognizes the problems that are inherent in construction, addresses the different-than-expected field conditions, resolves disputes in open communications manner, and makes contract adjustments in a timely, and fair manner consistent with the terms of the contract. These specifications are intended to fairly allocate risk, resulting in a balanced contractual approach to risk-sharing. The Department will provide information relevant to preparation of a bid for the contract, and in connection with submission of its bid, the Contractor has the right to rely on information provided by the Department in the contract documents.

A. Formal Partnering. Generally, an item for formal partnering will be included in the contract proposal for large, more complex contracts. In addition, the Department will accept requests by successful low bidders to incorporate formal partnering on any contract that requires coordination and cooperation with third parties such as Subcontractors, suppliers, utility companies and railroads, or as otherwise desired by the Contractor.

B. Informal Partnering. The Department is willing to informally partner with the Contractor on all other contracts. Informal partnering is defined as the application of partnering principles to the management of the contract by the mutual agreement of the interested parties. Although the principles of partnering are to be applied, there is no fixed organization or structure adopted for that purpose.

103-06 SAMPLE FORM OF CONTRACT AGREEMENT.

STATE OF NEW YORK
 DEPARTMENT OF TRANSPORTATION
 AGREEMENT

Contract No.
 County

THIS AGREEMENT, entered into this _____ day of _____, 20____, by THE PEOPLE OF THE STATE OF NEW YORK, hereinafter referred to as "State", acting by and through the Department of Transportation, pursuant to the Highway Law, and
 an individual conducting business as
 a partnership, consisting of
 a corporation organized and existing under the laws of the State of _____
 the location of whose principal office is _____ hereinafter called the "Contractor".

WITNESSETH: That the State and the Contractor, for the consideration hereinafter named agree as follows:

ARTICLE 1. WORK TO BE DONE. The Contractor shall (a) furnish all the materials, appliances, tools and labor of every kind required, and construct and complete in the most substantial and skillful manner, the construction, improvement or reconstruction of the project on or before the completion date of the _____ day of _____, 20 ____ as further described in Article 4, and as generally identified and shown on the contract plans entitled:

in accordance with the "Standard Specifications" of the New York State Department of Transportation, which contain the information for bidders; proposal form, contract agreement, and bonds; and payment items; and (b) do everything required by the Contract and/or Contract Documents as defined herein.

The Contractor further agrees their bid proposal is not based upon the assumption that any specifications, traffic restrictions, scheduling or phasing/staging requirements will be waived; an extension of Contract Completion Date will be granted; a labor dispensation will be granted; substitution of non-approved products, alternatives or claimed functional equivalents for specified construction materials and methods will be allowed; or any Value Engineering Change Proposals will be approved.

ARTICLE 2. DOCUMENTS FORMING THE CONTRACT. The Contract (and Contract Documents) shall be deemed to include the advertisement for proposals; the contract proposal, including Special Notes and Special Specifications contained therein; the contractor's proposal; the Equal Employment Opportunity (EEO) participation goals; the Disadvantaged/Minority/Women's Business Enterprise (D/M/WBE) participation goals; the contract agreement; the base line data; the "Standard Specifications" including all addenda thereto identified in the contract proposal; the Standard Sheets; the plans; any amendments issued prior to the date of proposal submission, and all provisions required by law to be inserted in the contract whether actually inserted or not. Whenever separate publications are referenced in

the Contract Documents it shall mean those, as amended, which are current on the date of advertisement for bids.

ARTICLE 3. EXAMINATION OF DOCUMENTS AND SITE. The Contractor agrees that before making its proposal it carefully examined the contract documents, together with the site of the proposed work, as well as its surrounding territory, and is informed regarding all of the conditions affecting the work to be done and labor and materials to be furnished for the completion of this contract, including the existence of poles, wires, pipes and other facilities and structures of municipal and other public service corporations on, over or under the site, except latent conditions that meet the requirements of §104-03 *Differing Site Conditions*, and that its information was secured by personal and other investigation and research.

ARTICLE 4. DATE OF COMPLETION. The Contractor further agrees that it will begin the work herein embraced within ten days of the effective date hereof, unless the consent of the State, in writing, is given to begin at a later date, and that it will prosecute the same so that it shall be entirely completed and performed on or before the completion date shown in Article 1.

No extension beyond the date of completion fixed by the terms of this contract shall be effective unless in writing signed by the State. Such extension shall be for such time and upon such terms and conditions as shall be fixed by the State, which may include the assessment of liquidated damages and a charge for engineering and inspection expenses actually incurred upon the work, including engineering and inspection expenses incurred upon the work by railroad companies on contracts for grade crossing elimination. Notice of application for such extension shall be filed with the Regional Director of the Region within which the highway under construction is located at least fifteen days prior to the date of completion fixed by the terms of this agreement.

ARTICLE 5. ALTERATIONS AND OMISSIONS. The said work shall be performed in accordance with the true intent and meaning of the contract documents without any further expense of any nature whatsoever to the State other than the consideration named in this agreement.

The State reserves the right, at any time during the progress of the work, to alter the plans or omit any portion of the work as it may deem reasonably necessary for the public interest- making allowances for additions and deductions with compensation made in accordance with the Standard Specifications, for this work without constituting grounds for any claim by the contractor for allowance for damages or for loss of anticipated profits, or for any variations between the approximate quantities and the quantities of the work as done.

ARTICLE 6. NO COLLUSION OR FRAUD. The Contractor hereby agrees that the only person or persons interested as principal or principals in the bid or proposal submitted by the Contractor for this contract are named therein, and that no person other than those mentioned therein has any interest in the above mentioned proposal or in securing of the award, and that this contract has been secured without any connection with any person or persons other than those named, and that the proposal is in all respects fair and was prepared and the contract was secured without collusion or fraud and that neither any officer nor employee of the Department of Transportation has or shall have a financial interest in the performance of the contract or in the supplies, work or business to which it relates, or in any portion of the profits thereof. (See also §139-a and §139-b of the State Finance Law referred to in the Standard Specifications which are made a part of this contract.)

ARTICLE 7. CONTRACT PAYMENTS. As the work progresses in accordance with the contract and in a manner that is satisfactory to the State, the State hereby agrees to make payments to the Contractor therefore, based upon the proposal attached hereto and made a part hereof, as follows: The State shall once in each month and on such days as it may fix, determine the quantity of work completed and of material which has actually been put in place in accordance with the terms and conditions of the contract, during the preceding month, and compute the value thereof and pay to the Contractor the monies due as provided in §38(7) of the Highway Law. No monthly payment shall be rendered unless the value of the work completed equals 5% of the contract amount or \$1,000, whichever is the lesser. Semimonthly payments may be rendered provided (a) the value of the work performed in two successive weeks is more

than \$50,000 or (b) the Commissioner of Transportation deems it to be in the best interests of the State to do so. The Contractor shall not hold any retainage from any Subcontractor.

ARTICLE 8. NO PAYMENT DUE TO CONTRACTOR'S NON-COMPLIANCE. It is further agreed that so long as any lawful or proper direction concerning the work or material given by the Commissioner of Transportation, or his/her representative, shall remain uncomplied with, the Contractor shall not be entitled to have said contract payment processed, nor shall any contract payment(s) be processed for work done or material furnished until such lawful or proper direction aforesaid has been fully and satisfactorily complied with.

ARTICLE 9. FINAL ACCEPTANCE OF WORK. When in the opinion of the Regional Director a Contractor has fully performed the work under the contract, the Regional Director shall recommend to the Commissioner of Transportation the acceptance of the work so completed. If the Commissioner accepts the recommendation of the Regional Director, he/she shall thereupon by letter notify the Contractor, with copies to other interested parties, of such acceptance. Prior to the final acceptance of the work by the Commissioner or his/her designee, the contract work may be inspected, accepted and approved by other agencies and/or municipalities who will have jurisdiction of the work after final acceptance.

Final acceptance shall be final and conclusive except for defects not readily ascertainable by the Department, actual or constructive, fraud, gross mistakes amounting to fraud or other errors which the Contractor knew or should have known about as well as the Department's rights under any warranty or guarantee. Final acceptance may be revoked by the Department at any time prior to the issuance of the final check by the Comptroller upon the Department's discovery of such defects, mistakes, fraud or errors in the work.

ARTICLE 10. FINAL PAYMENT. After the final acceptance of the work, the Engineer shall prepare a final agreement of the work performed and the materials placed and shall determine the value of such work and materials under and according to the terms of the contract. This final agreement shall be certified, as to its correctness, by the Engineer. Upon approval of such final agreement by the Regional Director, it shall be submitted to the Commissioner for final approval. The right, however, is hereby reserved to the Commissioner to reject the whole or any portion of the final agreement, should the said certificate of the Engineer be found or known to be inconsistent with the terms of the agreement or otherwise improperly given. All certificates upon which partial payments may have been made, shall be subject to correction in the final certificate or final agreement.

ARTICLE 11. RIGHT TO SUSPEND WORK AND CANCEL CONTRACT. It is further mutually agreed that if at any time during the prosecution of the work the Commissioner of Transportation shall determine that the work upon the contract is not being performed according to the contract or for the best interest of the State, the execution of the work by the Contractor may be temporarily suspended by the Commissioner of Transportation, who may then proceed with the work under his/her own direction in such manner as will accord with the contract specifications and be for the best interests of the State; or he/she may terminate the Contractor's employment under the contract while it is in progress, and thereupon proceed with the work, in affirmance of the contract, by contract negotiated or publicly let, by the use of his/her own forces, by calling upon the surety to complete the work in accordance with the plans and specifications or by a combination of any such methods; or he/she may cancel the contract and either readvertise or relet as provided in Section 38 of the Highway Law, or complete the work under its own direction in such a manner as will accord with the contract specifications and be for the interests of the State; any excess in the cost of completing the contract beyond the price for which it was originally awarded shall be charged to and paid by the Contractor failing to perform the work or its surety; all in pursuance of the provisions of Section 40 of the Highway Law.

Whenever the State determines to suspend or stop work under the contract, a written notice sent by mail to the Contractor at its address and to the sureties at their respective addresses, shall be sufficient notice of its action in the premises.

ARTICLE 12. DETERMINATION AS TO VARIANCES. In any case of any ambiguity in the plans, specifications or maps, or between any of them, the matter must be immediately submitted to the

§103

Commissioner, who shall adjust the same, and his/her decision in relation thereto shall be final and conclusive upon the parties.

ARTICLE 13. SUCCESSORS AND ASSIGNS. This agreement shall bind the successors, assigns and representatives of the parties hereto.

ARTICLE 14. INTERNATIONAL BOYCOTT PROHIBITION. In accordance with §139-h of State Finance Law, the Contractor hereby promises, asserts and represents that neither the Contractor nor any substantially owned or affiliated person, firm, partnership or corporation has participated, is participating or shall participate in an international boycott in violation of the provisions of the United States Export Administration Act of 1969, as amended, or the United States Export Administration Act of 1979, or the effective Regulations of the United States Department of Commerce promulgated under either act.

It is understood further that the State in awarding a contract does so in material reliance upon the promise and representation made by the Contractor in the forgoing paragraph and that such contract shall be rendered forfeit and void by the State Comptroller if subsequent to the bid execution date, the Contractor or such owned or affiliated person, firm, partnership or corporation has been convicted of a violation of the aforesaid Acts or Regulations or has been found upon final determination of the United States Commerce Department or any other appropriate agency of the United States to have violated such Acts or Regulations.

The Contractor agrees to and shall notify the Commissioner of Transportation, the Director of the Contract Management Bureau and State Expenditures in the Office of the State Comptroller of any such conviction or final determination of violation within five (5) days thereof.

IN WITNESS WHEREOF, this agreement has been executed by the State, acting by and through the Commissioner of Transportation, and the Contractor or its appointed representative, who has executed this agreement on the day and year first written above.

(Project Description)
In the county/counties of _____ which constitutes Contract No. _____

NOW, THEREFORE, the condition of this obligation is such that if the said Principal shall well, truly and faithfully perform the work in accordance with the terms of the contract and as said contract may be modified or amended, and with the plans and specifications, and will commence and complete the work within the time prescribed in the contract, and shall protect the said State against, and pay any excess of cost as provided in said contract, and all amounts, damages, costs and judgments which may be recovered against said State or its officers or agents of which the said State may be called upon to pay to any person or corporation by reason of any damages, direct or indirect, arising or growing out of the doing of said work, or from the negligence, nonfeasance, misfeasance or malfeasance of any officer, agent or employee of the State or Department thereof, or suffered or claimed on account of said public works contract during the time thereof or the manner of doing the same, or the neglect of the said Principal, or its agents, or servants, or the improper performance of the said work by the said Principal, or its agents, or servants, or from any other cause, then this obligation shall be null and void, otherwise to remain in full force and virtue.

In the event of a failure of performance of the contract by the Principal, which shall include, but not be limited to, any breach or default of the contract by the Principal, or in case said contract is forfeited by the Principal in the manner provided for in the contract and the said Surety, for value received, hereby stipulates and agrees, if requested to do so by the State, has the option to either remedy the default, or breach or forfeiture of the Principal or take charge and fully perform and complete the work, mentioned and described in said contract and specifications, pursuant to the terms, conditions and covenants thereof and as may be amended, at its own expense. The procedure by which the Surety undertakes to discharge its obligations under the bond shall be subject to the advance written approval of the Department. If the Surety completes the contract, it shall be paid for the actual items of work performed in accordance with the Principal's contract terms and prices. In this event the Surety assumes the rights and obligations of the Principal.

It shall be the duty of the Surety to give unequivocal notice in writing to the Department, within forty-five (45) days after receipt of written notice from the Department to the Surety, of the Surety's election to remedy default(s) or breach(es) or forfeiture(s) promptly or to perform and fully complete the contract promptly as provided herein, time being of the essence of this bond. In said notice of election, the Surety shall state the date on which the remedy or performance shall commence. During the period between the Department's notice and Surety's performance of the contract or remedy of the default, breach or forfeiture, the Surety shall be liable for and agrees to pay any and all reasonable and necessary costs as determined by the Department to maintain the contract site safe and convenient to the public.

It shall also be the duty of the Surety to give prompt notice in writing to the Department upon the completion of the remedy and/or correction of each breach or default or completion of the contract. The Surety shall not assert solvency of its Principal or its Principals denial of default as justification for its failure to give notice of election or for its failure to promptly remedy the breach or default or to complete the contract.

In the event the Surety shall fail to exercise either option or to act promptly then the Department shall give ten (10) days notice of such failure, both to Principal and Surety, and after the expiration of the 10 days the Department may cause the work to be completed pursuant to Section 40 of the Highway Law, and the Surety and the Principal shall be jointly and severally liable for the amount of excess cost of completing the contract work beyond the amounts remaining for this contract adjusted for the work actually performed. When the cost of completion of performance by the Obligee is estimated, the Principal and Surety shall pay, free from all liens and encumbrances, the State determined estimated completion costs above the funds remaining for this contract, to the Department within 30 days of receipt of the estimate. Adjustment of the Department's estimated completion cost will be made upon the Department's final acceptance of the work and appropriate refunds, if any, will be promptly made to the Surety. Any actual costs in excess of the estimated price shall be paid to the Department promptly on demand. Additionally, Principal and Surety shall be liable for any applicable liquidated and/or engineering costs or damages.

In addition, the said Principal and Surety further agree, as part of this obligation, to pay all damages of any kind to person or property that may result from a failure in any respect to perform and complete said contract including, but not limited to costs necessary to protect the traveling public or to avoid inconvenience to the traveling public, (liquidated damages as provided above) all repair and replacement

costs necessary to rectify construction errors, architectural and engineering costs and fees, all consultant fees, all testing and laboratory fees, and all interest, legal fees and litigation costs incurred by the Department.

And the said Surety thereby stipulates and agrees that no change, extension, alteration, deduction or addition in or to the terms of the said contract or the plans or specifications accompanying the same, shall in any way affect the obligations of said Surety of its bond.

IN TESTIMONY WHEREOF, the said Principal has hereunto set his/her (their/its) hand and the said Surety has caused this instrument to be signed by its authorized officer, the day and year above written.

Signed and delivered this ____ day of _____, 20 ____, in the presence of:

Notary Public

State Of New York Office of the Attorney General

I hereby approve the foregoing contract and bond as to form and manner of execution.

103-08 SAMPLE FORM OF LABOR AND MATERIAL BOND.

KNOW ALL PERSONS BY THESE PRESENTS, that _____
(Name of Contractor)

(Address)

(hereinafter called the "Principal") and the _____
a corporation created and existing under the laws of the State of _____ having its principal
office in the City of _____ (hereinafter called the "Surety"), are held and firmly bound
unto the People of the State of New York (hereinafter called the "State") by and through its Department of
Transportation (hereinafter called the "Department"), in the full and just sum of [*Total Contract Bid Price
or the "A Portion" of Total Contract Bid Price* Dollars (\$.....)] good and lawful money of the
United States of America, for payment of which said sum of money, well and truly to be made and done,
the said Principal binds itself, its heirs, executors and administrators, successors and assigns, and the said
Surety binds itself, its successors and assigns jointly and severally, firmly by these presents:

WHEREAS, said Principal has entered into a certain written contract, on the ____ day of
_____, 20____ with the Department of Transportation, 50 Wolf Road, Albany, New York 12232.

(Project Description)

In the county/counties of _____ which constitutes Contract No. _____

NOW, THEREFORE, the condition of this obligation is such, that if the said Principal shall promptly
pay all monies due to all persons furnishing labor or materials to it or its Subcontractors in the
prosecution of the work provided for in said contract, then this obligation shall be void, otherwise to
remain in full force and effect;

Provided, however, that the Comptroller of the State of New York having required the said Principal
to furnish this bond in order to comply with the provisions of Section 137 of the State Finance Law, all
rights and remedies on this bond shall inure solely to such persons and shall be determined in accordance
with the provisions, conditions and limitations of said Section to the same extent as if they were copied at
length herein; and

Further, provided, that the place of trial of any action on this bond shall be in the county in which the
said contract was to be performed, or if said contract was to be performed in more than one county then in
any such county, and not elsewhere.

IN TESTIMONY WHEREOF, the said Principal has hereunto set his/her (their, its) hand and the said
Surety has caused this instrument to be signed by its authorized officer, the day and year above written.

State Of New York Office of the Attorney General

I hereby approve the foregoing contract and bond as to form and manner of execution.

SECTION 104 - SCOPE OF WORK

104-01 WORK REQUIRED.

The Contractor shall begin work within ten days of the date of the award notification by the Department, unless written consent of the Department is given to begin at a later date. The Contractor shall perform all work enumerated under the terms of the contract and shall protect all adjoining properties, utility facilities and existing highway facilities within the right of way. The Contractor shall repair and/or replace any property, utility facility or highway facility damaged or destroyed by it or its employees through construction operations, within and adjacent to the right of way.

The Contractor shall coordinate the work of its Subcontractors, Manufacturers, Fabricators and Material Suppliers. Their operations shall be arranged and conducted so that delays will be avoided. Where the work of the Contractor, or Subcontractors, overlaps or dovetails with that of other Contractors, materials shall be delivered and operations shall be conducted so as to carry on the work continuously in an efficient and workmanlike manner.

During the life of this contract, Utilities may make changes in their facilities. These changes may be made by the Utility employees or by contract within the limits of or adjacent to this contract and may be temporary and/or permanent.

Delays or oversights on the part of the Contractor, Subcontractors or Utilities in properly completing any work, thereby requiring the removal and replacement of work already in place, will not be the basis for a claim of extra compensation. Such work will be performed at the cost and expense of the responsible Contractor, Subcontractor or Utility. Reference is made to General Obligations Law §11-102 which concerns the interference and/or delay of the Contractor's progress of work by Utilities.

104-02 CHANGES, CONTINGENCIES, EXTRA WORK AND DEDUCTIONS.

The provisions of Article 5, *Alterations and Omissions* of the contract agreement shall apply. Whenever the Department determines that from any unforeseen cause the terms of any contract should be altered to provide for changes, contingencies, extra work, or the deletion of work an order-on-contract may be issued to the Contractor shall promptly proceed with the performance of the work and the furnishing of the materials and equipment necessary for its accomplishment in accordance with the pertinent specifications. Such changes in quantities and alterations shall not invalidate the contract nor release the Surety, and the Contractor shall perform the work as altered.

No instructions, either written or verbal from any Department employee or agent shall be construed as an order for changes until receipt by the Contractor of written notification that an order-on-contract has been approved by the Department, or written notification from the Engineer that changes in the work are eligible and authorized for payment in accord with Section 697 *Field Change Payment*. The Contractor may proceed with the work in advance of the approved order-on-contract if the Contractor has received an approved *Authorization of Extra Work*.

104-03 DIFFERING SITE CONDITIONS.

In accordance with 23 CFR 635.109(a)(1):

During the progress of the work, if subsurface or latent physical conditions are encountered at the site differing materially from those indicated in the contract or if unknown physical conditions of an unusual nature, differing materially from those ordinarily encountered and generally recognized as inherent in the work provided for in the contract, are encountered at the site, the party discovering such

conditions shall promptly notify the other party of the specific differing site conditions before the site is further disturbed and before the affected work is performed.

Upon written notification, the Engineer will investigate the site conditions, and if it is determined that the conditions materially differ and cause an increase or decrease in the cost or time required for the performance of any work under the contract, an adjustment, excluding anticipated profits, will be made and the contract modified in writing accordingly. The Engineer will notify the Contractor, of the determination whether or not an adjustment to the contract is warranted.

No contract adjustment which results in a benefit to the Contractor will be allowed unless the Contractor has provided the required written notice.

The Department will administer the above Federal regulations as follows:

During the progress of the work, if subsurface or latent physical conditions are encountered at the site differing materially from those indicated in the contract or if unknown physical conditions of an unusual nature, differing materially from those ordinarily encountered and generally recognized as inherent in the work provided for in the contract, the party discovering such conditions shall promptly notify the other party of the specific differing site conditions before the site is further disturbed and before the affected work is performed, with subsequent written notice to be provided later. The Contractor shall comply with the notice and recordkeeping provisions of §104-06 *Notice and Recordkeeping*.

The Contractor or the State, as the case may be, must make written notice to the other party of the existence of apparent subsurface or latent physical conditions if that party wishes to adjust the contract price or time of performance, including direct costs and/or time related compensation, if applicable. Such notice shall be given within ten (10) work days of the time at which the party had knowledge, or should have had knowledge of the differing site condition. The Department will have no liability and no adjustment will be made for any damages which accrued more than ten (10) work days prior to the filing of such a notice with the Engineer.

Upon written notice, the Engineer will investigate the site conditions, and if it is determined that the conditions materially differ and cause an increase or decrease in the cost or time required for the performance of the work, an adjustment, excluding anticipated profits, will be made to the contract. The Engineer will make an initial response in writing to the Contractor, within 15 work days, with a determination whether or not an adjustment to the contract is warranted. Situations requiring examination of the site or input from other Department personnel may require additional time to resolve. No contract adjustment will be allowed unless the Contractor has provided the required written notice, or written notice was provided to the Contractor by the State.

The Contractor shall keep daily records and make reports of all labor, material and equipment used in connection with such work and the cost thereof as specified in §109-05C. *Force Account Reports*. Compensation for increased costs of the work resulting from the differing site conditions will be made in accordance with §109-05 *Extra Work and Time Related Compensation*. Compensation for time related costs, if any, will be made in accordance with §109-05D. *Time Related Dispute Compensation*.

104-04 SIGNIFICANT CHANGES IN THE CHARACTER OF WORK.

In accordance with 23 CFR 635.109(a)(3):

The Engineer reserves the right to make, in writing, at any time during the work, such changes in quantities and such alterations in the work as are necessary to satisfactorily complete the project. Such changes in quantities and alterations shall not invalidate the contract nor release the Surety, and the Contractor agrees to perform the work as altered.

If the alterations or changes in quantities significantly change the character of work under the contract, whether such alterations or changes are in themselves significant changes in the character of work, or by affecting other work cause such other work to become significantly different in character, an adjustment, excluding anticipated profits, will be made to the contract. The basis for the adjustment shall be agreed upon prior to the performance of the work. If a basis cannot be agreed upon, then an adjustment will be made by the Department, either for or against the Contractor, in such amount as determined to be fair and equitable.

If the alterations or changes in quantities do not significantly change the character of the work to be performed under the contract, the altered work will be paid for as provided elsewhere in the contract.

§104

The term 'significant change' shall be construed to apply only to the following circumstances: when the character of the work as altered differs materially in kind or nature from that involved or included in the original proposed construction; or when a Major Item of work, as defined elsewhere in the contract, is increased in excess of 125 percent, or decreased below 75 percent of the original contract quantity. Any allowance for a change in unit price shall apply only to that portion of work in excess of 125 percent of the original contract item quantity, or in the case of a decrease below 75 percent, to the actual amount of work performed.

The Department will administer the above Federal regulations as follows:

The Department may make, in writing, at any time during the work, any necessary changes in quantities and alterations to the work in order to satisfactorily complete the project. If the Contractor or the Department discovers a change that constitutes a significant change in the character of work as defined below, the party discovering the change shall promptly provide the other party written notice of the significant change in the character of work before additional work is performed. The Contractor shall comply with notice and recordkeeping provisions of §104-06 *Notice and Recordkeeping*.

The Contractor or the State, as the case may be, must make written notice to the other party of the existence of an apparent significant change in the character of work if that party wishes to adjust the contract price or time of performance, including direct costs and/or time related compensation, if applicable. Such notice shall be given within ten (10) work days of the time at which the party had knowledge, or should have had knowledge of an event, matter or occasion which results in a significant change in the character of work. The Department will have no liability and no adjustment will be made for any damages which accrued more than ten (10) work days prior to the filing of such a notice with the Engineer.

Upon written notice, the Engineer will investigate the changes and if it is determined that the alterations or changes in quantities significantly change the character of work, whether such alterations or changes are in themselves significant changes in the character of work, or by affecting other work, cause such other work to become significantly different in character, an adjustment, excluding anticipated profits, will be made to the contract. The Engineer will make an initial response in writing to the Contractor, within 15 work days, with a determination whether or not an adjustment to the contract is warranted. Situations requiring examination of the site or input from other Department personnel may require additional time to resolve. The basis for the adjustment shall be agreed upon prior to the performance of the work. If a basis cannot be agreed upon, then an adjustment will be made by the Department, either for or against the Contractor, in such amount as determined to be fair and equitable. No contract adjustment will be allowed unless the Contractor has provided the required written notice, or written notice was provided to the Contractor by the State.

The Contractor shall keep daily records and make reports of all labor, material and equipment used in connection with such work and the cost thereof as specified in §109-05C. *Force Account Reports*. Compensation for increased costs of the work resulting from significant changes in the character of work will be made in accordance with §109-05 *Extra Work and Time Related Compensation*. Compensation for time related costs, if any, will be made in accordance with §109-05D. *Time Related Dispute Compensation*.

A. Character of Work. The term 'significant change' shall be construed to apply only when the character of the work differs materially in kind or nature from that involved or included in the original proposed construction.

B. Major Items. The term 'significant change' shall be construed to apply to Major Items (as defined in §101-02 *Definitions of Terms*) only when the quantity of a Major Item is more than 125%, or is less than 75% of the original contract quantity. Any allowance for a change in the unit price shall apply only to that portion of work in excess of 125% of the original contract item quantity, or to the actual amount of work performed if the quantity decreases below 75% of the original contract item quantity. The Contractor or the State, as the case may be, must make written notice to the other party of the "significant change" in the quantity of a major item if that party wishes to adjust the contract price or time of performance. Knowledge of a "significant change" in quantity could result from receipt of an order on contract (approved or unapproved), a letter directing a change in the

contract work, review of plan details and estimates, review of work completed or progress payment quantities, or a combination of the above. Payment for major items will be limited in accordance with §109-02 *Payment for Altered Quantities*.

C. Minor Items. The term 'significant change' shall be construed to apply to Minor Items (as defined in §101-02 *Definitions of Terms*) only when extra work both (1) increases the quantity of a Minor Item to more than 200% of the original contract quantity and (2) results in an increase of more than \$1,000 from the original contract amount. Any allowance for a change in the unit price shall apply only to that portion of work both in excess of 200% of the original contract item quantity, and in excess of \$1,000 from the original contract amount.

D. Composite Items. Composite items, for the purposes of this subsection, consist of rock and non-rock components, and are limited to unclassified excavation and trench and culvert excavation. The term 'significant change' shall be construed to apply only if the composite item is a Major Item, any individual component of the composite is less than 75% or more than 125% of the quantity stated in the Earthwork Summary Sheet used by the Department in preparing the contract, and the reasonable costs of the composite item either increases or decreases as a result of the change. The adjustment in payment shall be based on variance in quantity of the individual components from the quantity stated in the Earthwork Summary Sheet. For contracts containing Major Items of unclassified excavation and/or trench and culvert excavation, the Contractor shall submit, at the request of the Engineer, its price breakdown of the bid price of the composite item for the rock and non-rock components.

E. Fixed Quantity Items. Certain items of work may be 'fixed quantity' items, and payment will be restricted to the quantity stated in the Estimate of Quantities. The term 'significant change' shall be construed to apply to fixed quantity items only if, during the progress of the work, the quantity of work is found to be less than 75% or more than 125% of the quantity stated in the Estimate of Quantities.

F. Lump Sum Items. Certain items of work may be Lump Sum items, wherein a single bid amount is intended to provide payment for all necessary work during the execution of the contract. The term 'significant change' shall be construed to apply to lump sum items only to the extent that changes in other contract work items result in a significant change in the character of work required to complete "Lump Sum" items of work.

104-05 SUSPENSIONS OF WORK DIRECTED BY THE ENGINEER.

In accordance with 23 CFR 635.109(a)(2):

If the performance of all or any portion of the work is suspended or delayed by the Engineer in writing for an unreasonable period of time (not originally anticipated, not customary, or not inherent to the construction industry) and the Contractor believes that it is due additional compensation and/or contract time is due as a result of such suspension or delay, the Contractor shall submit to the Engineer in writing a request for adjustment within 7 calendar days of receipt of the notice to resume work. The request shall set forth the reasons and support for such adjustment.

Upon receipt, the Engineer will evaluate the Contractor's request. If the Engineer agrees that the cost and/or time required for the performance of the contract has increased as a result of such suspension and the suspension was caused by circumstances beyond the control of and not the fault of the Contractor, its Suppliers or subcontractors at any approved tier, and not caused by weather, the Engineer will make an adjustment (excluding profit) and modify the contract in writing accordingly. The Contractor will be notified of the Engineer's determination whether or not an adjustment to the contract is warranted. No contract adjustment will be allowed under this clause to the extent that performance would have been suspended or delayed by any other cause, or for which an adjustment is provided or excluded under any other term or condition of this contract. No contract adjustment will be allowed unless the Contractor has provided the required written request for adjustment within the time prescribed.

§104

The Department will administer the above Federal regulations as follows:

During the progress of the work, the Engineer may direct the Contractor in writing to suspend work due to circumstances beyond the Contractor's control. If the performance of all or any portion of the work is suspended or delayed by the Engineer for an unreasonable period of time (not originally anticipated, not customary, or not inherent to the construction industry) and the Contractor believes that it is due additional compensation and/or additional time to perform the work as a result of such suspension or delay, the Contractor shall promptly provide the Engineer written notice. The Contractor shall comply with the notice and recordkeeping provisions of §104-06 *Notice and Recordkeeping*.

The Contractor shall provide written notice to the Engineer of a request for adjustment within seven (7) calendar days of receipt of the notice to resume work. The Department will have no liability and no adjustment will be made for any damages which accrued more than seven (7) calendar days prior to the receipt of such a notice by the Engineer.

The Contractor shall keep daily records and make reports of all labor, material and equipment used in connection with such work and the cost thereof as specified in §109-05D. *Time Related Dispute Compensation*.

The Contractor shall then submit a request for contract adjustment and set forth the reasons and support for such adjustment. Upon receipt, the Engineer will evaluate the Contractor's request for contract adjustment, and if it is determined that the cost and/or time required for the performance of the contract has increased as a result of a suspension of work directed by the Engineer and the suspension was caused by circumstances beyond the control of and not the fault of the Contractor, its Subcontractors, Manufacturers, Fabricators or Material Suppliers and not caused by weather, an adjustment, excluding profits, will be made to the contract. The Engineer will notify the Contractor of the determination whether or not an adjustment to the contract is warranted. No contract adjustment will be made to the extent that performance would have been suspended or delayed by any other cause, or for which an adjustment is provided for or excluded under any other term or condition of this contract. No contract adjustment will be allowed unless the Contractor has provided the required written notice, or written notice was provided to the Contractor by the State.

Compensation for increased costs of the work resulting from a Suspension of Work Directed by the Engineer will be made in accordance with §109-05 *Extra Work and Time Related Compensation*. Compensation for time related costs, if any, will be made in accordance with §109-05D. *Time Related Dispute Compensation*.

104-06 NOTICE AND RECORDKEEPING.

The Contractor shall provide the Engineer written notice of its contentions regarding Differing Site Conditions, Significant Changes in the Character of Work, Suspensions of Work Directed by the Engineer, disputed work, time related disputes or any other dispute in accordance with the notice provisions of the pertinent subsection that establishes the notice requirements. After submitting the required notice, the Contractor shall complete its dispute submission in accordance with §105-14 *Disputed Work and Dispute Resolution*.

Failure of the Contractor to provide such written notice in a timely fashion will be grounds for denial of the dispute and the Department does not have to show prejudice to its interest before such denial is made. In the event the Contractor fails to provide the required written notice within the time limit established, and/or in the event the Contractor fails to maintain and submit such specified records, the dispute for compensation shall be deemed waived, notwithstanding the fact that the Department may have actual notice of the facts and circumstances which comprise such dispute and is not prejudiced by said failure.

A. Disputed Work. The Contractor shall provide written notice to the Engineer within ten (10) work days of receipt of a direction to complete work that the Contractor believes is not contract work, or that any direction of the Engineer that the Contractor believes exceeds the requirements of the provisions of the contract.

During the progress of such disputed work, the Contractor shall keep daily records in accordance with §109-05C.1. *Daily Summary* for all labor, material and equipment used for disputed work.

B. Time Related Disputes. If time related damages are presumed to have been incurred and after providing the Department written notice of a dispute for time related damages, the Contractor shall keep daily records of all labor, material, and equipment for effected work incurred due to the delay. Records shall identify each operation affected and the specific locations where work is affected.

If it has been agreed that a delay has or is occurring, beginning the week following the date written notice was provided of a time related dispute, the Contractor shall compile and submit records on a weekly basis for the preceding week. If a delay has not been determined until after it occurs, the Contractor shall compile records on a weekly basis. Costs that are incurred on a monthly or similar basis, such as field office expenses, shall be submitted within one week following the week of receipt.

The Contractor shall prepare and submit to the Engineer, if requested, weekly written reports until complete resolution of the dispute. Such reports shall be available at the next scheduled contract meeting, and provide the following information:

1. Potential effect on the Contractor's schedule caused by the time related dispute;
2. Identification of all operations that have been, are, or may be affected or delayed;
3. Explanation of how the Department's act or omission affected or delayed each operation, and estimation of how much more time is required to complete the work;
4. Itemization of all extra costs being incurred, including:
 - a) An explanation as to how those extra costs relate to the effect or delay and how they are being calculated and measured.
 - b) Identification of all employees for whom costs are being compiled.
 - c) Identification of all items of equipment for which costs are being compiled.

104-07 SITE HOUSEKEEPING.

The contract site shall be cleaned up at the close of each work day, and be left in an orderly condition. Waste and debris shall be removed from the work site and surrounding areas cleaned of debris or waste generated from the work site. Containers shall be provided for the collection and separation of waste, and garbage and other waste shall be disposed of at frequent and regular intervals. Any salvaged material not specified to be disposed of otherwise, shall become the property of the Contractor and shall be removed from the site.

104-08 MAINTAINING TRAFFIC.

The Contractor shall maintain and protect traffic in accordance with the requirements of the MUTCD and the contract documents.

A. Closing of Highway. The legal closing of a highway to public travel in the manner provided by Section 104 of the Highway Law will be done by the Commissioner or by the County Superintendent of Highways when requested by the Department. Not all highways are legally closed during highway construction operations.

When a highway is legally closed and public travel diverted therefrom, adequate warning, danger and direction signs and lights shall be erected and maintained by the Contractor to properly protect and direct public travel by day and by night. Suitable barricades shall also be erected at the ends of such closed sections of highways and large signs displayed indicating such closure. All signs, barricades and other traffic control devices used shall conform to the MUTCD.

B. Use of Restricted Highway. With the award of a contract the Commissioner will, unless otherwise specified, designate the section of highway under contract a "Restricted Highway" pursuant to Section 104A of the Highway Law and Section 1625 of the Vehicle and Traffic Law. Pursuant to these legal sections, the Commissioner has the authority to (1) establish maximum and minimum speed limits at which vehicles may proceed along any such Restricted Highway; (2) establish weight and dimension limits of vehicles; (3) regulate the use of such Restricted Highway by pedestrians, equestrians, and animals; (4) regulate parking, standing, stopping, and backing of vehicles; (5) control persons and equipment engaged in work on such highway. When used on such Restricted Highways, all traffic control devices shall be considered as official traffic control devices and shall conform to the MUTCD.

The Commissioner will therefore cause signs indicating such restrictions to be placed at such points as deemed necessary for the safe use of the Restricted Highway. The traveling public and Contractor must observe and comply with these restrictions, as posted, except that the Contractor may be allowed greater latitude with respect to size and weight of construction equipment.

Construction Equipment or vehicles shall be operated on the Restricted Highway as provided under §105-12 *Load Restrictions*.

104-09 CONTRACTOR'S RETENTION OF RECORDS.

The Contractor shall retain all records for six years following the date of final contract payment. Required records shall include all payrolls, accounts, details that comprise its total cost pursuant to any of the provisions under §104-02 *Changes, Contingencies, Extra Work and Deductions*, records maintained pursuant to §105-14 *Disputed Work and Dispute Resolution* and §109-05 *Extra Work and Time Related Compensation*, papers, maps, photographs, or other documentary materials, regardless of physical form or characteristics, made or received by the Contractor in connection with the contract. Legible copies including microfilm copies, are acceptable, provided they are so arranged, identified, and indexed that any individual document, or component of the records, can be located with reasonable facility.

The Contractor shall make such records available to the Department for review and audit upon request, if deemed necessary by the Department. In case all or a part of such records are not made so available, the Contractor understands and agrees that any items not supported by reason of such unavailability of the records shall be disallowed, or if payment therefore has already been made, the Contractor shall, upon demand in writing by the Commissioner, refund to the Department the amount so disallowed.

104-10 VALUE ENGINEERING CHANGE PROPOSAL (VECP).

A. Purpose and Scope. The purpose of a Value Engineering Change Proposal (VECP) is to encourage the use of the Contractor's ingenuity and experience in arriving at alternative construction designs, methods, and procedures that result in a lower direct cost to accomplish a contract requirement. It is the intent of this provision to share with the Contractor any substantial direct cost savings which may be generated as a result of a VECP offered by the Contractor and approved by the Department. A VECP is a Contractor-initiated change request. If approved, the changes and payments will be authorized through the order-on-contract process. Before a VECP can be implemented, it must pass through three approval processes: conceptual approval, formal approval, and order-on-contract approval. To expedite the review process, the Contractor has the option of jointly submitting the conceptual VECP and the formal VECP for simultaneous review. If the VECP receives formal approval, as part of the order-on-contract process the Contractor may request that the Department consider granting advanced authorization of extra work.

The VECP should produce direct cost savings to the Department and the public without, in the sole judgment of the Department, impairing essential functions and characteristics of the facility including but not limited to service life, economy of operation, ease of maintenance, desired appearance, and safety. The Contractor, when developing a VECP, shall address the designer's objectives, environmental permit requirements and regulations, commitments made to the public to mitigate the impact of construction, and other such concerns.

The 'direct cost savings' is the difference of the 'construction savings' generated by implementing the VECP minus reasonable 'design costs' associated with the VECP. The 'construction savings' is the difference between what it would cost to complete all the contract work without implementing the VECP and the cost to complete all the contract work if the VECP is implemented. This includes any changes to quantities or unit prices across the entire contract if affected by the VECP. If the estimated cost to complete all the contract work without implementing the VECP differs from the contract bid amount for the work, supporting documentation to explain the variance shall be provided. Reimbursable 'design costs' are specific to engineering changes (examples: design changes, plan sheet revisions, and quantity estimating). Expenditures toward proposal preparation (examples: scheduling, documentation, cost analysis, material research, etc.) are not reimbursable.

Indirect cost savings (time, user delay, railroad force account costs, inspection costs, etc.), although considered when reviewing the merits of the VECP, are not reimbursed. A VECP may alter the progress schedule and milestone dates, which in turn could affect time-related contract provisions.

Proposals that reduce the time to complete the contract, and only result in indirect cost savings, may be accepted based on the mutual benefit derived. These proposals will be evaluated in accordance with §104-10F. *Time Savings*.

B. Submittal of Conceptual VECP. A conceptual proposal is required for all VECP. It should outline the general technical concepts associated with the VECP and the estimated direct cost savings which may result. Upon review by the Department, one of the following actions will be taken:

- Conceptual approval, and a request for the Contractor to submit a formal VECP.
- Request for additional information
- Rejection of the VECP

The Contractor shall submit an original and three copies of the conceptual VECP to the Engineer along with any additional information requested by the Department. The conceptual VECP should contain sufficient information for concept review and evaluation, including the following as a minimum:

1. Conceptual VECP Summary. A summary of the VECP identified as 'Conceptual VECP' which includes:

- a. Short title (description) of the VECP (10 or less words).
- b. Contract information (Contract D number, PIN, contract description, contractor, federal aid number if applicable, letting date, Region, and county).
- c. Original total contract bid price.
- d. Estimated contract cost. This may be different from the original total contract bid price due to addition or alteration of work (i.e., the estimated cost to complete the work if the VECP is not implemented). The Engineer must concur with the estimated contract cost.
- e. Estimated contract cost if the VECP is implemented (excludes VECP design cost and any VECP construction savings reimbursement).
- f. Estimated VECP construction savings (Item d. minus Item e.).
- g. Estimated VECP design cost (Not all VECP will have design cost).
- h. Estimated direct cost savings due to the VECP (Item f. minus Item g.).
- i. Fifty percent (50%) of the estimated direct cost savings (This should equal the overall savings to the State).
- j. Estimated total adjusted contract cost if VECP is implemented (includes VECP savings and design cost reimbursements).
- k. The type of VECP (either 'Cost Savings' or 'Time Savings Only').
- l. Date by which the authorization of extra work (order-on-contract) must be granted. (If time sensitive, requests for advance authorization of extra work per §104-02 *Changes, Contingencies, Extra Work and Deductions* will be considered.)
- m. Identification of any new or existing contract pay items requiring agreed prices.
- n. Identification of any materials with long lead times (to order, fabricate, deliver, etc.) that may require purchase authorization from the Engineer prior to formal approval/disapproval of the VECP, or may delay the implementation of the VECP. Identify any date by which authorization to order these materials must be received without affecting the progress schedule.
- o. A basic description of the VECP and associated benefits and impacts (progress schedule, environmental, maintenance & protection of traffic, quality, etc.).

2. Conceptual Plans. Conceptual plan drawings.

3. Design Criteria. If the VECP proposes design changes, supporting technical design criteria shall be provided.

4. Schedules.

- a. The most recently approved baseline progress schedule.
- b. The most recently approved construction progress schedule update.
- c. A draft, proposed, revised progress schedule illustrating the impacts of the VECP. The schedule shall identify: (1) the time required to develop a formal VECP; (2) the time required to

order, fabricate, and deliver materials with long lead times; (3) the time required to obtain any environmental permits or other required approvals; (4) any anticipated progress schedule changes (contract completion date, milestone dates, task durations, etc.); (5) the latest date by which authorization of the VECP order-on-contract work must be granted without affecting the schedule. The draft progress schedule should provide a sufficient level of detail upon which the reasonableness of the VECP can be determined.

Should the Department find that insufficient time is available for review and processing, it may reject the VECP solely on such basis. If the Department fails to respond to the VECP by the date specified, the Contractor will consider the VECP rejected and will have no basis for a dispute against the State as a result thereof. The Department may accept a VECP that requires a contract time extension if sufficient cost savings are anticipated.

5. Estimate of costs. The conceptual VECP estimate of costs should include sufficient information to determine the reasonableness of the VECP. If the proposal requires the ordering of materials, the Contractor needs to provide documentation from the suppliers to justify the cost of the materials.

6. Previous Use or Testing. A description of any previous use or testing of the VECP on another Department contract or elsewhere and the conditions and results therewith. The Contractor shall submit the technical aspects of the VECP in sufficient detail so the Department can determine the suitability of the VECP from an engineering perspective. If the technology is new, test information shall be provided to the Department's satisfaction. If a similar VECP was previously submitted on another Department contract, indicate the date, contract number, and the action taken by the Department.

C. Submittal of Formal VECP. Upon notification by the Engineer that the conceptual VECP is approved and a formal VECP is necessary, the Contractor will submit to the Engineer an original and three copies of the following materials and information for each formal VECP along with any additional information requested by the Department:

1. Formal VECP Summary. A summary of the VECP, identified as 'Formal VECP', which follows the conceptual VECP summary format and information requirements (Information and estimates may have changed since the conceptual VECP).

2. Complete Plans and Specifications. Complete plans and specifications, which meet Department standards, showing the proposed changes relative to the original contract features and requirements. The Department requires a Professional Engineer's stamp and signature on any significant engineering changes.

3. Field Change Sheets. Field change sheets and/or shop drawings. If the VECP results in a field change, and those items affected require the submission of shop drawings, the shop drawings will not be accepted unless accompanied by corresponding field change sheets. Documents shall be developed in compliance with Department requirements. The Department requires a Professional Engineer's stamp and signature on any significant engineering changes.

4. Schedules. The same information requirements as for the conceptual VECP apply, except that a formal, proposed, revised progress schedule in accordance with §108-01 *Progress Schedule* is required.

5. Cost Analysis. A complete cost analysis indicating quantity changes, unit price changes, and new contract pay items. As a minimum it shall include:

- a. An itemized comparison of estimated costs to complete all the contract work with implementing the VECP and without implementing the VECP.
- b. Proposed unit prices for any new contract pay items introduced by the VECP and appropriate documentation for review under the Agreed Price process.

- c. Proposed unit prices for any existing contract pay items for which agreed prices are sought due to a significant change in character of work (quantity or complexity), see §104-04 *Significant Changes in the Character of Work*. Appropriate documentation for review under the Agreed Price process is required.
- d. The cost of any items with long lead times (e.g., materials ordered) required after conceptual approval and before final approval shall be identified.

6. Differences. Full descriptions of the difference between the existing contract requirements and the proposed changes, and the comparative advantages and disadvantages of each, including considerations of service life, economy of operation, ease of maintenance, traffic flow, safety, desired appearance, progress schedule, and any increase/reduction of environmental impacts.

7. Technical Presentation. The Contractor may be required to conduct a technical presentation as part of the review process.

8. Cost Documentation. All formal VECP costs submitted shall be supported by documentation as required by §109-05 *Extra Work and Time Related Compensation*.

The Department will not formally approve any VECP until all required VECP documentation has been submitted and is acceptable to the Department.

A formal VECP may be submitted concurrently with the conceptual VECP, however, the Contractor assumes any costs associated with the formal VECP at its own risk. Reimbursable costs will be considered only if the conceptual VECP is approved. Clearly identify whether a VECP is being submitted for conceptual approval, formal approval, or both.

Once a formal VECP has been approved, the VECP will then be submitted as an order-on-contract and processed accordingly. If time sensitive, requests for advanced authorization of extra work per §104-02 *Changes, Contingencies, Extra Work and Deductions* will be considered, but only after formal VECP approval. The Contractor is responsible for submitting all appropriate information to the Engineer in a timely manner.

D. Conditions. The Contractor shall not base any bid prices on the anticipated approval of a VECP and should recognize that any VECP may be rejected. The following terms and conditions apply to VECP:

1. A VECP will only be considered after the contract is awarded.
2. A VECP applies only to the contract for which it was submitted. One VECP shall not be submitted for multiple contracts. Approval or disapproval of a VECP on one contract does not guarantee approval or disapproval on another contract.
3. The VECP becomes the property of the Department and will contain no restrictions imposed by the Contractor on its use or disclosure. The Department will have the right to use, duplicate, and disclose in whole or in part any data necessary for the utilization of the VECP. The Department retains the right to utilize any accepted or rejected VECP or part thereof on any other project without any obligation to the Contractor.
4. Approval of the conceptual VECP in no way obligates the Department to approve the formal VECP. The Contractor will have no claim against the Department as a result of the rejection of any such conceptual or formal VECP except as otherwise provided in §104-10E.4. *Payment*.
5. When the Department is in the process of making design and specification revisions and a Contractor submits a VECP with similar revisions, the Department will reject the VECP and proceed without any obligation to the Contractor.
6. A VECP will be considered only if reasonable, cost-effective options are not provided in the contract documents.
7. The Department will be the sole judge as to whether a VECP qualifies for consideration and evaluation. It may reject any VECP that requires excessive time or costs for design review, evaluation, and/or investigations. The Department will be the sole judge in determining if the

proposed VECP will result in a sufficient amount of direct or indirect cost savings to offset the Department's effort to review the VECP.

8. A VECP shall be consistent with the Department's design policies and basic design criteria, provide the same service life or more, facilitate economy of operations, ease of maintenance, and achieve the desired appearance and safety.

9. A VECP will not be allowed that changes the type and/or thickness of the pavement structure and material, or solely substitutes one material for another. Examples of materials that may fall into this inappropriate substitution situation are drainage pipes, bridge coatings, pavement markings, etc. The simple elimination of work does not necessarily constitute a VECP, however, a VECP which introduces a simple material substitution, or elimination of work, may be considered if it is accompanied by a design change or change in the construction method. A simple material substitution which introduces a new material to the Department may be also considered.

10. The VECP will not be experimental in nature, but will have been proven to the Department's satisfaction under similar or acceptable conditions on another Department contract or at another location acceptable to the Department.

11. If the Department requires any additional information to evaluate the VECP, this information shall be provided in a timely manner. Unless otherwise mutually agreed upon, failure to do so will result in the rejection of the VECP. An incomplete or a poor quality VECP which hinders the Department's review may also result in the rejection of the VECP.

12. The Contractor shall encourage submissions of VECP from an approved Subcontractor, provided that reimbursement is made by the Department to the Contractor and that the terms of payment to the Subcontractor are satisfactorily negotiated and accepted before the VECP is submitted to the Department. Subcontractors may not submit a VECP except through the Contractor.

13. A VECP approved by the Department is considered to be a revision to the contract documents and progress schedule. Consequently, if unsatisfactory results are being achieved or adjustments are necessary during implementation of a VECP, the rejection of work, removal of work, addition of work, or revision of work shall be evaluated in accordance with the Standard Specifications.

14. All contract pay items and quantities referenced in the VECP construction savings analysis shall be Department-approved contract provisions. Any extra work, inclusion of an omission of work, or other field changes shall be authorized prior to use in VECP savings calculations.

15. No work related to a VECP will be performed under force account. Agreed prices must be reached for any contract pay items related to the VECP before the VECP is approved. If the Contractor is deemed to have taken reasonable diligence in determining the work involved but if during the construction of VECP work a significant change in the character of work occurs, the Department may consider new agreed prices.

16. The Contractor will receive written notification from the Department when the VECP is approved. Material orders placed prior to VECP approval shall be submitted at the Contractor's risk.

17. Once a VECP has been submitted, no work, whether it is the original contract work that might be affected by the VECP or the proposed VECP work, should be performed until the VECP has been formally approved or disapproved. If the Contractor opts to perform work during the approval process, they do so at their own risk. If a VECP is approved and implemented, no payments will be made toward any original contract work affected by the VECP which the Contractor may have performed at risk. If a VECP is disapproved or not implemented, no payments will be made toward any VECP work that the Contractor may have performed at risk. The Contractor should consider potential impacts to the progress schedule and work limitations during the VECP approval process before submitting a VECP.

E. Payment. If the VECP is accepted by the Department, the changes and payments will be authorized through an order-on-contract. Reimbursement to the Contractor will be made as follows:

1. A VECP introduces two individual payments, one for VECP construction savings, and one for VECP design cost. The contract pay item changes along with the VECP construction savings and design cost reimbursements to the Contractor should be submitted in one order-on-contract.
2. The Department will pay to the Contractor fifty percent (50%) of the VECP construction savings. The VECP construction savings is the difference between the actual contract costs with the VECP implemented and a detailed estimate of what it would have cost to complete the contract work without implementing the VECP, based on final construction. If final construction savings differs from the amount estimated in the formal VECP, an adjustment may be made and included in another order-on-contract. The VECP construction savings reimbursement to the Contractor will not be paid until the VECP work has been completed (progress payments on the completed VECP work are allowed). The Department may withhold all or a portion of the payment for the Contractor's share of the VECP construction savings until the final contract accounting. In the event that at final contract accountings the implementation of VECP actually results in no construction savings, then the Contractor will receive no VECP construction savings payment. The Department is the sole judge in deciding the construction savings due to the implementation of the VECP. The Department will withhold VECP construction savings reimbursement until the Contractor supplies all required VECP documents,.
3. If a design cost is submitted for a VECP, the Department will pay to the Contractor a fifty percent (50%) share of the Contractor's reasonable cost for design incurred after conceptual VECP approval. If the design cost submitted for Department approval is deemed unreasonable, only fifty percent (50%) of the design cost deemed to be reasonable will be reimbursed. Not every VECP will have a design cost associated with it. The Department is the sole judge in determining the reasonableness of the design cost. Reimbursable design costs are for engineering changes. Preparation and submission of the proposal (e.g., savings analysis, progress scheduling, etc.) are not considered design costs and are not reimbursable. Reimbursable VECP design may be performed by a consultant or directly by the Contractor. The Contractor shall not be charged for, nor can the Contractor claim, any VECP design performed by the Department.

The design cost shall be submitted as a lump sum item with supporting documentation. The supporting documentation shall include itemized direct salary costs (rates & hours), overhead (only for consultant design), and direct non-salary costs. Payment for direct salary costs and overhead will be limited to the current Department reimbursement policies for Consultant Engineering agreements.

For consultant design, reasonable overhead on the direct technical salaries will be reimbursed. For Contractor design, overhead is not reimbursable for direct salary costs. Overhead shall not be charged for direct non-salary costs whether incurred by the Contractor or by a consultant. Payment for direct non-salary costs will be made at actual cost paid. Although for certain direct non-salary costs (lodging, meals, mileage) there are prevailing maximum rates established by the State Comptroller which the reimbursement rates shall not exceed.

The subtotal of direct salary costs, overhead, and direct non-salary costs shall be considered a 'professional service fee' and reimbursed in accordance with §109-05B.3. *Service Charges*. A maximum five percent (5%) for the Contractor's contract supervision and overhead is allowed, in addition to any overhead submitted for consultant direct salary costs. All design costs are subject to audit. Additional supporting documentation (receipts, time sheets, etc.) shall be supplied in a timely manner if requested by the Department.

In the case of a formal VECP being jointly submitted with the conceptual VECP, the Department will pay to the Contractor a fifty percent (50%) share of the Contractor's reasonable cost for design specific to the development of the formal VECP (nothing toward the conceptual VECP) if the conceptual VECP is approved.

4. In the event of the Department's conceptual approval of a direct cost savings VECP, and the Contractor is directed to proceed with the VECP implementation steps and final approval is not reached, regardless of whether due to the actions of the Department or the Contractor, fifty percent (50%) of the total reasonable design costs will still be reimbursed to the Contractor. If "advance" written approval was given to proceed with the work, procure materials, and begin fabrication; and rejection occurs, the work and fabrication costs will be reimbursed in accordance

with §109-05, *Extra Work and Time Related Compensation*. Only those materials not incorporated and unique to the contract (i.e., not restockable) will be evaluated for payment.

5. There will be no reimbursement for any costs incurred for the conceptual VECP or prior preparations.
6. If more than one VECP is approved for a contract, construction savings and design costs shall be tracked separately for each VECP.
7. When multiple submittals of information for a VECP are required to satisfy the information needs of the conceptual or formal VECP procedure, and contract timing will be negatively impacted before review and subsequent approval can be given by the Department, then the VECP may be rejected. In such cases, there will be no claim by the Contractor for design costs or loss of anticipated savings and/or profits.
8. VECP payments only involve direct savings or costs. Indirect savings or costs (time, user delay, contract delay, etc.) are not included in VECP payment calculations. The calculations of VECP payments are independent from the payments or penalties for contract time related issues. If a VECP revises the progress schedule, the contract milestones upon which time related provisions are based may be affected. Time savings resulting from a VECP may be realized in a time related contract provision. Conversely, if a VECP negatively affects a progress schedule, time related contract provisions may be negatively affected.

F. Time Savings. The Department will consider proposals that result in time savings and at the same time may increase the cost of the contract. The Department will be the sole judge as to whether the benefits of completing the contract, or a phase, before the scheduled completion date or milestone offsets any increase in cost. These submittals, while not constituting a Value Engineering Change Proposal, will be reviewed using the VECP approval process. In addition to information required in §104-10B. *Submittal of Conceptual VECP* and §104-10C. *Submittal of Formal VECP*, the Contractor shall provide the Department the anticipated amount of time to be saved and sufficient information to enable the Department to calculate and evaluate the cost benefit of the savings in user delay. Time savings generated by the VECP may be claimed under an existing time related contract provision. If the time savings VECP increases the cost of the contract, the additional cost shall not be subtracted from any time related contract provision payments.

G. Significant Changes. The description of what will be considered a 'significant change' associated with a VECP are identified in §104-04 *Significant Changes in the Character of Work*. Once a VECP is approved, any future significant change is no longer based on the original contract bid conditions (quantity, nature or kind of a material involved), but rather on the conditions as adjusted by the VECP (adjusted quantities, anticipated site conditions and materials, etc.). Any item that was identified as a Major Item in the original contract documents is still considered a Major Item regardless of the change in quantity or price due to the VECP.

All significant changes shall be agreed upon prior to formal VECP approval. If after formal VECP approval, an unforeseen change in the VECP work causes a significant change in the character of work, quantities and prices may be adjusted and the VECP savings shall be adjusted accordingly.

SECTION 105 - CONTROL OF WORK

105-01 ENGINEER'S AUTHORITY.

The Engineer will make all decisions for the Department regarding the quality and acceptability of materials furnished, work performed, work progress, and contract interpretation. All communications by the Contractor with the Department, written or verbal, shall be in English. All references to costs, charges, prices, etc. shall be in United States dollars.

The Engineer may stop by written order any work or any part of the work under the contract if the methods or conditions are such that 1) unsatisfactory work might result; or 2) if improper material(s) or procedure(s) are being used; or 3) if the Contractor fails to comply with any requirement or provision of the contract documents or with any State or Federal law or regulation; or 4) conditions are considered to be sufficiently deficient as to seriously affect the safety of the public or the workers employed; or 5) non-conformance with the maintenance and protection of traffic provisions is causing serious disruptions to

traffic operations. The Contractor will not be entitled to any additional monetary compensation for such a work stoppage. Any work completed in violation of a written stop order will not be paid for even if subsequently determined to be acceptable.

105-02 CHARACTER OF WORKERS.

The Contractor shall give its constant attention to the work while it is in progress or it shall place it in charge of a competent and reliable English speaking Superintendent, who shall have authority to act for the Contractor and who shall be acceptable to the Engineer.

The Contractor shall, at all times, employ sufficient workers to progress the work to completion in the manner and time specified. All workers shall have sufficient skill and experience to properly perform the work assigned them. All workers engaged on special or skilled work shall have had sufficient experience in such work to properly and satisfactorily perform it and operate the equipment involved. Any person employed by the Contractor whom the Engineer may deem unruly, disorderly, incompetent or unfit to perform the work shall be at once discharged, and shall not be again employed. In case of a disagreement with the Contractor regarding the discharge of such employees, the matter may be reviewed by the Director, Office of Construction ~~Division~~.

Whenever the Contractor or its superintendent is not present on any part of the work where it may be desired to give directions, orders will be given by the Engineer or his/her representative and shall be received and obeyed by the foreperson who may have charge of the particular work in reference to which the orders are given. All forepersons shall speak English.

105-03 METHODS AND EQUIPMENT. Where particular methods or equipment are specifically required, the Contractor may apply in writing to the Regional Director to use alternate methods and equipment to provide the same results. Such alternates may be used only after favorable recommendation by the Regional Director and the written approval of the Deputy Chief Engineer (Construction). When, in the opinion of the Regional Director, satisfactory results are not being obtained using the Contractor's alternate methods and equipment, the methods and/or equipment shall be immediately modified to produce satisfactory results.

The Contractor may use the most efficient equipment that is consistent with conditions at the time of use. It is anticipated that seasonal or weather conditions combined with the nature of the terrain will often require the use of lighter and smaller equipment than might be used under optimum conditions.

Construction operations requiring soil compaction shall not be performed from November 1st thru April 1st except with an approved Winter Earthwork submittal in accordance with §203-3.01 A. *Winter Earthwork Submittal*. In all work incorporated into the final product, the Contractor shall not place material that is frozen, or place fill material on frozen ground regardless of the date.

Comment [c4]:
E109029

~~105-03 METHODS AND EQUIPMENT.~~

~~—Where particular methods or equipment are specifically required, the Contractor may apply in writing to the Regional Director to use alternate methods and equipment to provide the same results. Such alternates may be used only after favorable recommendation by the Regional Director and the written approval of the Director, Office of Construction Division. When, in the opinion of the Regional Director, satisfactory results are not being obtained using the Contractor's alternate methods and equipment, the methods and/or equipment shall be immediately modified to produce satisfactory results.~~

~~—The Contractor may use the most efficient equipment that is consistent with conditions at the time of use. It is anticipated that seasonal or weather conditions combined with the nature of the terrain will often require the use of lighter and smaller equipment than might be used under optimum conditions.~~

~~—Earthwork construction operations requiring compaction shall not be performed from November 1 to April 1 except with the written permission of, and under such special conditions and restriction as may be imposed by the Regional Director.~~

105-04 INTERPRETATION OF CONTRACT DOCUMENTS.

In case of any difference in the interpretation of the plans, special provisions, specifications, special specifications, standard sheets, or between them, the Contractor shall immediately submit the matter to

§105

the Engineer. The Engineer will consult with other Department personnel, as necessary, and provide the Contractor with an interpretation in a timely manner.

The detail plans and specifications for the contract have been prepared with care and are intended to show as clearly as is practicable the work required to be done. The Contractor shall realize, however, that construction details can not always be accurately anticipated and that in executing the work, field conditions may require reasonable modifications in the details of plans and quantities of work involved. Contract work shall be carried out to meet these field conditions to the satisfaction of the Engineer and in accordance with his/her instructions and the contract documents.

In the event the Contractor discovers an error or omission in the contract documents, it shall immediately notify the Engineer. The Engineer will then make such corrections and interpretations as may be deemed necessary for fulfilling the intent of the contract documents.

105-05 REASONABLE CLOSE CONFORMITY WITH CONTRACT DOCUMENTS.

All work performed and all materials furnished shall be in reasonable close conformity with the lines, grades, cross sections, dimensions and materials requirements, including tolerances, shown in the contract documents.

Plan dimensions and contract specification values are to be considered as the target value to be strived for and complied with as the design value from which any deviations are allowed. It is the intent of the specifications that the materials and work quality shall be uniform in character and shall conform as nearly as realistically possible to the prescribed target value or to the middle portion of the tolerance range. The purpose of the tolerance range is to accommodate occasional minor variations from the median zone that are unavoidable for practical reasons. When a maximum or minimum value is specified, the production and processing of the material and the performance of the work shall be so controlled that material or work will not be preponderantly of borderline quality or dimension.

In the event the Engineer finds the materials or the finished product in which the materials are used not within reasonable close conformity with the plans and specifications, but that reasonably acceptable work has been produced, the Engineer shall then make a determination if the work shall be accepted and remain in place. In this event, the Engineer will document the basis of acceptance by contract modification which will provide for an appropriate adjustment in the contract price for such work or materials as he/she deems necessary to conform to his/her determination based on engineering judgment.

In the event the Engineer finds the materials or the finished product in which the materials are used or the work performed are not in reasonable close conformity with the plans and specifications, and have resulted in an inferior or unsatisfactory product, the work or materials shall be removed and replaced or otherwise corrected by and at the expense of the Contractor.

105-06 COOPERATION WITH UTILITIES AND OTHER CONTRACTORS.

The Contractor shall cooperate with Utilities and other contractors and coordinate and arrange the sequence of its work to conform with the operations of the work of other parties indicated in the Base Line Data. Delays and interferences to the Contractor's performance caused by activities of other Department contractors, which delays and/or interferences could not reasonably have been anticipated from the contract documents, may entitle the Contractor to an appropriate extension of time and/or time related damages.

The Contractor is responsible for cooperation and adjustments with the contractors already engaged and to be engaged upon the site to properly coordinate the construction efforts of all contractors, utilities, and subcontractors engaged in the work within and adjacent to the contract site. In the event that utility facility adjustments are to be made by a Utility's forces in connection with and during the life of the contract, the Contractor shall cooperate with the Utilities and coordinate and arrange the sequence of its work to conform with the progressive operations of the Utility's work underway or to be put underway.

In case of interference between the operations of the Utilities and contractors, the Department will adjust as necessary the schedule of each contractor and the sequence of work necessary to expedite the completion of the entire project. If it becomes necessary, coordination and access problems will be resolved by the Department.

If any part of the Contractor's work depends on the work of any other contractor and/or the Department for proper execution and/or results, that would render its work unsuitable for proper

execution and/or results, the Contractor shall promptly notify the Department of any discrepancies and/or defects in said other work prior to proceeding with its own work.

105-07 TERMINATION.

The provisions of Article 11 *Right to Suspend Work and Cancel Contract* of the contract agreement shall apply.

The Commissioner may, by written notice, terminate the contract or any portion thereof after determining that for reasons beyond either Department or Contractor control it is not feasible to proceed with or complete the work originally contracted for, and that termination would therefore be in the public interest. Such reasons for termination may include, but need not be necessarily limited to, executive orders of the President relating the prosecution of war or national defense, national emergency which creates a serious shortage of materials, orders from duly constituted authorities relating to energy conservation, and restraining orders or injunctions obtained by third-party citizen action resulting from national or local laws or regulations, or where the issuance of such order or injunction is primarily caused by acts or omissions of persons or agencies other than the Contractor, or where the orderly progression of a project is interfered with or delayed by acts or omissions of persons or agencies other than the Contractor. The Contractor specifically understands that the issuance of such notice by the Commissioner shall be conclusive as to its necessity.

When the contract, or any portion thereof is terminated, for any of the above mentioned reasons, before completion of all items of work in the contract, payment will be made for the actual numbers of units or items of work completed at the contract unit price, or as mutually agreed for items of work partially completed, but no claim for loss of anticipated profits on uncompleted work shall be made by the Contractor nor shall the State of New York be liable for the loss of anticipated profits for such uncompleted work.

In such cases of termination, reimbursement for organization of the work (when not otherwise included in the contract) and moving equipment to and from the contract site will be considered where the volume of work completed is too small to compensate the Contractor for these expenses under the contract unit prices, the intent being that an equitable settlement will be made with the Contractor.

Acceptable materials, obtained by the Contractor for the work, that have been inspected, tested and accepted by the Engineer, and that are not incorporated in the work, shall be returned to the Manufacturer, Fabricator, or Material Supplier whenever it is possible to do so at nominal or no cost. Where the Contractor returns such materials to its Manufacturer, Fabricator, or Material Supplier, the State will pay the Contractor the actual documented costs connected with returning such materials to the extent such costs are reasonable as determined by the Department. In the event the Contractor is unable to return such material at reasonable or no cost, and provides documentation satisfactory to the Department that such material can not be economically returned, the State will be responsible for all such material and will either direct the manner of disposition or purchase such material from the Contractor at actual cost as shown by receipted bills and actual cost records to the extent such costs are reasonable as determined by the Department, at such points of delivery as may be designated by the Engineer.

Termination of a contract or a portion thereof shall not relieve the Contractor of its responsibilities for the completed work, nor shall it relieve its surety of its obligation for and concerning any just claims arising out of the work performed.

105-08 REMOVAL OF UNACCEPTABLE AND UNAUTHORIZED WORK.

All work which does not conform to the requirements of the contract shall be considered unacceptable unless otherwise determined acceptable under the provisions in §105-05, *Reasonable Close Conformity with Contract Documents*.

The Department may direct the Contractor to remove any portion of the work performed under this contract for inspection or for any other purpose. If such inspection shows that the work was constructed in accordance with the terms of the contract, payment shall be made to the Contractor for such removal and subsequent replacement at a fair and reasonable price for the work performed. No payment will be made for such removal or for replacement of the work to satisfactory condition if such inspection shows that the work was not constructed in accordance with the contract requirements. No payment will be made for the removal or replacement of any work which may itself be satisfactory, but the removal of which is necessary for the replacement of unsatisfactory work. No payment shall be made in such removal and

§105

replacement situations if work was done or materials furnished without inspection by an authorized Department representative.

The above paragraph shall not apply to concrete foundation for pavement or portland cement concrete pavement rejected as a result of core tests. Work so rejected shall be removed and replaced at no additional cost to the State.

All work shall be in satisfactory condition at the time of contract acceptance. Any work done or materials used without inspection by an authorized Department representative may be ordered removed and replaced at the Contractor's expense.

Unacceptable work, whether caused by poor work, defective materials, damage through carelessness or any other cause found to exist prior to the final acceptance of the work, shall be removed immediately and replaced in an acceptable manner irrespective of the presence of, or lack of, a Department Inspector or representative. This clause shall have full effect regardless of the fact that the defective work may have been done or the defective materials used with the full knowledge of the Inspector. The fact that the Inspector or Engineer may have previously overlooked such defective work shall not constitute an acceptance of any part of it.

105-09 WORK AFFECTING RAILROADS.

Requirements and procedures for operations on or adjacent to railway facilities are found in a Special Note entitled "Special Provisions for Protection of Railway Interests".

A. Railroad Clearances. No temporary bridge, falsework, staging or obstructions shall be erected over the track or tracks where the vertical underclearance is less than 22 feet over top of rail until the existing bridge warnings have been relocated or new or temporary bridge warnings are installed by the railroad company or companies affected and are in service.

An operated track, catenary or electrical facility is fouled when any object is brought closer than the clearances set forth by the railroad company. Vehicles or construction equipment shall be considered to be fouling the track when located in such a position that failure of same with or without load brings the equipment within the fouling limit. The Contractor shall conduct its work and handle its equipment such that no part of any material or equipment shall foul an operated track, catenary, electrical facility, or signal facility without written permission of the chief engineer of the railroad company or companies affected.

Information on required railroad clearances may be found in the contract documents in a Special Note entitled "Special Provisions for Protection of Railway Interests". If fouling distances are provided by Special Note, the Contractor need not contact the railroad to verify fouling distances. If information on required railroad clearances is not provided in the contract documents, the Contractor shall contact the railroad facility owner prior to operation of any equipment or vehicles within 20 feet of the centerline of a track; within 15 feet of a catenary, electrical wire or other electrical facility; or within 15 feet of a signal wire or other signal facility to establish the fouling limits for that facility.

B. Supervision and Railroad Approval. All work on any contract affecting a railroad company's property, right of way facilities, including temporary track detour, shall be carried out under the joint supervision of the Department and the railroad company or companies in a manner satisfactory to both agencies.

Information on required railroad notice and approvals may be found in the contract documents in a Special Note entitled "Special Provisions for Protection of Railway Interests". If notice and approval provisions are provided by Special Note, the Contractor shall provide the railroad written notice as required therein. If notice and approval provisions are not provided in the contract documents, the Contractor shall provide written notice to the railroad facility owner a minimum of 21 work days, or other shorter time required by the railroad, prior to start of work.

The Contractor shall obtain prior approval from the railroad company to use a railroad service road to access a site, and shall be responsible for any associated permit application and fees. The Contractor shall obtain the written approval of the chief engineer of the railroad company or companies affected in respect to the details and methods to be employed in constructing any structures, track detours, falsework, removal of structures, allowable track clearances, and any or all other details that may in any manner affect the operation or maintenance of any or all railroad

facilities. The requirement that written approval shall be obtained from the chief engineer of the railroad company shall be complied with before the Contractor starts work. The Contractor shall include in its unit prices bid for this work all the costs of these requirements including any expense occasioned by delay or interruption of its work by reason of the operation or maintenance of the railroad facilities. Approval by the chief engineer of the railroad company or companies affected does not absolve the Contractor from any liability resulting from its contractual operations.

C. Coordination of Work. The Contractor shall coordinate with the railroad company or railroad companies in carrying out railroad force account work. When the work of the Contractor or Subcontractor dovetails with the railroad force account work, the materials shall be delivered and the operations conducted so as to carry on the work continuously in an efficient and skillful order. Delays or oversight on the part of the Contractor or Subcontractors in getting any or all of their work done in the proper manner, thereby requiring removal and replacement of work already in place will not be the basis for a claim for extra compensation. Such work shall be done at the cost and expense of the responsible Contractor or Subcontractor.

D. Railroad Employees. When, in the opinion of the chief engineer of the railroad company or companies the Contractor's normal operations in progressing its contract are such that an operated track is or might be fouled or railroad traffic endangered, the railroad company or companies will employ protective labor, when found necessary for railroad operations. Unless an item for railroad protection is included in the contract, payment for the services described above shall be made to the railroad company directly by the State pursuant to the terms of a State-Railroad agreement negotiated for the contract. When an item for railroad protection is included in the contract, the Contractor shall pay for such services.

All services for protective labor and similar protective service occasioned by the operation of the Contractor, except as noted in the preceding paragraph shall be at the sole expense of the Contractor and the Contractor shall include all such costs in its unit bid prices for such protection.

The Contractor shall, at its own expense, carry compensation and other insurance for protective labor furnished by the railroad company or companies.

It is agreed that the furnishing of any protective labor shall not relieve the Contractor from any liability of payment for any damage caused by its operations.

E. Protection of Railroad Service and Facilities. The Contractor shall take special care and vigilance to avoid damage to the trains, tracks or other facilities of the railroad company and shall conduct its work so as not to interfere with the movement of trains or other operations of the railroad company. Whenever work may affect the safety or movement of trains, the method of doing the work shall be submitted to the chief engineer of the railroad company affected for approval. No work affecting safety or movement of trains shall be commenced or prosecuted until written approval of the chief engineer of the railroad company is received. The approval of the chief engineer of the railroad will not release the Contractor from any responsibility for any damages to the railroad company caused by the acts of the Contractor or its employees and Subcontractors. If, during the carrying out of the contract work, the trains, tracks or other facilities of the railroad company are endangered, the Contractor shall immediately do such work as directed by the Engineer to restore safe conditions and, upon failure of the Contractor to carry out such orders immediately, the railroad company may, with the approval of the Engineer, take whatever steps are necessary to restore safe conditions. The cost and expense to the railroad company of restoring safe conditions or of any damage to the railroad company's trains, tracks or other facilities caused by the Contractor's operations shall, when approved by the Engineer, be considered a charge against the Contractor and shall be paid for by it, or upon its failure or refusal to pay such charge within a reasonable time after the railroad company submits the bill to it, the amount thereof may be deducted from any monies due or that may become due to it under its contract, and any such sum so deducted may be paid to the railroad company after an audit by the State of the items of such cost and expense.

In performing construction operations both on and off railroad right of way areas, the Contractor shall prevent the fouling of railroad track ballast with earth, mud, silt, or other foreign matter. To

prevent fouling of the ballast, it may be necessary for the Contractor to construct temporary erosion control measures or sheeting or provide other precautionary measures that are required.

Where, in the opinion of the railroad company, demolition work, concreting or hauling along or across tracks will result in ballast becoming fouled, the Contractor shall take preventive measures to protect the entire ballast section by nailing canvas, plywood or similar material to the ties in the entire area to be affected. The protective material shall remain in place until there is no further possibility of fouling the ballast and then shall be removed by the Contractor.

The work required to protect the railroad track ballast shall be performed by and at the expense of the Contractor and under the supervision of and to the satisfaction of the chief engineer of the railroad company or its authorized representative. The railroad company will assume no responsibility for the adequacy of the work.

In the event that the railroad track ballast does become fouled after the aforementioned protective measures are taken, the railroad company, with its own forces, shall remove and replace the fouled ballast with clean ballast. The charges for this work will be billed by the railroad company against the Contractor.

F. Lifting. All lifting operations shall be conducted in accordance with §107-05(P), *Lifting*. In addition, equipment used for the erection or removal of structures over railroad facilities shall have a minimum lifting capacity of one hundred-fifty percent (150%) of the lift weight (operational capacity limited to sixty-six and two-thirds (66 2/3 %) of the tipping load).

G. Use of Explosives. Blasting shall be conducted in such a manner as not to endanger facilities or operation of the railroad. The Contractor shall furnish, while blasting, at its own cost and expense, watch persons and other protection necessary to protect the public and railroad. The Contractor's attention is directed to §107-05, *Safety and Health Requirements*, with regard to blasting.

H. Foundations. Foundations may be extended or lowered if deemed necessary by the DCES and the chief engineer of the railroad company or companies affected only if such change is ordered by the DCES .

I. Telephone, Telegraph Telecommunications and Signals. The cost of all changes in telecommunication and signal facilities necessary to complete the contract work will be paid for by the State. The cost of all changes in telecommunication and signal facilities made for the convenience of the Contractor shall be paid for by the Contractor .

J. Contractor's Private Grade Crossing. If the Contractor elects, and the railroad company or companies approve, to have installed for its own use, a private grade crossing at the site of the work, it shall make a formal request to the railroad company or companies for such a crossing. After it has entered into an agreement with the railroad company or companies pertaining to the size and type of crossing, the payment of the cost for installing, and removing the crossing, the obtaining of the necessary insurance for the protection of the railroad company or companies, and the agreement as to the required protection to railroad traffic when the crossing is in use, the railroad company or companies will install and remove the temporary crossing at the sole expense of the Contractor.

K. Sidetrack Facilities. When sidetrack facilities are required by the Contractor, it shall at its sole cost and expense, make the necessary arrangements for the use of existing sidings, tracks not in service or the construction of new sidings. The Contractor shall restore any and all existing sidings and tracks used for sidetrack facilities to the condition existing prior to use by the Contractor. The construction location and use of all sidetrack facilities are to be subject to the approval of the chief engineer of the railroad company affected.

The railroad company may move the Contractor's cars, placed on existing sidings, at any time, to permit the placing of cars for said railroad company's business.

When any turnouts from the main tracks are approved by the railroad company such turnouts will be furnished, installed and removed by the railroad company at the expense of the Contractor. Any

signal work and derails necessary for sidetrack facilities will be furnished, installed and removed by the railroad company at the Contractor's expense.

L. Railroad Use of Completed Work. The railroad company affected may, prior to the completion of the work to be performed under contract and the acceptance thereof, enter upon and use any portion of said work without any compensation whatever to the Contractor for such use, and without any compensation or payment whatever to the Contractor for any delay in the work caused by such use. The taking possession and use shall not be deemed an acceptance of the work so taken and used or any part thereof.

M. Work Trains and Railroad Equipment. If the Contractor elects to use work trains or any railroad equipment which operates on the tracks of the railroad company, the operation of such trains and equipment is subject to any requirements determined by the chief engineer of the railroad company or companies affected. The cost of the services of any railroad employees required by the railroad company to operate such trains or equipment shall be paid by the Contractor, including the cost of necessary flaggers.

N. Operation of Railroad. The Contractor shall make every possible effort to reduce to a minimum the length of time that railroad company will have to operate over any track detour, and to this end it shall continue full operation throughout the winter months, if directed by the DCES on any and all works necessary to permit the railroad company to restore its tracks in their permanent location as quickly as possible. The Contractor shall conduct its work so that schedule speed can be maintained by the railroad at all times.

105-10 SURVEY AND STAKEOUT.

Prior to the start of construction work, all right of way markers, property line markers and survey control markers located in or adjacent to areas which may be disturbed during construction shall be properly protected and tied to fixed reference points or located from established contract control. Upon completion of the work, all right of way or property line markers or survey markers that have been disturbed by the Contractor, shall be reset under the direction of a Land Surveyor. Field location notes shall be recorded and made available to the Engineer upon request at no additional cost to the State.

All survey control and boundary location work shall be performed in accordance with the Department's *Land Surveying Standards and Procedures Manual* under the direction of a Land Surveyor.

All survey work performed for quality control by the Contractor and for quality assurance by the Department should both utilize: (1) similar levels of measurement precision and methods to perform positional measurements, (2) the same control network from which measurements are made, and (3) the same survey measurement procedures to ensure consistency of results.

Terrain features are measured and positioned by various methods relative to the contract control network established for each contract. The precision with which an instrument or equipment positions a point is related to the quality of the method by which measurements are made, and the ability to duplicate the same measurement. The local accuracy of a located point is the closeness of the measured or computed value to a standard or accepted value (actual spatial position on the earth). Positional tolerance is the allowable spatial difference between making measurements by two different methods or by the same method at separate times, all of which have the same level of precision.

Horizontal coordinates and vertical elevations of existing features provided as part of the contract are located in the field based on accuracies achievable for each positional point relative to the contract control. Positional accuracies are directly related to the strength of the contract control network, the methods used to make the measurements, the precision of the instruments used to measure to the feature, and how definable the feature is which is being located. Point feature locations represent a single position (for example: property line marker, sign post, utility pole, or fire hydrant) and can be re-identified or verified in the field to within a small variation (high confidence level) from where they were initially positioned. Linear feature locations define the alignment of that feature. That alignment can be verified to within a specific tolerance depending on the spacing or frequency at which the points were originally measured to define that alignment. Straight or uniformly curved linear features (for example: curbline, edge of roadway, or edge of sidewalk) which can be easily defined in the field should have a relatively

small positional variation from their designed location when compared to a verified field location. Irregular shaped or not as clearly defined linear features (for example: break lines, ditchlines, treelines, or environmental area perimeters) which are sometimes difficult to define or delineate precisely in the field, could have a larger variation from where they were initially positioned when compared to a field-verified location.

Digital terrain model (DTM) surfaces, when provided by the Department, are made up of a combination of point and linear features. The precision of a data collection instrument does not necessarily indicate what positional tolerance should be expected of any feature verified from an existing DTM. The location or elevation of a feature selected from a DTM surface can, at best, be determined by interpolating the horizontal position or elevation between previously located points. The verification of any specific elevation on the DTM surface is directly related to: (1) the spacing of collected data or breaklines used to produce that surface; (2) the uniformity of the surface being measured; (3) the steepness of the slope of that surface; and (4) how obscured the surface is from the measuring technique used to originally locate the surface. Standardized procedures for determining the spacing/frequency of point and linear features (including break lines), are critical to providing consistent results. Department standardized procedures for determining feature locations are described in both the “Land Surveying Standards and Procedures Manual”, and the “Specifications for Photogrammetric Stereocompilation”.

Verification of the positional tolerance of the DTM surface elevation requires a comparison of the original collected point data with recollected point data measured at the same horizontal locations. Field comparisons to interpolated DTM surfaces or recreated surface information (from other information sources) shall not be used for verification of the positional tolerance of a feature. Comparisons of re-measured point data can only be made with the original collected point data, not to interpolated positions. Measurements for verification of DTM point data shall also be made from the same contract control network, and by instruments capable of an equal or greater precision.

The precision of a data collection instrument does not necessarily indicate what positional tolerance should be expected of any feature verified from an existing DTM. The location or elevation of a feature selected from a DTM surface can, at best, be determined by interpolating the horizontal position or elevation between previously positioned points. The verification of any specific elevation on the DTM surface is directly related to: (1) the spacing of collected data used to produce that surface; (2) the uniformity of the surface being measured; (3) the steepness of the slope of that surface; and (4) how obscured the surface is from the measuring technique used to originally locate the surface. Standardized procedures for determining the spacing/frequency of point and linear features (including break lines), are critical to providing consistent results. Department standardized procedures for determining feature locations are described in both the "Land Surveying Standards and Procedures Manual," and the "Specifications for Photogrammetric Stereocompilation."~~

~~— Any true verification of the positional tolerance of the DTM surface elevation shall require a comparison of the original collected point data with recollected point data which are measured at the same horizontal locations. Field comparisons to interpolated DTM surfaces or recreated surface information (from paper drawings) shall not be used for verification of the positional tolerance of a feature. Comparisons of remeasured point data can only be made with the original collected point data, not to interpolated positions. Measurements for verification of DTM point data shall also be made from the same contract control network, and by instruments capable of an equal or greater precision.~~

105-11 INSPECTION.

Department Inspectors are authorized to inspect all work done and materials furnished, including all or any part of the work and the preparation, fabrication or manufacture of the materials to be used. Department Inspectors may be Department employees, or agents acting for the Department. Department Inspectors are not authorized to either alter or waive the provisions of these specifications or the contract, or to issue instructions contrary to the plans and specifications, without written approval of the Engineer, or act as a foreperson for the Contractor. Department Inspectors have the authority to reject unacceptable work or materials.

The Department inspections and tests are for the sole benefit of the Department and do not (1) relieve the Contractor of the responsibility for providing adequate quality control measures; (2) relieve the Contractor of responsibility for damage to or loss of the material before acceptance; (3) constitute or imply acceptance; or (4) affect the continuing rights of the Department after acceptance of the completed work under Article 9 *Final Acceptance of Work* of the contract agreement.

The Engineer and the Inspector shall be allowed full work access and shall be furnished with necessary information and assistance by the Contractor to make a complete and detailed inspection. The Contractor shall carry out the provisions of the contract at all times, regardless of whether an authorized inspector is present or not. Any work or item that is, at any time, found to be out of specification or not in compliance with the plans shall remain the responsibility of the Contractor and shall be subject to such corrective measures that are approved in writing by the Engineer.

The Contractor shall transmit a copy of any audit or inspection report conducted by SSPC, OSHA, or EPA of the contract site to the Engineer within seven days of receiving such a report. If the Contractor has been disciplined by SSPC or placed on warning, probation, suspended or revoked status from the Painting Contractor Certification Program (PCCP) during the past 24 months, the Contractor shall provide a written explanation of the cause for such action, the corrective measures enacted, and the Contractor's current PCCP status.

105-12 LOAD RESTRICTIONS.

Construction equipment or vehicles delivering materials or traveling to a site from outside the contract limits shall have all required permits issued through the established Department vehicle permit

§105

system in accordance with Section 385 of the Vehicle and Traffic Law (or 23 USC, Section 127 for Federal Aid Projects on the Interstate System). The permit will indicate the limits within which such equipment with over-legal gross weights or axle loadings may operate, the frequency of such passages and all other limiting factors.

Construction equipment or vehicles operating within the contract limits having gross weights or axle loadings within the legal limits Section 385 of the Vehicle and Traffic Law (or 23 USC, Section 127 for Federal Aid Projects on the Interstate System) may operate without specific approval.

Prior to the use of construction equipment or vehicles with over-legal gross weights or axle loadings on any structure, on any new pavement or on any resurfaced pavement within the contract limits, the Contractor shall submit a written request to the Engineer. This request shall be accompanied, upon request, by an appropriate analysis performed by a Professional Engineer, including the pertinent equipment data, and shall demonstrate that the operations will not result in detrimental effects on the highway or structure.

Use of over-weight construction equipment or vehicles within the contract limits other than listed above shall be subject to the approval of the Engineer. If it is determined that the use of construction equipment or vehicles is having a detrimental effect or will result in detrimental effects on the finished work, the Engineer will so notify the Contractor to modify or cease the operations.

105-13 MAINTENANCE AND PROTECTION OF TRAFFIC FOR MOBILE OPERATIONS.

For contracts that involve mobile operations, but do not include separate contract pay items for the maintenance and protection of traffic, a maintenance and protection of traffic sequence shall be provided by the Contractor in accordance with the MUTCD. When last following vehicle and/or trailing vehicles are required by these provisions, they shall meet the requirements of Section 619 for Shadow Vehicles. No separate payment will be made for this work, the cost shall be included in prices bid for the various contract items.

105-14 DISPUTED WORK AND DISPUTE RESOLUTION.

It is the goal of the Department to resolve disputes that may arise under the contract in a timely, just and fair manner consistent with the terms of the contract. The dispute resolution process may be undertaken at any time from the contract award to the issuance of the final payment by the Office of the State Comptroller. The dispute resolution process recognizes and will take into consideration the risks and controls inherent in construction which the Contractor or the Department have agreed to assume pursuant to the terms of the contract.

The term "dispute" shall mean a disagreement between the Contractor and the Department concerning a matter of contract performance or contract compensation. Dispute resolution may involve adjustments in compensation, adjustment of contract pay items, the addition of new contract pay items to the contract, and/or extension of time for performance. The Contractor shall continue the work during the pendency of the dispute.

Disputes of any nature shall be made in strict accordance with the contract provisions, including the notice and recordkeeping provisions of §104-06 *Notice and Recordkeeping*, which are a condition precedent to any recovery. If the Contractor fails to strictly comply with either the notice or the recordkeeping provisions, any claim of the Contractor with respect thereto shall be deemed waived, and the Department does not have to show prejudice to its interest before such denial is made. Timely notice and recordkeeping affords the Department the opportunity to initiate measures, including but not limited to modification of specifications or deletion of portions of the work, in order to mitigate damages to all parties and/or to agree to terms and conditions for timely payment for any eligible additional costs. The Contractor is encouraged, when initiating a dispute, to provide information concerning measures that may be taken to mitigate the damages. The Department reserves the option whether to consider contract adjustment for work which is substantially completed prior to the issuance of written notice.

A. Disputed Work. If the Contractor is of the opinion that any work directed by the Engineer to be completed as contract work is extra work and not contract work, or that any order of the Engineer exceeds the requirements of the provisions of the contract, the Contractor shall provide the Department written notice and maintain records in accordance with §104-06, *Notice and*

Recordkeeping. After submitting the required notice, the Contractor shall complete its dispute submission as soon as such information is ascertainable by the Contractor.

1. Determined to Be Contract Work. If the Department determines that the disputed work is contract work and not extra work, or that the direction given to the Contractor and protested was proper, the Department will direct the Contractor to continue the disputed work and the Contractor shall promptly comply. The Contractor's right to further pursue a dispute for extra compensation or damages will not be affected in any way by the Contractor complying with the directions of the Department to proceed with the work, provided the Contractor continues to keep and furnish the Engineer with required records.

2. Determined to Be Extra Work. If the Department, determines that the disputed work is extra work and not contract work, or that a direction given to the Contractor and protested was not proper, then a contract adjustment will be made. Compensation will be made for such work in accordance with §109-05 *Extra Work and Time Related Compensation*. The Contractor shall continue to maintain force account records until receipt of the order-on-contract approved by the Office of the State Comptroller. Documented, additional, actual and reasonable costs incurred by the Contractor pursuant to following a written order to perform work (that was subsequently contained in an order-on-contract which was disapproved) will be considered reimbursable. Eligibility for additional compensation shall cease upon notification of the disapproval of an order-on-contract.

B. Time Related Disputes. The term "time related dispute" shall mean any dispute arising from any event which affects the scheduled time of performance. This paragraph is intended to cover all such events which include major deductions or increases to quantities of work, suspension of work and cancellation of contract, and termination, as well as actions, forces or factors, such as "delay," "disruption," or "interference."

If the Contractor believes that it is or will be entitled to additional compensation for time related disputes, whether due to delay, extra work, disputed work, breach of contract, or other causes, the Contractor shall comply with the notice and recordkeeping provisions of §104-06 *Notice and Recordkeeping*. The Department will have no liability and no adjustment will be made for any damages which accrued more than ten (10) work days prior to the filing of written notice with the Engineer. The primary tool used to evaluate the time of performance is the Contractor's progress schedule. Department approval of a schedule or a revised schedule does not entitle the Contractor to a time extension or any time related damages. Compensation will be made for such work in accordance with §109-05D. *Time Related Dispute Compensation*.

C. Acceleration Disputes. The Contractor may not dispute costs associated with acceleration of the work unless the Department has given prior express written direction to the Contractor to accelerate its effort. The Contractor shall always have the basic obligation to complete the work in the time frames set forth in the contract. Lack of express written direction on the part of the Department shall never be construed as approval.

If the Contractor does accelerate its work efforts pursuant to written direction from the Department, compensation will be made in accordance with §109-05D. *Time Related Dispute Compensation*. The Department, in determining whether or not any compensation is warranted, will evaluate the facts and circumstances which led to the acceleration to determine whether they were in the Contractor's control.

D. Review Time Periods for Disputes. After providing written notice, the Contractor shall, as soon as the information is available or ascertainable, provide the Engineer with summary of its dispute contentions in accordance with §105-14E. *Required Content of Dispute Submission*, with sufficient detail so that the Engineer may make a determination. The Engineer will make an initial response, in writing, within 15 work days after the Contractor provides the dispute submission.

If a dispute is not resolved by the Engineer to the satisfaction of the Contractor, within 10 work days of receipt of the Engineer's written decision or the Engineer fails to reply within 15 work days,

the Contractor shall notify the Regional Director, in writing, with a copy to the Engineer, of its contentions relative to the dispute.

If the dispute is not resolved by the Regional Director to the satisfaction of the Contractor, within 10 work days of receipt of the Regional Director's written decision, the Contractor shall notify the Commissioner, in writing, with copies to the Engineer and the Regional Director, of its contentions relative to the dispute, indicating the substance of previous communication on the issue with the Engineer and the Regional Director and its rebuttal of their previous findings. If the Regional Director, or his/her designee, fails to reply within 30 calendar days, the Contractor may take the dispute to the Commissioner.

1. Disputes to the Commissioner Up to \$50,000. For all disputes to the Commissioner of \$50,000 or less, the Department will respond in writing within 45 calendar days of receipt of the dispute. If any additional documentation supporting the dispute, or relating to the subject matter of the dispute is required, the Department may request said documentation in writing within 30 calendar days of receipt of the dispute. The Contractor will provide such information within 30 calendar days of the request unless another time period is agreed to. The Department's written response to the additionally documented dispute will be submitted to the Contractor within 15 calendar days after receipt of said additional documentation or within a period of time no greater than that taken by the Contractor in producing said additional documentation, whichever is greater. If the Contractor disputes the Department's written response, or the Department fails to respond within the time prescribed, the Contractor may so notify the Department in writing within 15 calendar days of receipt of the Department's response, or within 15 calendar days of the Department's failure to respond. Upon the Contractor's request, the Department shall schedule a meeting or conference. By agreement between the Department and the Contractor, such time periods may be modified.

2. Disputes to the Commissioner Over \$50,000 to \$250,000. For all disputes to the Commissioner over \$50,000 and less than or equal to \$250,000, the Department will respond in writing within 60 calendar days of receipt of the dispute. If any additional documentation supporting the dispute, or relating to the subject matter of the dispute is required, the Department may request said documentation in writing within 30 calendar days of receipt of the dispute. The Contractor shall provide such information within 30 calendar days of the request unless another time period is agreed to. The Department's written response to the additionally documented dispute will be submitted to the Contractor within 30 calendar days after receipt of said additional documentation, or within a period of time no greater than that taken by the Contractor in producing said additional documentation, whichever is greater. If the Contractor disputes the Department's written response, or the Department fails to respond within the time prescribed, the Contractor may so notify the Department in writing within 15 calendar days of receipt of the Department's response, or within 15 calendar days of the Department's failure to respond. Upon the Contractor's request, the Department will schedule a meeting or conference and notify the Contractor within 30 calendar days of the scheduled date. By agreement between the Department and the Contractor, such time periods may be modified.

3. Disputes to the Commissioner Over \$250,000 or of Undetermined Value. For disputes to the Commissioner over \$250,000 or that have an undetermined value, the Department will respond in writing within 90 calendar days of receipt of the dispute. If any additional documentation supporting the dispute, or relating to the subject matter of the dispute, is required, the Department may request said documentation in writing within 30 calendar days of receipt of the dispute. The Contractor shall provide such information within 30 calendar days unless another time period is agreed to. The Department's written response to the additionally documented dispute will be submitted to the Contractor within 60 calendar days after receipt of the said additional documentation, or within a period of time no greater than that taken by the Contractor in producing said additional documentation, whichever is greater. If the Contractor disputes the Department's written response, or the Department fails to respond within the time prescribed, the Contractor may so notify the Department in writing within 30 calendar days after the receipt of

the Department's response, or within 30 calendar days of the Department's failure to respond. Upon the Contractor's request, the Department will schedule a meeting or conference and notify the Contractor within 30 calendar days of the scheduled date. By agreement between the Department and the Contractor, such times periods may be modified.

E. Required Content of Dispute Submission. All disputes shall be submitted in writing to the Engineer, and shall be in sufficient detail to enable the Engineer to ascertain the basis and the amount of each dispute. If requested and as a minimum, the following information shall be provided when such information is ascertainable by the Contractor:

1. General.

- a. The date on which actions resulting in the dispute occurred or conditions resulting in the dispute became evident.
- b. A copy of the notice of dispute for the specific dispute by the Contractor.
- c. To the extent known, the name, function, and activity of each Department official, or employee or agent, involved in, or knowledgeable about facts that gave rise to such dispute.
- d. The name, function, and activity of each Contractor or Subcontractor official, or employee, involved in, or knowledgeable about facts that gave rise to such dispute.
- e. The identification of any pertinent documents, and the substance of any material communication relating to such dispute.
- f. A statement as to whether the additional compensation or extension of time if requested is based on the provisions of the contract or is an alleged breach of contract.
- g. If an extension of time is also requested, the specific days for which it is sought and the basis for such request as determined by an analysis of the construction progress schedule.

2. Time Related Dispute Submissions.

- a. A description of the operations that were delayed, the reasons for the delay, how they were delayed, including the report of all scheduling experts or other consultants, if any.
- b. The documented process of establishing, maintaining and updating the progress schedule, showing when the delay occurred and how it affected the schedule, in accordance with §108-01 *Progress Schedule* or a CPM specification, if applicable.
- c. The amount of additional compensation sought in accordance with §109-05D. *Time Related Dispute Compensation.*

3. Acceleration Dispute and Disputed Work Submissions.

- a. A detailed factual statement of the dispute providing all necessary dates, locations and items of work affected by the dispute.
- b. The specific provisions of the contract which support the dispute and a statement of the reasons why such provisions support the dispute.
- c. The amount of additional compensation sought and a breakdown of that amount shall conform to the requirements of §109-05B. *Force Account Work* except for acceleration disputes which shall conform to the requirements and categories specified in §109-05D. *Time Related Dispute Compensation.*

F. Required Certification of Disputes Over \$50,000. When submitting any dispute over \$50,000, the Contractor shall certify in writing, under oath and in accordance with the formalities required by the contract, as to the following:

1. That supporting data is accurate and complete to the Contractor's best knowledge and belief;
2. That the amount of the dispute and the dispute itself accurately reflects what the Contractor in good faith believes to be the Department's liability;
3. The certification shall be executed by:
 - a. The Contractor, if the Contractor is an individual.
 - b. A senior company official in charge at the Contractor's plant or location involved or an officer or general partner of the Contractor having overall responsibility for the conduct of the Contractor's affairs, if the Contractor is not an individual.

G. Auditing of Records. A Contractor who has filed a dispute, or Subcontractor, Manufacturer, Fabricator or Material Supplier on whose behalf a dispute has been filed, shall have the following records available for audit at any time following the filing of such dispute, and shall cooperate with the auditors, whether or not such dispute is part of a suit pending in the courts of this State. The audit may be performed by employees of the Department or by an independent auditor appointed by the Department, and may begin on ten (10) work days notice to the Contractor, Subcontractor, Manufacturer, Fabricator or Material Supplier as is appropriate. The Contractor, Subcontractor, Manufacturer, Fabricator or Material Supplier shall cooperate with the auditors. The Department will maintain the audit, its backup, reports, schedules and conclusions as confidential material. Failure to maintain and retain sufficient records shall constitute a waiver of that portion of such dispute that cannot be verified and shall bar recovery thereunder. In the event the Contractor fails to substantially furnish the required reports and accounting records, such failure shall constitute a waiver of the dispute for payment other than for payment at contract unit prices for the work performed. Without limiting the generality of the foregoing, the auditors shall have available to them and the Contractor agrees to provide access to the following documents:

1. All documents related to the preparation of the Contractor's bid including the final calculations on which the bid was based.
2. All documents which relate to each and every dispute together with all documents which support the amount of damages as to each dispute.
3. Daily time sheets, superintendent diaries or log sheets and foreperson's daily reports.
4. Union agreements and reports, if any.
5. Insurance policies, welfare and benefits records or plans for union and non-union personnel.
6. Payroll register, Individual employee earnings records and Payroll tax returns.
7. Material invoices, purchase orders, and all material and supply acquisition contracts.
8. Material cost distribution work sheet.
9. Equipment records (list of company equipment, rates, depreciation schedules, daily equipment reports or logs, fueling logs or records, equipment lease purchase agreements, and equipment purchase invoices).
10. Depreciation records on all company equipment whether such records are maintained by the company involved, its accountant, or others.
11. If a source other than depreciation records is used to develop costs for the Contractor's internal purposes in establishing the actual cost of owning and operating equipment, all such other source documents.
12. Vendor rental agreements, subcontractor invoices, agreements and back charge records.
13. Subcontractor payment certificates.
14. Canceled checks (payroll and vendors).
15. Job cost ledger or report and Job payroll ledger
16. General ledger, general journal (if used), and all subsidiary ledgers and journals together with all supporting documentation pertinent to entries made in these ledgers and journals.
17. Cash receipts, cash disbursements journal, purchase journal, petty cash journal and supporting vouchers.
18. Audited and unaudited financial statements for all years during operations on this contract.
19. Documents which reflect the Contractor's actual overhead during the years contract work was performed.
20. Work sheets used to prepare the dispute establishing the cost components for items of the dispute including, but not limited to, labor, benefits and insurance, materials, equipment, subcontractors, and all documents which establish the time periods, individuals involved, the hours and the rates for the individuals.

H. Contract Closeout Process. A dispute, or a portion thereof, that has been previously submitted to the Department which remains unresolved to the satisfaction of the Contractor, may be submitted for Department review in connection with the closeout process. The records made, and recommendations or actions of a facilitator, a Dispute Review Board, or any other dispute resolution

method, shall be off the record, non-binding, confidential, and may not be used in any future litigation.

1. Contract Closeout Meeting. If requested by the Contractor, the Department will schedule a contract closeout meeting with the Office of Construction ~~Division~~ in Albany. The contract closeout meeting process involves meeting(s) with the Contractor and its representatives and Department personnel to amicably resolve all remaining disputes of the Contract. In lieu of pursuing the closeout meeting process, the Contractor may elect to utilize the Gatekeeper process.

2. Gatekeeper. The Chief Engineer of the Department of Transportation is the Gatekeeper. The Contractor may submit a single request per contract to the Department to have the Gatekeeper identify an alternate dispute resolution process to be used for unresolved dispute(s) in the contract closeout process. The Contractor shall provide to the Gatekeeper a brief description of the contract work and identify the Contractor's preferred method of dispute resolution. The Contractor shall document to the Gatekeeper that (a) the unresolved dispute involves unique, unusual or complex construction, engineering or legal issues; (b) the unresolved dispute has a monetary value in excess of \$50,000 and (c) the Contractor has demonstrated a clear commitment to active participation in partnering during the conduct of this contract.

Upon conclusion of the review, the Gatekeeper will advise the Contractor how it should proceed with processing such dispute(s) in an attempt to resolve the matter. The Gatekeeper will advise the Contractor to proceed to one of the following: (1) a contract closeout meeting with the Office of Construction ~~Division~~, (2) a facilitated contract closeout meeting with the Office of Construction ~~Division~~ or to (3) a Dispute Review Board (DRB). The decision of the Gatekeeper shall be final and shall not be subject to review under Article 78 of the New York Civil Practice Law and Rules. The expenses of the facilitator, a DRB, or any other method shall be equally shared by the Department and the Contractor.

a. Facilitated Closeout Meeting. A facilitator may be used to assist in resolving disputes arising out of the performance of the contract. The facilitator shall consist of one person, agreed to by the Department and the Contractor, who is knowledgeable in public works construction matters and who shall try to bring the parties to a mutually agreeable resolution of the disputes.

b. Dispute Review Board. A Dispute Review Board (DRB) may be established to assist in resolving disputes arising out of the performance of the contract. The DRB shall consist of one or three persons, agreed to by the Department and the Contractor, who are knowledgeable in public works construction matters. For a one person DRB, the person must be mutually acceptable to the Department and the Contractor. For a DRB of three persons, one will be selected by the Department, one will be selected by the Contractor and one will be mutually selected by the Department and the Contractor. The DRB will make a recommendation as to the resolution of the disputes.

3. Claims. If any dispute, or portion thereof, remains unresolved following the meeting(s) or conference(s) and the payment of the final agreement, the Contractor may file a claim in the New York State Court of Claims in accordance with law and the provisions of the Contract.

105-15 FURNISHING RIGHT OF WAY.

The Department will secure all rights-of-way in advance of construction. Any exception will be indicated prior to the award of the contract. The Contractor shall not enter upon any parcel until the proper rights of entry have been obtained.

The Contractor's attention is directed to the fact that Permanent Easements (P.E.), Temporary Easements (T.E.) and Temporary Occupancies (T.O.) are obtained by the Department for specific construction purposes. Contractors should not anticipate unlimited usage of such areas and shall confine construction activities to such purposes as are specifically described in the ROW appropriation maps and/or as shown on the plans unless separate agreements are made between the Contractor and the

§105

landowner permitting other usage of such areas. Such limitations and related costs shall be reflected in the bid prices.

105-16 SHOP DRAWING APPROVAL.

Approval by the Department of shop drawings, methods of installation or Contractor's construction detail(s) does not relieve the Contractor of the responsibility for compliance with the contract specifications, or relieve the Contractor of the responsibility for providing adequate quality control measures and does not relieve the Contractor of the responsibility for providing proper and sufficient materials, equipment and labor to complete the approved work in accordance with the contract documents.

Unless otherwise stated in the contract documents, no portion of the work requiring shop drawings or a sample of the work shall be commenced until the submission has been approved by the Department. Should, for any reason, the contract not be awarded, the Contractor will not be entitled to reimbursement for work performed prior to the contract award. Subsequent to award, the Contractor will not be entitled to reimbursement for changes made to the contract documents unless changes occur after approval of the submission.

Unless otherwise stated in the contract documents, review of shop drawings, erection plans and demolition plans will begin only after the submission of a complete set of information required to complete a discrete item of work. The review process will allow two work days per drawing submitted or a minimum of 10 days, unless stated otherwise in the contract documents. Unless otherwise stated in the contract documents, including the Steel Construction Manual or the Prestressed Concrete Construction Manual, a drawing shall be defined as a sheet of similar size and scale as the plan sheets prepared and offered for sale to potential bidders, or sheet provided on a different size media and using a proportional scale. Submission of materials directly to a reviewing unit shall be done only with the prior approval of the Engineer. Complete copies of all submissions shall be provided to the Engineer.

105-17 CONTRACT RECORDS.

The Engineer will keep contract records in accordance with the Manual for Uniform Record Keeping (MURK). Changes that are made in subsequent revisions of the Manual will be incorporated in the contract procedures and records unless authorized to the contrary in writing by the Director, Office of Construction ~~Division~~. The Contractor is invited to review the contract records with the Engineer if desired. The Contractor may request occasional or incidental copies of contract records in support of on-going construction activities, subject to the availability of staff to fulfill the Contractor's request. If the Contractor desires significant or large numbers of copies of records, the Contractor shall file a Freedom of Information Law (FOIL) request with the Regional Director. In several instances, (such as Force Account work, application for approval of Subcontractors, etc.) the Contractor shall furnish such data and information on forms as established in MURK and furnished by the Department.

105-18 MANUFACTURER WARRANTIES AND GUARANTEES.

The Contractor shall provide to the Department or the authority having jurisdiction of the facility any manufacturer's warranties and guarantees normally given as customary trade practice. For contracts involving the furnishing and/or installing of electrical and mechanical equipment, the Contractor shall guarantee the satisfactory in-service operation of mechanical and electrical equipment and related components for a period of 6 months following contract acceptance, at no cost to the State for either parts or labor. This requirement does not apply to mechanical and electrical equipment furnished by the State.

105-19 CONTRACTOR WARRANTIES.

The Department may make available, subject to express agreement in writing between the Department and the Contractor, with approval from the FHWA when required, warranties associated with the contract for limited circumstances. A prototype warranty specification is available from the Department for the purpose of the Contractor's providing a warranty for a particular item, as opposed to providing a warranty for an entire contract. The product warranty will be developed between the Department and the Contractor with input from appropriate technical experts and the ~~Office of~~ Legal Affairs ~~Division~~ in conjunction with the Office of Construction ~~Division~~, and incorporated into the contract via order-on-contract. The warranty may be used in situations including, but not limited to, work

performed not in full compliance with the contract documents, where initial testing does not indicate any deficiency in the end product.

105-20 OPENING HIGHWAY TO TRAFFIC PRIOR TO ACCEPTANCE.

When directed, in writing by the Regional Director, the Contractor shall open to traffic any portion of new pavement and/or structures before final acceptance of the contract. Traffic on these portions of highway so opened to travel by the Regional Director, shall be maintained and protected in accordance with all the provisions of the Maintenance and Protection of Traffic items in the contract.

Should the Contractor be dilatory in completing certain features of the work on the portion of the highway directed to be opened, the Regional Director may order all or a portion of the said highway open to traffic; and in this event the Contractor shall not be relieved of its liability and responsibility during the period the work is so opened prior to final acceptance.

These provisions apply not only to the reconstruction of existing highways, but also to work on new locations where traffic is not maintained during construction.

105-21 CIVIL RIGHTS MONITORING AND REPORTING.

The Contractor shall use the current version of Department approved civil rights reporting software on all contracts. The Contractor shall submit complete, accurate, electronic data to the Department for each month, not later than the 15th of the following month, using the Department approved civil rights reporting software. Data shall be current through the end of the last full payroll week for that month, or as otherwise approved by the Engineer to coordinate with contract payment submittals.

A. Civil Rights Officer(s). The Contractor shall designate a Corporate Civil Rights Officer, a Corporate DBE Representative, and a contract site Equal Employment Opportunity (EEO) Representative who shall have the responsibility to and shall be capable of effectively administering and promoting an active contractor program of equal employment opportunity and who shall be assigned adequate authority and responsibility to do so. A single individual may fulfill multiple roles. The Contractor shall notify the Department within 30 calendar days of any changes in these roles.

B. Workforce Participation Plan. At the pre-construction meeting, the Contractor shall submit a *Workforce Participation Plan* covering the Contractor's workforce and the workforce of all its Subcontractors, together and coordinated with the contract progress schedule, that addresses the Equal Employment Opportunity goals.

The Contractor shall not start work until the Department and the Contractor have agreed upon has accepted the *Workforce Participation Plan*. The Contractor shall submit a revised plan when a significant work force build-up or reduction will substantially affect goal attainment, or when a revised schedule is requested by the Department. Such revised *Workforce Participation Plan* must be agreed upon by the Department or the original will remain in effect.

C. Equal Employment Opportunity (EEO) Monitoring and Reporting. The Contractor's compliance with the EEO Requirements will be based on its Employment Utilization, affirmative action steps and its good faith efforts to meet the goals.

The Department, in evaluating the Contractor's good faith efforts to meet the EEO goal(s), will first analyze the Contractor's goal attainment on an individual contract. If the Contractor is not meeting the goal(s) for a single trade or contract, the Department will analyze, progressively, the Contractor's goal attainment on all contracts held by the Contractor within the county, the Region, and/or the State. This method of analysis shall be applied primarily but not solely to contracts with small population numbers. Other factors to be considered include, but are not limited to; the location of the contracts, the relative proximity of the contracts to each other, and the nature of the work.

1. Employee Utilization Data. The Contractor shall submit employee utilization data for its workforce and for each Subcontractor with a subcontract exceeding \$10,000 to the Department on a monthly basis showing hours worked for each payroll week, for each trade and classification, by gender and ethnicity. Employee utilization data shall include data from the start of the contract up to and including the month being reported. For the purpose of determining utilization

percentages, the hours of female and minority employment shall be tabulated separately and attainment percentages calculated separately.

2. Federal-Aid Highway Construction Contractors Annual EEO Report. The Contractor shall submit all required data to produce an annual Form FHWA 1391 Federal-Aid Highway Construction Contractors Annual EEO Report to the Department not later than the second Friday in August covering the last payroll period worked in July, for all ongoing Federal-Aid contracts. The data shall indicate the number of minority men, minority women, non-minority men, and non-minority women employees currently engaged in each trade.

3. Monthly Training Progress Report. When training is required under §102-11 *Equal Employment Opportunity Requirements* and/or Training Special Provisions, the Contractor shall submit a monthly training progress report to the Engineer.

4. Contractor Compliance. If the Contractor fails to meet the EEO goal(s) for minorities or women, the Department may require training of minorities and women to satisfy the employment goals. If the Contractor fails to meet the EEO goal(s) or is in noncompliance with the nondiscrimination clauses, the Department may suspend additional contract payments in accordance with Article 8 *No Payment on Contractor's Non-Compliance* of the contract agreement, the Contractor may be directed to attend a hearing before the Contract Review Unit, or the Department may follow any other lawful procedure upon due notice in writing to the Contractor, including cancellation, termination, or suspension in whole or in part in accordance with Article 11 *Right to Suspend Work and Cancel Contract* of the contract agreement.

The Contractor may also be referred to the U.S. Department of Labor, Office of Federal Contract Compliance Programs (OFCCP), which has the sole authority to determine compliance with Executive Order 11246 and its implementing regulations. OFCCP may declare the Contractor ineligible for further Federal-Aid contracts in accordance with procedures authorized in Executive Order 11246, and such other sanctions may be imposed and remedies invoked as provided in Executive Order 11246, or by rule, regulation, or order of the U.S. Secretary of Labor, or as otherwise provided by law.

D. D/M/WBE Monitoring and Reporting. The Engineer will monitor the work to ensure that the identified D/M/WBEs perform the work as identified in the Contractor's commitments. Attainments will be measured based on payments made to D/M/WBEs. Attainments based on work completed by D/M/WBEs that are no longer certified will not be counted after the D/M/WBE is no longer certified.

1. Report of Payments to Subcontractors and D/M/WBEs. The Contractor shall report payments made to all Subcontractors and all D/M/WBEs, in order to measure goal attainment and to gauge the effect of D/M/WBE goal(s) on the industry. The Contractor shall submit payment data for all Subcontractors and for all D/M/WBEs approved by the Department that are due a payment or have received a payment within the last month. The Subcontractor or D/M/WBE shall acknowledge payment not later than 15 calendar days after receipt.

2. Revisions to D/M/WBE Utilization. The Contractor shall obtain Department approval for significant revisions in D/M/WBE utilization prior to implementing any proposed change through submission of a revised *D/M/WBE Utilization Worksheet* using the Department approved civil rights reporting software.

The following modifications will be considered a significant revision in D/M/WBE utilization:

1. Adding, removing or substituting a D/M/WBE.
2. Adding new item(s) of work to a D/M/WBE within a core (3 digit) contract pay item number (i.e. 606 – Guide Railing) not currently approved.
3. Significantly reducing the dollar value of or eliminating the D/M/WBE's item(s) of work. Significant reduction will be determined by comparison to the total D/M/WBE contract goal.

In the cases of reduction, removal or substitution, the Contractor shall provide written justification with a substantive basis for the change. A Contractor's ability to negotiate a more advantageous contract with another Subcontractor will not be considered a valid basis for change.

If the reduction of the D/M/WBE's work or the removal of the D/M/WBE, including for reasons of commercially useful function violations, causes the D/M/WBE utilization to fall below the goal(s), the Contractor shall make good faith efforts to find another D/M/WBE to substitute for the original D/M/WBE to perform at least the same amount of work as the D/M/WBE that was terminated, to the extent needed to meet the contract goal(s).

A D/M/WBE may be substituted if its intended work is deleted or reduced by the Department and enough work remains to substitute an equal amount to the affected D/M/WBE. If not enough work remains, the Department may relieve the Contractor from attaining that portion of the goal(s).

The following modifications will not be considered a significant revision in D/M/WBE utilization:

1. Increasing the dollar value of an item(s) of work or adding new item(s) of work within the same core (3 digit) contract pay item number (i.e. 606 – Guide Railing) to a D/M/WBE.
2. Substituting similar dollar values of work within a currently approved core (3 digit) contract pay item number (i.e. 606 – Guide Railing).

3. Contractor Compliance. If the Contractor fails to meet the D/M/WBE utilization goal(s), to exert a good faith effort, or otherwise fails to comply with the D/M/WBE requirements, the Department may take further actions, as follows:

a. DBE Program. The Department may suspend contract payments in accordance with Article 8 *No Payment on Contractor's Non-Compliance* of the contract agreement, the Contractor may be directed to attend a hearing before the Contract Review Unit, or the Department may follow any other lawful procedure upon due notice in writing to the Contractor, including cancellation, termination, or suspension in whole or in part in accordance with Article 11 *Right to Suspend Work and Cancel Contract* of the contract agreement. The Contractor may also be referred to the USDOT for possible suspension or debarment as provided in 49 CFR 29 and such other sanctions as may be imposed and remedies invoked as provided under the authority of 49 CFR 26, or by rule, regulation, or order of the Commissioner or as otherwise provided by law.

b. M/WBE Program. The Department may suspend contract payments in accordance with Article 8 *No Payment on Contractor's Non-Compliance* of the contract agreement, the Contractor may be directed to attend a hearing before the Contract Review Unit, or the Department may follow any other lawful procedure upon due notice in writing to the Contractor, including cancellation, termination, or suspension in whole or in part in accordance with Article 11 *Right to Suspend Work and Cancel Contract* of the contract agreement. The Department may file a complaint with the NYS Department of Economic Development, Division of Minority and Women's Business Development pursuant to Executive Law Article 15A, or other sanctions may also be imposed and remedies invoked as provided under the authority of Executive Law Article 15A, 5 NYCRR 140 et seq., or by rule, regulation, or order of the Commissioner or as otherwise provided by law.

E. Compliance Reviews. A compliance review consists of a thorough review of all civil rights contract requirements, including non-discrimination in Labor/Employment, EEO, Training, and DBE requirements. The Department conducts annual compliance reviews of selected federal-aid contracts. A Contractor will typically not be selected for more than two compliance reviews per year statewide. Based on contract monitoring and/or the results of compliance review(s), the Department may conduct a review of some or all ongoing contracts with a single Contractor, regardless of funding source.

SECTION 106 - CONTROL OF MATERIAL

106-01 SOURCES OF SUPPLY.

Within seven (7) days of contract award, the Contractor shall notify the Deputy Chief Engineer (Structures) of the name and address of the fabricator of all Prestressed Concrete Units (Structural), Structural Steel, Bridge Bearings, Armored Bridge Joint Systems, Bridge and Culvert Railings and Overhead Sign Structures. This notification shall list the actual shop or shops in which the materials will be manufactured and/or fabricated. It shall be the responsibility of the Contractor to notify the Engineer of the proposed sources of materials sufficiently in advance of their use so that proper tests may be made.

At the preconstruction meeting, the Contractor shall furnish in writing to the Engineer the sources of supply, types and contract pay item(s) of materials which it proposes to use in the work in order to ensure that the materials are obtained from approved sources or that required inspection or approval will be completed in a timely manner. No change shall be made in the types of materials or sources of supply without written approval by the Engineer.

106-02 QUALITY REQUIREMENTS.

All materials used in the work shall meet the quality requirements described in Section 700 *Materials and Manufacturing*, unless the requirements are altered by a contract pay specification or by notes shown in the contract documents. Materials shall be inspected, sampled, and tested by the Department, or its designated representative, as described in Section 700 *Materials and Manufacturing*, as indicated by notes in the contract documents, or by procedural directives issued by the Department.

The Contractor shall provide to the Engineer a Material Safety Data Sheet (MSDS) for materials to be used in the work, before each material is first used in accordance with 29 CFR 1926 Subpart D. This applies to materials brought to the contract site to be incorporated into the work, as well as materials that are used at the contract site.

Test specimens shall be removed from sampled items in the presence of the Department representative, prepared for testing, and shipped to the Department as directed by the Department. The cost of all samples; shipment of samples; and any other expenses incurred in making materials or products ready for inspection, sampling and/or testing; shall be included in the unit prices bid for the various items in the contract. Where testing methods are not described in the specifications, details of test methods may be obtained by application to the Department.

The cost of all required inspection, sampling and testing performed in the 48 contiguous states of the United States and the provinces of Canada shall be paid for by the Department unless specifically excluded elsewhere in the contract documents or procedural directives.

The instructions for the use of all materials and products, as well as all identifying information required by the specifications (i.e., labels, tags, certifications, etc.) shall be in the English language. The U.S. Standard Screen Sieves meeting ASTM E11, shall be used on all materials requiring gradation tests.

Mechanical property measurements, dimensions, and all other numerical data included in documents such as shop drawings and computations prepared specifically for the contract, Material Details, and Manufacturer's Safety Data Sheets shall be presented in U.S. customary units, but they may also include International System (SI) of units, consisting of meters, kilograms, and seconds, as a second set of measurements. Shop drawings prepared for bridge rehabilitations, however, shall include both SI Units and U.S. Customary Units. Submissions in dual units shall be completely dimensioned in both systems. The U.S. Customary Units will take precedence and reviews will be based on these units. U.S. Customary Units should be the units listed first, and the SI Units should be included within parenthesis. Failure to adhere to this convention may result in the rejection of the drawing.

Documents which are relevant to the production and acceptance of hot mix asphalt (HMA) and portland cement concrete (PCC) mixtures shall be submitted in US Customary Units only. This refers to mix design forms, production monitoring (QC) forms, batching tickets, delivery tickets, and all other mix design and production related documents.

Unless otherwise directed by the Department, no materials shall be used until the Engineer has received written notification of acceptance of that material and such material shall be used only so long as the quality remains equal to that of the accepted sample. This initial acceptance of a material will in no way preclude further examination and testing of a material at any time the Engineer suspects that the material is no longer properly represented by the accepted sample. The acceptance at any time of any materials will not bar its future rejection if it is subsequently found to be defective in quality or uniformity.

Unless otherwise designated, when a reference is made in these specifications to a specification or test designation either of the AASHTO, ASTM, Federal Specifications, or any other recognized non-proprietary national organization, it shall mean the specification or test method (including Provisional AASHTO and Tentative ASTM) which is current on the date of advertisement for bids.

106-03 PLANT INSPECTED MATERIALS.

The manufacture, production and/or fabrication of some materials and products may require acceptance of the plant, including, but not limited to: mill, plant, shop or other location; on a recurring basis prior to the production and inspection of materials produced.

Materials inspected at manufacturing or fabrication plants shall be marked with the contract number and the contract pay item number prior to shipment to the contract site. Any material which has been plant inspected and accepted by this Department for any Department contract, shall not be shipped to other work unless authorized by the Department.

Where plant inspection is not maintained, the method and procedure for sampling, inspecting and reporting shall be in accordance with the procedural directives of the Department, issued by the Materials Bureau.

A. Covered Locations. The Department maintains plant inspection capabilities throughout the contiguous 48 states of the United States and the provinces of Canada. The Contractor shall notify the Department 60 calendar days in advance of beginning of the work in any mill, plant, shop or other manufacturing location that is not currently accepted, to allow time for a qualification inspection and arrangements for inspection, sampling and/or testing during the work.

B. Non Covered Locations. When inspection, sampling, and/or testing of materials and products manufactured, produced and/or fabricated in a non covered location, and deemed by the Department to require inspection, sampling and/or testing at the site of manufacture, production and/or fabrication, the plant, and manufacturer and/or fabricator shall be qualified by the Department prior to the required inspection, sampling and/or testing. The Contractor shall notify the Department 60 calendar days in advance of beginning of the work in any mill, plant, shop or other manufacturing location to allow time for a qualification inspection and arrangements for inspection, sampling and/or testing during the work.

The expense of all required inspection, sampling, testing and qualification of plants and manufacturers or fabricators in non-covered locations shall be paid for by the Contractor. These expenses shall include the costs of wages and benefits, travel, meals, lodging, communication and all other direct costs of inspection, sampling and testing paid by the Department to perform these services using Department employees or designated representatives under contract to the Department. Reimbursement to the Department shall be made in the form of a deduction from payments due the Contractor. The costs of tests performed in a Department Laboratory will not be charged to the Contractor.

The location of inspection, sampling and/or testing materials and products will, at the option of the Department, be performed at the site of manufacture, production and/or fabrication or at a covered location designated by the Contractor and approved by the Department.

C. Stock Lot Testing. When the Department determines that conformance with the contract requirements of plant inspected materials from non-covered locations may be determined by visual inspection and/or testing, specimens may be presented at a covered location in specifically defined lot quantities as directed by the Department. Such materials or products shall be offered for inspection not less than 30 days prior to their intended shipment to the contract. All expenses attendant to making such materials or products available for inspection, sampling and/or testing shall be paid by the Contractor.

D. Sample Shipment. The shipment of samples to the Department Laboratory from locations outside of the 48 contiguous states of the United States and the provinces of Canada shall be a direct cost borne by the Contractor or its agent and all such shipments shall be made under provisions established by the Department to ensure identity and security of the sample.

106-04 MATERIAL CERTIFICATION AND APPROVED LIST.

Whenever any specification provides for “Manufacturer’s Certification” or “Approved List” as a Basis of Acceptance, the Department reserves the right to sample and/or test material in any shipment prior to incorporation in the work.

Manufacturers’ Certifications and documents prepared for general use, such as catalog cuts and manufacturer’s directions, may use US Customary or S.I. measurement units, or units from both systems. In drawings and documents containing dual units, the US Customary units will be the primary units, and the US Customary units will be the units reviewed. The Contractor shall be responsible for all annotations on the source documents, conversions between the measurement systems and all errors resulting therefrom.

Some standard specifications reference a Manufacturer’s Certification as evidence of acceptability of specific materials or products. A Manufacturer’s Certification can only be properly executed by the manufacturer or producer of the material or product. When manufactured products are subsequently provided by a Material Supplier other than the manufacturer, a Material Supplier’s Certification shall be provided in addition to the Manufacturer’s Certification.

A. Material Certification. When shipments are made directly to a contract by the manufacturer or producer a Manufacturer’s Certification shall include the essential components outlined below. When shipments are made to a contract by a Material Supplier, a Material Supplier’s Certification shall accompany the Manufacturer’s Certification and shall include the essential components outlined below.

1. Identification of Manufacturer or Producer. Name of the company and address of its manufacturing or producing facility.

2. Identification of Material or Product. Generic name of the material or product and the Department Section 700 materials designation number.

3. Identification of Shipment. Sufficient detail to describe the quantity contained in the shipment, the contract number and a date of shipment. A Material Supplier’s Certification shall clearly indicate that the shipment is all or a portion of the quantity detailed on the accompanying Manufacturer’s Certification.

4. Statement of Conformance. The certification shall definitively state that the material contained in the shipment meets the requirements of a specific Department specification or a specific specification or standard of another agency (i.e., ASTM, AASHTO, AWWA, etc.). If the material in the shipment contains steel and/or iron, the certification shall definitively state that the material is or is not of domestic origin. An acceptable statement is: “Conforms (or Does not conform) to the requirements of NYSDOT Standard Specification §106-11, *Buy America*.”

If the product supplied has been altered subsequent to the certification by the manufacturer, the Material Supplier’s Certification shall definitively state that the material or product contained in the shipment meets the requirements of a specific Department specification or a specific specification or standard of another agency.

5. Certification Execution. The certification shall be signed by a person authorized to legally bind the company, as indicated by statement or title/position. Notarization of the signature is not required.

B. Improper Certification. If the Material Certification does not properly identify conformance to the specification, the product shall be rejected. If the Manufacturer and/or Material Supplier requests to leave the product in place and provide a revised certification only, the revised certification shall be accompanied by a letter of explanation indicating the basis for use of the revised certification. The letter shall also include corrective action to ensure future certifications will be representative of

the material or product supplied. The letter shall be signed by a person authorized to legally bind the company, as indicated by statement or title/position.

106-05 RECYCLED MATERIALS.

The Contractor is encouraged to provide reused or recycled materials to the maximum extent possible. Recycled materials currently approved by the Department include glass, recycled asphalt pavement (RAP), recycled portland cement concrete aggregate (RCA), blast furnace slag, fly ash, microsilica, waste stream plastics and tires.

In order to be considered for use by the Department, recycled or waste material must exhibit the desired engineering characteristics, consistently satisfy specification requirements, provide an acceptable level of performance, be economically competitive with available materials, and not be harmful to the environment. If waste materials are proposed to be used, the Contractor may need to obtain a beneficial use determination (BUD) from the NYS Department of Environmental Conservation prior to its use as specified in 6 NYCRR 360-1.15. The beneficial use determination, testing, evaluation and approval of unapproved waste materials can be a very long term process over multiple years, and should not be expected to be completed for any given contract.

106-06 STORAGE AND HANDLING OF MATERIALS.

Materials shall be so stored as to ensure the preservation of their quality and fitness for the work. Stored materials, even though accepted before storage, shall be inspected prior to their use in the work and shall meet the contract requirements at the time of their use. Railroad cars, barges and other containers used for the transportation of materials shall be clean when any materials are deposited therein.

106-07 BASIS FOR MEASUREMENT.

Weight shall be used in all cases for percentage determination unless otherwise specified.

106-08 REJECTED MATERIALS.

Any material which is rejected because of failure to meet the required tests or that has been damaged so as to cause rejection, shall be immediately removed from the site of the work by the Contractor at no additional cost to the State unless otherwise directed by the Engineer. Material which has been rejected on the results of Department tests will not be resampled or retested unless otherwise directed by the Department. No rejected materials, the defects of which have been subsequently corrected, shall be used until written notification of the acceptance of the material has been received by the Engineer.

106-09 EQUIVALENTS.

The requirements for apparatus, articles, or materials shall be specified, if feasible, in generic terms which afford competition for equivalent products or items. When no generic specification can be found or devised, a minimum of at least three, if available, known acceptable trade names or proprietary products shall be provided for the Contractor's benefit and to afford the desired competition. The Department will determine whether a product proposed by a Contractor meets the requirements of the specifications.

106-10 INDEPENDENT ASSURANCE SAMPLING AND TESTING.

Independent Assurance Sampling and Testing (IAST) is a Federally mandated program that assures that when acceptance testing is performed on Department contracts, proper procedures are followed and all equipment used is in proper working order and calibration. IAST is separate and independent from acceptance testing. Testing performed for IAST will in no way affect any acceptance or payment decision. The results of IAST testing will be used to determine the qualifications of inspectors performing acceptance testing and the condition of equipment used in acceptance testing on Department projects.

The IAST program will evaluate the personnel and equipment responsible for performing quality control sampling and testing that is used to make acceptance decisions. The Contractor and all personnel, organizations, who are responsible for performing acceptance sampling and testing on behalf of the Contractor shall cooperate with and accommodate this program by performing, and allowing State representatives to perform sampling and testing at the times and locations requested by the Regional IAST personnel. The required sampling and testing procedures are listed in the Department's Independent

§106

Assurance Sampling and Testing Manual. IAST personnel will observe the tester obtaining samples and performing the tests. IAST personnel will also take split samples to the Regional Laboratory for testing.

106-11 BUY AMERICA.

In accordance 41 U.S.C. §10a et. seq., 23 CFR 635.410 and Section 146 of the State Finance Law, as amended, permanently incorporated steel and/or iron materials shall be domestically produced regardless of the percentage they comprise in a manufactured product or form they take. Award of the contract will be made in accordance with §103-01, *Contract Award*.

For a contract awarded based on being allowed to permanently incorporate foreign steel and/or iron materials in the work, the Contractor may supply either domestic or foreign steel and/or iron materials and will be paid the foreign bid prices. For a contract awarded based on domestic steel and/or iron materials, the Contractor may permanently incorporate in the construction of this contract a minimal amount of foreign steel and/or iron materials if the combined cost of such materials does not exceed one-tenth of one percent (0.1 %) of the total contract cost or \$2,500, whichever is greater. The combined cost of foreign steel and/or iron materials will be the value of the materials as they are delivered to the contract, documented by invoice or bill of sale to the Contractor.

To qualify as domestic, all manufacturing processes, including manufacture, fabrication, grinding, drilling, welding, finishing, coating and assembly of any product containing steel and/or iron materials, must have been performed in the United States. To further define the coverage, a domestic product is a manufactured steel and/or iron materials construction material that was produced in one of the 50 States, the District of Columbia, Puerto Rico, or in the territories and possessions of the United States. Raw materials used in the steel and/or iron materials may be imported. Raw materials are materials such as iron ore, limestone, waste products, etc., which are used in the manufacturing process to produce the steel and/or iron materials products. Waste products include scrap; i.e., steel no longer useful in its present form from old automobiles, machinery, pipe, railroad rail, steel trimmings from mills or product manufacturing, and the like. Extracting, crushing, and handling the raw materials which is customary to prepare them for transporting are exempt from Buy America. The use of foreign source steel or iron billets is not acceptable under Buy America.

A. Control of Materials. All items, regardless of origin, shall comply with their individual specification requirements and with the requirements stated elsewhere in this subsection. In the event the contract is awarded based on using only domestic steel and/or iron materials, the Contractor shall supply only domestic steel and/or iron materials and will be paid the domestic bid prices. The Contractor will be responsible for ensuring the domestic steel and/or iron materials are supplied in conformance with the above referenced laws. Such responsibility extends to informing all affected Subcontractors and material suppliers of these specific requirements and ascertaining that steel and/or iron materials being supplied is in conformance with the standard specifications.

B. Waivers. In addition to the award of a bid based on foreign steel and/or iron materials, waivers to the Buy America requirement may be requested by the State to the Division Federal Highway Administration if it can be demonstrated that the use of domestic steel and/or iron materials would be inconsistent with the public interest, such materials and products are not produced in the United States in sufficient and reasonably available quantities and of satisfactory quality.

Provided one or more of the above requirements are met, the Contractor may submit a request for a waiver to the Engineer. The request shall include copies of all documentation verifying the unavailability of the material or product, and/or justification of the application for a waiver.

For Federally Aided contracts, final approval of the Buy America Waiver request will be made by the Division Federal Highway Administration and concurred with by the Director, **Office of Construction Division**. For non-Federally Aided contracts, upon final approval of the affected Department program areas, notification and approval of the Buy America Waiver request will be made by the Director, **Office of Construction-Division**.

The following is a list of materials or products which are exempt from the Buy America provisions, and do not require submission of a waiver request:

1. Hollow "I" shaped, steel extrusions.

SECTION 107 - LEGAL RELATIONS AND RESPONSIBILITY TO PUBLIC**107-01 LAWS, RULES, REGULATIONS AND PERMITS.**

The Contractor shall conduct its operations in compliance with all the laws and regulations of the United States, State of New York and Public Authorities and the applicable ordinances of any county, city, town, or village and the lawful direction of the officers, agents or representatives of the United States, the State of New York, Public Authorities or of said county, city, town, or village. The Contractor shall procure all licenses and permits necessitated by the Contractor's operations. All costs due to compliance with the above described laws, regulations, and ordinances shall be included in the contract bid prices unless otherwise provided for in the contract.

A. Invasive Species. Federal and State Agencies have promulgated regulations regarding invasive plant species, agricultural insects and diseases. The Contractor shall thoroughly clean all construction equipment and vehicles operating in infested areas prior to moving to non-infested areas in accordance with Federal and State Department of Agriculture regulations for plant pest control.

B. Independent Contractor. The relationship of the Contractor to the State is that of an independent Contractor, and said Contractor, in accordance with its status as such Contractor, covenants and agrees that it will conduct itself consistent with such status, that it will neither hold itself out as nor claim to be an officer or employee of the State by reason hereof, and that it will not, by reason hereof, make any claim, demand or application to or for any right or privilege applicable to an officer or employee of the State, including, but not limited to workers' compensation coverage, unemployment insurance benefits, social security coverage, or retirement membership or credit.

C. Cooperation With Investigations. The Contractor hereby agrees to the provisions of §139-a and §139-b of the State Finance Law which require that upon the refusal of a person, when called before a grand jury, head of a State department, temporary State commission or other State agency, or the organized crime task force in the NYS Department of Law, which is empowered to compel the attendance of witnesses and examine them under oath, to testify in an investigation, concerning any transaction or contract had with the State, any political subdivision thereof, a public authority or with any public department, agency or official of the State or of any political subdivision thereof or of a public authority, to sign a waiver of immunity against subsequent criminal prosecution or to answer any relevant question concerning such transaction or contract;

1. Such person, and any firm, partnership or corporation of which he is a member, partner, director or officer shall be disqualified from thereafter selling to or submitting bids to or receiving awards from or entering into any contracts with the State of any public department, agency or official thereof, for goods, work or services, for a period of five years after such refusal, and;
2. Any and all contracts made with the State or any public department, agency or official thereof, since the effective date of this law, by such person, and by any firm, partnership or corporation of which he is a member, partner, director or officer may be canceled or terminated by the State without incurring any penalty or damages on account of such cancellation or termination, but any moneys owing by the State for goods delivered or work done prior to the cancellation or termination shall be paid.

D. Archaeological Salvage. Whenever, during the course of construction, historical or prehistoric objects or human remains are encountered, such objects shall not be destroyed or moved. The Contractor shall stop work to avoid disturbing such areas and notify the Engineer immediately.

The Engineer will notify the appropriate Department personnel and other authorities and arrange to have an immediate inspection of the site conducted.

Removal or salvage of archaeological objects will be considered extra work. Such work will be limited to that performed within the right-of-way, and at any location under direct control of the Contractor used as a source of approved borrow material or a spoil disposal area.

Comment [c6]:
E109029

107-02 PATENTED DEVICES, MATERIALS AND PROCESSES.

It is mutually understood and agreed that the contract prices are to include all royalties and costs arising from patents, trademarks, and copyrights in any way involved in the work. Whenever the Contractor is required or desires to use any design, device, material or process covered by letters, patent or copyright, the Contractor shall indemnify and save harmless the State from any and all claims for infringement by reason of the use of any such patented design, device, material or process, to be performed under the contract, and shall indemnify the said State for any costs, expenses and damages which it may be obliged to pay, by reason of any such infringement, at any time during the prosecution or after the completion of the work.

107-03 FEDERAL AID PARTICIPATION.

All contracts in which the Federal Government participates financially are designated as Federal-Aid contracts. For all Federal-Aid contracts, the Contractor shall conform in all respects in accordance with the true intent and meaning of each and all of the requirements contained in the FHWA-1273 *Required Contract Provisions Federal-Aid Construction Contracts*, a copy of which will be found incorporated in each Federal-Aid contract proposal. When any of such Federal Provisions may be in conflict with any other provisions of the contract the Federal Provisions shall prevail and take precedence and be of force over and against any said conflicting provisions of said contract.

107-04 SANITARY CODE.

The Contractor shall comply with the provisions of the State Sanitary Code relating to camps and obtain from the local health officers permits for the construction, maintenance and operation of labor camps, if used.

107-05 SAFETY AND HEALTH REQUIREMENTS.

The Contractor shall perform all work in the contract with due regard to the safety and health of the employees and of the public. The Contractor shall comply with 29 CFR 1926, *Safety and Health Regulations for Construction*, administered by the Federal Occupational Safety and Health Administration (OSHA) regarding the safety and protection of persons employed in construction and demolition work.

No Contractor employee may use, distribute, dispense, possess or manufacture any alcoholic beverages, illegal drugs or any other intoxicating substance on a contract site. Contractor's written policy shall require that employees not report to work under the influence of drugs or alcohol, nor be impaired or unable to function at the workplace as a result of consuming alcohol or other intoxicants. While prescription drugs are not prohibited, they should not render an employee unfit for duty. Contractor employees that are suspected of using drugs or alcohol, or who are suspected to be under the influence of such substances, shall be reported to the Engineer. Contractor employees who are under the influence of drugs or alcohol may be deemed incompetent, and are subject to dismissal in accordance with §105-02 *Character of Workers*.

The Contractor shall notify the Engineer of any inspections scheduled or conducted on the contract by OSHA, NYS Department of Labor (NYSDOL), or other safety and health agencies, of any resulting closing conference, and provide the Engineer with the opportunity to be present at such inspections and closing conference. The Contractor shall notify the Department in writing of the results of any safety and health inspections conducted by representatives of OSHA, NYSDOL, or other safety and health agencies, within one work day of the completion of the closing conference resulting from such inspections. If any citations are issued for alleged violations of OSHA Regulations, a copy shall be provided to the Engineer within one work day of their receipt by the Contractor, and a copy of the final disposition of such citations shall be provided to the Engineer within one work day of receipt by the Contractor.

A. High Visibility Apparel. All workers shall wear at all times protective helmets and construction apparel or traffic control apparel when working within a highway right of way or contract limits. High visibility apparel is intended to contrast with the background for worker conspicuity. All high-visibility apparel shall be closed front and rear; in good condition to maintain the color, visibility, reflectivity, and conspicuity. Workers shall include Contractor employees, Subcontractor employees, material suppliers, and other personnel under the direction of the Contractor. Protective helmets and

high-visibility apparel are not required for employees when they are within a completely enclosed cab constructed of steel frame and glass, or inside a motor vehicle.

1. Protective Helmets. Protective helmets shall meet OSHA standards for impact, electrical shock, and burn protection. Protective helmets used during nighttime operations shall be equipped with a minimum of 12 square inches of reflective tape on all four sides (i.e., 1 inch by 3 inch – 3 square inches per side). Protective helmets for flaggers shall be orange.

2. Construction Apparel. Construction Apparel shall consist of a vest, shirt, or jacket; fluorescent orange-red or fluorescent yellow-green or combination of these colors with at least 201 in2 retroreflective bands meeting the requirements of ANSI 107 Class 2.

3. Traffic Control Apparel. Traffic Control Apparel shall consist of a vest, shirt, or jacket; fluorescent orange-red with fluorescent yellow-green striping bands or fluorescent yellow-green with fluorescent orange-red striping bands, placed both horizontal and vertical, meeting the requirements of ANSI 107 Class 2. The striping bands shall be approximately 5 inch wide with retroreflective strips. Retroreflective strips shall consist of two - 1 inch wide retroreflective strips being 2 inches apart in the center of the fluorescent striping band material or a single 2 inch wide in the center of the fluorescent striping band material.

~~**B. Project Safety and Health Plan.** The Contractor shall perform all necessary planning, supervision, and training activities to ensure that all of the requirements of 29 CFR 1926 are fully met for all workers employed in the construction of the contract. The Contractor shall provide to the Department prior to the start of work satisfactory evidence that all current requirements of 29 CFR 1926 will be adequately addressed. As a minimum, the Contractor shall provide a written Project Safety and Health Plan which documents the Contractor's company policy relative to safety, and which identifies and addresses specific safety and health concerns to be encountered on the project. Before the work begins and periodically throughout the project, the Contractor's project supervision staff shall meet with the Engineer to review and discuss the status of safety issues on the project. An appropriate notice shall be posted on the contract site that the Project Safety and Health Plan is available for examination by any worker employed on the project. As a minimum this plan shall include the following items:~~

- ~~• Identification of project and company safety officers.~~
- ~~• Hazardous Materials Communications Plan.~~
- ~~• Employee Safety Training Program.~~
- ~~• Company safety policy.~~
- ~~• Procedures to address project safety and health concerns.~~
- ~~• Procedures to address distraught, emotionally disturbed persons and/or homeless persons.~~
- ~~• Procedures for compelling worker compliance with safety and health requirements.~~

~~— Certain of these items may be submitted in the format of a Company Safety and Health Program, with the Project Safety and Health Plan limited to project specific issues.~~

~~— The Contractor shall ensure that each subcontractor employed on the project complies with this requirement. The Contractor shall provide to the Department a Project Safety and Health Plan covering all work to be done by the subcontractor prior to starting work. As an alternative, the Contractor may provide a certification that all activities performed by and workers employed by the subcontractor will be subject to the Contractor's Project Safety and Health Plan.~~

~~— Submission of the required Project Safety and Health Plan by the Contractor and its acceptance by the Department shall not be construed to imply approval of any particular method or sequence for addressing safety and health concerns, or to relieve the Contractor from the responsibility to adequately protect the safety and health of all workers involved in the project as well as any members of the public who are affected by the project.~~

B. Project Safety and Health Plan. The Contractor shall perform all necessary planning, supervision, and training activities to ensure that all of the requirements of 29 CFR 1926 are fully met

for all workers employed in the construction of the contract. The Contractor shall provide to the Department prior to the start of work satisfactory evidence that all current requirements of 29 CFR 1926 will be adequately addressed. As a minimum, the Contractor shall provide a written Project Safety and Health Plan which documents the Contractor's company policy relative to safety, and which identifies and addresses specific safety and health concerns to be encountered on the project. Before the work begins and periodically throughout the project, the Contractor's project supervision staff shall meet with the Engineer to review and discuss the status of safety issues on the project. An appropriate notice shall be posted on the contract site that the Project Safety and Health Plan is available for examination by any worker employed on the project. As a minimum this plan shall include the following items:

- Identification of project and company safety officers.
- Hazardous Materials Communications Plan.
- Employee Safety Training Program.
- Company safety policy.
- Procedures to address project safety and health concerns.
- Procedures to address distraught, emotionally disturbed persons and/or homeless persons.
- Procedures for compelling worker compliance with safety and health requirements.

Certain of these items may be submitted in the format of a Company Safety and Health Program, with the Project Safety and Health Plan limited to project-specific issues.

The Contractor shall ensure that each subcontractor employed on the project complies with this requirement. The Contractor shall provide to the Department a Project Safety and Health Plan covering all work to be done by the subcontractor prior to starting work. As an alternative, the Contractor may provide a certification that all activities performed by and workers employed by the subcontractor will be subject to the Contractor's Project Safety and Health Plan.

Submission of the required Project Safety and Health Plan by the Contractor and its acceptance by the Department shall not be construed to imply approval of any particular method or sequence for addressing safety and health concerns, or to relieve the Contractor from the responsibility to adequately protect the safety and health of all workers involved in the project as well as any members of the public who are affected by the project.

In accordance with NYS Labor law §220-h, all laborers, workers, and mechanics shall be certified prior to performing any work on the contract as having successfully completed a course in construction safety and health approved by the US Department of Labor's Occupational Safety and Health Administration (OSHA) that is at least ten hours in duration. The Contractor shall attach proof of completion to first certified payroll for initial workers, and to subsequent payrolls for new or additional workers. The Contractor shall clearly indicate on subsequent payrolls any workers not previously employed on that contract. If no proof of completion has been submitted for a worker listed on a certified payroll, the Engineer will alert the Contractor to this fact. If the Contractor cannot provide proof of completion and the worker continues to work, the Department will notify the Contractor in writing with a copy to the NYSDOL by e-mail at PWAsk@labor.state.ny.us.

Comment [cjt7]:
EI 08-024

C. Emergency Contact Person. The Contractor shall designate someone to be available to respond to emergency calls. The name of the person and the telephone number at which he/she can be reached at any time shall be given to the Engineer and all police agencies in the area. Such person shall have full authority and capability to mobilize forces promptly as required to respond to an emergency and protect the public.

D. Accident Reporting. The Contractor shall immediately notify the Department verbally of any accident or incident that results in the death of a worker, motorist or pedestrian. The Contractor shall notify the Department in writing within 24 hours, with the details relative to any accident or incident occurring within the contract limits or is directly related to construction activity or involving any worker employed on the contract or delivering materials, equipment or supplies to the contract, provided:

- The accident or incident results in the death of a worker, or (2) requires that a worker is hospitalized overnight for treatment of the injury, or (3) results in 3 or more personal injuries: or:
- The accident or incident involved a utility (overhead or underground) or:
- The accident or incident involved a motorist or pedestrian or:
- The incident was a near miss or:
- The accident otherwise meets the notification requirements of OSHA.

The Engineer will provide the Contractor with a copy of the Department accident report for any accident occurring within the contract limits or involving the Contractor's personnel, equipment or operations.

E. Imminent Danger and Emergency Actions. Any action by the Contractor that presents a potentially imminent danger of injury to the public, a worker, or the inspection staff will be halted immediately by the Engineer, and operations stopped in accordance with §105-01 *Engineer's Authority*. The Contractor's personnel shall have local emergency numbers readily available. These numbers shall include local utility, police/fire and medical assistance. In the event of an emergency, the Contractor shall evacuate all employees and endangered persons from the immediate vicinity to the best of the Contractor's ability.

F. Restricted Areas. The Contractor shall identify, guard and protect restricted areas such as open and unattended excavations, areas subject to falling debris and other potentially hazardous locations in and adjacent to areas lawfully frequented by any person. Such protection shall consist of one, or a combination of, the following:

- A substantial fence or barricade, not less than 4 feet in height and mounted on satisfactory supports spaced at intervals of not more than 10 feet. Warning signs reading "DANGER-KEEP OUT" shall be mounted on the fence or barricade at no more than 100 foot intervals. The signs shall be a minimum of 24 inches wide by 16 inches high. The lower portion of the sign shall be white and shall bear the words "KEEP OUT" in 5 inch black letters. The upper portion shall be predominantly red with 5 inch white lettering spelling out the word "DANGER." The lettering shall be enclosed by an approximately elliptical, white ring and the entire sign bordered in black. All barricades and warning signs shall be furnished, erected, relocated, maintained, and removed as required.
- A 4 foot (minimum) extension of the trench sheeting above the ground surface adjacent to an excavation.
- A substantial covering over an excavation. Where it is possible that vehicles will move over such covering, the covering shall be of sufficient strength to withstand the loading.

G. Work Site Access. The Contractor shall provide safe access to the work site by workers and inspection staff such that no active traffic lanes are routinely crossed by pedestrian workers or inspection staff reporting to and leaving the work site. Vehicles and equipment used to transport personnel to the work site shall safely enter and depart the work site.

The Contractor shall designate a safe parking area(s) for workers to park private vehicles near the project site acceptable to the Engineer. Contractor personnel shall park in non-designated parking areas within the right of way only with the prior approval of the Engineer.

H. Fall Protection. The Contractor shall provide fall protection for all workers in compliance with 29 CFR 1926. The Contractor shall include procedures to provide fall protection in the Project Safety and Health Plan. The minimum fall protection requirements include the following:

1. Fall protection shall be provided for all workers at or above 6 feet or the height thresholds listed in 29 CFR 1926, Subpart L and Subpart M, whichever is lower, and for all locations where there is a risk of a fall onto dangerous equipment or an impalement hazard, regardless of height. All fall protection systems shall meet the requirements of 29 CFR 1926, Subpart M. For situations where lifelines are interrupted, double lanyards shall be utilized to ensure that workers are continuously protected. One lanyard shall remain connected at all times.

2. Attachments or other temporary appurtenances on all beams and other structural elements shall be in place prior to erection or removal to provide fall protection until other means of protection such as deck forms are in place. Fall protection shall consist of personal fall arrest systems, safety nets or other means. During placement or removal of structural members when the member is supported by a lifting device, workers exposed to moving members shall be required to tie off only if they are not exposed to a greater risk from the moving member. Fall protection systems utilized shall enhance safety rather than create a secondary hazard.
3. The Contractor shall establish procedures to minimize occurrences of unprotected exposure to fall hazards. When a worker must rig a fall protection system, and rigging cannot be accomplished from an aerial lift or by tying-off to the existing structure, momentary exposure to a fall hazard may be unavoidable.
4. Ladders or stairways meeting the requirements of 29 CFR 1926, Subpart X shall be provided at all points of personnel access where there is a change in elevation of 19 inches or more, and no ramp, runway, sloped embankment or personnel hoist is provided. Climbing on forms, falsework, or the structure to gain access to work areas is expressly prohibited.
5. Scaffolds necessary to provide temporary access to work areas shall be in compliance with 29 CFR 1926, Subpart L and shall include a top rail, mid rail, and toe board on all open sides and ends. Scaffolds shall be erected, moved, altered and/or dismantled only under the supervision and direction of a competent person.
6. Suspended scaffolds may be used only if personnel lifts, scaffolds, or other means are not practical, and shall meet the requirements of 29 CFR 1926, Subpart L. Specifically, the scaffold shall be secured to the suspension cables at all times. All personnel working on a suspended scaffold shall be provided fall protection using an independent anchorage.
7. Workers in personnel aerial lifts shall use a personal fall arrest system attached to the boom or basket. Aerial lifts shall be operated in accordance with 29 CFR 1926, Subpart L.

I. Working Over Water. Any worker who is exposed to the risk of drowning shall wear a U.S. Coast Guard approved personal flotation device (PFD) at all times. A risk of drowning shall be considered to exist where water depths exceed 5 feet, or water is subject to sudden fluctuations to a depth exceeding 5 feet. A risk of drowning may also exist where water depths as little as 2 feet are combined with swift currents, or a fall into the water may result in a person being rendered unconscious or otherwise disabled. Working on top of ice shall be considered as working over water. Where practical, workers should not work alone in situations where a risk of drowning exists.

When continuous fall protection is used, without exception, the drowning hazard has effectively been removed, and wear of a PFD is not required. When safety nets are used as fall protection the drowning hazard has not been removed, and wear of a PFD is required. When aerial lifts are used over or near water the drowning hazard has not been removed, and wear of a PFD is required by occupants of the lift, regardless of whether a personal fall arrest system is used.

When working over or adjacent to water, ring buoys with a minimum of 100 feet of line attached, shall be placed at a maximum interval of 200 feet along the work site shoreline or along the work limits and a boat/skiff for emergency response shall be in place prior to that exposure. The boat/skiff shall be unlocked and available for immediate use at all times, and able to retrieve a worker from the water in no more than 4 minutes from the time they entered the water. If additional hazards (very cold water, rapids, etc.) exist the boat/skiff shall be able to retrieve the worker before being overcome by that hazard.

A boat/skiff for emergency rescue operations shall be equipped with a motor, paddles or oars, a ring buoy, and a reach extension device. The boat/skiff shall be equipped and operated in accordance with NYS Navigation Law.

J. Electrical Safety. Electrical safety policy and procedures are based on the New York State High Voltage Proximity Act and 29 CFR 1926. They apply to all operations that could cause employees or the vehicles or equipment they are operating to come into contact with (“direct contact”) or enter into dangerous proximity to (“indirect contact”) energized electrical systems. Electrical systems shall be assumed to be energized high voltage until verified otherwise by the

Utility. The Contractor shall identify and reference all potential electrical hazards and document such actions to the Engineer as part of the Project Safety and Health Plan.

Pursuant to the High Voltage Proximity Act, for all electrical systems carrying 600 volts or more, the Contractor shall:

- Notify the Utility at least 5 work days before any work begins which requires the Utility to identify voltages and clearances, or de-energize, insulate or relocate lines.
- Ensure employees are not placed in dangerous proximity to high voltage. Dangerous proximity is defined as within 10 feet for voltages up to 50 kilovolts, and an additional 4 inches for every 10 kilovolts over 50 kilovolts. Dangerous proximity applies to the individual and any conductive object.
- Inform employees of the hazards and corresponding precautions when working near high voltage.
- Post warning decals on equipment regarding the 10 foot minimum clearance.
- Ensure that when any equipment operator is unable to assess clearances, a "spotter" observes for clearance and directs the operator.

Prior to the start of work where contact with energized electrical systems is possible, the Contractor shall identify existing facilities and reference their location to prominent physical features. In advance of work, the Utility shall be called upon to identify energized facilities, and to determine the need to de-energize, insulate, or otherwise protect the facilities against accidental contact. The actual work of protecting facilities will be carried out by the Utility. Facility relocation or protection provided at the request of the Department will be as described in the contract documents. Protection provided for the benefit, or at the request, of the Contractor shall be the financial responsibility of the Contractor.

Energized electrical lines or equipment shall be conspicuously marked and workers shall be reminded of their locations and the safeguards and precautions to be taken prior to beginning any nearby work that may cause the workers to approach electrical lines. New employees shall be informed of electrical hazards and proper precautions and procedures.

1. Paving Operations. Prior to the start of each workday high visibility markers or other devices approved by the Engineer shall be placed to mark the location of all overhead wires, including, but not limited to electrical, telephone and cable television. As an alternative, the pavement beneath overhead lines may be marked with spray paint or by other means approved by the Engineer. This requirement shall also apply to off-site areas used for contract purposes. The Contractor shall periodically patrol the worksite to ensure that the markings are in place and shall replace any that are missing and shall maintain all markings in good condition.

2. Aerial Lifts, Lifting Equipment, Boom Devices. Where there is potential for proximity or contact with energized lines or equipment, work shall not begin until a safety meeting is conducted and appropriate steps are taken to identify, mark, and warn against accidental contact.

3. Tree Work. Branches touching wires shall be removed by the Utility before work begins. Limbs and branches shall not be dropped onto overhead wires. If limbs or branches fall across electrical wires, work shall stop immediately and the Utility shall be notified. Workers shall be equipped with appropriate personal protective gear for working near electricity.

4. Building Electrical Work. Employees working on electrical systems for buildings shall be knowledgeable about and shall employ, when appropriate, OSHA Lock-Out/Tag-Out procedures to prevent exposure to unguarded electrical systems.

K. Open Excavations and Trenches. In accordance with 29 CFR 1926.650, a trench is a narrow excavation (in relation to its length) made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench (measured at the bottom) is not greater than 15 feet. If forms or other structures are installed or constructed in an excavation so as to reduce the dimension measured from the forms or structure to the side of the excavation to 15 feet or less, the excavation is also considered to be a trench. The Contractor shall provide protection from collapse

and cave-in for any employee who enters a trench or other excavation in accordance with the requirements of 29 CFR 1926 Subpart P, unless the excavation is less than 5 feet in depth and examination of the ground by the Contractor's competent person provides no indication of a potential cave-in. The Contractor shall include procedures to meet the excavation safety requirements in the Project Safety and Health Plan.

Trenching and excavation work shall be carried out under the supervision of the Contractor's competent person. The Contractor shall provide ladders or ramps for access and egress within 25 feet of an employee work area if a trench is 4 feet or more deep. The Contractor shall keep traffic, equipment and materials at least 2 feet away from the edge of any trench or excavation, or use retaining devices. When mobile equipment is operated near an excavation or must approach the edge of an excavation, either the operator must have a clear and direct view of the edge of the excavation; or a warning system of barricades, hand signals or mechanical signals shall be used. Workers shall not be permitted under loads that are being handled by lifting or digging equipment.

For the purposes of open excavations and trenches, the term "competent person" shall be defined as one who has had specific training in, and is knowledgeable about, soil analysis, the use of protective systems and the requirements of 29 CFR 1926 Subpart P.

L. Hazardous Materials. The Contractor shall provide workers Hazard Communication Training (29 CFR 1926.59), Safety Training (29 CFR 1926.21), and other training as required by 29 CFR 1926.

1. Asbestos. Asbestos abatement contractors and workers, including both removal and air monitoring contractors, shall be appropriately licensed and certified by the NYS Department of Labor (NYSDOL). The asbestos abatement contractor will perform all removal and disposal of asbestos-containing material. The Contractor shall verify that a disposal site for the asbestos-containing material is available before starting work. Prior to removal and disposal work, the Contractor shall supply the Engineer with proof that:

- The firm performing the work has a valid asbestos-handling license.
- The firm's insurance coverage consists of an asbestos specific-occurrence type policy with no deductible or sunset clause.
- Its abatement supervisor is a NYSDOL certified asbestos project supervisor.
- All employees engaged in the work are properly certified and have current physical examinations and respirator fit tests.
- Proper notification of work beginning on the asbestos project has been given to NYSDOL and the United States Environmental Protection Agency (USEPA).

After work is completed, the Contractor shall provide the Engineer with two (2) copies of Daily Logs, Visitor's Logs, OSHA Air Monitoring Records, and NYSDOL compliance air monitoring records.

2. Lead Safety and Health. The Contractor shall provide worker lead protection in accordance with 29 CFR 1926.62. The Contractor shall provide to the Engineer a written Lead Compliance program addressing as a minimum the specific issues listed in 29 CFR 1926.62 (e)(2), a written Hazard Communication program and Worker Lead Training program as components of the Project Safety and Health Plan. The Contractor shall provide detailed information describing the training and experience of the competent person who will supervise the compliance program on site, provide a description of procedures to monitor worker exposures to lead and provide the proposed medical monitoring program. If respirators are to be used to protect workers from lead exposure, a written respirator program shall be provided.

Specific operations that would likely result in worker exposure to lead include, but are not limited to:

- Removal of lead based paint coatings by abrasive blasting or other procedures.
- Cleanup and removal of paint debris.
- Cleanup, relocation, and dismantling of paint removal containment structures.

- Flame cutting, heating, or welding of steel coated with lead-based paint.
- Removal of bolts or rivets coated with lead-based paint.
- Any other operations that may dislodge existing coatings of lead-based paint, or subject them to abrasion or elevated temperatures.

The Contractor shall identify and implement engineering and work practice controls to reduce worker exposure to lead to a level at or below the Permissible Exposure Level (PEL). The use of respirators and protective clothing shall be used to supplement engineering and work practice controls, if necessary, to protect workers from exposures above the PEL. Reliance on respirators or protective clothing to protect workers from exposures above the PEL, without first implementing feasible engineering and work practice controls, shall not be permitted except for initial assessment of exposure levels as described in 29 CFR 1926.62 (d). The removal of lead-based paint from structural steel shall be required prior to heating, welding, or flame cutting to reduce worker exposure below the PEL. In cases where the Contractor can clearly demonstrate through exposure monitoring that other work practices and engineering controls, under the oversight of a certified industrial hygienist, can effectively maintain actual worker exposure below the permissible exposure level, exceptions to this requirement may be granted by the Engineer.

The Contractor shall provide to the Engineer copies of documentation, as they are completed, to demonstrate full compliance with 29 CFR 1926.62. These records shall include, as applicable, the completed worker lead training, completed respirator programs, air monitoring results, exposure monitoring results, worker medical monitoring results, and other such records as are necessary to document compliance with the standard.

3. Equipment Involving Radioactive Materials. The use of equipment involving radioactive materials, including but not limited to nuclear density gauges, shall adhere to all applicable regulations, including U.S. Nuclear Regulatory Commission regulations, related USDOT regulations concerning transportation of radioactive materials, and 12 NYCRR 38. Fourteen (14) days prior to the start of any work involving such equipment, the Contractor shall submit to the Engineer a written Radiation Safety Plan. The plan shall address in detail transportation and storage of the equipment and operating and emergency procedures. It shall provide the name and address of the Contractor's Radiation Safety Officer. A copy of the owner's license to possess the radiation source, issued by the NYSDOL, shall also be provided. All operators of the equipment shall be certified by a gauge manufacturer as to having completed training on the safe use of the equipment. A copy of the certification shall be provided to the Engineer for each operator prior to their work on the project.

4. Silica. The Contractor shall provide protection to all workers from exposure to hazardous levels of silica in accordance with 29 CFR 1926.55. In accordance with §107-05B, *Project Safety and Health Plan*, the Contractor shall identify and address silica health and safety in the written Project Safety and Health Plan. The Contractor shall identify and implement worker training, engineering controls, and workplace practice controls to reduce worker exposure to silica prior to instituting a program based on respirators or protective clothing to protect workers from exposures. Engineering controls shall include, but shall not be limited to; dust suppression through the application of water or other methods, use of general or local ventilation, and containment/isolation. Workplace practice controls shall include proper use and implementation of supervision, task procedures, employee training, signing, protective clothing, housekeeping, and personal hygiene. If engineering controls and work practice controls cannot reduce exposures below the personal exposure limit, the Contractor shall institute a respirator program. Each of these safety components is covered individually by 29 CFR 1926.

Many materials disturbed by the Contractor's operations may contain hazardous levels of silica. Silica may be in soil, concrete or asphalt pavement, superstructure or substructure materials. Specific operations that may result in worker exposures to silica, include, but are not limited to:

- Saw cutting, grinding, milling, hammering, drilling, or chipping of rock, cement concrete, or asphalt concrete.
- Concrete pavement rubblizing.
- Demolition of brick, cement concrete, or masonry structures.
- Abrasive blasting, if the abrasive contains silica, or of cement concrete, rock, or asphalt concrete.
- Dry sweeping or pressurized air blowing of cement concrete, rock, sand, or asphalt concrete dust.

M. Demolition/Removal of Buildings and Structures. Demolition or removal work shall not be performed by the use of explosives unless approved by the Regional Director.

N. Drilling and Blasting. Blasting shall be performed in accordance with the Department publication entitled *Procedures for Blasting*. This publication is available upon request from the Regional Director or the Director, Geotechnical Engineering Bureau.

The Contractor shall submit a written Blast Plan in accordance with *Procedures for Blasting* for approval by the Department a minimum of 10 work days prior to start of blasting operations. A preblast meeting relative to the method, manner and procedure of blasting operations shall be held with the Engineer, the Contractor, the Blaster, a Departmental Engineering Geologist and representatives of all interested agencies prior to the commencement of drilling and blasting operations.

Whenever explosives are used, they shall be of such character and strength and in such amounts as permitted by state and local laws and ordinances and all agencies having jurisdiction over them. The Department reserves the right to specify the maximum size of the charges. Blasting shall be done only when the Engineer and those agencies shall approve and under such restrictions as they may impose.

If a blast causes injury, damage to property, adverse affects upon traffic, or causes gases to migrate and/or accumulate in a potentially harmful manner, all blasting operations shall cease pending review of the procedures. The review will be conducted by the Engineer in conjunction with an Engineering Geologist to ensure that proper procedures and practices were used to determine if the approved procedures need to be revised. Should the findings of the review indicate the injury, damage, traffic delay, or migration/accumulation of gases was attributed to improper blasting operations, the blaster of record may be removed at the Department's option.

The Contractor shall meet all the requirements of 12 NYCRR 23 and 12 NYCRR 39, which include but are not limited to the licensing for ownership, possession, transportation, or use of explosives, certifications for blasters, and provisions for storage, construction and maintenance of magazines.

O. Equipment Safety Procedures. The following provisions shall apply to all work on the project, including but not limited to, the activities of all Subcontractors, Manufacturers, Fabricators, Material Suppliers, independent truckers and owner-operators. The Contractor shall include the proposed equipment safety procedures in the Project Safety and Health Plan.

- A spotter shall guide the backing of any vehicle or equipment with restricted visibility to the rear. This rule applies in any location where workers on foot, pedestrians, private vehicles or similar hazards may be present.
- If the operator loses visual contact, the vehicle shall immediately be brought to a full stop until visual contact with the spotter is reestablished.
- Dump truck boxes may be raised only under the control of a spotter, unless the vehicle is in an area clearly marked to be free of overhead wires and safe for dumping.
- Dump truck boxes shall be lowered prior to moving, except when dumping into a paver or similar operations, under the control of a spotter.
- All excavating, lifting and similar equipment shall comply with electrical safety requirements, and shall operate under the control of a spotter whenever working within 5m of an overhead line.

The distance shall be measured as a slope distance perpendicular from the conductor to the nearest point on the vehicle.

- Any operator found in violation of the above rules by the Engineer or his/her representative will be removed from the project immediately, and will not be allowed to work on any Department project for a minimum of one (1) year.

P. Lifting. The following shall apply for all lifting operations when utilizing lift equipment. Lift equipment for this lifting paragraph shall be defined as equipment capable of lifting an item more than 15 feet high, has the ability to swing or rotate a boom, and has a maximum rated lifting capacity exceeding 1 ton. All lift provisions of the Steel Construction Manual and the Prestressed Concrete Construction Manual remain in effect. This paragraph does not pertain to lifting operations covered under Section 585, *Structural Lifting Operations*, nor ordinary excavation operations. This paragraph does apply however to cranes with either fixed or swinging leads that are dedicated to pile driving operations.

1. Competent Person. The Contractor shall designate, to the Engineer, one person, who is competent in lifting operations, to be completely in charge of each lifting operation. In general, Competent Person shall mean one who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them. The Competent Person shall have the authority to take an unsafe piece of equipment out of service until the hazard is eliminated. The Competent Person shall be knowledgeable about lifting equipment and equipment operations, Manufacturer's specifications and recommendations, and have a thorough knowledge of the requirements, regulations and standards governing his/her duties. The Competent Person shall, as a minimum, have the ability to interpret load charts, calculate lift loads, recognize overhead wire hazards and know all aspects of the rigging.

The Competent Person shall inspect all lift equipment prior to and during usage to make sure the equipment is in a safe operating condition.

2. Lift Equipment. Lift equipment shall have durable, legible load charts which shall have been prepared by either the equipment manufacturer or a Professional Engineer. If manufacturer's load charts are unavailable, charts may be prepared by a Professional Engineer. The Professional Engineer shall utilize the same factors of safety against overturning as the equipment manufacturer. The charts shall be attached to the equipment in a location accessible to the operator while at the controls. The charts shall contain a full range of load ratings at all stated operating radii. The charts shall also note conditions such as outriggers, counter weights, and work area, i.e., over side, over front, or over rear of equipment.

Equipment may lift loads up to those indicated on the manufacturer's or Professional Engineer's load chart if the equipment has the following safety devices and the safety devices are operating:

- a. Load and radius measuring device pre-programmed to continuously relate the measured data to the load radius chart as a direct reading of load or percentage of the rated load, and connected to a warning light and an acoustical signal located at the operator's position or in the cab to indicate overload.
- b. A device that continuously indicates the levelness of the machine and is visible from the operator's controls.

Lift equipment with non-operational safety devices or no safety devices shall be operated at levels not to exceed 78 percent of the Manufacturer's or Professional Engineer's load charts. This equipment shall have a separate load chart labeled "78% Load Chart" and it shall be attached to the equipment.

Lift Equipment with operational safety devices that is operating from a barge shall utilize a manufacturer's or Profession Engineer's load chart that is established specifically for operating from a barge. Lift Equipment on barges with non-operational safety devices or no safety devices shall operate at 78 percent of the Manufacturer's or Professional Engineer's load chart for

working on barges. This equipment shall have a separate load chart labeled “78% Load Chart for Equipment on Barges.”

Equipment used for lifting over a railroad shall be restricted such that the operational capacity shall be limited to 66 2/3% of its tipping load as specified in §105-09, *Work Affecting Railroads* or be limited to the load limits indicated in the previous three paragraphs, whichever is lower.

3. Lift Plan. A Lift Plan is necessary only when required by a contract pay item specification, the Steel Construction Manual, or Prestressed Concrete Construction Manual. The Contractor shall submit erection drawings, demolition plans or other information as required, which detail the lifting procedure or lift plan. This information shall be submitted to the Engineer 30 days prior to the commencement of erection or demolition work, for review and approval by the Department and, when applicable, any railroad affected by the proposed procedure.

Structural elements shown on shop drawings and erection drawings may have units expressed in both metric and English units, however metric measurements or dimensions shall control.

As a minimum, the information in the submittal for a lift plan shall include the following:

- a. Plan of the work area showing support structures, roads, railroad tracks, canals, streams and utilities.
- b. Lift radii and pin locations.
- c. Length of boom.
- d. Counterweight size and location.
- e. Lift configuration(s).
- f. Location of trucks for delivery or removal of materials.
- g. Restrictions on swing radii.
- h. Sectional views of all lifts where electrical facilities are within a 15 foot radius of any part of the lifting equipment or object being lifted.
- i. Wind restrictions if they are a requirement of the Manufacturer’s lifting notes.
- j. Catalog cuts for all lifting devices shown on the drawing.
- k. All pertinent rigging with dimensions.
- l. Equipment such as rigging, beam clamps, jibs, swing-away, super-lifts, additional blocks, cheek plates, headache balls, and additional cables at the time of the lift shall be included as part of the load and shall be indicated as such.
- m. Position of outriggers and outrigger supports.
- n. Outside dimension of tracks for track mounted lifting equipment.
- o. Parts of line for hook block.
- p. A comparison of total lift weight vs. lifting equipment capacity for the pick radius.
- q. Maintenance and protection of traffic provisions specifically required for the lift.

When the lifting operation imparts loads on a structure, false work or utility, when there is a two machine lift, or when a slider beam is used, the Contractor shall submit calculations which show that the proposed operation is safe and/or that the operation will not cause an overstress condition. The calculations and any supporting drawings or other information shall be stamped and signed by a Professional Engineer. Any and all alterations or modifications to a lift plan shall be signed and stamped by a Professional Engineer if the originally approved lift plan was prepared and signed by a Professional Engineer. The Engineer shall be notified of any alterations or modifications.

4. Pre-Lift Meeting. A pre-lift meeting will be required for projects that require a lift plan. The Competent Person, and other appropriate contractor staff, shall attend the pre-lift meeting with the Engineer, as well as representatives from the utilities and railroads if deemed applicable, five work days before lifting operations are to be performed. The meeting shall include but not be limited to: the review of site conditions, erection or demolition plans, lift loads vs. lift equipment capacity, obstructions, utilities, traffic concerns, and the roles of Department and Contractor personnel.

5. Lift Operations. The Competent Person shall be present for all lifting operations. If a crane is utilized in a lifting operation, or a crane with either fixed or swinging leads is utilized in a pile driving operation, the operator shall present to the Engineer a valid New York State Certificate of Competence to operate a crane, except an individual operating a crane within a city having a population of one million or more. Individuals operating a crane within a city having a population of one million or more shall present the Engineer with a valid license or certification to operate a crane issued by such city. If there are any other local crane license requirements, they too shall be presented to the Engineer. In addition, a copy of the annual inspection report of the crane shall be readily available and provided upon the Engineer's request.

Any discrepancies between the Lift Plan and the actual lift conditions shall be reported immediately to the Competent Person in charge of the lift operations and to the Engineer. The operation shall not proceed until all issues are resolved to the satisfaction of the Engineer.

Q. Histoplasmosis. Histoplasmosis is a fungal infection caused by a soil organism found in large masses of bird or bat droppings, and is a potential health hazard in areas where birds or bats have nested for long periods. Such conditions are often found on bridge structures, in barns, farm buildings and cold storage facilities, areas with small amounts of dried droppings pose minimal hazard. Airborne material may enter the body by inhalation or ingestion.

Prior to work in any area where birds or bats nest, the Contractor shall conduct a thorough inspection to determine if, and to what extent there is a build-up of droppings. Workers conducting an inspection shall be equipped with personal protective equipment, which include gloves, rubber boots, rain suit components, goggles and a dust/nuisance respirator. Questions regarding proper equipment for this activity shall be directed to the Engineer.

If substantial material is found, the Contractor shall clean the work area using a high powered water hose or by scraping. If the material is to be scraped away, it shall be kept wet during the entire process. Workers engaged in cleaning activity shall wear personal protective equipment specified above. Application of a cleaning agent (bleach, for example), before removal may help dissolve the material, and a disinfectant shall be applied to cleaned surfaces. Compressed air shall not be used to remove pigeon droppings because it produces airborne particles.

When cleaning has been successfully completed, the personal protective equipment specified above is no longer required. Employees engaged in cleaning, or any other activity which involves exposure to pigeon droppings, shall observe a high degree of personal hygiene, even if the exposure is casual. Special care shall be taken to wash hands thoroughly before eating or smoking.

R. Confined Spaces. Confined spaces are defined as any space having limited means of egress, which is subject to the accumulation of toxic or flammable contaminants or has an oxygen deficient atmosphere. Confined spaces include, but are not limited to: sanitary sewers, sanitary manholes and structures, drainage lines and drainage structures, underground utility vaults, enclosed bridge beams and heated enclosures. All personnel required to enter confined spaces shall be instructed as to the nature of the hazards, the necessary precautions and in the use of protective and emergency equipment required.

Fuel-fired heated enclosures are frequently constructed to provide the requirements for winter concrete placement or similar operations. The Contractor shall provide adequate ventilation to maintain acceptable air quality or conduct air quality monitoring when heaters are or have been operating prior to personnel entry. If acceptable air quality cannot be verified, then appropriate respirators shall be worn. No worker shall enter a confined, heated space unless that space can be ventilated or the worker removed from outside the enclosure if the worker is overcome by fumes. Particularly during off-shift hours, no worker shall enter an unventilated, heated enclosure unless another worker is present immediately outside the enclosure. All unnecessary combustibles and debris shall be removed from the enclosure and escape exits shall be provided so workers can escape safely if a fire starts, prior to heating.

S. Fire and Explosion Prevention. The Contractor shall ensure that combustibles do not accumulate. Flammable materials shall be handled and stored as required by OSHA regulations. "No Smoking" signs shall be posted and enforced wherever flammable materials are stored or used. Fire

extinguishers shall be provided and maintained throughout the site, in accordance with the requirements of 29 CFR 1926, Subpart F. Fires will be considered, as a minimum, a near-miss accident, and therefore shall be reported in accordance with existing reporting requirements.

During refueling, all possible sources of ignition, including, but not limited to sparks, open flames and electrical equipment shall be eliminated. Fuel containers shall be grounded to the tank to prevent static electrical sparks. A "No Smoking or Open Flame" sign shall be posted conspicuously in the vicinity of refueling operations.

Cutting and welding equipment shall be stored according to recognized safety standards. Any defective tanks or equipment shall be removed to a safe storage area immediately until repairs are made. When cutting or burning is underway, steps shall be taken to ensure that sparks do not ignite combustibles.

T. Pavement Striping. The Contractor's striping safety procedures shall be spelled out, as appropriate, in the Project Safety and Health Plan. For polyester striping operations, specific procedures for the safe handling and storage of MEKP (organic peroxides) shall be addressed in the Contractor's project safety and health plan. The equipment shall be carefully inspected by a person knowledgeable about striping operations and trained on safe operating and emergency procedures prior to the start of work to ensure safety features are in place. All appropriate Material Safety Data Sheets and safety operations manuals shall be present in the cab of the striping machine at all times. All required placards and warnings shall be in place and clearly legible at all times.

U. Use of Personal Entertainment Devices and Portable Phones. The Contractor shall ensure that workers are able to perceive hazards, are not distracted from their tasks, and are not creating hazard(s) through the use of personal entertainment devices. The Contractor shall ensure that portable phones, two-way radios, and other communication devices are used by workers for performing work tasks only. Flaggers shall use portable phones, two-way radios, and other communication devices only to communicate with other flaggers, workers or supervisors regarding flagging operations. Equipment operators shall use portable phones, two-way radios or other communication devices while actively operating equipment only for communicating with workers performing directly related work tasks. Truck drivers shall use hands free technology for all calls while driving within work zones. Portable phones, two-way radios, and other communication devices shall be equipped with hands-free technology whenever practicable. Workers shall not use personal entertainment devices with earphones such as radios, iPods, MP3 players, media players, or other personal listening devices while working.

Comment [cjt8]:
EI 08-017

107-06 INSURANCE.

~~—The Contractor shall procure and maintain, at its own expense and without expense to the State, insurance for liability for damages imposed by law, for the work covered by the contract, of the types and in the amounts hereinafter provided, covering all operations under the contract whether performed by it or its Subcontractors. Insurance shall be procured from insurance companies authorized to do such business in the State and shall be maintained until contract final acceptance by the State. Before commencing work, the Contractor shall furnish to the Commissioner a certificate or certificates of insurance, in form satisfactory to the Commissioner, showing that it has complied with this subsection, which certificate or certificates shall provide that the policies shall not be changed or canceled until thirty (30) days written notice has been given to the Commissioner. All policies supplied under the provisions of this Section shall be endorsed to provide for the above 30 day written notice of cancellation or change provisions. —The types of insurance are as follows:~~

~~**A. Workers' Compensation Insurance.** A policy covering the obligations of the Contractor in accordance with the provisions of the Workers' Compensation Law and the Disability Benefits Law, covering all operations under the contract, whether performed by it or its Subcontractor(s). The contract shall be void and of no effect unless the person or corporation making or executing same shall secure compensation and disability benefits coverage for the benefit of, and keep insured during~~

the life of said contract, such employees in compliance with the provisions of the Workers' Compensation Law (State Finance Law Section 142).

~~B. Liability and Property Damage Insurance.~~ Policies shall follow the current 1986 Insurance Services Office (ISO) format. Unless otherwise specifically required by special provision, policies shall not be amended or contain deductible clauses or coverage exclusions of any nature and shall have limits not less than:

~~Bodily Injury and Property Damage Liability Combined Single Limit~~

Each Occurrence	Aggregate
\$1,000,000	\$2,000,000

~~— For all damages arising during the policy period, insurance shall be furnished in the types (1.) through (6.) as described below. An umbrella type policy, dedicated to the contract, may be used to meet these limits.~~

~~1. a. Contractor's Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon the CONTRACTOR with respect to all work performed by it under the contract agreement;~~

~~b. Contractor's Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon EACH SUBCONTRACTOR with respect to all work performed by said Subcontractor under the contract agreement;~~

~~2. Owners Protective Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon The People of the State of New York, the State of New York, the Commissioner of Transportation, all employees of the Department of Transportation both officially and personally, any municipality in which the work is being performed, any public benefit corporation, railroad, public utility whose property or facilities are affected by the work, any consultant inspecting engineer or inspector working for or on the contract, and their agents or employees, with respect to all operations under the contract agreement by the Contractor or its Subcontractors, including omissions and supervisory acts of the State, municipality, public benefit corporation or consultant. Specifically, this includes, but is not necessarily limited to the parties listed in the Special Note entitled *Additional Insured Parties*. Failure to list a firm, organization or municipality, etc. does not eliminate the requirement to provide such coverage. — If the Contractor elects to use the same policy for more than one contract, it shall provide, with the insurance certificate, the Aggregate Limits of Insurance Endorsement (per contract) indicating the specific contract site and contract number;~~

~~3. Contractor's Protective Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon the Contractor with respect to all work under the contract agreement performed for the Contractor by Subcontractors;~~

~~4. Completed Operations Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon the Contractor and each Subcontractor arising out of that part of the work performed by each between the date of final cessation of the work and the date of final acceptance thereof;~~

~~5. Commercial General Liability Insurance. A policy issued to and covering the liability for damages imposed by law upon The People of the State of New York, the State of New York and the Commissioner of Transportation and all employees of the Department of Transportation both officially and personally, any municipality in which the work is being performed, any public benefit corporation, railroad, or public utility whose property or facilities are affected by the work, or any consultant inspecting engineer or inspector working for or on the project, and their agents or employees, with respect to temporarily opening any portion of the State construction project under this contract agreement, until the construction or reconstruction pursuant to the~~

~~contract agreement has been accepted by the State.— Specifically, this includes, but is not necessarily limited to the parties listed in the Special Note entitled *Additional Insured Parties*. Failure to list a firm, organization or municipality, etc. does not eliminate the requirement to provide such coverage. This coverage will not be required for contracts involving only turf establishment, landscaping, or traffic signals, which do not involve work on the roadway.~~

~~**6.— Automobile Liability and Automobile Property Damage Insurance.**— A policy covering all owned, non-owned and hired vehicles used in connection with the work covered by the contract documents, bearing, or required by NYS Motor Vehicle Law to bear, license plates under the circumstances for which they are being used.~~

107-06 INSURANCE. The Contractor shall procure, at its own sole cost and expense, and shall maintain in force at all times during the term of this contract including any extensions or renewals until Contract Final Acceptance, the policies of insurance covering all operations under the contract whether performed by it or its subcontractors as herein below set forth, written by companies authorized by the New York State Insurance Department to issue insurance in the State of New York and that have an A.M. Best Company rating of (A -) or better or approved by the Department. The Department may, at its sole discretion, permit the placement of policies with a non-authorized carrier or carriers upon request by the Contractor accompanied by the documentation required by 11 NYCRR §27.0 *et seq.*; provided that nothing herein shall be construed to require the Department to accept insurance placed with a non-authorized carrier under any circumstances. The Contractor shall deliver to the Department evidence of such policies as the Department deems necessary to verify that the required insurance is in effect.

A. Conditions Applicable to Insurance. All policies of insurance required by this agreement must meet the following requirements:

1. Coverage Types and Policy Limits. The types of coverage and policy limits required from the Contractor are specified in Paragraph B *Insurance Requirements* below. General liability insurance shall apply separately on a per-job or per-project basis.

2. Policy Forms. Except as may be otherwise specifically provided herein or agreed in writing by the Department, policies must be written on an **occurrence** basis. In the event that occurrence-based coverage is not commercially available, claims-made policy forms will be considered provided that, at minimum, it includes provisions that allow for (a) reporting circumstances or incidents that may give rise to future claims and (b) an extended reporting period of not less than three (3) years with respect to events that occurred but were not reported during the term of the policy.

3. Certificates of Insurance/Notices. Contractor shall provide a Certificate or Certificates of Insurance, in a form satisfactory to the Commissioner, before commencing any work under this contract. Certificates or transmittal correspondence shall reference the NYSDOT Contract D Number. Certificates shall be mailed to the:

**Office of Contract Management
New York State Department of Transportation
50 Wolf Rd.
Albany, NY 12232**

Unless otherwise agreed, policies shall be written so as to require that the policy will not be (i) canceled, (ii) materially changed or (iii) permitted to expire or lapse for any reason except upon thirty (30) days' prior written notice to the Department by Certified Mail, Return Receipt Requested at the address stated above. In addition, if required by the Department, the Contractor shall deliver to the Department within forty-five (45) days of such request a copy of any or all policies of insurance not previously provided, certified by the insurance carrier as true and complete. Certificates of Insurance shall:

- a. Be in the form provided by the Department (C218 or successor) unless the Department specifically approves a different form. The ACORD forms of Certificate of Insurance are not acceptable.
- b. Be signed by an authorized representative of the insurance carrier or producer and be acknowledged before a notary public.
- c. Disclose any deductible, self-insured retention, aggregate limit or any exclusion to the policy that materially changes the coverage required by the contract.
- d. Specify the Additional Insureds and Named Insureds as required herein.
- e. Refer to this Contract by number on the face of the certificate, and
- f. Expressly reference the inclusion of all required endorsements.

If at any time during the term of this contract, it shall come to the attention of the Department that required insurance is not in effect or that adequate proof of insurance has not been provided, the Department may, at its option:

- a. Direct the Contractor to suspend work and not re-enter the premises with no additional payment or extension of time due on account thereof, or
- b. May withhold further contract payments in accordance with Article 8 *No Payment Due to Contractor's Non-Compliance* of the contract agreement, or
- c. Treat such failure as a breach or default of the contract.

4. Additional Insureds. All insurance policies required by these specifications, except workers' compensation and professional liability shall be endorsed to provide coverage to **"The State of New York/New York State Department of Transportation, any municipality in which the work is being performed, any public benefit corporation, railroad, or public utility whose property or facilities are affected by the work, and any consultants working for or on the project, and their agents or employees"** with respect to any claim arising from the Contractor's Work under this contract or as a result of the Contractor's activities. The endorsement shall be effected by endorsement of the applicable policy using ISO form CG 20 10 11 85, CG 20 37 07 04, CG 20 33 07 98 when used in combination with CG 20 37 07 04, or CG 20 33 10 01 or a form(s) that provides equivalent coverage.

5. Primary Coverage. All insurance policies, excepting workers' compensation, shall provide that the required coverage shall be primary as to any other insurance that may be available to the Department for any claim arising from the Contractor's Work under this contract, or as a result of the Contractor's activities.

6. Waiver of Subrogation. As to every type and form of insurance coverage required from the Contractor, there shall be no right of subrogation against **the State of New York/New York State Department of Transportation, its agents or employees.** To the extent that any of Contractor's policies of insurance prohibit such a waiver of subrogation, Contractor shall secure the necessary permission to make this waiver.

7. Policy Renewal/Expiration. At least thirty (30) calendar days prior to the expiration of any policy required by this contract, evidence of renewal or replacement policies of insurance with terms no less favorable to the Department than the expiring policies shall be delivered to the Department in the manner required for service of notice in Paragraph A.3. *Certificates of Insurance/Notices* above.

8. Self-Insured Retention/Deductibles. Contractors utilizing self-insurance programs are required to provide a description of the program for Department approval. Collateralized deductible and self-insured retention programs administered by a third party may be approved. Except as may be specifically provided in the Contract Documents of a particular project, Contractor or third-party-administered insurance deductible shall be limited to the amount of the bid deposit or \$100,000.00, whichever is less. Security is not required if it is otherwise provided to an administrator for an approved risk management program. The Department will not accept a self-insured retention program without security being posted to assure payment of both the self-insured retention limit and the cost of adjusting claims. The Contractor shall be solely responsible for all claim expense and loss payments within any permitted deductible or self-insured retention. If the Contractor's deductible in a self-administered program exceeds the amount of the bid deposit, the Contractor shall furnish an irrevocable Letter of Credit as collateral to guarantee its obligations. Such Letter of Credit or other collateral as may be approved by Department must be issued by a guarantor or surety with an AM Best Company rating of (A -) or better. If, at any time during the term of this agreement, the Department, in its sole discretion, determines that the Contractor is not paying its deductible, it may require the Contractor to collateralize all or any part of the deductible or self-insured retention on any or all policies of insurance or, upon failure to promptly do so, the same may be withheld from payments due the Contractor.

9. Waiver of Indemnities. The Contractor waives any right of action it and/or its insurance carrier might have against the Department (including its employees, officers, commissioners, or agents) for any loss that is covered by a policy of insurance that is required by this contract. The Contractor waives any right of action it and/or its insurance carrier might have against the Department (including its employees, officers, commissioners, or agents) for any loss, whether or not such loss is insured.

10. Subcontractor's Liability Insurance. In the event that any portion of the work described in this contract is performed by an approved subcontractor, the insurance requirements of this Article shall be incorporated into the subcontract agreement. Subcontractor insurance requirements shall include the requirements for Workers' Compensation, Commercial General Liability, and, if applicable, Commercial Auto and/or Professional Liability. Excess or umbrella insurance is not required for subcontractors. Contractor shall require that Certificates of Insurance, meeting the requirements of the Department are provided to the Department documenting the insurance coverage for each and every subcontractor employed by them to do work under this contract.

B. Insurance Requirements. The types of insurance and minimum policy limits shall be as follows:

1. Workers' Compensation and Disability Insurance. As required by State Finance Law §142, the Contractor shall maintain in force workers' compensation insurance upon forms required by or acceptable to the Workers Compensation Board for all of Contractor's employees. Contractor shall also maintain disability insurance as required by the Disability Benefits Law of the State of New York.

2. Commercial General Liability Insurance. The Contractor shall maintain an occurrence form commercial general liability policy or policies insuring against liability arising from premises (including loss of use thereof), personal injury or death, advertising injury, liability insured under an insured contract (including the tort liability of another assumed in a business contract) occurring on or in any way related to the premises or occasioned by reason of the operations of Contractor. Such coverage shall be written on an ISO occurrence form (ISO Form CG 00 01 12 07 or a policy form providing equivalent coverage) in an amount of not less than \$1,000,000.00 per occurrence and not less than \$2,000,000.00 aggregate. Unless otherwise provided, the policy or policies of insurance providing the liability coverage shall include:

- a. Coverage for contractual liability assumed by the Contractor insured under an insured contract (including the tort liability of another assumed in a business contract).
- b. All insurance policies required by these specifications except workers' compensation and professional liability shall be endorsed to provide coverage to **“the State of New York/New York State Department of Transportation, any municipality in which the work is being performed, any public benefit corporation, railroad, or public utility whose property or facilities are affected by the work, or any consultant inspecting engineer or inspector working for or on the project, and their agents or employees”** using ISO form CG 20 10 11 85, CG 20 37 07 04, CG 20 33 07 98 when used in combination with CG 20 37 07 04, or CG 20 33 10 01 or a policy form or forms providing equivalent coverage.
- c. Products-Completed Operations Coverage, as provided in the General Liability Policy, or in certain instances through ISO form CG 26 11 09 99 or suitable equivalent.
- d. Where contract work will be performed by unregistered off-road equipment, Contractor shall provide documentation of a blanket Pollution Liability policy, or an endorsement to cover short-term pollution events, ISO form CG 04 33 10 01 or equivalent.
- e. Coverage for claims for bodily injury asserted by an employee of an additional insured and any Employer Liability Exclusion which may otherwise operate to exclude such coverage shall be voided in this respect.
- f. Explosion, Collapse and Underground Hazards coverage (“XCU”) (*for contracts that call for the performance of excavating, underground work, and/or the use of blasting equipment*).

3. Commercial Automobile Insurance including liability and required coverage for New York (*applicable to any project where automobiles or other vehicles will be employed to complete the work*). In the event that automobiles are used in connection with Contractor's business or operations with the Department, the Contractor shall maintain a commercial or other automobile policy or policies insuring against liability for bodily injury, death, or damage to property and other mandatory coverages, relating to the use, operation, loading or unloading of any of Contractor's automobiles (including owned, hired and non-owned vehicles) on and around the project. This should be ISO form CA 00 01 10 01, CA 00 01 01 87 or a policy form providing equivalent coverage along with mandatory New York endorsements. Coverage shall be in an amount of not less than \$1,000,000.00 each accident.

4. Umbrella or Excess Liability Insurance. The Contractor shall maintain an occurrence form umbrella liability policy or policies insuring against liability arising from premises (including loss of use thereof), operations, independent Contractors, products-completed operations, personal injury and advertising injury, and liability insured under an insured contract (including the tort liability of another assumed in a business contract) occurring on or in any way related to the premises or occasioned by reason of the operations of Contractor or arising from automobile liability as described above. Such coverage shall be written on an ISO occurrence form CU 00 01 12 07 or a policy form providing equivalent coverage. In the event that umbrella coverage is unavailable, equivalent excess coverage may be substituted. The minimum required limits for the umbrella/excess coverage shall be sufficient to provide a total of not less than \$5,000,000.00 per occurrence/ aggregate.

5. Special Protective and Highway Liability Policy. The Contractor shall maintain, separate and apart from its umbrella policy, a policy issued to and covering the liability of the People of the State of New York, The State of New York, the Commissioner of Transportation, all employees of the Department of Transportation both officially and personally, any municipality in which the work is being performed, any public benefit corporation, railroad, or

public utility whose property or facilities are affected by the work, or any consultant inspecting engineer or inspector working for or on the project, and their agents or employees, against damages that the insureds may be held legally liable to pay for property damage, personal injuries, or death that is caused by any occurrence that takes place within any location where work is to be or is being performed by Contractor, including at the location of any of the work. This should be ISO form CG 00 14 12 or a policy form providing equivalent coverage along with mandatory New York endorsements. Coverage shall be in an amount of not less than \$1,000,000.00 per occurrence and at least \$2,000,000.00 for each aggregate limit.

6. Contractor's Risks. The Contractor shall be responsible for obtaining any insurance it deems necessary to cover its own risks, including without limitation: (a) business interruption, such as gross earnings, extra expense, or similar coverage, (b) personal property, and/or (c) automobile physical damage and/or theft. In no event shall the Department be liable for any damage to, or loss of, personal property, or damage to, or loss of, an automobile that is covered by a policy of insurance that is required by this agreement, even if such loss is caused by the negligence of the Department.

7. Builders' Risks Policy. *(applicable to projects that call for the construction of any "Structure" or building, including, but not limited to pump stations and in connection with such projects, only to the extent of the value associated with such construction).* The Contractor shall procure and maintain a Builder's Risk policy in a form such as ISO form CP 00 20 10 90 or a policy form providing equivalent coverage, covering the perils insured under and including the special causes of loss form, including collapse,. Subject to the allowances stated in Paragraph A.8. *Self-Insured Retention/Deductibles*, above, the deductible not to exceed the amount of the bid deposit or \$100,000.00, whichever is less, covering the total value of work performed and equipment, supplies and materials at the location of the Work as well as at any off-site storage locations. Policy shall cover the total value of structures and buildings, supplies and materials at the location of the Work as well as at any off-site storage locations. Sub-limits for loss caused by Flood and Earthquake are acceptable. The policy shall cover the cost of removing debris, including demolition as may be legally necessary by the operation of any law, ordinance or regulation, and for loss or damage to any owned, borrowed, leased or rented capital equipment, tools, including tools of their agents and employees, staging towers and forms, and property of Department held in their care, custody and/or control. Such policy shall name the Contractor as insured, and The People of the State of New York, and Subcontractors as additional insureds.

8. Professional Liability/ Errors and Omissions. *(applicable to professional services requiring the signature, stamp or certification of a licensed professional, including, without limitation, erection plans, demolition plans, containment plans, coffer dams, and temporary sheeting.)* The Contractor shall maintain at its own expense or shall require to be maintained, such insurance as is customary to compensate Department for any claims or losses that occur because of Contractor's errors, omissions malpractice or breach of professional obligations. Such policy or policies may be written on a claims-made form so long as coverage is maintained to be in effect to cover claims arising from the performance of services under this contract. Said coverage may be subject to a deductible or self-insured retention level of no more than \$250,000.00 subject to approval by Department, such approval not to be unreasonably withheld, except that it is also agreed that Department may withhold payment for services rendered under this contract in the event, and to the extent of any deductible in the event that a claim is asserted. Such coverage shall be written on a claims-made basis (or a policy form providing equivalent coverage) in an amount of no less than \$5,000,000.00 per claim and not less than \$5,000,000.00 in the aggregate.

9. Railroad Protective Liability Insurance. *(applicable to any Work Affecting Railroads as described in §105-09.)* The Contractor shall maintain at its own expense railroad protective liability policy of insurance in the name of the affected railroad and with limits of coverage as specified in the Special Notes on Railroad Insurance, or if no limits of coverage are specified, the

limits shall be not less than \$5,000,000.00 combined Bodily Injury Liability and/or Property Damage for each occurrence with a \$10,000,000.00 Aggregate Limit applying separately to each annual period. Said policy shall be subject to the approval of the railroad and comply with 23 CFR 646 Subpart A.

Comment [c9]:
EI09021

107-07 PROTECTION OF UNDERGROUND FACILITIES.

The Contractor shall use the necessary precautions to prevent damage to pipes, conduits, and other underground facilities. All costs associated with verification of the location of underground facilities pursuant to 16 NYCRR 753 *Protection of Underground Facilities*, as amended, shall be included in the prices bid for the respective contract items involved unless separate payment is otherwise provided for in the contract. The Contractor shall provide access to Public Service Commission personnel to examine and inspect excavation and demolition methods used within 15 feet in any direction of any underground facility.

A. One-Call. Pursuant to 16 NYCRR 753 *Protection of Underground Facilities*, prior to non-emergency excavation, subsurface exploration of any kind, or installation below existing grade, including, but not limited to; digging, auguring, backfilling, boring, drilling, excavation, grading, jack hammering, pipe jacking, pavement milling, pile driving, plowing in, pulling in, sawcutting, tree root removal, trenching, tunneling and the installation of guiderail posts, sign posts, fence posts or underground conduit, the One-Call notification system shall be notified of the date and location of the proposed work. The Contractor shall contact the One-Call notification system serving the area a minimum of 2 days and a maximum of 10 days, not including the date of the call, prior to work. The Contractor shall mark proposed locations of excavation, or other activity listed above, with white paint, white stakes or other indications as agreed to by the Utilities to facilitate the work of underground utility designation. Utilities that do not belong to the One-Call notification system shall be contacted separately. The Town, City or County may be contacted to obtain a list of Utilities. If additional work is required, and staking, marking or other designation has been lost, the Contractor shall contact the One-Call notification system for subsequent designation. If an underground facility has been designated, but the Contractor cannot physically locate the facility, the Utility shall be notified, so that the designation can be verified. If an unmarked or unknown facility is discovered during the course of the Contractor's operations, the Utility or suspected Utility shall be notified. If the owner cannot be determined, the One-Call notification system shall be notified. The Contractor shall support and protect from damage all exposed underground facilities. The Contractor shall notify the Engineer of any accidental contact with or potential damage to any underground facility, regardless of whether the damage is visible or not.

The Contractor shall provide to the Engineer, in writing, the information provided to the One-Call notification system, or the Utility if it is not a One-Call notification system member, and the control number issued for each call placed to request designation of underground facilities. The Contractor shall protect and preserve designations until no longer required for safe work near the underground facility.

The Contractor shall identify and provide to all forepersons and equipment operators, a list of emergency phone numbers for each Utility having facilities within the contract limits. Supervisors shall periodically review the location of underground facilities with all workers who are subject to exposure, including new employees. If the Contractor fails to notify the One-Call notification system or a non-member Utility prior to excavation or activity listed above, a Stop Work Order will be issued in accordance with the provisions of §105-01 *Engineer's Authority*. Prior to lifting the Stop Work Order, the Department will consider convening a show cause meeting, at its convenience, to consider possible worker dismissal in accordance with §105-02 *Character of Workers* or contract termination in accordance with Article 11 *Right to Suspend Work and Cancel Contract* of the contract agreement.

B. Verification. Pursuant to 16 NYCRR 753 *Protection of Underground Facilities*, the Contractor shall verify precise location, size, depth and direction of run of an underground facility or its encasement, by hand shovel or vacuum excavation, prior to the use of powered equipment or the installation of any proposed work, including the projected line of a trenchless installation such as boring or drilling, within the tolerance zone. Powered equipment may be used to remove pavement

or masonry within the tolerance zone, but only to the depth of such pavement or masonry. Powered equipment shall not be used within 4 inches of the verified location of an underground facility.

C. Contact or Damage. Pursuant to 16 NYCRR 753 *Protection of Underground Facilities*, the Contractor shall, in the event of contact or damage to an underground facility, immediately notify the Utility and the Engineer, suspend excavation or demolition in the immediate vicinity of the contacted or damaged facility and take such emergency actions as are warranted to protect all endangered persons to the best of its ability.

D. Pressure Pipes. Pressure pipes shall not be pressurized without being adequately restrained against movement, and no personnel shall be allowed in a trench or area containing a pressure pipe during initial pressurization until the pipe has been fully pressurized. Particular attention shall be paid to fittings and bends that create a thrust, which, if improperly restrained, may cause the pipe joints to separate and injure nearby personnel.

E. Quality Level Designations. The quality of information gathered about underground utilities is shown on contract plans using a Quality Level Designation. The Quality Level Designation may be different within the same area for different underground utilities, depending on the accuracy and availability of information. Below are the Quality Level Designation definitions:

1. Quality Level A. Quality Level A is the highest degree of accuracy. The information shown on the plans has been obtained by the actual exposure (or verification of previously exposed and surveyed utility facilities) of subsurface utilities, using (typically) minimally intrusive excavation equipment to determine their precise horizontal and vertical positions, as well as their other utility facility attributes. Shown on contract plans as QLA.

2. Quality Level B. Quality Level B is the second highest degree of accuracy. The information shown on the plans has been obtained through the application of appropriate surface geophysical methods (i.e., underground cameras, radar, sonar, tone outs, etc.) to identify the existence and appropriate horizontal position of subsurface utility facilities. Quality Level B data are reproducible by surface geophysics at any point of their depiction. The information was surveyed to applicable tolerances and reduced onto the plans. No excavations were performed. Shown on contract plans as QLB.

3. Quality Level C. Quality Level C is the third highest degree of accuracy. The information shown on the plans has been obtained by surveying and plotting visible above-ground utility features and by using professional judgment in correlating this information to Quality Level D information. Shown on contract plans as QLC.

4. Quality Level D. Quality Level D is the lowest degree of accuracy. The information shown on the plans was derived solely from existing NYSDOT and/or utility company records or recollections. Shown on contract plans as QLD.

107-08 PROTECTION AND RESTORATION OF PROPERTY AND LANDSCAPE.

The Contractor shall protect and preserve all public and private property, including all existing vegetation, existing landscape features, and monuments within, along, and adjacent to the highway right of way. The Contractor shall use every precaution necessary to prevent damage, injury, pollution or destruction; shall protect all trees and other woody plants which are to remain; and shall take special care to protect the natural vegetation and surroundings including all natural drainageways, waterways, wetlands, woods and fields. The Contractor shall store materials in such a manner as to prevent leaching which would be injurious to water, soils, and plants.

A. Within the Right of Way. Before beginning the use of any area within the right of way, but not within the limits of disturbance shown in the contract documents, the Contractor shall obtain the written approval of the Engineer. Before beginning the use of any area within the right of way, but

outside the contract limits, the Contractor shall obtain the written approval of the Department through modification of the contract limits by order-on-contract or the issuance of a highway work permit.

Approval will not be given if the area is not suitable for acceptable restoration or if serious or permanent environmental damage is foreseeable. This applies to areas such as, but not limited to: borrow areas, spoil areas, equipment and/or material storage areas, haul roads, batching areas, water points, shop areas and all similar areas.

Where a contract pay item for turf establishment is not included in the contract, disturbed earth areas within the work limits shall be graded and seeded as specified for the standard turf establishment item. The cost of this work shall be included in the prices bid for the various items in the contract and no separate payment will be made therefore.

B. Outside the Right of Way. The Contractor shall notify the Engineer of the use of any specific area outside the right of way before work in any such area is begun, except areas which have been or are being used by the Contractor as its established and permanent headquarters, equipment storage sites or to commercial borrow sources, commercial gravel pits, commercial quarries, and all similar areas. The Contractor shall provide the Engineer with a copy of any permit application or notice of intent, without attachments.

In accordance with the SPDES General Permit for Stormwater Discharges from Construction Activity, any construction activity that results in a soil disturbance of more than 1 acre on a single property will require SPDES permit coverage from the NYS Department of Environmental Conservation (NYSDEC). When SPDES permit coverage is required, the property owner, as the "Operator" must develop and implement a NYSDEC approved stormwater pollution prevention plan (SWPPP) and conduct required periodic inspections until the permit coverage is terminated.

In accordance with the Mined Land Reclamation Law, (Environmental Conservation Law Article 23, Title 27), all borrow pits and aggregate sources outside of the State right of way, where more than 1,000 tons or 750 cubic yards, whichever is less, of minerals are removed from the earth within any twelve successive calendar months, require mining permits obtained from NYSDEC. When a mining permit is required, the Contractor, in addition to complying with restoration requirements for all areas as stated below, may be required by the Engineer to meet pertinent standards contained in the law and/or 6 NYCRR Part 420 et. seq.

Where borrow pits result in the formation of ponds or low areas intermittently filled with water, the Contractor shall furnish the Engineer with a copy of its agreement with the landowner permitting the use of such areas. If such an area is within sight of any highway, the Regional Director's written approval shall be obtained prior to the removal of borrow from such a location. If such approval is not granted, material for use on the contract or for any other State contract may not be removed from the area. If the Contractor removes material from such an area without the written approval of the Regional Director, payment will not be made for any item of work in which the material has been used. Grading plans may be required for such areas and due consideration given to the appearance of the areas if they are visible from any highway.

C. Restoration. All areas disturbed by the Contractor shall be restored to a pleasing and acceptable condition, particularly those areas within sight of the finished highway or any other highway. All such areas shall present a pleasing appearance to travelers on any highway. Where deemed necessary by the Engineer, the Contractor shall submit a grading plan. Grading plans shall include the sequence of operations, the erosion and sediment controls, final slopes and surface restoration details.

Because the extent of such areas and the use and treatment during construction is within the discretion of the Contractor, within the limitations and requirements outlined, no direct payment will be made for any labor, material or equipment necessary for the restoration of these areas. The cost of the work shall be included in the amount bid for other items of work. Work shall be done in general accordance with the Department's specifications for similar items of work.

The Contractor shall repair all injuries to woody plants which are to remain by approved horticultural methods; and shall scarify the compacted soil and regrade so as to restore the property to a natural condition. Where the soil over the root area of trees to be preserved has been compacted, it

shall be restored by proper cultivation to a condition to permit the entrance of water and the proper aeration of roots.

In general, the restoration of disturbed areas shall include:

1. The removal of all equipment and parts, junk, rubbish, excess materials and debris of all kind;
2. Clean up as required, grading as shown on a grading plan if required; or graded so as to blend into the surrounding ground forms;
3. Scarification of yards, batch sites, haul roads, etc., to the depth necessary to support vegetation;
4. The removal of pavement or granular surfacing from, and regrading of, temporary roads or areas;
5. The repair/removal of damaged trees;
6. The fertilizing, seeding and mulching of disturbed areas;
7. Grading the slopes of excavated areas to a stable condition, but in no case shall earth cut faces be left steeper than one (1) vertical on one and one-half (1.5) horizontal. All rock cut slopes shall be scaled to remove any loose or unstable rock.

The restoration of disturbed areas shall be accomplished prior to contract final acceptance. The work of restoring Contractor's work areas (storage, batching, equipment, shop areas, etc.) may be done after contract final acceptance, but shall be completed prior to execution of the final agreement.

~~107-09 DAMAGE.~~

~~—All damage, direct or indirect, of whatever nature resulting from the performance of the work or resulting to the work during its progress from whatever cause, including omissions and supervisory acts of the State, shall be borne and sustained by the Contractor, and all work shall be solely at its risk until it has been finally inspected and accepted by the State except that:~~

~~**A. Damage by Public Traffic.** Payment shall be made to the Contractor for repair or replacement of any permanent element of the highway which is completed to the stage of serving its intended function and is subsequently damaged by accident by public traffic. The Contractor must supply satisfactory evidence that such damage was caused by a public traffic accident and not by vandalism or by the Contractor's equipment. Satisfactory evidence shall generally be limited to: accident reports filed with the NYS Department of Motor Vehicles, police agencies or insurance companies; statements by reliable, unbiased eye witnesses; or identification of the vehicle involved in the accident. Physical evidence that the damage was caused by a motor vehicle (such as tire marks or broken headlight glass) will not be sufficient unless it can be shown that the damage was not caused by the Contractor's vehicles or by vandalism.~~

~~—Work for which there is a bid item will be paid for at the unit price for that item. Work for which there is no bid item will be paid for at an agreed price or by means of force account. Payment will not be made for repair or replacement in any way connected with untimely failure of any portion of the highway under public traffic, and the determination regarding this matter shall be made by the Regional Director, taking into consideration the normal life and the amount of normal wear of the element involved. This provision does not relieve the Contractor of the responsibility of maintenance and protection of traffic for the contract or the responsibility of having wholly complete and acceptable work at the time of final inspection and contract acceptance. Payment for such damage shall be made only after the Contractor has demonstrated to the satisfaction of the Regional Director that it had made every reasonable effort to collect the costs from the person or persons responsible for damage.~~

~~—The Contractor shall not be responsible for damages resulting from faulty designs as shown in the contract documents nor damages resulting from willful acts of Department officials or employees and nothing in this paragraph or contract shall create or give to third parties any claim or right of action against the Contractor or State beyond such as may legally exist irrespective of this paragraph or contract.~~

~~**B. Damage by Occurrence.** In the event that damage to the work in progress is caused by an Occurrence, as hereinafter defined, and to the extent that such damage has been determined by the Department to be beyond that which may be anticipated from heavy storms, and also to the extent that such damage is not reimbursable by insurance carried by the Contractor, the Contractor may apply to~~

the State to pay or participate in the cost of repairing the damage to the work, unless such damage is caused by the Contractor's action or inaction or the Contractor's means and methods of construction. At the sole discretion of the Department, terminate the contract may be terminated and the Contractor relieved of further obligation to perform the work, subject to the following:

1. Occurrence. Occurrence shall include only those floods, droughts, tidal waves, fires, hurricanes, earthquakes, windstorms or other storms, landslides or other catastrophes when such occurrences or conditions and effects have been proclaimed a disaster or state of emergency by the President of the United States, or the Governor of New York State, or the Federal Highway Administrator, or the chief executive of a county or city.

2. Application by Contractor. The Contractor's written request for the State to pay or participate in the cost of rebuilding, repairing, restoring or otherwise remedying damage to the work caused by an occurrence shall be submitted to and approved by the Commissioner before performing any work other than emergency work, including emergency work necessary to provide for passage of public traffic.

C. Obligation to Indemnify by the Contractor. The Contractor shall indemnify and save harmless the State, except as prohibited by law, any municipality in which the work is being performed, and/or any public benefit corporation, railroad, or public utility whose property or facilities are affected by the work, from suits, claims, actions, damages and costs, of every name and description resulting from the work under its contract during its prosecution and until the acceptance thereof. The Contractor and any assigns, heirs, or successors in interest shall also indemnify and save harmless, except as prohibited by law, the consultant inspecting engineer or inspector working for the State relative to the project from suits, claims, actions, damages and costs involving personal injury and property damage resulting from the Contractor's work under the contract during its prosecution and until the acceptance thereof. The State may retain such monies from the amount due the Contractor as may be necessary to satisfy any claim for damages recovered against the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the work or consultant inspecting engineers or inspectors working for the State relative to the project. The Contractor's obligation under this paragraph shall not be deemed waived by the failure of the State to retain the whole or any part of such monies due the contractor, nor where such suit, action, damages and/or costs have not been resolved or determined prior to release of any monies to the Contractor under the contract, nor shall such obligation be deemed limited or discharged by the enumeration or procurement of any insurance for liability for damages imposed by law upon the Contractor, Subcontractor or the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the work, or any consultants or contract engineers working for the State relative to the project.

—The Contractor has the obligation, at its own expense, for the defense of any action or proceeding which may be brought against the parties specified in this Section. This obligation shall include the cost of attorney fees, disbursements, costs and other expenses incurred in connection with such action or proceeding.

—Such obligation does not extend to those suits, actions, damages and costs of every name which arise out of the sole negligence of the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the contract work, or any consultants or contract engineers working for the State relative to the project, their agents or employees, relative to the construction, alteration, or repair or maintenance of a building, highway or structure and appurtenances and appliances thereof including moving, demolition and excavating connected therewith.

D. Prompt Response to Claims by the Public. The Contractor's responsibility for the contract site applies to the full limits of the contract regardless of the extent or nature of contract work at a particular location. This obligation begins when the contract is awarded and continues until final acceptance of the work. The Contractor shall promptly address all written damage claims of the

~~public and, if not addressed directly, claims shall be promptly turned over to the Contractor's insurance carrier without prejudicing the validity of the claim. There should be an interval of no more than ten (10) working days between receipt of a written claim by the Contractor and receipt by the carrier. The Contractor and/or the Insurance Carrier are expected to investigate, determine and adjust such claims promptly and fairly with notice to the Engineer. The Engineer will monitor claims by the public. If the Contractor fails to provide satisfactory resolution through a timely claims adjustment process or denies the claim without proper cause and justification, the Department may invoke Article 8 of the contract or utilize other remedies.~~

107-09 DAMAGE. All damage, direct or indirect, of whatever nature resulting from the performance of the work or resulting to the work during its progress from whatever cause, including omissions and supervisory acts of the State, shall be borne and sustained by the Contractor, and all work shall be solely at its risk until it has been finally inspected and accepted by the State except that:

A. Damage by Public Traffic. Payment shall be made to the Contractor for repair or replacement of any permanent element of the highway which is completed to the stage of serving its intended function and is subsequently damaged by accident by public traffic. The Contractor must supply satisfactory evidence that such damage was caused by a public traffic accident and not by vandalism or by the Contractor's equipment. Satisfactory evidence shall generally be limited to: accident reports filed with the NYS Department of Motor Vehicles, police agencies or insurance companies; statements by reliable, unbiased eye witnesses; or identification of the vehicle involved in the accident. Physical evidence that the damage was caused by a motor vehicle (such as tire marks or broken headlight glass) will not be sufficient unless it can be shown that the damage was not caused by the Contractor's vehicles or by vandalism.

Work for which there is a bid item will be paid for at the unit price for that item. Work for which there is no bid item will be paid for at an agreed price or by means of force account. Payment will not be made for repair or replacement in any way connected with untimely failure of any portion of the highway under public traffic, and the determination regarding this matter shall be made by the Regional Director, taking into consideration the normal life and the amount of normal wear of the element involved. This provision does not relieve the Contractor of the responsibility of maintenance and protection of traffic for the contract or the responsibility of having wholly complete and acceptable work at the time of final inspection and contract acceptance. Payment for such damage shall be made only after the Contractor has demonstrated to the satisfaction of the Regional Director that it had made every reasonable effort to collect the costs from the person or persons responsible for damage.

The Contractor shall not be responsible for damages resulting from faulty designs as shown in the contract documents nor damages resulting from willful acts of Department officials or employees and nothing in this paragraph or contract shall create or give to third parties any claim or right of action against the Contractor or State beyond such as may legally exist irrespective of this paragraph or contract.

B. Damage by Occurrence. The term "Occurrence" shall include only those floods, droughts, tidal waves, fires, hurricanes, earthquakes, windstorms or other storms, landslides or other catastrophes when such occurrences or conditions and effects have been proclaimed a disaster or state of emergency by the President of the United States, or the Governor of New York State, or the Federal Highway Administrator, or the chief executive of a county or city.

If damage to the work in progress is caused by an Occurrence, and to the extent that such damage has been determined by the Department to be beyond that which may be anticipated from heavy storms, and also to the extent that such damage is not reimbursable by insurance carried by the Contractor, the Contractor may apply to the State to pay or participate in the cost of repairing the damage to the work, unless such damage is caused by the Contractor's action or inaction or the Contractor's means and methods of construction.

The Contractor's written request for the State to pay or participate in the cost of rebuilding, repairing, restoring or otherwise remedying damage to the work caused by an occurrence shall be

submitted to and approved by the Commissioner before performing any work other than emergency work, including emergency work necessary to provide for passage of public traffic.

At the sole discretion of the Department, the contract may be terminated and the Contractor relieved of further obligation to perform the work.

C. Obligation to Indemnify by the Contractor. To the fullest extent permitted by law, the Contractor shall indemnify and save harmless the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad, or public utility whose property or facilities are affected by the work, from suits, claims, actions, damages and costs, of every name and description arising from the work under its contract during its prosecution and until the final acceptance thereof. The Contractor and any assigns, heirs, or successors in interest shall also indemnify and save harmless, to the fullest extent permitted by law, any consultant working for or on the project from suits, claims, actions, damages and costs involving personal injury and property damage arising from the Contractor's work under the contract during its prosecution and until the final acceptance thereof. The State may retain such monies from the amount due the Contractor as may be necessary to satisfy any claim for damages recovered against the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the work, or consultants working for the State on or for the project. The Contractor's obligation under this paragraph shall not be deemed waived by the failure of the State to retain the whole or any part of such monies due the Contractor, nor where such suit, action, damages and/or costs have not been resolved or determined prior to release of any monies to the Contractor under the contract, nor shall such obligation be deemed limited or discharged by the enumeration or procurement of any insurance for liability for damages imposed by law upon the Contractor, Subcontractor or the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the work, or any consultants working for the State on or for the project.

The Contractor has the obligation, at its own expense, for the defense of any action or proceeding which may be brought against the parties specified in paragraph §107-09 C. *Obligation to Indemnify by the Contractor*. This obligation shall include the cost of attorneys' fees, disbursements, costs and other expenses incurred in connection with such action or proceeding.

Such obligation does not extend to those suits, actions, damages and costs of every name that arise out of the sole negligence of the State, any municipality in which the work is being performed, and/or any public benefit corporation, railroad or public utility whose property or facilities are affected by the contract work, or any consultants working for the State, their agents or employees, relative to the construction, alteration, or repair or maintenance of a building, highway or structure and appurtenances and appliances thereof including moving, demolition and excavating connected therewith.

D. Prompt Response to Claims by the Public. The Contractor's responsibility for the contract site applies to the full limits of the contract regardless of the extent or nature of contract work at a particular location. This obligation begins when the contract is awarded and continues until contract final acceptance. The Contractor shall promptly address all written damage claims of the public and, if not addressed directly, claims shall be promptly turned over to the Contractor's insurance carrier without prejudicing the validity of the claim. There should be an interval of no more than ten (10) work days between receipt of a written claim by the Contractor and receipt by the carrier. The Contractor and/or the Insurance Carrier are expected to investigate, determine and adjust such claims promptly and fairly with notice to the Engineer. The Engineer will monitor claims by the public. If the Contractor fails to provide satisfactory resolution through a timely claims adjustment process or denies the claim without proper cause and justification, the Department may invoke Article 8 *No Payment Due to the Contractor's Non-Compliance* of the contract or utilize other remedies.

Comment [c10]:
EI09021

107-10 MANAGING SURPLUS MATERIAL AND WASTE.

The Contractor shall manage all surplus materials and waste generated in the performance of the contract in accordance with applicable federal, state, and local laws and regulations. Nothing herein is

§107

intended to prevent the Contractor from removing surplus materials or waste to appropriate off-site locations for beneficial reuse, recovery, or recycling purposes. The Contractor is encouraged to reuse, salvage or recycle materials to the maximum extent possible. Surplus or used materials generated from Department contracts that are easily recognizable, maintain their physical properties, are easily separated and transported, and have value as commodities are often recycled. These include metals (steel, iron, etc.), recycled asphalt pavement (RAP) in the form of chunks or millings, and recycled portland cement concrete aggregate (RCA). Surplus and used materials, unless identified otherwise, become the property of the Contractor. In accordance with 6 NYCRR 371.1(e)(1)(xiii) excluded scrap metal is not solid waste when being recycled.

Waste Management shall mean the collection, transportation, transfer, processing, recovery, storage, reclamation, treatment, handling and disposal of waste whether performed directly by the Contractor or others. Unless otherwise noted in the contract documents, all materials or substances that are spent, useless, worthless, or in excess to the Department, including materials generated on-site by the Department's contract supervision and inspection activities, are covered by this subsection.

Unless specifically noted in the contract documents, it is not guaranteed that placement of surplus materials or spoil will be allowed within the right of way. Payment for managing surplus material and solid waste shall be included in the various contract pay items. The absence or unavailability of disposal areas on the contract site or the refusal of a permitted solid waste management facility to accept waste will not be the basis for a dispute for additional compensation for the disposal of wastes.

A. Excess Soil and Rock. Excess soil and rock may be generated by construction activities associated with Department contracts. Excess soil and rock may be presumed uncontaminated absent records, existing data, or knowledge/observation to the contrary. These materials may be excess because the quantity available exceeds the quantity required, or they do not have the engineering properties required for use, or they may not be of economic value in the current location, such as when the cost to transport the material approaches or exceeds its sale value. Provided these materials are uncontaminated, in accordance with 6 NYCRR 360-1.15(b)(7) they are not considered waste when used as fill material. These materials may be sold ("placed in commerce") to a consumer and the consumer is responsible for its use/placement.

B. Spoil. Spoil may include excess soil and rock, and contains recognizable, uncontaminated concrete (including incidental pavement markings), asphalt pavement (including incidental pavement markings), brick, glass or soil materials generated by the cleaning of drainage ditches, culverts, storm sewers, catch basins or related appurtenances. Reinforcing steel embedded in concrete is considered an incidental metal and is included within the definition of concrete. Spoil may be presumed uncontaminated absent records, existing data, or knowledge/observation to the contrary. Spoil shall not be pulverized, shredded, or otherwise processed such that the individual waste components are rendered unrecognizable. Provided spoil is uncontaminated, in accordance with 6 NYCRR 360-1.15(b)(11) these materials are not considered waste when placed in commerce for service as a substitute for conventional aggregate.

Spoil areas for the disposal of excess soil and rock and spoil shall be established and restored in accordance with §107-08 *Protection and Restoration of Property and Landscape*. Excess soil and rock and spoil may be disposed of within the right of way whenever possible to flatten embankment side slopes, or may be disposed of in other locations within the right of way approved by the Engineer, but is not subject to the provisions governing lift placement and compaction. The Department makes no assurance that appropriate spoil areas within the right of way will be available for any individual contract. If no spoil area is available within the right of way, the Contractor shall dispose of these materials elsewhere, subject to appropriate environmental and land use regulations. Excess soil and rock and spoil may be disposed of at a location outside the right of way that takes no compensation, fee or other form of consideration, exempt from permit requirements, in accordance with 6 NYCRR 360-7(b)(1), between the hours of sunrise and sunset.

C. Construction and Demolition Debris. In accordance with 6 NYCRR 360-1.2(b)(38), Construction and demolition (C&D) debris is uncontaminated solid waste resulting from land clearing and from the construction, remodeling, repair and demolition of utilities, structures, and roads. C&D

debris may include excess soil and rock or spoil, and includes but is not limited to: wood (including painted, treated and coated wood and wood products), land clearing debris, plumbing fixtures, electrical wiring, electrical components containing no hazardous liquids, nonfriable asbestos, wall coverings, plaster, drywall, roofing shingles and other roof coverings and pipes or metal attached to or embedded in these waste materials. C&D debris shall not be pulverized, shredded, or otherwise processed such that the individual waste components are rendered unrecognizable. C&D debris shall be disposed of in an permitted C&D waste management or processing facility. Nonfriable asbestos shall be disposed of at permitted C&D waste management facility. If a C&D waste facility is not available, C&D debris may be disposed of at a solid waste facility.

Unadulterated wood chips and mulch used for mulch, landscaping, or erosion control purposes are not solid waste. Trees, stumps, wood chips and yard waste generated from activities within the right of way may be disposed of in spoil areas within the right of way only, but are not subject to the provisions governing lift placement and compaction. Spoil areas shall be established and restored in accordance with §107-08 *Protection and Restoration of Property and Landscape*. These materials may also be disposed of at a permitted C&D or solid waste management facility.

In Nassau and Suffolk Counties all C&D debris shall be disposed of only in a C&D landfill or processing facility permitted by the NYS Department of Environmental Conservation (NYSDEC). In addition to the requirements of these specifications, no on-site disposal shall take place in these counties without appropriate notice to the Regional Office of the NYSDEC.

Within the Adirondack Park, construction and demolition debris shall only be deposited in accordance with additional requirements of the Adirondack Park Agency.

D. Non-Hazardous Solid Waste. Non-hazardous solid waste includes, but is not limited to: tires, office trash, garbage, roadside litter and street sweepings. The Contractor may collect and store non-hazardous solid waste on the contract site in transfer containers or other appropriate containers pending transportation to a legally permitted solid waste management facility. The Contractor shall meet the following conditions:

- Waste management activities shall be controlled to prevent odors and other nuisance conditions.
- Putrescible solid waste shall be removed when transfer containers are full, or weekly, whichever comes first.
- Non-putrescible solid waste may be collected and stored on the site in a transfer or other appropriate container not longer than 45 days.

E. Non-Hazardous Industrial Waste. Non-hazardous industrial waste includes, but is not limited to: asbestos, pavement marking waste, contaminated soil, empty drums and empty fuel tanks. These wastes require disposal at permitted solid waste management facilities or may be used in applications that have received generic or case-specific beneficial use determinations from NYSDEC. A waste transporter permitted by NYSDEC is required for transport of over 500 pounds of waste in a single load to a disposal facility.

1. Asbestos. Friable and nonfriable asbestos containing materials (ACM) shall only be handled or packaged for transport by a NYS Department of Labor licensed contractor using certified personnel. Friable asbestos waste shall only be transported by a permitted waste transporter under a waste shipment record and disposed of at a permitted waste management facility approved to accept friable asbestos. Non-friable asbestos shall be transported and disposed of as C&D debris.

2. Pavement Marking Wastes. Pavement marking wastes, including millings from the localized removal of only pavement markings and not surface milling, including the pavement material and debris containing the removed markings generated by cleaning and removal operations shall be disposed of as non-hazardous industrial solid waste, at a permitted solid waste management facility, typically a municipal landfill. Pavement marking waste should be collected by typical construction methods such as sweeping and/or vacuuming.

Solid waste management facilities may question whether pavement marking wastes are regulated hazardous wastes because yellow pavement marking products may contain lead and chromium in the pigments. Testing by the Department (toxicity characteristic leaching potential

(TCLP)) of yellow pavement marking waste as well as the dried pure paint samples indicated that although it contained lead and chromium, it did not meet the regulatory limit for classification as a hazardous waste and was therefore considered a non-hazardous industrial waste.

3. Contaminated Soil. Soil contaminated with petroleum or other non-hazardous materials shall be disposed of as non-hazardous industrial waste at a permitted solid waste management facility or used in applications that have received generic or case-specific beneficial use determinations from the NYSDEC.

4. Empty Drums or Containers that Previously Held a Known Hazardous Material.

In accordance with 6 NYCRR Part 371.1(h), drums and containers that have had the contents removed by common practices, have less than 1 inch of product residue on the bottom, and less than 3% of the original product are considered “empty” and non-hazardous, even if the material they previously contained would otherwise have been classified as a hazardous waste. This does not apply to drums or containers that held acutely hazardous wastes. Empty drums and containers shall be recycled or disposed of at a permitted waste management facility. Empty containers may be returned to the manufacturer, sent to a reconditioner or handled as scrap metal, cardboard, etc. and are exempt from waste transporter requirements when destined for such reuse.

F. Hazardous Waste. Hazardous wastes are those wastes that are specifically “listed wastes” per 6 NYCRR 371 and/or those that display hazardous wastes characteristics for ignitability, corrosivity, reactivity and/or toxicity.

1. Generator Status. Unless specifically noted otherwise in the contract documents, for all contacts that generate more than 220 pounds (100 kg) of hazardous waste per month, the Contractor shall comply with the regulations governing a Large Quantity Generator.

a. Conditionally Exempt Small Quantity Generator (CESQG). Federal and State hazardous waste regulations classify a CESQG as one that generates less than 220 pounds (100 kg) of hazardous waste per month and stores less than 2,200 pounds (1,000 kg) of hazardous waste.

b. Small Quantity Generator (SQG). Federal and State hazardous waste regulations classify an SQG as one that generates between 220 and 2,200 pounds (100 and 1,000 kg) of hazardous waste per month or stores between 2,200 and 13,200 pounds (1,000 and 6,000 kg) of hazardous waste.

c. Large Quantity Generator (LQG). Federal and State hazardous waste regulations classify an LQG as one that generates more than 2,200 pounds (1000 kg) of hazardous waste per month.

2. Hazardous Waste Handling Requirements. The Contractor shall meet the following hazardous waste requirements:

a. Waste shall be properly packaged, with a written description and labeled as hazardous.

b. Waste shall be inspected at least weekly while stored on site.

c. Waste shall be shipped by a permitted waste transporter with a hazardous waste manifest and required documentation.

d. Waste shall be disposed of at a permitted hazardous waste treatment storage and disposal facility (TSDF).

e. Waste shall be removed within 90 days after generation, unless a specific contract pay item requires removal sooner.

f. Hazardous waste shall be stored on the site of generation until manifested and shipped for disposal. The only exceptions for this are for CESQG wastes which may be temporarily relocated to non-permitted facilities.

g. Preparedness and prevention features and contingency planning and emergency procedures shall be developed as per 6 NYCRR 373-3.3 and 373-3.4, respectively.

h. Personnel must be trained in hazardous waste management procedures relevant to the positions in which they are employed.

- i. Appropriate security shall be provided for hazardous wastes while stored on site.

107-11 AIR QUALITY PROTECTION.

The Contractor shall schedule and conduct activities to minimize impacts to air quality and to prevent hazardous or objectionable air quality conditions within the contract limits and in areas adjacent to or affected by the work. The Engineer will suspend the performance of any construction activity that creates hazardous or objectionable air quality conditions until the unsatisfactory condition has been corrected.

A. Dust. The Contractor shall apply pro-active measures to prevent discharge of dust into the atmosphere that unreasonably interferes with the comfortable enjoyment of life and property or is harmful to plants or animals.

B. Burning. Any material generated by any activity for the development, modification and construction of any transportation facility shall not be burned on the contract site. This shall include but not be limited to products of land clearing and demolition.

C. Prevention. The Contractor shall employ appropriate protection techniques and/or systems to prevent hazardous or objectionable air quality conditions, particularly when conducting drilling, cutting, grinding, abrasive blasting or similar operations that impact air quality.

107-12 WATER QUALITY PROTECTION.

Water quality protection is a joint responsibility of the Department, as the owner and the holder of environmental permits, and the Contractor, acting as an agent for the Department. The Contractor shall protect all water resources within the contract limits and on lands adjacent to or affected by the work, and take measures to maintain water quality of receiving water bodies.

The Contractor shall schedule and conduct its work to minimize soil erosion, not cause or contribute to a violation of water quality standards and prevent sedimentation on lands adjacent to or affected by the work. Construction of temporary soil erosion and sedimentation control measures, temporary and permanent soil stabilization, construction of drainage facilities and performance of other contract work which will contribute to the control of erosion and sedimentation shall be carried out in conjunction with related construction operations. The area of disturbance at any one time by construction operations shall be kept to a minimum and shall not exceed the limits established in the contract documents or applicable permits.

Prior to the start of related construction, the Contractor shall review the erosion and sediment control plan included in the contract documents, and if necessitated by the Contractor's operations, modify the plan for compatibility with the Contractor's intended sequence of construction operations, to include, but not limited to: construction phases; contract milestones, installation of control measures, clearing and grubbing operations, earthwork, etc. The Contractor's modified erosion and sediment control plan shall be submitted to the Engineer for approval, along with a progress schedule for accomplishment of temporary and permanent erosion and sediment control work in accordance with §108-01 *Progress Schedule*.

Prior to the start of related construction, the Contractor shall submit for approval a proposed plan of erosion and sediment control and water pollution control on material storage areas, haul roads and borrow pits and a plan for disposal of surplus excavated materials within the right of way. The Contractor shall submit for approval the names of individuals who will be inspecting control measures, and a description of their qualifications. The Contractor's erosion and sediment control plan shall be prepared in accordance with Department specifications and the guidance contained in the *New York Guidelines for Urban Erosion and Sediment Control*, latest edition, printed by the Empire State Chapter, Soil and Water Conservation Society, c/o Cayuga County SWCD, 7413 County House Road, Auburn, New York 13021.

No related work shall be started until the erosion and sediment control plans and progress schedules have been approved by the Engineer. As conditions change during construction or work is not progressed in accordance with the schedule, the Contractor shall regularly submit a progress schedule update in accordance with §108-01 *Progress Schedule* and an updated erosion and sedimentation control plan, as necessary, for approval by the Engineer.

§107

The Contractor's operations shall be carried out in accordance with the approved erosion and sediment control plans, progress schedule, contract documents and permits. The Contractor shall be guided by, but not limited to, the following:

A. Permits. All applicable statutes, regulations, permits and approvals of the NYSDEC, other water quality management agencies and fish and wildlife agencies shall be complied with in the performance of the contract. Care shall be taken so as not to cause turbidity that will result in a visible contrast to the natural conditions of a waterway or impoundment, cause sedimentation or impair the waters for their best usages.

B. Borrow or Spoil Areas. Erosion and sediment control of borrow areas, spoil areas and construction roads shall be conducted both during and after completion of the work, to minimize soil erosion and not cause or contribute to a violation of water quality standards and prevent sedimentation on lands adjacent to or affected by the work.

C. Forging. Forging of waterways may require a permit from NYSDEC, and will not normally be allowed, therefore, temporary bridges or other structures shall be used where a waterway crossing is necessary. Unless otherwise approved in writing by the Engineer, the Contractor shall not ford or operate mechanized equipment in waterways.

D. Work Areas Adjacent to Waterways. When work areas, borrow areas, spoil areas or gravel pits are located in or adjacent to waterways or impoundments, such areas shall be separated from the rest of the waterway or impoundment by a dike or other barrier to prevent sediment from entering a flowing waterway or impoundment. Care shall be taken during the construction and removal of such barriers so as not to cause turbidity or sedimentation.

E. Removal of Temporary Obstructions. All waterways shall be cleared as soon as practicable of false work, piling, debris or other obstructions placed during construction operations and which are not a part of the finished work.

F. Maintenance. Ditches which are filled, or are partly or wholly inoperative, shall be cleaned and made operative before the Contractor stops work for each day, and shall be maintained in a satisfactory condition for the duration of the contract. All erosion and sedimentation control measures which have been displaced, or are partly or wholly inoperative, shall be repaired within 72 hours after required inspection, unless repairs are required sooner by the contract documents.

G. Water Discharges. Water containing sediment from aggregate washing, pump discharges or other operations shall be treated by filtration, settling basin or other means sufficient to prevent turbidity or sedimentation of receiving waterways. Turbid wash water or pump discharges shall not be allowed to enter waterways or impoundments.

H. Pollutants. Pollutants such as fuels, lubricants, bitumens, raw sewage and other harmful materials shall not be discharged into or near waterways and impoundments or into natural or manmade channels leading thereto.

The Contractor shall ensure that all controls are functioning in an effective manner and address all failures or other problems in a pro-active manner, immediately. If a situation comes to the Engineer's attention, the Engineer will inform the Contractor of unsatisfactory construction procedures and operations insofar as water quality management are concerned. The Engineer will also review the Contractor's compliance with state and federal permit conditions as they relate to water quality. If the unsatisfactory construction procedures and operations are not corrected in a timely manner, the Engineer will suspend the performance of any or all operations in accordance with §105-01, *Engineer's Authority* until the unsatisfactory condition has been corrected.

SECTION 108 - PROSECUTION AND PROGRESS

108-01 PROGRESS SCHEDULE.

All costs to create and update the progress schedule shall be solely the Contractor's obligation and will be at no additional cost to the State unless specifically provided for in other contract provisions.

A. Initial Progress Schedule. Within five days after date of commencement of work, or within such time as determined by the Regional Director, the Contractor shall prepare and submit to the Engineer for approval, a progress schedule showing the order in which the Contractor proposes to carry on the work, the date on which it will start the major items of work (including but not limited to excavation, drainage, paving, structures, mobilization, soil erosion and sediment control, etc.) and the critical features (including procurement of materials, plant and equipment) and the contemplated dates for completing the same. The purpose of the progress schedule is to ensure adequate planning and execution of the work and to evaluate the progress of the work. Any graphical representations shall be shown at a suitable scale to be legible and readable. Progress schedules shall, at a minimum, include the following items, as applicable: (a) major work items and activities to be performed; (b) seasonal weather limitations; and (c) phase duration or milestone events.

Such schedule may be utilized to facilitate the State's inspection and coordination of construction activities. Approval of the progress schedule shall not be construed to imply approval of any particular method or sequence of construction or to relieve the Contractor of providing sufficient materials, equipment and labor to guarantee completion of the contract in accordance with the contract documents. Approval shall not be construed to modify or amend the contract agreement or the date of completion therein.

B. Progress Schedule Updates. On a monthly basis, or at such intervals as directed by the Engineer, the Contractor shall adjust the schedule to reflect any major changes in the contract work, completion time, or both, and submit the adjusted schedule to the Engineer.

When requested by the Regional Director, the Contractor shall furnish weekly progress schedule updates indicating number of personnel, equipment type, and location and nature of the work to be performed.

If the work falls behind the progress schedule, the Contractor shall take such actions as necessary to improve its progress. If the Contractor is behind schedule any month, the Contractor shall indicate what measures it will take in the next thirty (30) days to put the work back on schedule so as to meet the contract completion date specified in the contract. In preparing the revised schedule, the Contractor shall consider increasing its work force, construction plant and equipment, the number of work shifts, etc. If the Engineer finds the proposed schedule not acceptable, he/she may require the Contractor to submit a new schedule. The Department may request that meetings be held by the Contractor at least on a monthly basis and be attended by the Engineer who shall monitor the Contractor's progress and performance.

C. Failure to Submit Progress Schedule. If the Contractor fails to submit a progress schedule within the time period described or any revision or update when required, the Engineer may withhold approval of contract payments pursuant to Article 8 *No Payment on Contractor's Non-compliance* of the contract agreement until such time as the Contractor submits the required progress schedule.

108-02 COMPLETION DATE.

The Contractor shall employ and supply a sufficient force of workers, materials and equipment and shall progress the work with such diligence so as to ensure completion of the work prior to the contract completion date.

In accordance with Article 4 Date of Completion of the contract agreement, the Contractor shall complete all work to be performed under the contract within the time stated in the contract agreement or within such extended time for completion as may be granted by the Commissioner. If the Contractor desires an extension of time, an Application For Extension of Completion Date shall be submitted to the Engineer sufficiently early for the Engineer to make a recommendation and forward the application so that it may be filed with the Regional Director at least 15 days prior to the contract completion date.

108-03 FAILURE TO COMPLETE WORK ON TIME.

For each calendar day, or any portion thereof, that any work remains uncompleted after the contract completion date specified in the contract agreement, Liquidated Damages and/or Engineering Charges from the contract completion date to the final date of completion of the work will be assessed against the Contractor. When specified in the contract documents, Liquidated Damages may also be assessed for each calendar day, or any portion thereof, for failure to complete certain portions of work or for failure to comply with requirements shown in the contract documents. Liquidated Damages will be assessed not as a penalty, but as liquidated damages; provided however that due account shall be taken of any adjustment of the contract time for completion of the work as provided for elsewhere in the specifications.

A. Engineering Charges. Engineering Charges include all appropriate engineering and inspection expenses incurred by the State, its consultants and inspection agencies, and by railroad companies.

Engineering Charges will be assessed in cases where the work has been unduly delayed by the Contractor because of unwarranted reasons, inefficient operation, or for any other reason for which the Department determines the Contractor to be responsible. Reasonable time necessary for reviews of shop drawings by the State or its agents, for changes or additions to the work to meet field conditions which do not significantly affect the scheduled completion of the contract, delays incurred by seasonal and weather limitations, localized labor actions and shortages of supplies or materials, and other situations which should be anticipated are neither compensatory nor eligible for extensions of time without the assessment of Engineering Charges, except as provided for under §108-04 *Delay Provisions*.

Before assessing Engineering Charges, the Department will give due consideration to factors attributing to such delay due to extenuating circumstances beyond the control of the Contractor limited to the following:

1. The work or the presence on the contract site of any third party, including but not limited to that of other contractors or personnel employed by the State, by other public bodies, by railroad, transportation or utility companies or corporations, or by private enterprises, or any delay in progressing such work by any third party except as indicated or disclosed in the contract documents or ordinarily encountered or generally recognized as inherent in the work.
2. The existence of any facility or appurtenance owned, operated, or maintained by any third party, except as indicated or disclosed in the contract documents or ordinarily encountered or generally recognized as inherent in the work .
3. The act, or failure to act, of any public or governmental body, railroad, transportation or utility companies or corporations, including, but not limited to, approvals, permits, restrictions, regulations or ordinances not attributable to a Contractor's submission, action or inaction or Contractor's means and methods of construction.
4. Restraining orders, injunctions, or judgments issued by a court not caused by a Contractor's submission, action or inaction or Contractor's means and methods of construction.
5. Any industry-wide labor boycotts, strikes, picketing or similar situations, as differentiated from jurisdictional disputes or labor actions affecting a single or small group of contractors or suppliers.
6. Any industry-wide shortages of supplies or materials required by the contract work, as differentiated from delays in delivery by a specific or small group of suppliers.
7. Unusually severe storms of extended duration or impact, other than heavy storms or climatic conditions which could generally be anticipated by the bidders, as well as floods, droughts, tidal waves, fires, hurricanes, earthquakes, landslides, or other catastrophes.
8. Decisions by the Department to open certain sections of the contract to traffic before the entire work is completed.
9. Significant changes in contract quantities, major extra contract work, delays in the review or issuance of orders-on-contract or field change sheets, or delays beyond the established time periods for review and approval for shop drawings, which significantly affect the overall completion of the contract

10. Failure of the State to provide individual rights-of-way parcels for an extended period of time beyond that indicated by the contract if such unavailability, as determined by the Commissioner, significantly affects the scheduled completion of the contract.
11. Any situation which was beyond the contemplation of the parties at the time of entering into the contract.
12. Award of the contract by the State more than forty-five (45) days beyond the letting date.
13. Situations covered by §104-03 Differing Site Conditions, §104-04 Significant Changes in the Character of Work and §104-05 Suspensions of Work Directed by the Engineer.

B. Liquidated Damages. Liquidated damages will be in the amount per calendar day specified in Table 108-1 *Schedule of Liquidated Damages*, in addition to Engineering Charges as provided for in §108-03A. *Engineering Charges*. Liquidated Damages for special or very large contracts may be specified in the contract proposal. Liquidated Damages will not apply to contracts containing no work within the roadway limits. The Commissioner may waive such portions of the liquidated damages as may accrue if the work is deemed to be in such condition as to be safe and convenient for use by the traveling public.

Permitting the Contractor to continue and finish the work or any part of it after the time fixed for its completion or after the date to which the time for completion may have been extended, will in no way constitute a waiver on the part of the State of any of its rights under the contract.

The Contractor is responsible and liable for said liquidated damages even in the event that the Contractor abandons the performance of the contract or the Contractor's employment is terminated pursuant to the provisions of this contract.

TABLE 108-1 SCHEDULE OF LIQUIDATED DAMAGES		
Original Total Contract Bid Price		Liquidated Damages per Calendar Day
From More Than	To and Including	
\$0	\$ 100,000	\$ 500
\$100,000	\$500,000	\$1,000
\$500,000	\$2,000,000	\$1,500
\$2,000,000	\$5,000,000	\$2,000
\$5,000,000	\$10,000,000	\$2,500
\$10,000,000	\$20,000,000	\$4,000
\$20,000,000	-	\$7,000

108-04 DELAY PROVISIONS.

A. Compensable Delays. The Department may provide monetary compensation for delays and interference in certain defined instances. The Contractor will only be eligible for extra compensation caused by delay or interference affecting the performance or the scheduling of contract work for those instances arising out of:

1. §104-03 Differing Site Conditions;
2. §104-04 Significant Changes in the Character of the Work; and
3. §104-05 Suspensions of Work Directed by the Engineer ;
4. Situations not referenced in this paragraph and which are not within the contemplation of the parties at the time of entering into the contract.

These aforementioned provisions may also form the basis for extra work compensation pursuant to §105-14 *Disputed Work and Dispute Resolution* and §109-05 *Extra Work and Time Related Compensation*. Failure of the Contractor to adequately progress completion of the work will be considered in determining whether the aforementioned instances are the primary causes of delay. In all such instances, for any requests made under this subsection, the Contractor shall keep detailed written records of the costs in accordance with §104-06 *Notice and Recordkeeping*. Any dispute shall

§108

be promptly submitted to the Engineer in writing, pursuant to §105-14 *Disputed Work and Dispute Resolution*.

B. Non-Compensable Delays. The Contractor agrees to make no monetary request for, and has included in its bid prices for the various items of the contract, any extra/additional costs attributable to any delays, inefficiencies or interferences in the performance of the contract caused by or attributable to the items set forth below. The Contractor shall be compensated solely by an extension of time, with or without engineering charges as appropriate, to complete the performance of the work in accordance with the provisions of §108-02 *Completion Date*.

1. The work, or the presence on the contract site, of any third party, including but not limited to personnel or other contractors employed by the State, by other public bodies, by railroad, transportation or utility companies or corporations, or by private enterprises.
2. Any delay in progressing work by any third party as indicated or disclosed in the contract documents or ordinarily encountered or generally recognized as inherent in the work.
3. The existence of any facility or appurtenance owned, operated, or maintained by any third party, as indicated or disclosed in the contract documents or ordinarily encountered or generally recognized as inherent in the work.
4. The act, or failure to act, of any other public or governmental body, railroad, transportation or utility companies or corporations, including, but not limited to, approvals, permits, restrictions, regulations or ordinances attributable to a Contractor's submission, action or inaction or Contractor's means and method of construction.
5. Restraining orders, injunctions, or judgments issued by a court which were caused by a Contractor's submission, action or inaction or Contractor's means and method of construction.
6. Any labor boycott, strike, picketing or similar situation.
7. Any shortages of supplies of materials required by the contract work.
8. Climatic conditions, storms, floods, droughts, tidal waves, fires, hurricanes, earthquakes, landslides, or other catastrophes. However, payment may be made for repairing damage to the work caused by an "occurrence" as provided in §107-09 *Damage*.
9. Extra work which does not significantly affect the overall completion of the contract, delays in the review or issuance of orders-on-contract, or field change sheets or delays within the established time periods for review and approval for shop drawings.
10. Any situation which was within the contemplation of the parties at the time of entering into the contract.
11. Award of the contract by the State more than forty-five (45) days beyond the letting date.

108-05 SUBLETTING OR ASSIGNING THE CONTRACT.

The Contractor shall perform with its own organization contract work amounting to not less than 50 percent of the original total contract bid price, except that any items designated by the State as "Specialty Items" may be performed by subcontract and the amount of any such "Specialty Items" so performed may be deducted from the original total contract bid price before computing the amount of work required to be performed by the Contractor with its own organization. The contract amount upon which the 50 percent requirement is computed includes the cost of materials and manufactured products which are to be purchased or produced by the Contractor under the contract provisions.

- "Its own organization" shall be construed to include only workers employed and paid directly by the Contractor and equipment owned or rented by it, with or without operators.
- "Specialty Items" shall be construed to be limited to work that requires specialized knowledge, skill or equipment not ordinarily available in contracting organizations qualified to bid on the contract as a whole and in general are to be limited to minor components of the overall contract.

The Contractor shall be responsible for all work performed by Subcontractors, Manufacturers, Fabricators, Material Suppliers and any other parties in the performance of the contract. Contract work shall be performed under a subcontract only after approval by the Regional Director. Work shall be performed only by the Subcontractor specifically approved by the Regional Director. Work shall not be

assigned by the Subcontractor to a lower tier subcontractor. Violations of the aforementioned will result in no payment by the State for the completed work.

A. Subcontractor Approval.

Approval of Subcontractors is required for:

- The on-site completion of items of work as defined in the contract documents.
- The on-site maintenance of previously furnished and installed products.
- The delivery of materials to the contract site and incorporation directly into the work by the supplier's work force in such a manner that no further handling or manipulation of the material is necessary in order to conform with the construction details of the appropriate specification item.
- Approval of subcontractors excludes:
 - Manufacturers, Fabricators and Material Suppliers who do not incorporate supplies or materials directly into the contract work.
 - The on-site completion of a portion of the work that does not constitute a complete contract item, and that occurs over less than an aggregate of 5 days on the contract site.
 - Specialized work which is not accounted through labor, equipment and materials, such as professional fees, testing fees, dumping fees, utility charges
 - Owner/Operator Trucking, both on-site and off-site.

B. Approval Procedure. Subcontractors will not be approved by the Department until such time as the Contract Management Bureau has received a completed Form CCA-1, *New York State Uniform Contracting Questionnaire* from the Subcontractor. For each Subcontractor, the Contractor shall submit an *Approval to Subcontract*, a labor affidavit on Form AC 2948 *Subcontractor's Certification*, a *Designation of Affirmative Action Representatives*, and a *Contractor/Subcontractor SPDES Permit Certification* to the Regional Construction Group for approval by the Regional Director. Contractors that own Department approved civil rights reporting software shall submit subcontractor approval forms generated with that software. The Contractor shall not subsequently alter software generated forms.

C. Trucking and Other Equipment Owner/Operators. Equipment owner/operators are recognized by the Department and by Labor Law as unique business situations. Owner/Operators, by definition are individual businesses, do not have employees, and therefore are not subject to prevailing wage rates.

D. Disadvantaged/Minority/Women's Business Enterprises (D/M/WBE) Policy. In the solicitation of Subcontractors to perform work under this contract, prior to bidding or entering into any commitments for subcontracting or for purchase of supplies, materials or leasing of equipment, the Contractor shall solicit participation of D/M/WBEs in accordance with the utilization goals published in the contract documents, and in accordance with the provisions of §102-12 *D/M/WBE Utilization*.

E. Subcontract Provisions. All Subcontracts shall be in writing and shall contain all pertinent provisions of the contract in regard to Federal and State Laws and Regulations. All Subcontractors shall maintain insurance coverages as required by §107-06 *Insurance*.

All subcontracts, supply or equipment contracts in excess of \$10,000 shall incorporate the provisions of §102-11 *Equal Employment Opportunity Requirements*.

All subcontracts, supply or equipment contracts shall incorporate the provisions of §105-14 *Disputed Work and Dispute Resolution*. If such subcontracts or supply or equipment contracts do not have similar provisions, then the State payments to the Contractor for such subcontract or supply or equipment work shall be limited to only that which are provided by the provisions of this subsection as if it were in effect for such subcontract or supply or equipment contract.

For all Federal-Aid contracts, all subcontracts, supply or equipment contracts shall incorporate all of the provisions of Form FHWA-1273, *Required Contract Provisions Federal-Aid Construction*

§108

Contracts. The provisions of Form FHWA-1273 shall be directly incorporated into each subcontract, and may not be incorporated by reference.

All Subcontractors working within the contract limits or at a facility dedicated to the contract shall have a written Project Safety and Health Plan in accordance with §107-05 *Safety and Health Requirements* or shall have a copy of the Contractor's written Project Safety and Health Plan and shall confirm by written agreement with the Contractor that all Subcontractor operations are adequately addressed. The Contractor shall have a copy of each Subcontractor's written Safety and Health Plan, and shall ensure that the Subcontractor's plans are not in conflict with the Contractor's written Safety and Health Plan.

108-06 COMMENCEMENT OF ACTIONS ON STATE PUBLIC WORKS CONTRACTS.

In accordance with State Finance Law §138-a, the time within which an action on this contract, against the Contractor, must be commenced shall be computed from the date of completion of the physical work. The Contractor may notify the Department in writing that such physical work has been completed by specifying a completion date, which date shall be no more than 30 days previous to the date of such notice, in which case the completion date set forth in such notice shall be deemed to be the date of completion of the physical work unless the Department, within 30 days of receipt of such notice, notifies the Contractor in writing of its disagreement.

In the event the Contractor fails to send a notice provided for herein, or the State disagrees, then the date of completion of the physical work shall be determined in any other manner provided by law. If the Contractor elects to send such a notice, it shall be sent by certified mail to:

New York State Department of Transportation
~~Office of~~ Legal Affairs ~~Division~~
50 Wolf Road
Albany, New York 12232

The Department hereby disagrees with any date selected by the Contractor pursuant to §138-a of the State Finance Law which is earlier than the date of contract final acceptance as determined by the Commissioner or his/her designee. The provisions of §138-a shall in no way modify the duties and obligations of the Department to comply with Article eleven-A of the State Finance Law (prompt payment legislation).

108-07 SEASONAL SHUT-DOWN.

If it should become necessary to stop the work due to the lateness of the season, the Contractor shall open proper draining ditches, erect temporary structures where necessary, prepare the contract site so that there will be a minimum interference with traffic, set up and maintain a competent organization to maintain traffic through the contract site, and take precautions to prevent damage or unreasonable deterioration of the work during the time it is closed.

SECTION 109 - MEASUREMENT AND PAYMENT

109-01 MEASURING QUANTITIES.

All contract payments, including the final, will be made for quantities of work performed and materials placed in accordance with the contract documents as determined by the measurements of the Engineer, and the resulting quantities shall be accepted as final, conclusive and binding upon the Contractor. Various methods of quantity computation may be used by the Engineer, including but not limited to: manual arithmetic calculations, manual measuring tools such as a planimeter, and computer tools/software. The Engineer will choose the computation method, and the method may vary by contract and by contract pay item as appropriate. The Engineer will choose the method by which the work will be measured, such as: measure from documents/data (contract plans, cross sections, CADD files, etc.) or measure from field survey of completed work, with the goal of obtaining reasonably accurate quantities of work for payment using a commensurate amount of effort and resources.

109-02 COMPENSATION FOR ALTERED QUANTITIES.

The Department reserves the right to order changes in quantities of contract pay items as is necessary to complete the work, in accordance with the intent of the contract documents.

A. Major Items. For Major Items (as defined in §101-02 Definitions of Terms), payment will be made for all extra work at the contract unit bid price for work up to 125% of the original contract quantity. For Major Item quantities less than 75% or more than 125% of the original contract quantity, consideration of contract adjustment will be in accordance with §104-04B. Major Items. Total payments made for all work on a Major Item that decreases to below 75% of the original contract item quantity, will not exceed the total payments which would have been made if the original contract quantity had been completed at the original unit price bid.

B. Minor Items. For Minor Items (as defined in §101-02 Definitions of Terms), payment will be made for extra work at the contract unit bid price, except for any extra work that is both: (1) more than 200% of the original contract quantity and (2) results in an increase of more than \$1,000 from the original contract amount, will be in considered a Significant Change in accordance with §104-04C Minor Items.

For Minor Items where the contract bid price does not exceed 125% of either the statewide or regional weighted average bid price, the contract bid price may be extended up to an increase of \$5,000 from the original contract amount.

109-03 SCOPE OF PAYMENT.

The Contractor is directed to the provisions of Sections 70, 71 and 79-a of the Lien Law that apply to funds being received by a Contractor for a public improvement. The funds received by the Contractor shall constitute trust funds in the hands of the Contractor and shall be applied first to the payment of certain claims.

No certificate approving or authorizing the first partial payment, or in the event there shall be no first partial payment, then no certificate approving or authorizing any final payment will be made to a foreign Contractor unless such Contractor shall have furnished satisfactory proof that all taxes due by such Contractor under the provisions of Articles 9, 9A, 16 and 16A of the Tax Law have been paid. The certificate of the State Tax Commission to the effect that all such taxes have been paid shall be conclusive proof of the payment of such taxes. The term foreign Contractor means: in the case of an individual, a person who is not a resident of this State; in the case of a partnership, one having one or more partners who is not a resident of this State; and in the case of a corporation, one not organized under the laws of this State.

Section 179 of the State Finance Law requires the Department to make payment on highway construction contracts within certain time frames. If the Department unjustifiably fails to pay within the prescribed time, it may be required to pay interest for each day in excess of the prescribed time.

109-04 PARTIAL PAYMENTS.

Upon application by the Contractor, and approval by the Regional Director, payments for the actual cost of certain materials may be made to the Contractor prior to incorporation of such material in the permanent work.

A. Eligibility. To be eligible for partial payment, materials must meet all of the following conditions:

1. Inclusion on the listing later in this section;
2. Have a minimum material cost of \$5,000. Individual components of an item or related items may be combined to meet the minimum (i.e. combination of all guiderail components);
3. Be materials which will be incorporated into permanent work;
4. Steel and iron materials shall be in a condition which is ready for fabrication or installation. Other materials shall be in a condition which is ready for on-site installation without further fabrication or processing;
5. Be delivered and stored at the work site or at a site and in a manner approved by the Regional Director; and
6. Be materials which will be stored, or already have been stored, for a minimum of 60 days.

B. Application for Partial Payment. With application for partial payments, the Contractor shall provide documentation as follows:

1. Bill(s) of sale or vouchers indicating the actual dollar value of the materials as stored;
2. Certification of Title showing that title to the materials, without encumbrances, is in the name of the Contractor and that title is warranted to the NYS Department of Transportation;
3. Documented evidence of acceptability of the materials; and
4. If the materials are stored on private property, a release and waiver covering such materials, and providing access to the storage site, which release and waiver shall be executed by the property owner in favor of the NYS Department of Transportation or its agents.

When applying for partial payment of products which are claimed to be in short supply or unique to an individual contract, the Contractor shall include documentation supporting that claim, to the satisfaction of the Regional Director.

The amount of partial payments will not exceed the total invoice amount for stored materials, nor will the partial payment for materials relating to any contract work item exceed eighty five percent (85%) of the unit price for that item. The quantity of material for which payments are made will not exceed the estimated contract quantity for that item.

The making of partial payments shall not be deemed to be a final acceptance of materials, nor will it relieve the Contractor of responsibility for such materials. The Contractor shall be responsible for ensuring that only those materials which comply with the specifications are incorporated into the work.

All costs associated with handling, transportation and storage of materials; including any storage site rental, security, and weather protection; shall be borne by the Contractor and included in the prices bid for contract work. Any materials, other than those which are determined by the Regional Director to be unique to the contract, not incorporated into the work shall remain the property of the Contractor. Partial payments made for such unused materials will be withdrawn with no further obligation by the State.

LIST OF MATERIALS

- Iron, Steel and Aluminum products (including bridge bearings and all metal components of railings and bridge superstructures);
- Precast and Prestressed Concrete products;
- Pipe and Underdrain products;
- Concrete and Stone curb or masonry products;
- Concrete, Steel and Timber piles and appurtenances;
- Timber products;
- Traffic Signal, Traffic Control, Signing and Lighting components;
- Intelligent Transportation System (ITS) components (cameras, telecommunications components, computers, etc.)
- Cable, Wire and Conduit;
- Impact Attenuator components;
- Materials in short supply; or
- Materials meeting specific, unique requirements (determined by the Regional Director)

109-05 EXTRA WORK AND TIME RELATED COMPENSATION.

The Contractor will be compensated for extra work under existing unit prices in accordance with §109-02 *Compensation for Altered Quantities*, by agreed price in accordance with §109-05A. *Agreed Price Work*, or by force account in accordance with §109-05B. *Force Account Work*.

A. Agreed Price Work. Agreed prices for new items of work or materials in accordance with one of the methods outlined below may be accepted by the Engineer and incorporated into an order-on-contract as the Department may deem them to be just and fair and beneficial to the State. An order-on-contract containing an agreed price not supported by one of the following may be subsequently rejected by the Department or the Office of the State Comptroller.

- 1. Original Contract Bid Price.** The original contract bid price, adjusted for documented increase or decrease in material cost, equipment rate, mobilization, and/or site conditions.
- 2. Weighted Average Bid Price.** Reference to the statewide or regional weighted average bid price for a minimum of 3 contracts for similar type, quantity, and/or location of work from the Weighted Average Item Price Report or other recent contracts, adjusted for documented increase or decrease in labor, materials, equipment, mobilization, and/or site conditions.
- 3. Average of 3 Bidders.** For work in unusual circumstances or unusual site conditions, the average bid price for the 3 lowest responsible bidders presented in the Tabulation of Bids for that contract. If less than 3 responsible bids were received, this option shall not be used.
- 4. Price Analysis.** A price analysis shall be based on an estimated breakdown of charges listed in §109-05B *Force Account Work* below, using the equipment and other rates in effect when the agreed price is developed by the Contractor. The analysis shall be based on crew composition, material prices, equipment production and overall production rates that are reasonable in comparison with contract bid price work.

Equipment rates shall be used with no rate adjustment factor and no regional adjustment factor. An appropriate type and size of equipment similar to that available on the contract site, if present, shall be used.

Labor rates may be determined using 15% of wages and supplemental (fringe) benefits for FICA, Medicare, paid holidays, Federal unemployment tax, and State unemployment insurance in lieu of a detailed accounting. Overhead and profit will not be allowed on the labor markup.

Due to the cost and effort associated with development, a price analysis should generally be reserved for extra work under an individual contract pay item or a single price analysis, of more than \$1,000.

The Contractor shall provide a price analysis within 10 work days of request by the Engineer. The Department will accept or reject the Contractor's proposed agreed price within 10 work days of receipt of a complete price analysis.

B. Force Account Work. Where there are no applicable unit prices for extra work and agreed prices cannot be readily established or substantiated, the Contractor will be paid by Force Account for the actual, reasonable and verifiable cost of the items listed below. The Contractor shall maintain and submit force account records in accordance with §109-05C. *Force Account Report*.

1. Contractor Charges. At the preconstruction meeting, the Contractor should provide the Engineer documentation supporting its Commercial General Liability Insurance rates for the current period, and provide updates within 30 days after the renewal date, to assist in timely preparation and review of force account reports.

a. Labor. Necessary labor costs include wages, supplemental (fringe) benefits, payroll taxes, state unemployment insurance, workers compensation insurance and other such reasonable charges that are paid by the Contractor pursuant to existing written agreements with its employees and/or labor organizations. Each class of labor shall be billed separately at actual payroll rates, average rates based on different classes of labor will not be accepted. The wage rate for an individual worker may be up to 110% of the prevailing wage, provided the Contractor documents through certified payrolls that the worker has and continues to be paid more than the prevailing wage for contract work. No reimbursement will be made for travel, lodging, signing bonuses, or other similar payments made to workers.

At the Contractor's option, a labor markup of 15% of all wages, not including supplemental (fringe benefits), for FICA, Medicare, paid holidays, Federal unemployment tax, and State unemployment insurance in lieu of a detailed accounting. Overhead and profit will not be paid on the labor markup.

§109

Workers compensation insurance rate will be the base rate and the territorial differential only established by the NYS Workers Compensation Insurance Rating Board, subject to the Construction Employment Limitation Program limits. No other additional charges or modifiers will be included.

Insurance and other costs incurred or limited on a weekly basis will be reimbursed based on the percentage of the employees weekly gross wages paid under force account.

b. Materials. Materials are necessary products incorporated in the temporary or permanent work, including transportation to the site. Transportation may be accounted for under materials as either a unit price for transportation or equipment/operator charges. Equipment charges for transportation of materials shall be accounted for as equipment in accordance with §109-05B.1.c. *Equipment* with no allowance for overhead and profit. Materials will be measured as quantities incorporated, with no reduction for required overlap, and appropriate waste due to construction and/or installation.

Oxygen, acetylene, propane, welding rods, grinding wheels, saw blades, hammer and drill bits, drill steel, and tooth-bits consumed in progressing the work are considered to be materials for which reimbursement will be made. Other materials which are consumed in progressing the work are considered to be included in overhead and no separate reimbursement will be made. Material acquired by direct purchase shall be documented by bills or acceptable invoices. All prices on used material incorporated in either temporary or permanent work shall be billed at a fair value, less than the original cost when new. A reasonable salvage credit will be determined by the Engineer in coordination with the Contractor for substantial salvageable material recovered.

c. Equipment. Equipment, other than small tools, used by the Contractor shall be of suitable size and suitable capacity required for the work to be performed. If the Contractor elects to use equipment of a higher rate than the equipment suitable for the work, payment will be made at the rate applicable to the suitable equipment. The equipment actually used and the suitable equipment upon which the rate is based will be recorded as a part of the force account report. Usage will be recorded in hours to the nearest whole hour. The Engineer will determine the suitability of the equipment. If there is a differential in the rate of pay of the operator of oversize or higher rate equipment, the rate paid for the operator will likewise be related to the suitable equipment.

(1) Contractor Owned Equipment. The Contractor will be reimbursed for its ownership costs and for its operating costs for self owned equipment at the rates listed in the "Rental Rate Blue Book for Construction Equipment" published by Primedia Information, Inc. (hereafter referred to as the Blue Book) in effect at the time the work is performed.

a) Ownership Costs. The rates for ownership costs will reimburse the Contractor for all non-operating costs of owning equipment, including depreciation on the original purchase, major overhaul repairs, cost of facilities capital, normal risk insurance, property taxes, storage, licenses, record keeping costs, overhead, and profit.

In the event that the Contractor does not have a needed type or piece of equipment on the contract site, the Contractor will be paid for the reasonable cost of moving the equipment onto and away from the contract site.

The hourly rate for the first 8 hour shift will be the Blue Book monthly rate divided by 176 multiplied by the rate adjustment factor and then multiplied by the regional adjustment factor. The hourly rate for subsequent shifts during the same day will be 75% of the first shift hourly rate. Equipment required to be present, but idle, will be paid at 50% of the first shift hourly rate. Reimbursement will be made for the product of the hours of actual use or hours it is required to be present, and not available for mobilization elsewhere, multiplied by the hourly rate.

b) Operating Costs. The rate for operating costs includes preventative and field maintenance, fuel, lubricants, and other operating expendables. Operating cost does not include the operator's wages. Reimbursement will be made for the product of the number of hours of actual use multiplied by the operating rate. The hourly rate will be paid for all hours of operation, including those during subsequent shifts on the same day.

c) No Established Rate. In the event that rates are not established in the Blue Book for a particular piece of equipment, the Contractor shall contact the Blue Book publisher to establish rates. If the publisher will not establish rates, the Department will establish rates for ownership costs and operating costs for that piece of equipment consistent with its cost and expected life.

(2) Rented Equipment. In the event that the Contractor does not own a specific type of equipment and must obtain it by rental, the Contractor will be paid for the time that the equipment is used to accomplish the work or is required to be present, plus the reasonable cost of moving the equipment onto and away from the contract site.

a) Rental Costs. The Contractor will be paid the invoiced rental rate for the equipment, not to exceed the Blue Book ownership rate.

b) Operating Costs. The Contractor will be paid for the operating cost of the equipment in accordance with §109-05B.1.c.(1)b) unless reflected in the rental price.

c) Rates Including Operator. In the event that the Contractor rents equipment with an operator or fully fueled and/or maintained equipment such as cranes, concrete pumpers, trucks, etc. payment will be made on the basis of an invoice for the rental of the equipment and the costs of moving to and from the site, provided the total rate is substantiated by area practice. The rate including operator will not exceed the total of the ownership rate and the operating rate from the Blue Book, and the prevailing wage rate of an appropriate operator, if an operator is supplied.

(3) Maximum Ownership/Rental Costs. The maximum amount paid for the ownership costs of Contractor owned or the rental costs of rented equipment, is limited to the original purchase price as listed in the "Green Guide for Construction Equipment" published by Primedia Information, Inc. If the ownership or rental reimbursement is limited by the original purchase price, the Contractor will be reimbursed for the operating cost per hour for each hour of actual use.

d. Sales Taxes. Sales taxes, if any, required to be paid on rented equipment or materials not permanently incorporated into the work.

e. Overhead. Overhead will be computed at ten percent (10%) of items §109-05B.1.a. *Labor* (but not including the premium portion of overtime) and §109-05B.1.b. *Materials*, and will be defined to include the following:

(1) Additional premium on bond, additional premium for insurance required by the State other than Workers Compensation Insurance and Commercial General Liability Insurance;

(2) All salary and expenses of executive officers, supervising officers/ employees, superintendents, and clerical or administrative employees, including payroll taxes, unemployment insurance, workers compensation insurance, and charges that are paid by the Contractor to or on behalf of those employees pursuant to written agreement with its employee(s) and/or labor organizations;

- (3) Minor equipment such as small tools, including shovels, picks, axes, saws, bars, sledges, lanterns, jacks, etc., and other miscellaneous supplies and services;
- (4) Contractor's field office rental, utility charges, potable water, sanitation, cleaning, computers, CADD equipment, drafting equipment reproduction costs, etc.

f. Profit. Profit will be computed at ten percent (10%) of items §109-05B.1.a. *Labor* (but not including the premium portion of overtime) and §109-05B.1.b. *Materials*.

g. Commercial General Liability (CGL) Insurance. Commercial General Liability (CGL) insurance will be reimbursed at the rate paid by the Contractor in accordance with the method procured from its insurer.

- (1) Contractors that pay commercial general liability on the basis of a percentage of payroll will be paid that percentage of item §109-05B.1.a. *Labor*.
- (2) Contractors that pay commercial general liability on the basis of a percentage of gross sales will be paid that percentage of items §109-05B.1.a. through f.

2. Subcontractor Charges. When the work is performed by a Subcontractor, the Contractor will be paid the actual and reasonable cost of such subcontracted work as outlined above in §109-05B.1.a through §109-05B.1.g, plus an additional overhead of five percent (5%) of the cost of items §109-05B.1.a. *Labor* and §109-05B.1.b. *Materials*.

3. Service Charges. When work is performed by, and a fee is paid to, a service provider, the Contractor will be paid the actual cost of the service fee plus five percent (5%) for contract supervision, overhead and profit. This 5% will be applied once to the service fee regardless of the firm making direct payments to the service provider.

C. Force Account Report. Payment for force account work will be made on the basis of the following reports. Reports shall be submitted in a format acceptable to the Department. Appropriate forms are available from the Department.

If the Engineer disagrees with the accuracy, applicability, or reasonableness of any portion of a Contractor's submission, he/she shall promptly notify the Contractor. The Engineer will make any notations, remarks or comments on the records that may assist in final payments and then sign and date to indicate receipt, but not necessarily concurrence.

1. Daily Summary. The Contractor shall deliver a daily summary of force account work to the Engineer not later than close of business on the work day following that for which the work is reported. This summary shall be dated and signed by the Contractor's authorized representative.

The summary shall contain:

- a. The contract number, other contract information, and the Contractor name/information.
- b. A brief description of the work performed and the work location for that day.
- c. A list of personnel by name, including the hours worked, and labor classification.
- d. A list of materials used indicating the quantity and nature. The cost shall be documented later by proper receipts.
- e. A list of equipment used indicating the number of hours used and the type, manufacturer, model, model year, size of equipment, and any required attachments.

2. Weekly Labor Summary. Within 5 calendar days after the end of each pay period, the Contractor should deliver to the Engineer a Force Account Summary of Labor used on the work, which shall include the name, labor classification, hours worked, hourly rate of pay, supplemental (fringe) benefits, and/or other items as shown on the certified payroll. If the Contractor does not provide the Engineer with Weekly Labor Summaries, no progress payments on that force account will be made.

3. Force Account Report Submission. On completion of the specific force account work, the Contractor shall deliver to the Engineer a Force Account Report, wherein all labor, materials, equipment, and other charges are shown and totaled. The Force Account Report shall be dated and signed by the Contractor's authorized representative. When the Contractor and the Engineer agree on the Force Account Report, the Engineer will prepare and submit an order-on-contract containing the Force Account Report to the Regional Construction Engineer for approval.

4. Force Account Review. The Department will review the Force Account Report and make any notations, remarks or comments on this form that may assist in final payments. The emphasis of this review will be on labor rates, payroll taxes, material costs, equipment rates, insurance rates, conformance with payment provisions of technical specifications, and overall documentation. The Regional Construction Engineer will forward the order-on-contract to the Director, Office of Construction ~~Division~~. The Department, after review and approval, will forward the order-on-contract to the Office of the State Comptroller (OSC) for review and approval. Payment cannot be made prior to approval by the OSC.

5. Late Submissions. In the event the Contractor fails to deliver the required force account documentation to the Engineer in a timely manner, and as a result the order-on-contract for the force account work is not fully approved at the date of final acceptance, the required final payment date will be extended by the number of calendar days between final acceptance and the issuance of this force account order-on-contract, attributable to the Contractor's late force account submissions.

D. Time Related Dispute Compensation. The Contractor will only be eligible for extra compensation for expenses or costs which are identified as compensable under §108-04A. *Compensable Delays.* In the event any legal action is instituted against the State by the Contractor due to any such dispute for additional compensation, whether due to time related dispute, delay, acceleration, breach of contract, or otherwise, the State's liability will be limited to those items which are specifically identified as compensable under §109-05D.1. *Recoverable Contractor Costs.* Nothing in this subsection is intended to create any liability of the State not existing at common law or pursuant to the terms of this contract or to prevent the Contractor from filing a claim in the New York State Court of Claims. The remedies contained herein are exclusive.

1. Recoverable Contractor Costs. Only the following elements, will be recoverable by the Contractor as "time related dispute compensation" provided that they are actual and reasonable. Any such adjustment will be made via order-on-contract. Escalated costs will include unanticipated higher or lower costs attributable, with appropriate credits, to the performance of work or portions of work in an extended time period due to extenuating circumstances beyond the control of the Contractor.

Extra work required due to a time related dispute shall be accounted for and reimbursed in accordance with §109-05B., less any appropriate credit.

a. Labor. Documented escalated labor costs determined in accordance with §109-05B.1.a. *Labor*;

b. Materials. Documented escalated material costs determined in accordance with §109-05B.1.b. *Materials*;

c. Equipment. Documented escalated equipment costs less appropriate credits, determined in accordance with §109-05B.1.c. *Equipment.* The ownership cost for idle equipment will be 50% of the rate set forth in §109-05B.1.c. *Equipment.* Idle time shall not exceed 8 hours per day, 40 hours per week, or the annual usage hours established in the "Blue Book". No operating costs will be paid for idle equipment;

d. Extended Field Office Costs. Fees paid to service provider(s) for required Contractor's field office rental, utility charges, potable water, sanitation, cleaning, etc. The Contractor will be paid the actual cost of the service fee plus five percent (5%) for contract supervision, overhead and profit. This 5% will be applied once to the service fee regardless of the firm making direct payments to the service provider;

e. Extended Contract Site Overhead. Documented additional or escalated contract site overhead costs during the extended period, including superintendent, office engineer and clerical staff, but not including working forepersons;

f. Home Office Overhead. Home office overhead equal to 10% of the total of items §109-05D.1.a *Labor* and §109-05D.1.b. *Materials*;

g. Profit. Profit of 10% of the total of items §109-05D.1.a through §109-05D.1.d. except when §104-03 *Differing Site Conditions*, §104-04 *Significant Changes in Character of the Work* or §104-05 *Suspensions of Work Ordered by the Engineer* apply, no profit or anticipated profits will be allowed;

h. Insurance and Bond Costs. Documented additional or escalated premium on bond and insurance for the extended period;

2. Recoverable Subcontractor Costs. When the work is performed by a Subcontractor, the Contractor will be paid the actual and reasonable costs of such subcontracted work as outlined above in §109-05D.1.a. through §109-05D.1.g. and an additional overhead of 5% of the costs outlined in §109-05D.1.a through §109-05D.1.c.,

3. Non-Recoverable Costs. The parties agree that, in any dispute for time related compensation, the Department will have no liability for the following items and the Contractor further agrees it shall make no claim for the following items:

- a.* Home office overhead in excess of that provided in §109-05D.1.e. *Home Office Overhead*;
- b.* Profit, in excess of that provided in §109-05D.1.f. *Profit*;
- c.* Loss of anticipated or unanticipated profit;
- d.* Labor inefficiencies and loss of productivity;
- e.* Consequential damages, including but not limited to interest on monies in dispute, including interest which is paid on such monies, loss of bonding capacity, bidding opportunities, or interest on investment, or any resultant insolvency;
- f.* Indirect costs or expenses of any nature;
- g.* Direct or indirect costs attributable to performance of work where the Contractor, because of situations or conditions within its control, has not progressed the work in a satisfactory manner.
- h.* Attorneys fees and dispute or claims preparation expenses.

109-06 CONTRACT PAYMENTS.

Payments will be made to the Contractor for work satisfactorily performed monthly in accordance with Article 7 *Contract Payments* of the contract agreement. No contract payment will be rendered unless the value of the work done equals 5% of the Contract Amount or \$1000, whichever is the lesser. At the Contractor's request, semimonthly contract payments may be rendered provided the value of the work performed in a two-week interval is in excess of \$50,000 or if, in the opinion of the Department, it is to the best interests of the State to do so.

In order to enable the Department to process a contract payment properly and expeditiously, the Contractor shall submit certified weekly payroll statements for the Contractor and each Subcontractor, Form AAP-21, and other required documents and submissions, as may be appropriate to this contract.

Unless otherwise specified in a particular contract pay item, no progress payment will be made for any item of work until its completion in accordance with the specification. In accordance with Article 8 *No Payment on Contractor's Non-Compliance* of the contract agreement, no contract payment will be

completed so long as any lawful or proper direction to the Contractor by the Commissioner or his/her representative concerning the work or material has not been complied with.

This contract may be funded by monies from other governmental or non-governmental entities which may include municipalities, counties, towns, villages, or authorities. If the contract is funded by monies from the New York State Thruway Authority, separate payment may be made by both the State of New York and the New York State Thruway Authority.

Extra work for others, including municipalities, utilities, or other entities added by order-on-contract requires funds be deposited with the State prior to approval of the order-on-contract. Funding delays for extra work by others may cause payment delays. If extra work for others is combined with Department funded work, payment for all the work may be delayed.

The Contractor may opt to receive electronic payments from the State, which are generated by the Office of the State Comptroller (OSC). Information on the electronic payments program is available on the OSC website at www.osc.state.ny.us.

109-07 PROMPT PAYMENTS BY THE CONTRACTOR.

~~— Section 139-f(2) of the State Finance Law requires the Contractor to pay each Subcontractor and materialman for the value of work performed pursuant to contract no later than fifteen (15) calendar days from the receipt of each payment the Contractor receives from the State. Payment by the Contractor to Subcontractors or materialmen shall represent the value of work performed and/or materials furnished and reflect the percentage of work completed or materials furnished by the Subcontractor or materialmen and be based upon the actual value of the subcontract or purchase order. The Contractor shall not hold any retainage, but may deduct an amount necessary to satisfy any claims, liens or judgments against a Subcontractor or materialman which have not been fully discharged.~~

~~— The Contractor shall maintain an accounting system acceptable to the Department to track payments made by the State to the Contractor and payments made by the Contractor to each Subcontractor, Manufacturer, Fabricator or Material Supplier by item and by date, for the purpose of enabling the Department to audit the payment provisions of this subsection. The system shall be able to provide data necessary for the completion of Contractor Report of Contract Payments. Reports shall include a certification that Subcontractors, Manufacturers, Fabricators and Material Suppliers have been paid with any exceptions noted and explained.~~

109-07 PROMPT PAYMENTS BY THE CONTRACTOR. In accordance with Section 139-f(2) of the State Finance Law, the Contractor shall pay each Subcontractor and materialman for the value of work performed pursuant to contract no later than seven (7) calendar days from the receipt of each payment the Contractor receives from the State. Payment by the Contractor to Subcontractors or materialmen shall reflect the quantities or percentage of work completed by the Subcontractor or materials furnished by the materialmen, and paid by the State; and such payment shall be based upon the actual conditions of the subcontract or purchase order. The Contractor shall not hold any retainage, but may deduct an amount necessary to satisfy any claims, liens or judgments against a Subcontractor or materialman which have not been fully discharged.

The Contractor shall maintain an accounting system acceptable to the Department to track payments made by the State to the Contractor and payments made by the Contractor to each Subcontractor, Manufacturer, Fabricator or Material Supplier by item and by date. The Contractor shall enter payment data into the current Department approved civil rights reporting system in accordance with §105-21 *Civil Rights Monitoring and Reporting*, with any exceptions noted and explained.

Comment [cjt11]:
EI08029

109-08 ELIMINATED MATERIALS.

Materials required by the contract documents and not incorporated into the work due to changes caused by field conditions or revisions to the design by the State after the material was ordered or purchased may be eligible for reimbursement. Materials will be eligible for reimbursement if they are determined by the Regional Director to be unique to the contract, and meet one or more of the following conditions:

- The material order cannot be canceled or changed to reflect the revised quantity required.
- The material cannot be restocked or the cost of restocking is excessive.
- The Contractor or Subcontractor does not maintain a supply of the material.
- The cost of the material exceeds \$1000. or five percent (5%) of the item, whichever is greater.

§109

The Contractor will be reimbursed its material cost minus salvage value, or the material cost plus necessary delivery costs to a site identified by the Engineer, if the Department opts to take the material. Overhead and profit will be paid once, at a maximum of five percent (5%) for all materials not incorporated into the work, regardless of whether the Contractor or the Subcontractor pays for the material and/or delivery costs.

109-09 FINAL ACCEPTANCE AND FINAL PAYMENT.

The provisions of Article 9 *Final Acceptance of Work* and Article 10 *Final Payment* of the contract agreement shall apply.

A. Final Additions or Deductions. Upon the completion of the required work as shown in the contract documents, should the final quantities show either an increase or decrease from the original estimate of quantities, then such increases or decreases will be computed at the unit bid prices, unless the unit bid prices have been adjusted and the final value will be computed by adding or deducting this amount from the gross sum bid as modified by any orders-on-contract.

B. Final Acceptance. Prior to the final acceptance of the work by the Commissioner or his/her designee, the contract work may be inspected, accepted and approved by other agencies and/or municipalities who will have jurisdiction of the work after final acceptance.

C. Final Agreement. The final agreement will not be drawn and finalized until all work required under the contract has been satisfactorily completed, all disputes presented and all accounts for extra work and materials have been rendered, considered, and if agreed to, incorporated by order on contract or made a part of such final agreement. Work remaining to be accomplished under an Uncompleted Work Agreement shall be considered as completed work for the purpose of the final agreement, provided the Uncompleted Work Agreement has been executed in accordance with §109-10 *Uncompleted Work Agreement*. Work accomplished under a warranty agreement shall be considered as completed work for the purpose of the final agreement, provided the warranty agreement has been executed and any required bond deposited by the Contractor.

The Commissioner, or his/her designee, will approve a final agreement as prepared and approved by the Regional Director, less any and all deductions authorized to be made by the Commissioner under the contract. Payment pursuant to such final agreement less any deductions authorized to be made by the Comptroller shall constitute the final payment to the Contractor.

In order to enable the Department to process the final agreement properly and expeditiously, the Contractor shall submit the following documents, as may be appropriate, to enable the processing of the final payment as described above.

Certified Payrolls
Final Labor Affidavits (AC 2947, Contractor's Certification & AC 2948, Subcontractor's Certification)
Final Civil Rights Reports (In accordance with §105-21 *Civil Rights Reporting*)
Final Agreement
Release from any Outstanding Disputes
Final Survey Notes/Computations
Approved Reproducible Drawings
Approved Field Change Sheets (From VECP or other Contractor Proposals)
Material Certifications
Tax Clearance for "Foreign" (out of State) Contractors, Corporations or Entities

The above list is general in nature, every item may not be applicable to the contract and other documents and submissions not shown above may be required to enable the processing of the final payment. Any time taken beyond the date of final acceptance to satisfy or furnish the above information shall extend the required payment date by an equal period of time.

D. Final Payment. Section 179 of the State Finance Law requires the Department to make final payment on highway construction contracts within seventy-five (75) calendar days after final acceptance by the Commissioner. If the Department unjustifiably fails to pay the final payment within the prescribed 75 calendar days, it may be required to pay interest for each day in excess of the 75 calendar days. The Department, in accordance with Section 179 of the State Finance Law, has determined that a thirty (30) calendar day inspection period after contract final acceptance is required for final payments, after which time the 75 day interest-free processing period will commence.

E. Acceptance of Final Payment. The acceptance by the Contractor, or by anyone claiming by or through it, of the final payment shall constitute and operate as a release to the State from any and all claims of any liability to the Contractor for anything theretofore done or furnished for or relating to or arising out of the work done thereunder, and for any prior act, neglect, or default on the part of the State or any of its officers, agents, or employees unless the Contractor serves a detailed and verified statement of claim upon the NYS Department of Transportation not later than 40 days after the mailing of such final payment. Such statement shall specify the items and details upon which the claim will be based and any such claim shall be limited to such items. Should the Contractor refuse to accept the final payment as tendered by the Comptroller, it shall constitute a waiver of any right to interest thereon.

109-10 UNCOMPLETED WORK AGREEMENTS.

Whenever a contract shall, in the judgment of the Department, be substantially completed, and keeping the contract open and maintaining the contract bonding, would be an injustice to the Contractor, the Department may enter into an Uncompleted Work Agreement with the Contractor. Prior to entering into an Uncompleted Work Agreement, the essential items in the contract shall have been completed by the Contractor in accordance with the terms of the contract and the provisions of §109-09C. *Final Agreement*, and certified by the Regional Director. The essential items in the contract shall include, but will not be limited to the completion of or the safe working order of all pavement, shoulders, guide rail, drainage, signs, and signals, so that the highway is safe for use by the traveling public without the use of any temporary or emergency devices.

The final contract account will include such uncompleted items and pay therefore at the item prices in the contract, upon execution of the Uncompleted Work Agreement. The Uncompleted Work Agreement will be based on an estimate of work remaining to be completed. If actual quantities are later found to vary from the estimate, no adjustment of quantities can be made under an Uncompleted Work Agreement.

The Contractor shall execute an Uncompleted Work Agreement upon depositing with the Department a certified check drawn upon a legally incorporated bank or trust company, or securities as are listed in State Finance Law §139(3). The deposit shall be an amount equal to at least double the value of such uncompleted work, including those pay items that are uncompleted and such work that is required but not included as a contract pay item. When the cost to perform the work is not reflected by the unit prices bid, the Engineer will estimate the value of uncompleted work. The deposit will be held by the Department until the Engineer certifies that all previously uncompleted work has been satisfactorily completed. When the Contractor satisfactorily completes the uncompleted portions of work, the deposit will be returned. No partial releases of funds from an Uncompleted Work Agreement will be made. If portions of uncompleted work will be completed at varying times, the Department may consider the use of multiple Uncompleted Work Agreements.

Section 200

EARTHWORK

SECTION 201 - CLEARING AND GRUBBING

201-1 DESCRIPTION

201-1.01 General. This work shall consist of clearing, grubbing, removing and disposing of all trees, brush, stumps, fences, debris, and miscellaneous structures not covered under other contract items within the construction area and such other areas as specified or directed. The Contractor shall clear such additional areas within the limits of the right-of-way and easement lines as specified or directed.

201-1.02 No Burning Requirement. Materials generated by the work, including construction and demolition debris, shall not be disposed of by burning on or off the site. Off site burning in a permitted solid waste incinerator or in another lawful manner as refuse derived fuel will be permitted.

201-2 MATERIALS (Not specified)

201-3 CONSTRUCTION DETAILS

201-3.01 Limits of Work Areas. The Engineer will establish the limits of areas to be cleared and grubbed, to be cleared but not grubbed, or areas, objects or features that are designated to remain undisturbed. In general, the work areas shall include the road section, stream channels, ditches, temporary approaches to bridges, detours and other areas as shown in the contract documents or directed by the Engineer. The Engineer will designate fences, structures, debris, trees and brush to be cleared where grubbing is not required. Clearing beyond the areas of construction shall be done only where specified or directed.

201-3.02 Clearing and Grubbing. During the life of the contract the Engineer may order the clearing of any trees within the R.O.W. that the Engineer determines to be hazardous or dead and unsightly.

The Contractor shall carefully prune all branches of trees less than ~~+5 feet~~ **16 feet** above any part of the roadway and all branches which have been broken or injured during construction. The work shall be done as specified under §614-3.01A Equipment and B. Pruning.

Whenever trees are felled or trimmed on/or adjacent to highways, all wood shall be immediately removed from the roadway or any area that would present a hazard to traffic. Grubbed stumps shall be moved immediately at least 30 feet from the edge of pavement. No trees, tree trunks, stumps or other debris shall be felled, sidecast or placed outside the limits of the road section. No grubbing will be required beneath the embankment where the finished grade will be 6 feet or more above the original ground surface unless otherwise specified in the contract documents. Where trees or existing stumps are cleared and grubbing is not required, the tree trunk or existing stump shall be cut off not more than 6 inches above the original ground surface unless otherwise approved. Exposed stumps not required to be removed, but which are within 30 feet of the edge of the pavement or are in a built-up area, shall be chipped out to a depth of not less than 6 inches below the finished grade and the holes backfilled if directed by the Engineer. This work shall be completed within one week after start of work on the tree.

201-3.03 Disposal

A. General. All wood including grubbed stumps shall be removed from the contract site or otherwise disposed of.

B. Methods of Disposal of Wood and Brush.

1. Disposal (No Burning). All wood and brush shall be disposed of within fifteen (15) days after cutting or felling unless otherwise approved. No burning of land clearing materials that result from the clearing and grubbing operations, except in a permitted solid waste incinerator or as refuse derived fuel, will be permitted. The Contractor will have the following options or combination of options for disposal of this material:

a. The Contractor shall make every effort to salvage marketable timber as specified in paragraph B4 of this subsection.

b. When permitted by a note in the contract documents, disposable material may be placed at locations approved by the Engineer within the right-of-way but outside of the embankment area.

When permitted by a note in the contract documents, disposable material may be placed in the embankment side slope area. The contract documents will define the embankment side slope area and the procedures for the concurrent construction of the embankment and disposal section.

This type of disposal will require certain preparatory work. Preparation for direct burial of woody materials shall consist of cutting main trunks and limbs and chipping smaller limbs, branches, foliage and brush. Under conditions when disposal space and earth cover are limited in size and quantity, stumps will have to be ranked in size and placed in layers so as to make best use of the space available and the quantity of materials to be buried.

c. The Contractor may bury disposable material off the right-of-way at locations obtained by the Contractor at no expense to the State. Such locations are to be approved in writing by the Engineer. The disposal work will require the same preparatory work as stated in option b. above except that the Engineer may waive such requirements for miscellaneous work which may be accommodated in a satisfactory manner by other methods. The disposal area is to be covered with earth as hereinafter specified.

d. The Contractor may reduce all woody materials to chips and dispose of the chips as specified in paragraph B2 of this subsection.

e. The material may be sent to a refuse derived fuel processing facility or to other processing facility for eventual beneficial re-use as fuel or for other lawful re-use.

Under no circumstances is disposal to be made in swamp or wet lands. When the disposal area is within the embankment section or is formed by flattening the embankment slopes, the elevation of the normal embankment construction shall always equal or exceed that of the disposal area. There is to be absolutely no end dumping of disposable material over the sides of the embankment. All disposal areas are to be finally covered with a minimum of 2 feet of earth and graded to drain properly.

2. Chipping. Wood may be reduced to chips by the use of an approved chipping machine or stump grinder. Chips shall be 1/2 inch maximum thickness or of other approved thicknesses. Chips resulting therefrom may be disposed of by being stockpiled and used as mulch for planting, by distribution on the ground surface in wooded areas within the right-of-way as approved by the Engineer, or by disposal at a location off the contract site satisfactory to the Engineer.

3. Burying. No tree trunks, stumps or other debris shall be buried inside the right-of-way limits without the written approval of the Engineer. Disposal areas outside the right-of-way limits shall be approved in writing by the Engineer and shall be acquired by the Contractor at no expense to the State.

4. Salvage of Marketable Timber. In the interest of conservation, the Contractor shall make every effort possible to salvage marketable timber produced as a result of clearing operations, provided the amount of timber is great enough to make the hauling practical. In general, marketable timber is construed to mean logs 8 to 16 feet in length, plus appropriate trimming allowance, having a diameter inside the bark, at the small end, of approximately 10 inches. In the event that the Contractor is not successful in salvaging marketable timber, the Contractor shall

advise the Engineer, in writing, of the efforts to salvage and indicate the reason why the timber could not be salvaged.

Any wood that is cut up in firewood lengths or other marketable lengths may be neatly piled adjacent to the right-of-way in an area provided by the Contractor for periods in excess of one week but shall be removed prior to completion of the contract.

201-4 METHOD OF MEASUREMENT

201-4.01 Per Acre. Payment for Clearing and Grubbing will be made at the unit price bid per acre computed to the nearest one tenth acre.

201-4.02 Per Lump Sum. Payment for Clearing and Grubbing will be made on a lump sum basis for work satisfactorily completed. Monthly payments will be made in proportion to the amount of work done as determined by the Engineer.

201-4.03 Borrow Areas. Borrow pits or other pit areas from which material is secured shall not be included for measurement of clearing and grubbing.

201-5 BASIS OF PAYMENT.

201-5.01 Clearing and Grubbing. Payment will be made at the contract price to furnish all materials, labor and equipment necessary to satisfactorily complete the work as specified. No separate payment will be made for any excavation, backfill or earth cover necessary to complete the work of disposal outside the embankment area nor for the work in handling, storing, rehandling and hauling of disposable material within or outside the right-of-way.

Payment will be made under:

Item No.	Item	PayUnit
201.06	Clearing and Grubbing	Lump Sum
201.07	Clearing and Grubbing	Acre

SECTION 202 - REMOVAL OF STRUCTURES AND OBSTRUCTIONS

202-1 DESCRIPTION. This work shall consist of the removal and disposal, wholly or in part, of all buildings, structures, pavements, obsolete utility lines and tanks which are released to the Contractor in accordance with the provisions of these specifications. The work includes the demolition of existing superstructures, substructures, supporting bents and columns, surrounding material, and the removal of old bituminous concrete overlay and bituminous patches, within the right-of-way, listed in the itemized proposal, or directed by the Engineer. It also includes salvaging and storing designated materials, relocating designated buildings and backfilling resulting trenches, holes, pits, and cellars.

202-2 MATERIALS (Not specified)

202-3 CONSTRUCTION DETAILS

202-3.01 General and Safety Requirements. The Contractor shall conduct all demolition operations in a safe, legal, and responsible manner and shall ensure that any equipment, material, or method used shall be safe for the workers and the public. All laws, rules, regulations, and local building codes shall be followed. Local building code shall mean, outside of New York City, a code enacted or adopted by competent local officials or bodies at least as stringent in its requirements as the “New York State Fire Prevention and Building Code” and its associated reference standards. In New York City, Local Building Code shall mean the New York City Building Code.

Prior to demolition operations, an engineering survey shall be made by a competent person of the building, bridge, or other structure to determine its condition and the possibility of collapse of any

§202

portion, as outlined in 29 CFR 1926, Subpart T. As defined in 29 CFR 1926, Subpart C “Competent Person” means someone who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are or will be unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them. For purposes of this contract a competent person for bridge structures longer than 20 feet shall mean a registered professional engineer experienced in the design, construction or demolition of such structures unless waived in the contract documents. For buildings, other than ordinary wood frame construction, shall mean a registered professional architect or registered professional engineer experienced in building design, construction, or demolition.

Adjacent buildings or structures, within 100 feet of the building or structure, shall also be included in the survey if directed by the Engineer. The findings and recommendations of this survey shall constitute a “removal plan.” Removal plans that are required to be prepared by a registered professional engineer or architect shall be submitted to the Engineer thirty (30) days prior to the commencement of demolition. Other removal plans shall be submitted fifteen (15) days prior to demolition. The removal plan shall include a description of the type, size, weight, and location of all equipment to be used and a sequence of removal activities. The removal plan shall be filed with the Project Safety and Health Plan.

The Engineer may return the removal plan and require additional engineering surveys and studies to be conducted if the removal plans do not adequately identify and address obvious safety and other identified conditions. However, the Engineer's failure to return any removal plan for additional studies and recommendations shall not relieve the Contractor from the obligation of preparing an adequate removal plan and conducting adequate engineering surveys that safeguard the workers and public.

The competent person shall frequently and on a continuing basis perform monitoring to reassess the structural condition of the surveyed buildings and structures. This shall be accomplished by observing them for the presence of excessive vibrations; measuring and recording the width, extent, and progression of cracks; by measuring and recording the plumbness and integrity of structural elements and bracing; and by making other observations as necessary. Should the results of these assessments indicate that potential for collapse of a structure or building to be demolished exists, the competent person shall recommend and cause measures to be taken to ensure safety. Should the results of these assessments indicate that the work is causing damage to or diminution of structural condition of a structure or building that is to remain either wholly or in part or one that is to be relocated, the competent person shall recommend and cause to be undertaken measures to prevent additional damage or diminution of structural condition from occurring and, if directed by the State, shall recommend and cause to be undertaken measures necessary to reverse the diminution or repair the damage. The findings and recommendations of these monitoring assessments shall be made part of the removal plan prepared for the work and shall be provided to the Engineer promptly.

Before any structure or building served with or having utilities thereon is demolished or relocated all telephone, cable, electric, gas, water, steam, or any other service shall be shut off at the street and capped, or otherwise made safe and controlled, outside the building or off the structure before the general demolition work is started. Remediation work of asbestos or other hazardous material however may proceed before services are cut, except that all electric circuitry in any work area that is humid, wet, or will become wet or humid during the work shall be shut down and locked out. If power is required in such places, temporary power and light circuits may be brought into the work area provided such circuits have ground fault interrupters at their sources. In each case, the utility companies involved shall be notified, in writing, at least five (5) working days, or longer if indicated elsewhere in the contract documents, in advance of the work. The Contractor will be held fully responsible for any claim arising from failure to do so.

All severed sewer lines or drains emanating from the building or structure shall be capped or otherwise tightly sealed to prevent the entry of foreign materials into the main sewer or drain.

The Contractor shall protect power, water, or other utility lines during demolition. If such lines cannot be protected in place they shall be temporarily relocated, as necessary, and protected prior to undertaking any demolition work that might affect them. Unless indicated otherwise, all utility relocation work will be performed by, and at the expense of, its respective owners upon adequate notice.

During the periods that personnel are required to work on, in, or around a building or structure to be demolished or relocated which is in a damaged or deteriorated condition by fire, flood, explosion, weather, or other cause, its elements shall be adequately braced to prevent collapse. Details of the bracing

shall be provided in the removal plan previously mentioned in connection with the engineering survey and shall be included with the Project Safety and Health Plan for the project.

All asbestos materials or other hazardous materials shall be removed from or otherwise remediated on each structure or building before the general demolition work on that building or structure begins. The requirements and payment for this work will be as indicated elsewhere in the contract documents and as outlined in the asbestos or hazardous material remediation plan prepared by the State or others for the project.

Where a falling hazard exists to personnel, the openings shall be protected to a height of approximately 42 inches ~~3-feet~~. All floor or deck openings not used as material drops shall be covered over with materials substantial enough to support the weight of any loads which may be imposed upon them. Such materials shall be properly secured to prevent accidental movement.

When excavation is required, the Contractor shall provide excavation protection for workers and the public in accordance with §107-05K. Open Excavations and Trenches.

The Contractor shall repair or replace in kind, at no cost to the State and in a manner as approved by the Engineer, sidewalks, curbs, roadway and other materials designated to remain in place which are damaged by or as a result of the work.

202-3.02 Disposal Of Buildings. Any building designated for disposal and released to the Contractor thirty (30) days or earlier before the contract completion date, shall become the property of the Contractor and shall be promptly demolished at its site. Any proposal to allow such building or any portion thereof to remain standing at the site, or to be relocated to another site, shall be referred to the Director of the Office of Real Estate ~~Division~~ for approval and shall be accomplished under terms and conditions established by the State. An appropriate extension of time may be allowed for work resulting from demolition of buildings released to the Contractor after the date indicated above. All abandoned equipment, material other than those of a hazardous nature, and fixtures of any kind remaining on the property after it is released to the Contractor shall become the Contractor's property and shall be removed as part of the building disposal. Materials of a hazardous nature shall be removed or remediated as indicated below. All the requirements of §202-3.01 General and Safety Requirements shall apply together with the following:

A. Unauthorized Entry. The Contractor shall immediately inspect all buildings released for demolition and shall prevent unauthorized entry to these buildings by boarding up or otherwise blocking potential entrances. If material blocking entrances is removed, the Contractor shall, after determining the building to be vacant, replace the removed material in such a manner as to keep the buildings from being re-entered.

B. Hazardous Material. Asbestos, hazardous chemicals, gases, explosives, flammable materials, or similarly dangerous materials in the building or on the property shall be removed and disposed of or otherwise remediated in accordance with all applicable rules, regulations and laws concerning the handling and disposal of Hazardous Materials or Hazardous Wastes. Payment and requirements for such disposals and/or remediations shall be as indicated elsewhere in the contract documents. Petroleum products in storage tanks shall be removed in accordance with and paid for under the pay item for Disposal of Petroleum Storage Tanks.

C. Rodent, Insect, and Wildlife Control. The Contractor shall exterminate rodents and insects in each building so infested, as determined by the Engineer, City, County or District Office of the State Department of Health. The Contractor or Subcontractor performing the exterminating work shall, upon request, show at least five (5) years experience at extermination of the kind required. If the building or structure to be demolished is inhabited by wildlife, the Regional Office of the Department of Environmental Conservation or the local animal control officer shall be contacted and given the opportunity to remove such wildlife before extermination or demolition operations are commenced. If inhabited by domesticated animals, the local animal control officer shall be given the opportunity to arrange for their removal.

The work of extermination shall be performed in accordance with the requirements of the City, County or District Office of the State Department of Health.

Bait shall be placed at least thirteen (13) calendar days but not more than thirty (30) calendar days before actual demolition is started, or at such other times as required by the City or County Health Department. Insects shall be controlled by spraying or fumigating. If it is necessary to seal the building for the treatment to be effective or to prevent migration of insect, pest, or vermin, the Contractor shall seal the building.

If extermination is being conducted because it was ordered by the City, the County, or the State Department of Health, then the Contractor shall notify that office that the extermination has been completed and shall obtain their written concurrence that the extermination work was satisfactorily completed. Demolition work shall not proceed until the Engineer receives a copy of the written concurrence of the City, County or District Office of the State Health Department stating the extermination has been satisfactorily performed.

D. Glass. Glass that will create a hazard if fragmented shall be removed.

E. Demolition of Party Wall Structures. In the event that the demolition of one or more units of a group of party wall structures leaves a wall or walls exposed, the Contractor shall comply with the following requirements:

1. Furring, plaster, chimneys which are directed to be removed, projecting parts, and the like shall be removed.
2. The walls shall be made self-supporting, safe and weatherproof with construction similar to or consistent with the remaining building. The supports and bracing details necessary to accomplish this shall be included as a recommendation contained in the removal plan.

The walls shall be left in a presentable and sound weatherproof condition compatible in appearance with the remaining building and in conformance with local building codes, as determined by the Engineer.

3. The roof shall be properly flashed, repaired, or otherwise treated to prevent leaks.
4. The Contractor shall provide and place on solid foundation any shoring necessary to prevent damage to adjacent property. Necessary details of the foundation and shoring shall be included in the Removal Plan. The Contractor shall be held responsible for any claim arising out of failure to prevent damage to adjacent properties.
5. All work shall be in conformance with local building codes.

F. Demolition of Buildings. Unless mechanically demolished, the demolition of multi-story buildings herein defined as consisting of more than 2 1/2 stories shall be accomplished story by story without accumulating rubble on the floors of the partially demolished structure.

If mechanical demolition is used, during actual operations no worker shall be permitted at any location onto which debris may fall or which may become unstable or collapse as a result of the demolition operations. Only the minimum number of workers actually necessary for the performance of the work shall be permitted in those locations at other times until such time as the operations are complete and the debris has been removed.

If debris is dropped through holes in the floor without the use of chutes, the area onto which the material is dropped shall be completely enclosed with substantial barricades nominally ~~42 inches~~ ~~3 feet~~-high, or higher if directed, and placed not less than 6 feet back from the projected edge of the opening above. If the hole is to be used by machines as a material drop, substantial timber or other curbing shall be securely anchored around the hole. The barricades, but not the curbing, may be moved aside temporarily during periods that the machines are actually using the hole. Barricades shall be promptly restored to their proper locations when the machines have ceased actually using the hole.

Signs warning of the hazard and of falling materials shall be posted at each level.

Demolition and removal activities shall not be permitted in lower areas until debris handling ceases above.

The locations and details of any signs, barricades, curbings, and decking used to cover over holes in the flooring shall be indicated in the removal plan prepared for the building.

G. Partial Demolition of Buildings. If the work involved consists of demolishing only a portion of a building, the Contractor shall cooperate with the owner(s) of the remaining portion so that annoyance and inconvenience is minimized.

The competent person shall survey the site of the partial demolition and shall recommend any measures necessary to prevent the work from affecting adjacent property. Any measures recommended shall be included in the Removal Plan.

The Contractor shall close the open ends of the buildings being partially demolished with construction similar to the remainder of the building and shall furnish and install supporting members, framing, and foundations to support the remaining structure. All construction necessary to close the openings shall be of a strength and type to meet the local building codes. Structural supports shall be of the same materials as the existing supporting members to which they frame or with which they share load or shall be compatible with them. The Contractor may use salvaged lumber for sheathing provided that such lumber is sound and suitable, as determined by the Engineer. New kiln dried timber and lumber shall be used for all other purposes. The supporting members, framing and foundation etc, necessary to accomplish this shall be submitted as a recommendation of the previously mentioned engineering survey and included with the Removal Plan for the building.

H. Demolition of Foundation. Unless indicated otherwise or their removal would endanger adjacent improvements, the Contractor shall remove the foundation walls to the depth of the lowest cellar floor and shall break up any cellar floor, backfill the hole and grade the site to the satisfaction of the Engineer immediately after demolition of the structure.

I. Dust Control. Provisions shall be made at every demolition site to control the quantity of dust resulting from demolition operations by wetting the debris and the immediate work area with water or other appropriate spraying agents or by means acceptable to the Engineer. Dust control measures shall be included in the Removal Plan.

J. Maintenance and Protection of Traffic, Including Pedestrians. The Contractor shall, for the duration of the contract, maintain and keep safely passable and free from debris, snow and ice, all public walkways adjacent to the properties on which buildings to be demolished are located.

Active entrances to two or more story buildings being demolished shall be completely protected by sidewalk sheds, canopies or other means detailed in the Removal Plan and approved by the Engineer. Protection shall be provided a minimum distance of 8 feet from the face of the building. All such protection shall extend a minimum of 1 foot beyond each side of the building entrances or openings and shall be capable of sustaining a load of 150 psf.

All sidewalks or other walkways subject to falling objects as determined by the Engineer or within 8 feet of a two story or taller building, or greater distance if indicated in the contract documents, upon which traffic is to be maintained shall be protected by sidewalk shed or canopy designed by a professional engineer registered to practice in the State of New York to withstand the loading as required above. For single story buildings, these requirements may be waived if in the opinion of the Engineer the work may be satisfactorily and safely completed without these protective devices. No canopy or shed shall contain design features that will deflect falling material into an area where they could cause harm or injury to person or property.

K. Disposal of Materials. Disposal of all materials shall be in accordance with all federal, state, and local laws, rules, and regulations, any provision found elsewhere in the contract documents, and most specifically in §107-10 C “Construction and Demolition Debris”, if included in the contract, and shall be subject to the approval of the Engineer.

L. Removal of Salvaged Materials. All salvaged materials shall be removed from the site of the work prior to the final acceptance of the project. The Contractor shall not hold any sales, public or private, of salvaged equipment, material, or articles on State owned land. The State does not guarantee the number of fixtures, quantity or quality of equipment or any other material of value existing in the building to be present after its release to the Contractor. The Contractor waives all

claims against the State because the salvage value of any building has decreased at the time of disposal.

M. Use of Non-State Owned Land. If any material is to be placed upon non-state owned lands, written permission from the owner thereof shall be furnished to the Engineer prior to the use of such lands.

N. Removal of Buildings by Others. The State reserves the right to clear the Right of Way of any building by permitting the owner thereof to remove it from the site. Should any building be removed or demolished by its owner, the Contractor shall demolish the foundation and grade the site as indicated in §202-3.02H Demolition of Foundation.

O. Deletion of Buildings from Contract. The State reserves the right to delete any building demolition work from the Contract. There will be no compensation for claims of lost profits.

P. Explosives. Unless specifically authorized in the contract documents, demolition shall be accomplished without the use of explosives.

Q. Domestic Sewage Facilities. Septic tanks, leaching basins, cesspools and other similar facilities associated with buildings being demolished or those that will be abandoned shall be pumped free of septage or sewage, removed, and the resulting hole shall be backfilled in lifts of compacted suitable material. If permitted by the Engineer, the facilities may be collapsed in place after pumping instead of removal. Septage recovered from the pumping operation shall be handled, transported, and disposed of in accordance with 6 NYCRR Part 364.

202-3.03 Relocating Buildings. The Contractor shall, if directed by the Engineer, relocate specified buildings to sites designated by the owner and approved by the Department. The Contractor shall do all work in accordance with applicable State and local requirements and shall obtain necessary permits.

All the applicable requirements of §202-3.01 General and Safety Requirements, §202-3.02 Disposal of Buildings and the following shall apply:

A. Preparation of Site. The Contractor shall construct all necessary foundations and cellar floors for the relocated building to meet applicable local building codes but not less than equivalent in construction to the existing features. The Contractor shall also grade the new site, and construct necessary driveways and sidewalks, topsoil and/or seed the area and perform other incidentally required items of work to prepare the site as indicated in the contract documents or by the Engineer.

B. Moving Buildings. The Contractor shall move the building safely and in a manner so as to cause the least possible damage to the building and the least possible interference with or inconvenience to its occupant(s). The Contractor shall also arrange for any temporary rerouting of overhead lines or relocating guide wires and for the clearance of other obstructions. The Contractor shall be responsible for the repair of any damage that may occur to the building, pavement and other features within and around the area of the move as a result of the move.

C. Service Connections. At the building's final location, the Contractor shall reconnect or arrange for the reconnection of necessary plumbing, gas, heating, electrical, sanitary, water supply and other services at least equivalent in construction to those existing. The work shall be accomplished in such a manner as to cause the least possible disruption to the properties affected. All work shall be in conformance with the requirements of the various utilities and local building codes. Payment and requirements for such work shall be as indicated elsewhere in the contract documents.

D. Restoration Work. The Contractor shall restore all portions of the building, including steps, porches, railings, lean-tos, and other appurtenances, to as good and serviceable condition, in accordance with local building codes, as existed prior to its relocation as determined by the Engineer.

Any property damaged or destroyed during the execution of the work shall be repaired or replaced, as determined by the Engineer at the Contractor's expense to the satisfaction of the Engineer.

E. Demolition of Old Foundations. The Contractor shall remove old foundation walls in compliance with the provisions of §202-3.02H Demolition of Foundation.

F. Expenses and Liabilities. The Contractor shall save the State and the owner harmless as to all costs, expenses, and liabilities in connection with carrying out the work, and shall not hold the State liable for any claim on account of any delay or interferences with any part of the work due to relocating buildings.

G. Furnishing Sites. Sites to which the buildings are to be moved will be furnished without cost to the Contractor.

H. Removal of Building by Others. The State reserves the right to clear the Right of Way of any building by permitting the owner thereof to remove it from the site.

Should the building be removed or demolished by its owner, the Contractor shall demolish the foundation and grade the site as indicated in §202-3.02H Demolition of Foundation.

~~202-3.04 Disposal of Petroleum Storage Tanks. Subsection 202-3.01 General and Safety Requirements and the following shall apply to this work:~~

~~—All tanks containing petroleum liquids shall be removed in accordance with the requirements of the local fire and police officials, and those of the New York State Department of Environmental Conservation in general and 6 NYCRR Part 613 in particular. In addition, the following requirements shall apply:~~

~~**A. Explosion Meter.** The Contractor shall supply an explosion meter to monitor the tank atmosphere.~~

~~**B. Emptying Tanks Before Removal.** Before the removal of any tank is commenced, it shall first be pumped completely dry. All water obtained from this operation shall be transported and disposed of in accordance with applicable laws. All product obtained shall be either disposed of according to applicable laws or used or recycled at the Contractor's option. During the emptying operation the following restrictions shall apply:~~

- ~~1. Smoking shall be banned in the area.~~
- ~~2. All open flame and spark producing equipment within the area shall be shut down.~~
- ~~3. All electrical and internal combustion equipment, unless it is designed to be "explosive proof", shall be removed from the area.~~
- ~~4. Only "non-sparking" tools shall be used.~~
- ~~5. Static electricity shall be controlled.~~
- ~~6. The work area shall be secured.~~

~~**C. Additional Safety Precautions.** After the excavation work of underground tanks has been completed, but before removal of the tank, the Contractor shall distribute a minimum of one pound crushed dry ice for every 60 gallons capacity in the tank. Removal work shall not start until the readings from the explosion meter indicate that a safe and non-explosive tank atmosphere has been achieved as evidenced by readings less than ten percent (10%) of the lower explosive or flammable level at all elevations within the tank. Removal work shall be progressed diligently and expeditiously without interruption until its completion. The explosion meter shall be used to take subsequent readings periodically or continuously as directed by the Engineer as work is progressing. If any reading indicates a dangerous level is approaching, work shall cease, the workers shall exit the tank, and additional carbon dioxide shall be introduced into the tank until safe conditions are restored to all levels within the tank.~~

~~—The Contractor shall permit only trained and properly equipped personnel to enter the tank. Tanks shall not be entered unless personnel have and use proper self-contained breathing apparatus and standby personnel similarly equipped are present at the site to safeguard and protect those working in the tank. Workers in the tank shall also have and use appropriate harnesses and lifelines connected to personnel retrieval equipment fully rigged, and ready for use.~~

~~**D. Removal of Contaminated Soil.** Contaminated soil shall be removed and paid for in accordance with provisions found elsewhere in the contract documents.~~

~~**E. Backfilling.** The Contractor shall backfill any resulting holes and trenches with suitable material placed and compacted as indicated in §202-3.02H Demolition of Foundation and regrade the area to drain as directed by the Engineer.~~

~~**F. Removal of Supporting Structures.** Tank supports shall be removed and disposed of in a manner approved by the Engineer.~~

~~**G. Cleaning of Tanks.** All tanks shall be cleaned prior to disposal, either on site or off, of all residue and product clinging to their surfaces. All product, cleaning solvents, and water generated by the operation, shall be transported by a transporter permitted under 6 NYCRR 364 and, if disposed of in New York State, disposed of at a site regulated by the New York State Department of Environmental Conservation.~~

~~**H. Transportation of Tanks.** Unless cleaned, tanks shall be transported only by transporters permitted under 6 NYCRR 364. Prior to transporting an uncleaned tank, all holes shall be plugged and the tank shall be placarded. The tank shall be vented by means of a 1/8 inch hole in one of the plugs. The tank shall be securely fastened to the transporting vehicle oriented so that the plug with the hole in it is uppermost on the tank. Cleaned tanks need not be transported by permitted transporters nor is it necessary to placard a cleaned tank.~~

~~**I. Disposal of Tanks.** All tanks shall be cleaned prior to disposal. All non-metal tanks shall be disposed of (or recycled) at facilities permitted by the New York State Department of Environmental Conservation. Metal tanks shall be disposed of only by recycling.~~

202-3.04 (Vacant)

Comment [cjt12]:
EI08025

202-3.05 Demolition of Structures. General. §202-3.01 General and Safety Requirements shall apply to this work and in addition the following also apply:

Except as noted below, any structure designated for demolition and released to the Contractor shall be demolished at its site. Any proposal to allow such structure or any portion thereof to remain standing on the site or to be relocated to another site, shall be referred to the Deputy Chief Engineer, Structures for approval and accomplished under terms and conditions established by the State.

Colored tapes, barricades, marking paint, and signs shall be used to mark all areas that could become subject to collapse or that could become unstable as a result of demolition activity. Such areas are to be designated as non-access areas, and are to be identified by the previously mentioned Engineering Survey. Personnel and equipment with operators on board shall remain outside these designated non-access areas at all times during demolition operations or at any time the area is subject to collapse.

During the course of demolition work, the Contractor shall cause the structure to continue to be monitored by a competent person, as defined in §202-3.01, and the designated non-access areas or any additional non-access areas identified during the course of the work shall be appropriately marked and signed.

In accordance with state policy, steel and other metals other than those embedded in concrete or otherwise inseparable from articles being discarded shall be disposed of in a manner that ensures their salvage or beneficial re-use.

For steel structures coated with lead-based paint, the contractor shall comply with the provisions of 29 CFR 1926.62 and all other applicable worker Health and Safety Regulations. In addition, the contractor shall comply with all applicable regulations controlling the release of lead-based paint into the

environment. Prior to the beginning of any steel removal operations, the paint shall be removed for a minimum distance of four inches on each side of the centerline of cut, bolt row, or weld as applicable.

All paint shall be removed using vacuum-shrouded paint removal equipment. The equipment shall be approved by the Engineer prior to the beginning of any paint removal work. The equipment shall be demonstrated to successfully remove all paint, collect and contain the removed material, not permit release of visible dust or debris, and not vaporize existing paint into the atmosphere. If the equipment uses abrasives, the contractor may use any abrasive that contains less than one percent free silica. The supplied abrasive shall be compatible with the requirements of the equipment. All material not contained by the paint removal equipment shall be collected by vacuum methods only. All vacuums shall be equipped with high efficiency particulate (HEPA) filters. No shoveling, dry sweeping, wet sweeping, or air-blowing will be permitted.

In cases where the contractor can clearly demonstrate through exposure monitoring that other work practices and engineering controls, under the oversight of a certified industrial hygienist, can effectively maintain actual worker exposure below the permissible exposure level, exception to this requirement may be granted by the Engineer

202-3.06 Dismantling and Storing of Existing Superstructures. In accordance with §202-3.01 General and Safety Requirements, §202-3.05 Demolition of Structures-General and the following, all concrete and paving material and other materials as directed shall be carefully removed from the structure in a manner so as to not damage materials to be stored. If not incorporated into the work the removed materials shall be disposed of by the Contractor in a manner approved by the Engineer and as outlined in §202-3.02K Disposal of Waste Materials. The parts of superstructure designated to be stored shall be dismantled, protected, and stored on site or at the locations designated without damage. All stored steel members and other stored members as directed shall be adequately match-marked in order to permit reassembly.

Any parts of the structure designated for storage which are damaged during the course of the operation or during storage shall be repaired or replaced at the direction of the Engineer at the Contractor's expense.

202-3.07 Removing Existing Superstructures. In accordance with §202-3.01 General and Safety Requirements, §202-3.05 Demolition of Structures-General and the following, all concrete and paving material shall be removed from the structure and if not incorporated into the work shall be disposed of by the Contractor in a manner in accordance with laws, rules or regulations and as approved by the Engineer and as outlined in §202-3.02K Disposal of Waste Materials.

The rest of the material removed under this work will become the property of the Contractor and, except for materials incorporated into the work, shall be removed from the site of the work and disposed of in a manner approved by the Engineer.

202-3.08 Removing Old Bituminous Concrete Overlay. The Contractor shall remove the old bituminous concrete overlay and bituminous patches indicated in the Contract Documents in a manner approved by the Engineer. If the Contract Documents indicate that the overlay or patch to be removed contains asbestos, but not more than one percent by volume, the material shall be softened by radiant heat and removed while still hot, or in a thoroughly wet condition by means other than cold milling, or in accordance with the blanket variance for the removal of bituminous pavement containing asbestos.

Should the percentage asbestos be greater than one percent (1%) by volume, the material is defined as Asbestos Containing Material by Industrial Code Rule 56 and shall be removed and paid for as indicated elsewhere in the Contract Documents.

202-3.09 Removal of Substructures.

The appropriate construction details specified for Section 203 *Excavation and Embankment*, as stated in §203-3.01 *General* through and including §203-3.02 *Unclassified Excavation and Disposal* shall apply. The excavation shall be dewatered and kept free from water, snow and ice when necessary. ~~The appropriate construction details specified for Section 203, *Excavation and Embankment*, as stated in §203-3.01 *General* through and including §203-3.08 *Disposal of Surplus Excavated Material* shall apply. The excavation shall be dewatered and kept free from water, snow and ice when necessary.~~

Comment [c13]:
EI09024

§202

Sheeting or piling shown on the Contract Plans which is integral with the substructure and is designated to remain in place shall be cut off at the elevations shown on the plans. If indicated in the Contract Documents, existing sheeting or piling shall be extracted.

The Contractor may, with the permission of the Engineer, extract sheeting or piling not shown to be extracted or designated to remain in place rather than cutting it off at the elevations shown on the plans at no additional cost to the State.

If excavation protection is required solely to ensure the safety of workers and the public, the Contractor shall provide excavation protection. ~~If excavation support is necessary to support structures or other improvements, or if the alternatives of laying back slopes or benching are not available, the support system shall be as indicated in the contract documents. If excavation protection is necessary also to protect structures or other improvements, or if the alternatives of laying back slopes or benching are not available, the support system shall be as indicated in the contract documents.~~

If directed, the resulting hole shall be backfilled with suitable material placed in lifts and compacted as indicated in §202-3.02H Demolition of Foundation to the satisfaction of the Engineer and the area shall then be regraded as directed, topsoiled, and/or seeded.

202-4 METHOD OF MEASUREMENT

202-4.01 Relocating or Disposal of Buildings. The work will be measured on a lump sum basis for the relocation or disposal of the given building in accordance with the provisions of these specifications. Monthly estimates of the percentage completion will be made in proportion to the amount of work satisfactorily completed.

If a property owner, upon agreement with the Department, removes the building, the Contractor shall demolish the existing foundation, cellar floors, walks and other facilities to properly complete the work, and will be paid 20% of the bid price.

202-4.02 Disposal of Buildings (Credit Item). The bidder may provide a credit bid price for this work in the event that the estimated salvage value of the building materials exceeds the cost of demolition. When a credit bid price is intended for this work, it shall be identified by the bidder as follows:

A. Where the unit bid price is written in words in the proposal the words “a credit to New York State of” shall be written by the bidder preceding the bid price in words.

B. The bidder shall insert the word “credit” where the unit bid price and amount bid are written in numbers.

~~**202-4.03 Disposal of Petroleum Storage Tanks.** This work will be measured as the number of tanks within the indicated size range removed and disposed of in accordance with the provisions of these specifications.~~

~~—However, if the tank owner, upon agreement with the Department, removes the tank or tanks, the Contractor shall remove any supporting structures and backfill the resulting hole and/or trenches with suitable material, placed and compacted in accordance with §202-3.02H Demolition of Foundation, and will be paid 20% of the bid price in compensation for backfilling any resulting hole or for removing and disposing of the tank supporting structure.~~

202-4.03 (Vacant)

202-4.04 Dismantling and Storing Existing Superstructures. The work will be measured on a lump sum basis for “Dismantling and Storing Existing Superstructures.” Monthly estimates of the percentage completion will be made for this work in proportion to the amount of work satisfactorily completed.

202-4.05 Removing Existing Superstructures. The Contractor will be paid the lump sum price bid for “Removing Existing Superstructures.” Monthly estimates of the percentage completion shall be made for this work in proportion to the amount of work satisfactorily completed.

Comment [cjt14]:
EI08025

202-4.06 Removing Old Bituminous Concrete Overlay. The quantity to be measured will be the number of square yards of bituminous concrete overlay removed in accordance with the plans or as approved by the Engineer.

202-4.07 Removal of Substructures. The quantity of material removed and disposed of shall be the number of cubic yards of material computed from the payment lines shown on the Contract Plans irrespective of the excavation protection method chosen by the Contractor under §202-3.09.

202-5 BASIS OF PAYMENT

202-5.01 Disposal of Buildings. Except as indicated in the following the lump sum bid for Disposal of Buildings shall include the cost of all labor, materials and equipment necessary to satisfactorily complete the work. Unless indicated otherwise, asbestos and hazardous waste removal or remediation work shall be paid for under separate pay items. Suitable or select material obtained from other than the demolition site used to fill cellars will be paid for separately. Water used for dust control or compaction shall also be paid for separately if a pay item for water is included in the contract.

The cost of extermination work shall be included in the price bid if the contract documents indicate that extermination work is required for the given building; otherwise the work of extermination will be paid for as extra work.

202-5.02 Disposal of Buildings (Credit Item). When a credit price is bid for this work, the total or gross sum bid for the contract shall be the sum of all the bid amounts for the various items, not including those credit bids, reduced by the total bid amount involving credit bid prices.

202-5.03 Relocating Buildings. Except as indicated in the following the lump sum price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work including the cost of any excavation necessary at the old or the new building site, and any incidentals. Suitable or select material obtained off-site to backfill the original cellar hole will be paid for separately. Water used for dust control or for compaction shall be paid for separately only if an item for water exists in the contract. Sidewalks, driveways, topsoil, and turf reestablishment will also be separately paid. The cost of extermination work shall be included in the price bid if the contract documents indicate that extermination work is required for the given building; otherwise the work of extermination will be paid for as extra work.

Unless indicated otherwise, the work of reconnecting and providing services for the relocated building at its new site shall be performed and paid for under separate pay items.

~~**202-5.04 Disposal of Petroleum Storage Tanks.** The unit bid price for the removal and disposal of tanks within the indicated size range shall include the cost of all labor, materials, and equipment necessary to satisfactorily perform the work except that suitable or select material obtained from other than the tank site used to fill the resulting hole will be paid separately. Removing and disposing of contaminated soil, except that contaminated during the tank removal operations, will be separately paid.~~

202-5.04 (Vacant)

Comment [cjt15]:
EI08025

202-5.05 Dismantling and Storing Existing Superstructures and Removing Existing Superstructures. The lump sum bid shall include the cost of all labor, materials, and equipment necessary to complete the work. The lump sum bid shall also include the cost of repair or replacement of any element designated to be stored that is damaged during the operation and any protective system(s) required to ensure the safety of the workers or the public unless indicated on the plans. Support or protection systems when indicated on the plans, the extraction of existing sheeting designated to be extracted, topsoiling, and seeding will be paid for separately under their respective items. Water used for compaction or to control dust will also be paid for separately if a pay item for water is included in the Contract. Backfilling with select material or with suitable materials that must be obtained off-site will be separately paid.

§202

202-5.06 Removal of Substructures. Except as indicated below, the unit price bid per cubic yard for this work shall include the cost of furnishing all labor, materials, and equipment necessary to complete the work, including the cost of cutting existing sheeting or piling the protective system(s) required to ensure the safety of the workers and the public, unless indicated on the plans, and keeping the site dewatered and free of water, ice and snow when necessary. Support or protection systems when indicated on the plans, Topsoiling, and/or Seeding will be paid for separately under their respective items. Backfilling with select materials or with suitable materials which must be obtained off-site will be separately paid. Water will be paid for separately only if the pay item for Applying Water is in the contract. If the Contract Plans indicate that the sheeting or piling is to be extracted, payment for the extraction shall be made separately.

202-5.07 Removing Old Bituminous Concrete Overlay. The unit price bid per square yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except the cost of removing Asbestos Containing Material shall be paid for separately.

Payment will be made under:

Item No.	Item	Pay Unit
202.01nnnn	Disposal of Buildings	Lump Sum
202.02nnnn	Disposal of Buildings (Credit Item)	Lump Sum
202.03nnnn	Relocating Buildings	Lump Sum
202.05xx	Disposal of Petroleum Storage Tanks (various size ranges)	Each
202.11nnnn	Dismantling and Storing Existing Superstructures	Lump Sum
202.12nnnn	Removing Existing Superstructures	Lump Sum
202.19	Removal of Substructures	Cubic Yard
202.20	Removing Old Bituminous Concrete Overlay	Square Yard

Comment [cjt16]:
EI08025

NOTE: nnnn denotes serialized pay item for each building or structure; see §101-02 Definitions of Terms under "Specifications".

xx -see Catalog of Standard Pay Items or Proposal for complete description.

SECTION 203 – EXCAVATION AND EMBANKMENT

203-1 DESCRIPTION. This work shall consist of excavation, disposal, placement and compaction of all materials that are not provided for under another section of these Specifications, and shall be executed in conformance with payment lines, grades, thicknesses and typical sections specified in the contract documents.

203-1.01 Definitions.

A. Unclassified Excavation. Unclassified excavation shall consist of the excavation and disposal of all materials, of any description, encountered in the course of construction, unless otherwise specified in the contract. Estimated limits and descriptions of subsurface deposits and formations which may be shown in the contract documents are supplied as a part of Base Line Data.

B. Embankment. The embankment is the portion of a fill section situated between the embankment foundation and the subgrade surface, excluding any material placed under another section of these specifications.

C. Embankment Foundation. The embankment foundation is the surface upon which an embankment is constructed after all work required under §203-3.03A. *Embankment Foundation* has been completed.

D. Subgrade Surface. The subgrade surface is the surface of the road section upon which the select materials and/or subbase are placed.

E. Subgrade Area. The subgrade area is that portion of an embankment situated above either of the following, but excluding any material placed under another section of these specifications.

1. A line located 2 ft. below the subgrade surface and extended to the intersection with the embankment side slopes, or
2. The embankment foundation, whichever is higher.

The material and compaction requirements for the subgrade area in embankments are found in §203-2.01A. *Subgrade Area Material* and §203-3.03C. *Compaction*, respectively.

In cut sections, the subgrade area is not defined except where undercut and backfill with a select material item is specified or ordered: in such cases, the payment lines for undercut work shall define the subgrade area.

F. Embankment Side Slope Area. The embankment side slope areas are those cross-sectional areas of an embankment situated outside of lines projected downward and outward on a one on one slope from the edges of the subgrade surface to their intersection with the embankment foundation, but excluding any portion lying within a subgrade area.

G. Topsoil. See Section 613 *Topsoil*.

H. Suitable Material. A material whose composition is satisfactory for use in embankment construction is a suitable material. The moisture content of the material has no bearing upon such designation. In general, any mineral (inorganic) soil, blasted or broken rock and similar materials of natural or man made (i.e. recycled) origin, including mixtures thereof, are considered suitable materials. Determinations of whether a specific natural material is a suitable material shall be made by the Engineer on the above basis.

Recycled materials that the Department has evaluated and approved for general use shall be considered to be suitable material for embankment construction subject to the conditions for use as determined by the Department. The Regional Geotechnical Engineer and Geotechnical Engineering Bureau are available to provide guidance on the use of such materials. In general, the use of recycled materials must be also sanctioned by the Department of Environmental Conservation, usually in the form of a Beneficial Use Determination (BUD).

Glass from recycling facilities meeting the requirements of §733-05 *Glass Backfill* shall be considered suitable material for embankment construction.

Reclaimed Asphalt Pavement (RAP), and Recycled Portland Cement Concrete Aggregate (RCA) shall be considered suitable materials for embankment construction, subject to the following conditions for use:

RAP - The Contractor shall provide and place RAP conforming to the requirements of §733-06 *Reclaimed Asphalt Pavement for Earthwork and Subbase*.

RCA-The Contractor shall provide and place RCA conforming to the requirements of §733-07 *Recycled Portland Cement Concrete Aggregate*.

Pieces of broken up concrete pavement from on-site pavement removal or in-place recycling (i.e. rubblizing, crack and seat, break and seat, etc.) may be used in embankment construction. Refer to §203-3.03A. *Embankment Foundation* and §203-3.03B. *Embankments*.

I. Unsuitable Material. Any material containing vegetable or organic matter, such as muck, peat, organic silt, topsoil or sod, or other material that is not satisfactory for use in embankment construction under §203-1.01H. *Suitable Material* is designated as an unsuitable material. Certain man made deposits of industrial waste, toxic or contaminated materials, sludge, landfill or other material may also be determined to be unsuitable materials, based on an evaluation by the Department's Geotechnical Engineering Bureau and Office of Environment, and the Department of Environmental Conservation.

J. Borrow. Borrow is material required for earthwork construction in excess of the quantity of suitable material available from the required grading, cuts and excavations. Borrow may be necessary even though not shown in the contract documents.

K. Embankment Construction Control Devices. Embankment construction control devices allow real-time observations of embankment construction to assess the actual performance of the embankment compared to that envisioned in the design phase. Settlement and pore water pressure are common measures of embankment performance. Techniques for monitoring settlement include a settlement rod or a surface settlement gauge. A settlement rod is an optical survey technique to monitor settlement of the embankment surface. The settlement rod(s) establish monitoring point(s) in relation to a reliable bench mark.

A surface settlement gauge is an optical survey technique to monitor settlement of the existing ground surface, below the embankment installation. The surface settlement gauge is installed prior to placing the embankment and extended upwards through the fill.

Pore water pressure monitoring may be used to determine the effective overburden diagrams (the basis of all geotechnical analyses), monitoring consolidation progress of embankments constructed over soft soils, evaluating seepage in natural slopes or earth dams (slope stability), checking the effectiveness of subsurface drainage facilities, or monitoring water well tests.

A piezometer is an instrument which provides measurements of pore water pressure at the elevation of the installed sensor. Pore pressure data is needed in a foundation soil to assess the excess pore water pressure and hence the undrained strength of the soil. Piezometers are used at various depths within cohesive foundation soils. Some piezometers are used in granular foundation soils to assess their drainage behavior.

L. Proof Rolling. Proof rolling consists of applying test loads over the subgrade surface by means of a heavy pneumatic-tired roller of specified design, to locate and permit timely correction of deficiencies likely to adversely affect performance of the pavement structure.

M. Select Granular Fill – Slope Protection. Select granular fill – slope protection is a material used to protect the grade of a slope from erosion and sloughing from runoff and groundwater seepage. Seepage is the slow movement of water through small openings and spaces in the surface of unsaturated soil into or out of a body of surface or subsurface water. Sloughing is a shallow surface failure caused by erosive removal of supporting material.

Select granular fill – slope protection is highly permeable while also providing sufficient frictional resistance to resist seepage forces and remain in place.

N. Applying Water. Under this work, the Contractor shall furnish and apply water for dust control. Moisture control for compaction purposes is the Contractor's responsibility. Water shall not be applied in inclement weather or when the temperature is 32° F or less.

O. Modifying Cut Slopes and Other Means of Obtaining Borrow. The Regional Director may approve the modification of cut slopes and other means of obtaining material, which is not part of the contract, so long as provisions are made to prevent unsafe conditions, damage, and nuisances to property, wildlife areas, and haul routes within and outside the contract limits. Such approval may be granted only after review of a written proposal by the Contractor showing the final deposition of the material, the haul route, hauling hours, and provisions necessary to comply with the above. Should unanticipated conditions arise resulting in any unsatisfactory situation, the Engineer shall immediately rescind the approval pending satisfactory correction.

The following procedure shall apply to areas within the R.O.W. limits which are not designated as available sources of borrow by a Special Note in the contract proposal where the Contractor requests and is granted permission to modify slopes to obtain material for use on State contract work only. The Contractor will be required to reimburse the State with a rebate for the material obtained in these areas. Permission will not be granted to excavate material beyond the design slopes if it is to be used on other than State contract work.

The rebate to be obtained from the Contractor for this material is comprised of 1) A royalty based on the actual value of the excavated material, and 2) A credit for the difference in the Contractor's handling costs if these handling costs have been reduced. The royalty which is to be obtained for the excavated material shall be appropriate for the item for which it is to be utilized and shall be comparable to the current price being paid to purchase similar material in the area.

If the Contractor's handling costs associated with obtaining material from within the R.O.W. limits are greater than those for obtaining material from other acceptable sources, these additional handling costs must be borne by the Contractor. The royalty shall not be reduced to offset any increased handling costs incurred by the Contractor.

If the Contractor's handling costs associated with obtaining materials from within the R.O.W. limits are less than those for obtaining material from other acceptable sources, the differences shall be reimbursed to the State as a credit in addition to the royalty.

The difference in the Contractor's handling cost shall be determined by an analysis based on a comparison of haul lengths, hauling equipment, hauling operation, use of haul roads or public highways, preparation and restoration of the borrow areas, and any other variables involved.

Prior to modifying rock cut slopes, the Geotechnical Engineering Bureau must be consulted. If rock cut slopes are flattened sufficiently to eliminate the need for presplitting, an additional rebate will be necessary.

All special requirements to be fulfilled by the Contractor, at the Contractor's own expense, shall be clearly stated in the agreement. The foregoing requirement of receiving a rebate from the Contractor for material obtained by modification of slopes shall apply only to locations not designated in the Contract Documents.

203-2 MATERIALS

203-2.01 General. The requirements for select materials and subgrade area materials are described below. All processing operations including washing, removal of oversize material, blending, or crushing shall be completed at the source of the material. The procedure for acceptance or rejection of these materials shall be in conformance with the procedures contained in the geotechnical control procedure “*Procedure for the Control and Quality Assurance of Granular Materials*”.

A. Subgrade Area Material. Subgrade area material shall consist of any suitable material having no particles greater than 6 in. in maximum dimension, unless Select Granular Subgrade with the well graded rock option is used. In that case, refer to §733-13 *Select Granular Subgrade*. If concrete is used, any exposed mesh or rebar shall not exceed 1 in. in length. RAP is also permitted.

B. Glass Backfill. Provide backfill material meeting the requirements of §733-05 *Glass Backfill*.

C. RAP. Provide backfill material meeting the requirements of §733-06 *Reclaimed Asphalt Pavement for Earthwork and Subbase*.

D. RCA. Provide backfill material meeting the requirements of §733-07 *Recycled Portland Cement Concrete Aggregate*.

E. Miscellaneous. Necessary fill material for cleaning, grading and shaping the existing roadside section shall conform to the requirements of §203-2.01A, *Subgrade Area Material*.

203-2.02 Unclassified Excavation and Disposal. None Specified.

203-2.03 Embankment In Place. Provide backfill material meeting the requirements of §733-08 *Embankment In Place*.

203-2.04 Select Borrow. Provide backfill material meeting the requirements of §733-09 *Select Borrow*.

203-2.05 Select Fill. Provide backfill material meeting the requirements of §733-10 *Select Fill*.

203-2.06 Select Granular Fill. Provide backfill material meeting the requirements of §733-11 *Select Granular Fill*.

203-2.07 Select Granular Fill Slope Protection. Provide backfill material meeting the requirements of §733-12 *Select Granular Fill Slope Protection*.

203-2.08 Surface Settlement Gauges. Provide materials for the embankment construction control device surface settlement gauge meeting the requirements of §733-17 *Surface Settlement Gauge*.

203-2.09 Settlement Rods. Provide materials for the embankment construction control device settlement rod meeting the requirements of §733-18 *Settlement Rod*.

203-2.10 Piezometers. Provide materials for the piezometer installation meeting the requirements of §732-11 *Open Well Piezometer*.

203-2.11 Applying Water. Water used for dust control purposes may be obtained from any source.

203-2.12 Select Granular Subgrade. Provide backfill material meeting the requirements of §733-13 *Select Granular Subgrade*.

203-2.13 Select Structural Fill. Provide backfill material meeting the requirements of §733-14 *Select Structural Fill*.

203-2.14 Sand Backfill. Provide backfill material meeting the requirements of §733-15 *Sand Backfill*.

203-3 CONSTRUCTION DETAILS

203-3.01 General. The Contractor shall remove all soil, rock, and other material, and utilize or dispose of these materials as required by the contract documents. All excavation and embankment work shall be executed to payment lines shown in the contract documents.

All graded earth surfaces outside the roadway limits shall be smoothed and trimmed in reasonably close conformity (6± in.) of true grade. After trimming, the area shall be left in a compact and satisfactory condition, free of large stones or other objectionable materials, as determined by the Engineer.

Earthwork construction operations requiring compaction shall not be performed from November 1st thru April 1st except with a Winter Earthwork submittal subject to the provision of this Section and approved by the Regional Director or his designated representative. Winter Earthwork will be subject to the following restrictions:

- Transitioning from the normal construction season to the exempt winter earthwork months between November 1st and April 1st, the use of standard earthwork materials may be permitted only under the conditions where the air temperature, ground temperature and material temperature are all above 32° F at the time of placement. Modifications to compaction procedures, including but not limited to the use of thinner lifts, may be required when the temperatures are above 32° F but below 40° F at the time of placement.
- Between November 1st and April 1st, if the air temperature, ground temperature, or material temperature is at or below 32° F at the time of placement, earthwork may only proceed using material that meets the requirements of §733-16 *Winter Earthwork*.

In all work incorporated into the final product, the Contractor shall not place material that is frozen, or place fill material on frozen ground regardless of the date.

A. Winter Earthwork Submittal. For Contractors choosing to proceed with earthwork compaction operations between November 1st thru April 1st, provide the Engineer with a Winter Earthwork submittal, with a copy to the Regional Geotechnical Engineer, outlining the modifications to the materials and methods including the following:

1. Material Requirements. The material meets the requirements of §733-16 *Winter Earthwork*. Provide information on material composition and source substitute, if proposed.

2. Material Placement. Provide information on the proposed methods for controlling the weather effects on the material and existing ground conditions (i.e. insulation, enclosures, canvas and framework). Devise a plan to be outlined in the Winter Earthwork Submittal such that all

snow, ice, and frozen material shall be removed from the surface of the ground on which embankment or backfill material is to be placed, and from the surface under construction before succeeding lifts are added.

3. Transition Period. Provide acknowledgement of a transition period allowing the use of standard earthwork materials between November 1st and April 1st only under conditions where the air temperature, ground temperature and material temperature are all above 32° F at the time of placement. Acknowledge the transition period ends either when the air temperature, ground temperature or material temperature is at or below 32° F at the time of placement.

Proceed with Winter Earthwork only after receiving written approval by the Regional Director or his designated representative subject to the provisions of this Section.

B. Scheduling of Work to Minimize Soil Erosion and Water Pollution. The Contractor shall ensure effective and continuous soil erosion and sediment control throughout the construction period. The Contractor shall prepare and submit for approval, plans and schedules for all excavation, stripping, embankment, fill and grading operations. Such plans and schedules shall include but are not limited to temporary and permanent erosion control measures specified in Section 209 *Soil Erosion and Sediment Control*, Section 610 *Turf and Wildflower Establishment* and Section 612 *Sodding*.

C. Drainage and Grading. The Contractor shall provide and maintain slopes, crowns and ditches on all excavation and embankments to ensure satisfactory surface drainage at all times. Ditches and other drainage facilities necessary to remove ponded water shall be constructed as soon as practical to have the work area dry during the progression of work. All existing culverts and drainage systems shall be maintained in satisfactory operating condition throughout the course of the work. If it is necessary to interrupt existing surface drainage, sewers or under-drainage, then temporary drainage facilities shall be provided until the permanent drainage work is complete. Top-of-slope interceptor ditches, where shown on the contract documents, shall be completed before adjacent excavation operations are begun. In earth cuts, the Contractor shall progress excavation operations in such a manner that the portion of the cut immediately adjacent to the design slope is at least 5 ft. lower than the general level of the cut at all times until the lower payment line is reached.

The construction of these temporary drainage facilities shall be considered as incidental to the construction of the project and no additional payment will be allowed.

Any portion of an embankment or subgrade which has been damaged by the Contractor's equipment during the course of construction, shall be repaired and re-compacted by the Contractor at no additional cost to the State.

Where seepage causes instability of slopes, excavation and backfill or other corrective measures shall be performed as ordered by the Engineer and paid for under the appropriate item. Excavation for the installation of slope protection may be necessary at any time and location throughout the duration of the contract and may not necessarily coincide with the Contractor's performance of the general excavation work.

D. Suitable Materials. Moisture content has no bearing on the suitability of material to be used for embankment construction, however, the moisture content of a material may be such that its use will require manipulation. It is the Contractor's responsibility to determine the economics of using, or disposing of and replacing, such materials. Material determined by the Contractor to be uneconomical for use may be disposed of as specified under §203-3.02B. *Disposal of Surplus Excavated Materials* and replaced with other material at no additional cost to the State.

When a contract includes the item "Unclassified Excavation and Disposal", all excavated suitable materials, including the excavation performed under "Structure Excavation" and "Trench and Culvert Excavation," shall become the Contractor's property for disposal or use under another item of these specifications.

E. Unsuitable Materials. All excavated unsuitable materials shall be the Contractor's property for disposal as surplus materials under the provisions of §203-3.02B. *Disposal of Surplus Excavated Materials*.

F. Borrow. The management of a borrow source and the acceptability of all borrow material shall be subject to the approval of the Engineer at all times. The Contractor shall notify the Engineer at least ten (10) work days in advance of opening any borrow area, and request approval of the source under the pay item involved. Test pits required by the Engineer to evaluate the acceptability and limits of the source, shall be provided by the Contractor at the Contractor's own expense. Concurrent removal of material for more than one pay item from a single source or pit shall be prohibited except with the written permission of, and under such conditions and restrictions as may be imposed by the Engineer. All borrow pits shall be stripped of sod, topsoil and vegetable matter well in advance of any working face. The minimum distance by which stripping shall lead excavation for a given source shall be established by the Engineer to suit local conditions. Where a borrow source is not under direct control of the Contractor or where special conditions exist, the Engineer may waive any of the above requirements and establish alternative provisions for the control and acceptability of borrow.

Ordinary borrow will be accepted for use where the material qualifies under the definition of Suitable Material, §203-1.01H. *Suitable Material*. All borrow placed within the limits of Embankment or the Subgrade Area shall be placed in conformance with §203-3.03B. *Embankments* or §203-3.01G. *Subgrade Area* respectively, as appropriate, or where used for fill or backfill at structures, culverts and pipes, in conformance with §203-3.06 *Select Granular Fill* and §203-3.17 *Select Structural Fill*.

G. Subgrade Area. Where a subgrade area is defined in an embankment by §203-1.01E. *Subgrade Area*, the material placed shall conform to §203-2.01A. *Subgrade Area Material*, placed and compacted in conformance with §203-3.03B. *Embankments* and §203-3.03C. *Compaction*. Where longitudinal and transverse changes from cut to fill are encountered in the work, a subgrade transition section shall be provided in conformance with Standard Sheet *Earthwork Transition and Benching Details*. Where a subgrade area becomes defined by §203-1.01E. *Subgrade Area* in a cut section, the materials placed and other details shall be as specified under §203-3.02C. *Proof Rolling in Cut Sections 3. Procedure*, unless otherwise required by the contract documents. Prior to subbase course placement, the surface on which the subbase is to be placed shall be thoroughly compacted to the satisfaction of the Engineer.

1. Subgrade Surface Tolerance. After compaction, the subgrade surface shall not be above design elevation at any location.

203-3.02 Unclassified Excavation and Disposal.

A. Rock Excavation. Presplitting is required where the design rock slope is 1 vertical on 1 horizontal or steeper and the vertical height of the exposed rock slope exceeds 5 ft. Ripping will not be allowed within 10 ft. of a slope that requires presplitting. Test sections will be required at the outset of presplit drilling and blasting operations for the evaluation of the presplit rock slopes by a Departmental Engineering Geologist. The Contractor will be required to completely expose the presplit rock face in the test section for evaluation prior to any further presplit drilling.

All rock slopes shall be thoroughly scaled and cleaned. For rock excavations involving multiple lifts, scaling of upper lifts shall be completed prior to drilling and fragmenting of lower lifts. Scaled rock slopes shall be stable and free from possible hazards of falling rocks or rock slides that endanger public safety. If, after scaling, such conditions still exist, a determination of the cause will be made by a Departmental Engineering Geologist and if it is determined that the conditions are the result of poor quality work or improper methods employed by the Contractor, the Contractor shall provide approved remedial treatment, at no expense to the State. Such treatment may include, but is not necessarily limited to, laying back the slope, rock bolting, or shotcreting. In no case shall the subgrade be trimmed prior to the completion of the scaling operation at any location.

1. Presplitting. Prior to drilling presplitting holes, the overburden shall be completely removed to expose the rock surface along the presplitting line. The methods of collaring the holes to achieve required inclination and alignment shall be approved by the Engineer.

The presplitting holes shall be a maximum of 4 in. in diameter, spaced not more than 3 ft. center to center along the slope, and drilled at the designed slope inclination for a maximum slope

distance of 60 ft. When excavation operations are conducted in multiple lifts, the presplitting holes for successive lifts may be offset a distance of not more than 3 ft. for a design slope of 1 vertical on 1 horizontal and not more than 1 ft. for slopes of steeper design; however, a presplitting hole shall not be started inside the payment line. The Contractor shall control the presplit drilling operations by using proper equipment and technique to achieve the design slope and maximum bench between lifts. If presplitting is conducted in lifts, each lift shall be of approximately equal depth. All presplitting holes shall be checked and cleared of obstructions immediately prior to loading any holes in a round. All presplitting holes shall be loaded with a continuous column charge manufactured especially for presplitting which contains not more than 0.35 lbs. of explosive per foot. The top of the charge shall be located not more than 3 ft. below the top of rock. A bottom charge of not more than 3 lbs. of packaged explosive may be used; however, no portion of any bottom charge shall be placed against a proposed finished slope. Each presplitting hole shall be filled with No. 1A crushed stone stemming meeting the gradation requirements of §703-02 *Coarse Aggregate*. The presplitting charges shall be fired with detonating cord extending the full depth of each hole and attached to a trunk line at the surface. Detonation of the trunk line shall be with blasting cap(s) and shall precede the detonation of fragmentation charges within the section by a minimum of 25 milliseconds. Presplitting shall extend for a minimum distance equal to the burden plus 3 ft. beyond the limits of fragmentation blasting within the section.

2. Fragmentation Blasting. Fragmentation holes, or portions thereof, shall not be drilled closer than 4 ft. to the proposed finished slope. Where presplitting is required, fragmentation holes adjacent to the presplitting holes shall be drilled parallel to the presplitting holes for the full depth of the production lift at a spacing not exceeding the spacing of the production pattern. Only packaged explosives shall be used 10 ft. or less from a design slope which requires presplitting regardless of the construction sequence.

Fragmentation charges shall be detonated by properly sequenced millisecond delay blasting caps.

3. Explosive Loading Limits. In the absence of more stringent requirements, the maximum quantity of explosives allowed per delay period shall be based on a maximum particle velocity of 2 in./s at the nearest structure to be protected. In the absence of seismic monitoring equipment, the following explosive loading limits shall apply:

DISTANCE EQUAL TO OR LESS THAN 212 ft. FROM THE NEAREST STRUCTURE

- a. When the distance from the proposed blasting area to the nearest structure to be protected is 6 ft. or less, no blasting shall be allowed.
- b. When the distance between the blasting area and the nearest structure to be protected is greater than 6 ft. and equal to or less than 15 ft., a maximum of ¼ lb. of explosives per delay period (minimum of 25 milliseconds) blasting cap shall be allowed.
- c. When the distance between the blasting area and the nearest structure to be protected is greater than 15 ft. and equal to or less than 212 ft., a Scaled Distance of 30 ft. shall be utilized to determine the maximum amount of explosive allowed per delay period (minimum of 25 milliseconds) blasting cap. The Scaled Distance Formula is as described below:

$SD = \frac{D}{\sqrt{E_{\max}}}$
<p>where: <i>SD</i> = Scaled Distance <i>D</i> = Distance from blasting area to nearest structure to be protected in feet</p>

or

$E_{\max} = \frac{D^2}{(SD)^2}$
<p>where: E_{\max} = Maximum pounds of explosive per delay period (minimum of 25 milliseconds) blasting cap</p>

DISTANCE GREATER THAN 212 ft. FROM THE NEAREST STRUCTURE

a. When the blaster elects to utilize more than 50 lbs. of explosive per delay period (minimum of 25 milliseconds) blasting cap, a seismograph shall be employed to monitor the blasting vibrations generated. The initial loading shall be computed using a Scaled Distance of 30 ft. The resulting particle velocity measured by the seismograph shall be evaluated by a Department Engineering Geologist. The Geologist's evaluation shall be the basis for adjusting the Scaled Distance.

No separate payment shall be made for this work. The cost shall be included in the appropriate excavation item. The above requirements shall in no way relieve the Contractor of liability for any damage incurred as a result of the blasting operations.

B. Disposal of Surplus Excavated Materials. Only unsuitable materials, or that portion of suitable material excavated in excess of the quantity required to construct all embankments on the project, shall be considered as surplus.

Where disposal of surplus materials cannot be accommodated within the right of way, the excess shall become the Contractor's property for disposal. Surplus material disposed of within the right-of-way shall be placed in accordance with §107-10 *Managing Surplus Material And Waste*.

C. Proof Rolling in Cut Sections. Immediately prior to final trimming of the subgrade surface and placement of subbase materials in cut sections, all areas of the subgrade surface within roadway limits shall be proof rolled according to the requirements of this subsection. This work, and any delays due to this work, shall be considered incidental to the excavation item.

1. Purpose. In cut sections, the purpose of proof rolling is to determine the location and extent of areas below the subgrade surface that require corrective undercutting and are not so specified in the contract documents.

2. Equipment. The proof roller used in embankment sections, as specified in §203-3.03D. *Proof Rolling in Embankment Sections 1. Equipment*, shall be employed for proof rolling in cut sections except that the roller shall be loaded to achieve a single stress level in operation, using a gross ballasted weight of 30 tons and all tires inflated to 40 psi.

3. Procedure. Two complete passes shall be applied over all elements of the area to be proof rolled. Where any portion of the cut subgrade surface other than that which has been damaged by the Contractor's operations fails to provide a satisfactory support for the proof rolling operation, the Engineer may order corrective undercut and backfill work performed. Backfill of undercuts shown in the contract documents or ordered by the Engineer shall be in conformance with §203.3-13 *Select Granular Subgrade*. Where natural soil below this course will not support the weight of the construction equipment, and when ordered by the Engineer, the course shall be placed in one lift. No additional proof rolling shall follow corrective work.

4. Exceptions. Proof rolling of the subgrade surface in cut sections will not be required in any area where the subgrade surface is in a rock cut, or where undercut and backfill has been previously performed. The Engineer may order undercutting and backfill without proof rolling of any cut where the need for corrective work, as determined by the Engineer, is obvious without actual proof rolling. The Engineer may also delete proof rolling in any cut section where, based

upon a written evaluation by a Departmental Geotechnical Engineer, proof rolling would be detrimental to the work.

203-3.03 Embankment In Place.

A. Embankment Foundation. After completion of the work required under Section 201 *Clearing and Grubbing*, and Section 202 *Removal of Structures and Obstructions*, the embankment foundation shall be prepared. Sod and topsoil shall be removed where the final pavement grade is 6 ft. or less above the existing ground surface and in other areas designated in the contract documents or by the Engineer. Prior to embankment construction and subbase course placement, the surface on which the embankment and/or subbase is to be placed shall be thoroughly compacted to the satisfaction of the Engineer. Unsuitable materials other than sod and topsoil shall be removed to the depths shown in the contract documents or as directed by the Engineer. Underwater areas shall be filled in accordance with §203-3.04 *Select Borrow* or §203-3.05 *Select Fill* and paid for under its appropriate item.

Where embankments are to be constructed over ground that will not adequately support embankment construction equipment, an initial layer of fill may be allowed to form a working platform. The need, manner of construction, and thickness of such a layer shall be subject to approval of the Engineer, and the layer will be permitted only where the lack of support is, as determined by the Engineer, not due to deficient ditching, grading or drainage practices or where the embankment could be constructed in the approved manner by the use of different equipment or procedures. Thicknesses of up to 3 ft. may be permitted for such a layer. Concrete or asphalt slabs may be used at the bottom of such a layer, provided they are placed horizontally.

In locations where embankments are to be constructed on hillsides or against existing embankments with slopes steeper than 1 vertical on 3 horizontal, the slopes shall be benched. Required benches shall be constructed as shown on the Standard Sheet *Earthwork Transition and Benching Details*.

Where old pavement is encountered within 2 ft. of the top of the subbase course, it shall be broken up or scarified.

B. Embankments. The embankment shall be constructed of suitable material as defined by §203-1.01H. *Suitable Material*. Embankment material shall not be placed on frozen earth, nor shall frozen soils be placed in any embankments. Embankment material shall be placed and spread in lifts (layers) of uniform thickness, then uniformly compacted as specified under applicable portions of §203-3.03C. *Compaction*. During embankment construction operations, earth moving equipment shall be routed so as to prevent damage to any compacted lift. Damage to any compacted lift at any time during the course of construction, such as rutting under the loads imposed by earth moving equipment, shall be fully repaired by the Contractor at his/her own expense prior to placement of any overlying materials. At the close of each day's work, the working surface shall be crowned, shaped and rolled with smooth steel wheel or pneumatic tired rollers, for positive drainage.

Particles with a dimension in excess of $\frac{2}{3}$ of the loose lift thickness are designated as oversized particles. Oversized particles shall be removed prior to compaction of the lift and may be placed in the Embankment Side Slope Area.

Pieces of concrete or asphalt may be used provided that the voids between the pieces are completely filled, and the greatest dimension of any piece does not exceed $\frac{2}{3}$ the loose lift thickness. Exposed mesh or rebar shall not exceed 1 in. in length.

Embankments constructed using rock products or pieces of concrete shall be spread by bladed equipment on each lift to minimize the formation of large voids as the work progresses. The top lift of a rock or concrete fill shall be chinked.

When permitted by a note in the contract documents, stumps, logs, and other materials may be placed in the Embankment Side Slope Area, provided that: 1) such matter is deposited and compacted concurrent with the adjacent embankment, and; 2) any stumps or woody material are covered by not less than 2 ft. of soil beneath the exposed side slope surface.

Glass shall not be placed in contact with synthetic liners, geogrids, geotextiles or other geosynthetics.

C. Compaction

1. General Requirements. It shall be the Contractor's responsibility to properly place and compact all materials in the road section and other locations specified in the contract documents, and to correct any deficiencies resulting from insufficient or improper compaction of such materials throughout the contract period. The Contractor shall determine the type, size and weight of compactor best suited to the work at hand, select and control the lift (layer) thickness, exert control over the moisture content of the material, and other details necessary to obtain satisfactory results. During the progression of the work, the Department will inspect the Contractor's operations and will permit the work to continue where:

- a.** Lift thickness is controlled and does not exceed the maximum allowed according to the equipment classifications in subparagraph 2. *Compaction Equipment*, of this subsection, and the equipment meets all specified class criteria. Thinner lifts and lighter equipment than the maximum allowed may be necessary for satisfactory results on some materials.
- b.** The compactive effort (number of passes and travel speed) is uniformly applied and not less than that specified for the given equipment class and lift thickness. Higher efforts than the minimum allowed may be necessary for satisfactory results on some materials.
- c.** The Engineer concludes from a visual observation that adequate compaction has been attained, with the exception of backfill at structures, culverts, pipes, conduits, and direct burial cables. However, the State reserves the right to perform density tests at any time. When tests are performed, the results shall indicate that not less than 90% of Standard Proctor Maximum Density is attained in any portion of an embankment, or 95% in a subgrade area, or as specified for other items with a percent maximum density requirement.
- d.** Significant rutting under the action of the compactor is not observed on the final passes on a lift.

Whenever the Contractor's operations do not conform to the above criteria, or requirements contained in other subparagraphs of this subsection, the Engineer will prohibit placement of an overlying lift until the Contractor takes effective corrective action.

As part of the Department's Quality Assurance (QA) program, the Engineer or his representative may verify the adequacy of the compaction at any time through QA testing. When the Engineer determines that QA tests are necessary, the Contractor shall provide any assistance requested to facilitate such tests. Such assistance shall include but will not be limited to excavation and backfill of test pits and holes. This work shall be considered to be incidental construction.

Damage to any compacted lift at any time during the course of construction such as rutting under the loads imposed by earth moving equipment, shall be fully repaired by the Contractor at his/her own expense prior to placement of any overlying materials.

2. Compaction Equipment. The selection of compaction equipment is the Contractor's responsibility, but shall be subject to meeting the requirements of this subparagraph and approval by the Engineer with respect to its provisions. All compaction equipment shall be marked by a permanently attached manufacturer's identification plate designating the name of the manufacturer, model number and serial number of the machine as minimum identification. This plate shall be installed in a readily visible location. Compaction equipment lacking such an original manufacturer's identification plate, or with altered or illegible plates, will not be recognized as acceptable compaction equipment. Any equipment not principally manufactured for soil compaction purposes and equipment which is not in proper working order in all respects shall not be approved or used. The Engineer will also withhold approval of any compactor for which the Contractor cannot furnish manufacturer's specifications covering data not obvious from a visual inspection of the equipment and necessary to determine its classification.

The term, "pass," for any type of compactor, shall denote one direct vertical application of compactor effort over all elemental areas of a lift surface. Terms in common parlance, such as "coverage," "trips," etc., have no significance, equivalence, or application under these specifications.

TABLE 203-1 PNEUMATIC-TIRED COMPACTOR CLASSIFICATIONS				
Pneumatic Compactor Class	Tire Requirements			Range of Ballasted Wheel Loads (lbs. per Wheel)
	Tire Size	No. Plys	Inflation Pressure (psi)	
A	7.50 x 15	4	35	2,000 – 3,000
B	7.50 x 15	6	60*	2,000 – 4,000
		10	90*	
C	7.50 x 15	14	130*	2,000 – 4,000
D	9.00 x 20	10	75*	4,000 – 6,000
		12	90*	
E	11.00 x 20	12	90*	6,000 – 8,000
		18		
F	13.00 x 24	18	100*	8,000 – 10,000

* Inflation pressure for not less than the last two passes on each lift. May be reduced during earlier passes and gradually increased to this level.

a. Pneumatic-Tired Compactors. This type of compactor shall be classified for use according to the requirements of Table 203-1. For the lift thickness selected by the Contractor, the minimum class and wheel load which will be allowed on that lift thickness, shall be as shown in Figure 203-1.

The minimum effort for all pneumatic compactors shall be 6 passes, at speeds up to 12 ft./sec on no more than the first 2 passes, and all subsequent passes at speeds of 6 ft./sec. or less.

b. Smooth Drum Vibratory Compactors. This type of compactor is defined as a machine which primarily develops its compactive effort from the vibrations created and is classified for use according to the developed compactive force rating (CFR) per linear inch of drum width.

The CFR is defined as follows:

$$\text{CFR} = \frac{\text{Unsprung Drum Weight (lbs.)} + \text{Dynamic Force (lbs.)}}{\text{Drum Width (in.)}}$$

The unsprung drum weight is the static weight of the drum and appurtenances without any reaction transmitted to the drum from the main chassis of the compactor. The dynamic force produced is dependent on the frequency of vibration, and therefore, CFR ratings shall

be determined for the actual operating frequency of the compactor. Approval for vibratory compactors shall be confined, however, to equipment operating at not less than 1100 vpm, nor more than 1500 vpm, and those where the actual dynamic force at the actual operating frequency is at least 2.5 times the unsprung drum weight.

Conversion of manufacturer's published ratings, at a given frequency, shall be made with the following equation:

$F_2 = \frac{F_1(V_2)^2}{(V_1)^2}$
<p>where: F_1 = Dynamic Force at Rated Frequency F_2 = Dynamic Force at Operating Frequency V_1 = Rated Frequency V_2 = Operating Frequency</p>

For the lift thickness selected by the Contractor, the minimum CFR rating and minimum effort on such a lift, shall be as shown in Figures 203-2B&C, respectively. Non-Centrifugal (Vertical force only) types of vibratory compactors shall be approved as above, less 175 lbs./in. before using Figures 203-2 B&C as a minimum number of passes at a single specified speed. An equivalent effort, relating varying numbers of passes to other speeds is given by the equation:

<p>Speed X = <u>(Specified Speed) (Min. Passes at Speed X)</u> (Specified Min. Passes)</p>
--

The Contractor may choose to alter the specified minimum pass requirement, provided that speed is adjusted to the value given by this equation and does not exceed 6 ft./sec.

FIGURE 203-2 VIBRATORY COMPACTORS

Where vibratory compactors are used on a project, the Contractor shall furnish for the exclusive use of the Engineer, one vibrating reed tachometer per project, plus one additional tachometer for each group of two vibratory compactors in excess of two per project. Tachometers shall have a frequency range adequate to cover operating frequencies of all vibratory compactors used on the project and shall have scale divisions of 50 vpm or less. Tachometers may be placed on the ground surface near the compactor when making readings, or with suitable damping materials interposed, placed directly on the compactor drum frame.

The dispensations permitted under this specification for vibratory compactors are contingent upon proper operation of the equipment at all times during compaction operations. In any instance where the Engineer encounters any problems with operators rolling without vibration, for any reason, and immediate and effective corrective action is not taken by the Contractor, the Engineer will halt the work until the problem is resolved. If continuing problems of this nature occur, the Engineer may suspend all provisions of this subparagraph and consider the vibratory compactors as smooth steel wheel rollers classified according to their gross weight.

c. Sheepfoot and Segmented Pad Foot Rollers. This type of compactor shall be defined as a machine which is primarily designed to compact a lift from the bottom to the top.

The maximum loose layer thickness of the material to be compacted shall be equal to the length of the feet plus 15%. The end area size and configuration of the feet shall be selected by the Contractor to suit the characteristics of soil being compacted.

Where sheepsfoot and segmented pad foot rollers are used, with or without vibration, the number of passes required for job control shall be determined by a jobsite test in which the feet penetrate into the loose lifts and, with further passes, eventually and substantially “walk out” of the layer. This job control shall then be established for that machine, lift thickness and material, provided that adequate moisture control is continuously maintained per §203-3.03C. *Compaction 3. Moisture Control.* Sheepsfoot and segmented pad foot rollers shall be operated at speeds not exceeding 6 ft./sec., when towed and 15 ft./sec. when self-propelled.

d. Smooth Steel Wheel Rollers. Smooth steel wheel rollers shall be considered as primary compactors on layers whose maximum thickness, after compaction, is 8 in. When so used, the roller shall have a nominal gross weight of not less than 10 tons, exert a minimum force of not less than 300 lbs/in. of width on the compression roll faces, and a minimum of 8 passes shall be applied over each lift with the roller operating at a speed not exceeding 6 ft./sec.

When the Contractor employs smooth steel wheel rollers exclusively for surface compaction, leveling or finishing operations on lifts previously compacted by other types of primary compactors, the above restrictions shall not apply.

This section applies to non-vibratory rollers or vibratory rollers operated in the static mode only.

e. Other Type of Compactors. Compactor types other than those classified above, may be employed by the Contractor, subject to approval by the Engineer of the proposed minimum applied effort (minimum number of passes and travel speed) and maximum lift thickness. Such approval by the Engineer will be based upon the results of appropriate on-site field tests.

f. Compaction Equipment for Confined Areas. In areas inaccessible to conventional compactors, or where maneuvering space is limited, impactor rammers, plate or small drum vibrators, or pneumatic buttonhead compaction equipment may be used with layer thickness not exceeding 6 in. before compaction. Hand tampers shall not be permitted. The Engineer may approve or reject any of the above described mechanical devices based upon the results of appropriate on-site field tests.

3. Moisture Control. All fill or backfill material to be compacted, shall be at a moisture content for adequate compaction of that material using the compactor selected by the Contractor to perform the work. The Contractor shall be responsible for determining the appropriate moisture content, and for controlling it within the proper limits as the work is progressed. When water must be added to a material, it may be added on the lift or in the excavation or borrow pit. Water added on the lift, however, shall be applied by use of an approved pressure distributor. Distributors must be approved and documented by the Engineer. Documentation by the Engineer shall be adequate evidence of approval. Water added shall be thoroughly incorporated into the soil, and the soil shall be manipulated to attain uniform moisture distribution. When the moisture content of a lift about to be compacted exceeds the required amount, compaction shall be deferred until the layer has dried back to the required amount. Natural drying may be accelerated by blending in a dry material or manipulation alone, to increase the rate of evaporation. Increased loose lift thickness caused by blending in a dry material, however, may necessitate a change in compaction equipment and/or methods to meet the minimum provisions of subparagraph 2. *Compaction Equipment* of this subsection.

FIGURE 203-3 GUIDE FOR SELECTING THE INITIAL STRESS LEVEL FOR PROOF ROLLING EMBANKMENT SECTIONS

Relative Subgrade Support	Poor	Fair			Good		Excellent
Compacted Subgrade Soil Type Description	Well Graded Soils						GRAVEL - SAND Mixtures little to no fines
							GRAVEL - SAND - SILT - CLAY Mixtures SANDS or GRAVELLY SANDS little or no fines SAND - SILT - CLAY Mixtures, slight plasticity SILTY SANDS OR SAND - SILT Mixtures, slight plasticity
Poorly Graded Soils							
							SANDS or GRAVELLY SANDS little or no fines
							SAND - SILT - CLAY Mixtures, plastic SILTY GRAVELS or GRAVEL - SAND - SILT Mixtures
							SAND - SILT - CLAY Mixtures or CLAYEY SANDS, plastic to high pl. SILTS and Very Fine SANDS slight or no plasticity GRAVELS and GRAVEL - SAND Mixt. little or no fines
							LEAN CLAYS, SILTY CLAYS, slightly plastic to plastic
							ELASTIC SILTS, Micaceous or Diatomaceous SILTS FAT CLAYS, SILTY CLAYS highly plastic
Stress Level	Minimum	1	2	3	4	5	Maximum
Gross Tons	30	34	38	42	46	50	50
Tire psi	40	50	60	70	80	90	130

D. Proof Rolling in Embankment Sections. Immediately prior to final trimming of the subgrade surface and placement of subbase materials in embankment sections, all areas of the subgrade surface within roadway limits shall be proof rolled according to the requirements of this subsection. This work, and any delays due to this work, shall be considered incidental to the embankment item.

1. Equipment. The proof roller shall consist of a chariot type rigid steel frame with a box body suitable for ballast loading up to 50 tons gross weight, and mounted on four pneumatic tired wheels acting in a single line across the width of the roller on its transverse load center line. The wheels shall be equipped with 18.00 x 24 or 18.00 x 25, 24 ply tires, and shall be suspended on articulated axles such that all wheels carry approximately equal loads when operating over uneven surfaces.

2. Determination of Roller Stress. Initially, the gross ballasted weight and tire inflation pressure of the proof roller shall be adjusted to the highest stress level shown in Figure 203-3 based on:

- a. The general description of the subgrade soils.
- b. The estimation of the relative subgrade support within the subgrade soil description range.

The initial roller stress for embankments constructed of rock shall be the maximum level listed in Figure 203-3 (50 Gross Tons, 130 Tire psi).

The roller shall be operated briefly to establish the acceptability of the initial stress level. Proof rolling of the embankment shall be performed at the next lower stress level whenever

operation of the roller at a higher stress level is accompanied by consistent lateral displacement of soil out of the wheel paths.

3. Procedure. After an acceptable stress level is established, two complete passes of the roller shall be applied over all elements of the area to be proof rolled. Any deficiencies disclosed during the proof rolling operation shall be corrected. Subsidence depressions shall be filled with material similar to the subgrade soil and then compacted in a normal manner. After compaction, these areas shall be proof rolled again. Corrective work shall be judged complete and accepted by the Engineer when all elements of the subgrade surface over a given embankment show a satisfactory uniform response to the proof roller.

4. Exceptions. Proof rolling of the subgrade surface in embankment sections will not be required in any area where:

- a.** Due to restrictions in available access and/or maneuvering space, use of the proof roller may damage adjacent work;
- b.** The proof roller will approach a culvert, pipe or other conduit closer than 5 ft. in any direction.

203-3.04 Select Borrow. The management of a select borrow source and the acceptability of all select borrow material shall be in conformance with §203-3.01F. *Borrow*.

Underwater areas shall be filled with select borrow to 2 ft. above the water surface at the time of placement and in conformance with the details shown on the appropriate Standard Sheet or as noted in the contract documents.

All select borrow placed within the limits of Embankment or the Subgrade Area shall be placed in conformance with §203-3.03B. *Embankments* or §203-3.01G. *Subgrade Area* respectively, as appropriate, or where used for fill or backfill at structures, culverts and pipes, in conformance with §203-3.06 *Select Granular Fill* and §203-3.17 *Select Structural Fill*.

203-3.05 Select Fill. Underwater areas shall be filled with select fill to 2 ft. above the water surface at the time of placement and in conformance with the details shown on the appropriate Standard Sheet or as noted in the contract documents.

All select fill placed within the limits of Embankment or the Subgrade Area shall be placed in conformance with §203-3.03B. *Embankments* or §203-3.01G. *Subgrade Area* respectively, as appropriate, or where used for fill or backfill at structures, culverts and pipes, in conformance with §203-3.06 *Select Granular Fill* and §203-3.17 *Select Structural Fill*.

203-3.06 Select Granular Fill. The type of material to be used in bedding, filling and backfill at culverts, pipes, conduit and direct burial cable shall be in conformance with the details shown on the appropriate Standard Sheet or as noted in the contract documents. Do not use RAP. Do not use slabs or pieces of either concrete or asphalt.

Fill or backfill material at culverts and pipes shall be deposited in horizontal layers not exceeding 6 in. in thickness prior to compaction. Compaction of each layer shall be as specified under §203-3.03C. *Compaction*. A minimum of 95% of Standard Proctor Maximum Density will be required. When placing fill or backfill around culverts and pipes, layers shall be deposited to progressively bury the pipe or culvert to equal depths on both sides. The limits to which this subsection will apply shall be in accordance with the Standard Sheets or as modified in the contract documents.

Fill or backfill for conduit or cable placed in a trench shall be carefully placed in a horizontal layer to a depth of 6 in. over the top of the conduit or cable. This layer of material shall not be compacted, however, the remaining portion of the trench shall be backfilled in accordance with the preceding paragraph. Where cables or conduits are placed and backfilled by a machine in one operation, the above requirements for backfilling do not apply.

Where sheeting has been used for the excavation, and incremental removal of sheeting is not specified in the contract documents, sheeting shall be pulled when the trench has been backfilled to the maximum unsupported trench depth allowed by 29 CFR 1926.

203-3.07 Select Granular Fill Slope Protection. The Contractor shall perform the excavation in accordance with the requirements for “Unclassified Excavation and Disposal” as described elsewhere in these specifications. The Contractor shall then spread material conforming to the requirements given in §733-12 *Select Granular Slope Protection*, in one layer to its full thickness by a method approved by the Engineer. The work shall be performed where shown in the contract documents or where directed by the Engineer in accordance with the Standard Sheets, and details shown on the contract documents.

Compaction of the slope protection is not required. Slope Protection shall be either of two types, as described below:

A. Select Granular Fill, Slope Protection - Type A. Under this type, the Contractor shall furnish and install the slope protection where shown in the contract documents in accordance with the details shown on the Standard Sheets.

B. Select Granular Fill, Slope Protection - Type B. Under this type, the Contractor shall furnish and install the slope protection where directed by the Engineer in accordance with the details shown on the Standard Sheets.

203-3.08 Surface Settlement Gauges. Surface settlement gauges shall be constructed, installed, and maintained where shown in the contract documents and in accordance with the details contained in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” covering construction, installation, maintenance, and abandonment of these devices.

Where surface settlement gauges are called for, it will be the Contractor's option to install pipe gauges or manometer gauges, unless a definite type is specified in the contract documents. Surface settlement gauges will be accepted for conformance with the specification requirements on the basis of an inspection of the installation by the Departmental Geotechnical Engineer.

203-3.09 Settlement Rods. Settlement rods shall be constructed, installed, and maintained where shown in the contract documents and in accordance with the details contained in the geotechnical control procedure “*Settlement Gauges and Settlement Rods*” covering construction, installation, maintenance, and abandonment of these devices.

Settlement rods will be accepted for conformance with the specification requirements on the basis of an inspection of the installation by the Departmental Geotechnical Engineer.

203-3.10 Piezometers. Piezometers shall be constructed, installed, and maintained at the locations shown in the contract documents and in accordance with the detailed drawings included in the contract documents.

203-3.11 Applying Water. None Specified.

203-3.12 Select Granular Subgrade. The type of material to be used in fill or backfill of undercuts shall be in conformance with the details shown in the contract documents or as ordered by the Engineer.

Fill or backfill material shall be deposited in horizontal layers not exceeding 6 in. in thickness prior to compaction. Compaction of each layer shall be as specified under §203-3.03C. *Compaction*. A minimum of 95% of Standard Proctor Maximum Density will be required.

203-3.13 Select Structural Fill. The type of material to be used in bedding, filling and backfill at structures shall be in conformance with the details shown on the appropriate Standard Sheet or as noted in the contract documents or as ordered by the Engineer. Do not use RAP. Do not use slabs or pieces of either concrete or asphalt.

Fill or backfill material at structures shall be deposited in horizontal layers not exceeding 6 in. in thickness prior to compaction. Compaction of each layer shall be as specified under §203-3.03C. *Compaction*. A minimum of 95% of Standard Proctor Maximum Density will be required. When filling behind abutments and similar structures, all material shall be placed and compacted in front of the walls prior to placing fill behind the walls to a higher elevation. The limits to which this subsection will apply shall be in accordance with the Standard Sheets or as modified in the contract documents.

Where sheeting has been used for the excavation, and incremental removal of sheeting is not specified in the contract documents, sheeting shall be pulled when the trench has been backfilled to the maximum unsupported trench depth allowed by 29 CFR 1926.

203-3.14 Sand Backfill. The type of material to be used in bedding and filling shall be in conformance with the details shown in the contract documents or as ordered by the Engineer.

Bedding or fill material shall be deposited in horizontal layers not exceeding 6 in. in thickness prior to compaction. Compaction of each layer shall be as specified under §203-3.03C. *Compaction*. A minimum of 95% of Standard Proctor Maximum Density will be required.

203-4 METHOD OF MEASUREMENT

203-4.01 General. Quantities for all items of work with payment units in cubic yards will be computed from payment lines shown in the contract documents. Work performed beyond any designated payment line, including any offset required for the construction of presplit rock slopes in lifts, will not be included in the computation of quantities for the item involved.

For any item paid for in its final position, no additional quantity will be measured for payment to make up losses due to foundation settlement, compaction, erosion or any other cause.

Cross-sectioning, for the purpose of determining quantities for payment, will be employed only where payment lines are not shown in the contract documents or Standard Sheets, and cannot be reasonably established by the Engineer.

Quantities for benching will be computed for payment from the details and instructions shown on the Standard Sheet *Earthwork Transition and Benching Details*.

The excavation of unsuitable materials designated as topsoil under Section 613 *Topsoil*, will be included in the quantity measured for the appropriate unclassified excavation item, without distinction.

Where the item, "Embankment in Place," is designated for the project by the proposal, all borrow of ordinary suitable materials shall be incidental to the work of that item.

203-4.02 Unclassified Excavation and Disposal. Unclassified excavation and disposal will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the original position for all excavation within right-of-way limits. No deduction shall be made for any pipes, culverts, structures, or other obstructions, unless these are measured for payment under another contract item. Excavation for borrow of suitable materials for embankment construction, shall not be included in the computation for this work.

203-4.03 Embankment in Place. Embankment in place will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the final compacted position. Any additional quantity of material required to compensate for embankment settlement shall not be included in the measurement of this item. The quantities of embankment will exclude the total volume of pipes, culverts, other roadway items, and granular backfill within the payment lines for such granular backfill.

203-4.04 Select Borrow. Select borrow will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the original position.

203-4.05 Select Fill. Select fill will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the final compacted position.

203-4.06 Select Granular Fill. Select granular fill will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the final compacted position. A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area exceeds 1 ft² unless otherwise shown in the contract documents. No deduction will be made for the cross-sectional area of an existing facility.

203-4.07 Select Granular Fill Slope Protection. Select granular fill slope protection will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the final position.

203-4.08 Surface Settlement Gauges. Surface settlement gauges will be measured by the number of devices satisfactorily installed.

203-4.09 Settlement Rods. Settlement rods will be measured by the number of devices satisfactorily installed.

203-4.10 Piezometers. Piezometers will be measured by the number of devices satisfactorily installed.

203-4.11 Applying Water. The unit of measurement of water will be one pressure distributor per calendar day, denoted hereafter as one p.d.d., for dust control. Where the Contractor works in more than one separate and distinct shift per calendar day, each shift shall be considered as one p.d.d. A single shift plus overtime work, however, shall be considered as one p.d.d. The quantity thus determined shall be applied directly as the quantity to be paid for where the distributors used have a capacity of 3,000 gal. or less.

Provided that the Engineer determines that the total operating distributor capacity (number and sizes of all distributors) employed is reasonably commensurate with the needs for water application, additional payment will be allowed for distributors exceeding 3,000 gal. in capacity as follows:

Distributor Capacity	Pressure Distributor per Calendar Day Adjustment
3,000 gal. < distributor capacity < 5,000 gal.	p.d.d.'s will be multiplied by 1.5
5,000 gal. ≤ distributor capacity	p.d.d.'s will be multiplied by 2.0

No additional quantity shall be measured for payment for compaction purposes.

203-4.12 Select Granular Subgrade. Select granular subgrade will be measured in cubic yards, measured to the nearest whole cubic yard, computed in the final compacted position.

203-4.13 Select Structural Fill. Select structural fill will be measured in cubic yards, measured to the nearest whole cubic yard, in the final compacted position. A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area exceeds 1 ft² unless otherwise shown in the contract documents. No deduction will be made for the cross-sectional area of an existing facility.

203-4.14 Sand Backfill. Sand backfill will be measured in cubic yards, measured to the nearest whole cubic yard, in the final compacted position. A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area exceeds 1 ft² unless otherwise shown in the contract documents. No deduction will be made for the cross-sectional area of an existing facility.

203-5 BASIS OF PAYMENT

203-5.01 General-All Items. The unit price bid shall include the cost of furnishing all labor, materials, and equipment as necessary to complete the work, except where specific costs are designated or included in another pay item of work. Incidental costs, such as acquisition of borrow pits or material outside of the right-of-way, rock drilling and blasting, compaction and special test requirements, stockpiling and re-handling of materials, precautionary measures to protect private property and utilities, to form and trim graded surfaces, proof rolling, re-proof rolling, corrective work disclosed by proof rolling and any delays caused by this corrective work, shall be included in the unit price of the pay item where such costs are incurred. The exception is that corrective work ordered in cut sections based on an evaluation of proof rolling will be paid for under the appropriate excavation and backfill items.

Quantities for any additional items of work or substitution of material in accordance with the approved Winter Earthwork submittal shall be furnished at no cost to the State.

203-5.02 Unclassified Excavation and Disposal. The provisions of §203-5.01 *General-All Items* apply including the following:

The unit price bid shall cover all costs of required excavation within the right of way limits, and all costs of disposal if the excavated materials are not used under another pay item.

203-5.03 Embankment In Place. The provisions of §203-5.01 *General-All Items* apply.

203-5.04 Select Borrow. The provisions of §203-5.01 *General-All Items* apply.

203-5.05 Select Fill. The provisions of §203-5.01 *General-All Items* apply.

203-5.06 Select Granular Fill. The provisions of §203-5.01 *General-All Items* apply.

203-5.07 Select Granular Fill Slope Protection. The provisions of §203-5.01 *General-All Items* apply.

203-5.08 Surface Settlement Gauges. The provisions of §203-5.01 *General-All Items* apply including the following:

The unit price bid shall cover all costs of providing, installing and maintaining each device, including excavation, trenching and backfill during the course of the work. No payment will be made under any other item of the contract for any work associated with these items.

When each installation is completed, 75% of the item unit price will be paid. The remaining 25% will be paid when each device has been properly maintained and is abandoned according to the procedures contained in the geotechnical control procedure "*Settlement Gauges and Settlement Rods*". Unless otherwise specified in the proposal, the unit price shall also include the costs of removal.

203-5.09 Settlement Rods. The provisions of §203-5.01 *General-All Items* apply including the following:

The unit price bid shall cover all costs of providing, installing and maintaining each device, including excavation, trenching and backfill during the course of the work. No payment will be made under any other item of the contract for any work associated with these items.

When each installation is completed, 75% of the item unit price will be paid. The remaining 25% will be paid when each device has been properly maintained and is abandoned according to the procedures contained in the geotechnical control procedure "*Settlement Gauges and Settlement Rods*". Unless otherwise specified in the proposal, the unit price shall also include the costs of removal.

203-5.10 Piezometers. The provisions of §203-5.01 *General-All Items* apply including the following:

The unit price bid shall cover all costs of providing, installing and maintaining each device, including excavation, trenching and backfill during the course of the work. No payment will be made under any other item of the contract for any work associated with these items.

When each installation is completed and the device placed in satisfactory operation, 75% of the unit price will be paid. The remaining 25% will be paid when all earthmoving and slope work is completed in the vicinity of each installation. Any installation rendered inoperative due to damage by construction equipment after partial or full payment, shall be immediately repaired or the full amount of such payment shall be deducted from other monies due the Contractor under the contract.

203-5.11 Applying Water. The unit price bid per one operating pressure distributor per calendar day for applying water shall include the costs of furnishing all labor, material and equipment necessary for dust control.

203-5.12 Select Granular Subgrade. The provisions of §203-5.01 *General-All Items* apply.

203-5.13 Select Structural Fill. The provisions of §203-5.01 *General-All Items* apply.

203-5.14 Sand Backfill. The provisions of §203-5.01 *General-All Items* apply.

Payment will be made under:

Item No.	Item	Pay Unit
203.02	Unclassified Excavation and Disposal	Cubic Yards
203.03	Embankment In Place	Cubic Yards
203.05	Select Borrow	Cubic Yards
203.06	Select Fill	Cubic Yards
203.07	Select Granular Fill	Cubic Yards
203.0801	Select Granular Fill, Slope Protection - Type A	Cubic Yards
203.0802	Select Granular Fill, Slope Protection - Type B	Cubic Yards
203.10	Surface Settlement Gauges	Each
203.12	Settlement Rods	Each
203.13	Piezometers	Each
203.1601	Applying Water	P.D.D.
203.20	Select Granular Subgrade	Cubic Yards
203.21	Select Structural Fill	Cubic Yards
203.25	Sand Backfill	Cubic Yards

Comment [c17]:
E109024

~~SECTION 203 – EXCAVATION AND EMBANKMENT~~

~~**203-1 DESCRIPTION.**—This work shall consist of excavation, disposal, placement and compaction of all materials that are not provided for under another section of these Specifications, and shall be executed in conformance with payment lines, grades, thicknesses and typical sections specified in the contract documents.~~

~~**203-1.01 Unclassified Excavation.**—Unclassified excavation shall consist of the excavation and disposal of all materials, of any description, encountered in the course of construction, unless otherwise specified in the contract. Estimated limits and descriptions of subsurface deposits and formations which may be shown in the contract documents are supplied as a part of Base Line Data.~~

~~**203-1.02 Embankment.**—The embankment is the portion of a fill section situated between the embankment foundation and the subgrade surface, excluding any material placed under another section of these specifications.~~

~~**203-1.03 Embankment Foundation.**—The embankment foundation is the surface upon which an embankment is constructed after all work required under §203-3.09 has been completed.~~

~~**203-1.04 Subgrade Surface.**—The subgrade surface is the surface of the road section upon which the select materials and/or subbase are placed.~~

~~**203-1.05 Subgrade Area.**—The subgrade area is that portion of an embankment situated above either of the following, but excluding any material placed under another section of these specifications:~~

- ~~A. A line located 2 feet below the subgrade surface and extended to the intersection with the embankment side slopes, or~~
- ~~B. The embankment foundation, whichever is higher.~~

~~—The material and compaction requirements for the subgrade area in embankments are found in §203-2.02 and §203-3.12, respectively.~~

~~—In cut sections, the subgrade area is not defined except where undercut and backfill with a select material item is specified or ordered; in such cases, the payment lines for undercut work shall define the subgrade area.~~

~~**203-1.06 Embankment Side Slope Area.**—The embankment side slope areas are those cross-sectional areas of an embankment situated outside of lines projected downward and outward on a one on~~

~~one slope from the edges of the subgrade surface to their intersection with the embankment foundation, but excluding any portion lying within a subgrade area.~~

~~**203-1.07 Topsoil.**— See Section 613, Topsoil.~~

~~**203-1.08 Suitable Material.**— A material whose composition is satisfactory for use in embankment construction is a suitable material. The moisture content of the material has no bearing upon such designation. In general, any mineral (inorganic) soil, blasted or broken rock and similar materials of natural or man-made (i.e. recycled) origin, including mixtures thereof, are considered suitable materials. Determinations of whether a specific natural material is a suitable material shall be made by the Engineer on the above basis.~~

~~— Recycled materials that the Department has evaluated and approved for general use shall be considered to be suitable material for embankment construction subject to the conditions for use as determined by the Department. The Regional Geotechnical Engineer and Geotechnical Engineering Bureau are available to provide guidance on the use of such materials. In general, the use of recycled materials must be also sanctioned by the Department of Environmental Conservation, usually in the form of a Beneficial Use Determination (BUD).~~

~~Glass from recycling facilities shall be considered suitable material for embankment construction.~~

~~— Reclaimed Asphalt Pavement (RAP), and Recycled Portland Cement Concrete Aggregate (RCA) shall be considered suitable materials for embankment construction, subject to the following conditions for use:~~

~~— RAP— The Contractor shall provide and place RAP conforming to the requirements of Section 304.~~

~~— RCA— The Contractor shall provide and place RCA conforming to the requirements of Section 304.~~

~~— Pieces of broken up concrete pavement from on-site pavement removal or in-place recycling (i.e. rubblizing, crack and seat, break and seat, etc.) may be used in embankment construction. Refer to §203-3.09 and §203-3.10.~~

~~**203-1.09 Unsuitable Materials.**— Any material containing vegetable or organic matter, such as muck, peat, organic silt, topsoil or sod, that is not satisfactory for use in embankment construction under §203-1.08 is designated as an unsuitable material. Certain man-made deposits of industrial waste, toxic or contaminated materials, sludge, landfill or other material may also be determined to be unsuitable materials, based on an evaluation by the Department's Geotechnical Engineering Bureau and Environmental Analysis Bureau, and the Department of Environmental Conservation.~~

~~**203-1.10 Borrow.**— Borrow is material required for earthwork construction in excess of the quantity of suitable material available from the required grading, cuts and excavations. Borrow may be necessary even though not shown on the plans.~~

~~**203-1.11 Embankment Construction Control Devices.**— This work shall consist of furnishing, installing and maintaining devices such as settlement gages, settlement rods, piezometers and other equipment used specifically for controlling earthwork construction.~~

~~**203-1.12 Proof Rolling.**— Proof rolling consists of applying test loads over the subgrade surface by means of a heavy pneumatic-tired roller of specified design, to locate and permit timely correction of deficiencies likely to adversely affect performance of the pavement structure.~~

~~**203-1.13 Graded Surfaces.**— The Contractor shall form and trim all graded surfaces to the lines and grades shown on the plans or as modified by the Engineer.~~

~~**203-1.14 Select Granular Fill—Slope Protection.**— This work shall consist of excavating for, furnishing, and installing granular fill slope protection in accordance with these specifications, the standard sheets, conforming to the lines and grades shown on the plans, or where directed by the Engineer.~~

203-1.15 Applying Water.— Under this work, the Contractor shall furnish and apply water for dust control, for compaction purposes and for such other purposes (not provided for in other Sections) as called for on the plans, in the itemized proposal or as directed by the Engineer. Water shall not be applied in inclement weather or when the temperature is below 32°F.

203-1.16 Modifying Cut Slopes and Other Means of Obtaining Borrow.— The Regional Director may approve the modification of cut slopes and other means of obtaining material, which is not part of the contract, so long as provisions are made to prevent unsafe conditions, damage, and nuisances to property, wildlife areas, and haul routes within and outside the contract limits. Such approval may be granted only after review of a written proposal by the Contractor showing the final deposition of the material, the haul route, hauling hours, and provisions necessary to comply with the above. Should unanticipated conditions arise resulting in any unsatisfactory situation, the Engineer shall immediately rescind the approval pending satisfactory correction.

— The following procedure shall apply to areas within the R.O.W. limits which are not designated as available sources of borrow by a Special Note in the contract proposal where the Contractor requests and is granted permission to modify slopes to obtain material for use on State contract work only. The Contractor will be required to reimburse the State with a rebate for the material obtained in these areas. Permission will not be granted to excavate material beyond the design slopes if it is to be used on other than State contract work.

— The rebate to be obtained from the Contractor for this material is comprised of 1) A royalty based on the actual value of the excavated material, and 2) A credit for the difference in the contractor's handling costs if these handling costs have been reduced. The royalty which is to be obtained for the excavated material shall be appropriate for the item for which it is to be utilized and shall be comparable to the current price being paid to purchase similar material in the area.

— If the Contractor's handling costs associated with obtaining material from within the R.O.W. limits are greater than those for obtaining material from other acceptable sources, these additional handling costs must be borne by the Contractor. The royalty shall not be reduced to offset any increased handling costs incurred by the Contractor.

— If the Contractor's handling costs associated with obtaining materials from within the R.O.W. limits are less than those for obtaining material from other acceptable sources, the differences shall be reimbursed to the State as a credit in addition to the royalty.

— The difference in the Contractor's handling cost shall be determined by an analysis based on a comparison of haul lengths, hauling equipment, hauling operation, use of haul roads or public highways, preparation and restoration of the borrow areas, and any other variables involved.

— Prior to modifying rock cut slopes, the Geotechnical Engineering Bureau must be consulted. If rock cut slopes are flattened sufficiently to eliminate the need for presplitting, an additional rebate will be necessary.

— All special requirements to be fulfilled by the Contractor, at the Contractor's own expense, shall be clearly stated in the agreement. The foregoing requirement of receiving a rebate from the Contractor for material obtained by modification of slopes shall apply only to locations not designated in the Contract Documents.

203-1.17 Cleaning Culverts, Closed Drainage Systems, Drainage Structures and Manholes. This work shall consist of cleaning and keeping clean, existing culverts, closed drainage systems and drainage structures indicated in the contract documents or where directed by the Engineer, for the duration of the contract.

203-2 MATERIALS

203-2.01 Tests and Control Methods.— Materials tests and control methods pertaining to the item requirements and work of this Section will be performed in conformance with the procedures contained in the appropriate Departmental publication in effect on the date of the advertisement for bids. These publications are available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau.

~~**203-2.02 Select Materials and Subgrade Area Material Requirements.**—The requirements for select materials and subgrade area materials are described below. All processing operations including washing, removal of oversize material, blending, or crushing shall be completed at the source of the material. The procedure for acceptance or rejection of these materials shall be as described in the appropriate Geotechnical Control Procedure (GCP) manual.~~

~~**A. Subgrade Area Material.**—Subgrade area material shall consist of any suitable material having no particles greater than 6 inches in maximum dimension, unless Select Granular Subgrade with the well graded rock option is used. In that case, refer to 203-2.02 E. 1. A.~~

~~—If concrete is used, any exposed mesh or rebar shall not exceed 1 inch in length.~~

~~**B. Select Borrow and Select Fill**~~

~~**1. Gradation.**—Material furnished for these items shall be suitable material having no particles greater than 3 feet in maximum dimension. Of the portion passing the 4 inch square sieve, the material shall have the following gradation:~~

Sieve Size	Percent Passing by Weight	Sieve Size	Percent Passing by Weight
No. 40	0 to 70	No. 200	0 to 15

~~**2. Soundness.**—The material shall be sound and durable. A material with a Magnesium Sulfate Soundness Loss exceeding 35 percent will be rejected.~~

~~**3. Composition.**—RAP shall not be used.~~

~~**C. Select Granular Fill and Select Structural Fill.**—Materials furnished under these items shall be suitable, well graded, and conform to the following requirements:~~

~~**1. Gradation.**—Except when used as backfill material for aluminum pipe with Type IR corrugations (Spiral Rib Pipe), the material shall have the following gradation:~~

Sieve Size	Percent Passing by Weight
4 inch	100
No. 40	0 to 70
No. 200	0 to 15

~~—When used as backfill for Corrugated Aluminum Pipe, Type IR (Spiral Rib Pipe) 100% of the material shall also pass the 2 inch sieve.~~

~~**2. Soundness.**—The materials shall be substantially free of shale and soft, poor durability particles. A material with Magnesium Sulfate Soundness Loss exceeding 30% will be rejected.~~

~~**3. Composition.**—RAP shall not be used.~~

~~—When used as backfill for aluminum pipe, the material shall be free of Portland cement or Portland cement concrete.~~

~~**4. pH.**—Where the State elects to test for this requirement, a material with pH of less than 5 or more than 10 shall be rejected.~~

~~**D. Select Granular Fill Slope Protection.**—Material furnished for use under this item shall consist of rock, stone, slag, cobbles, or gravel, substantially free of shale or other soft, poor durability particles.~~

~~**1. Gradation**~~

a. ~~Broken or blasted unweathered rock used for this item shall be well graded, having no particles greater than 24 inches in maximum dimension, and substantially free from particles greater than 12 inches in maximum dimension, containing little or no material passing the No. 10 sieve.~~

b. ~~All materials, other than broken or blasted unweathered rock, shall meet the following gradation requirements:~~

Material Size	Percent Passing by Weight
24 inch maximum dimension	100
6 inch maximum dimension	90 to 100
2 inch square sieve	0 to 30
1/4 inch sieve	0 to 10

~~**2. Soundness.** Where the State elects to test for this requirement, a material with a Magnesium Sulfate Soundness Loss exceeding 35 percent will be rejected.~~

~~E. Select Granular Subgrade.~~

~~1. Gradation~~

a. ~~Well graded rock may be used for this item. Particles shall not exceed 12 inches in greatest dimension nor two thirds of the loose lift thickness, whichever is less.~~

b. ~~All materials, other than well graded rock, furnished under this item shall have no particles greater than 6 inches in maximum dimension. Of the portion passing the 4 inch square sieve, the material shall have the following gradation:~~

Sieve Size	Percent Passing by Weight
1/4 inch	30 to 100
No. 40	0 to 50
No. 200	0 to 10

~~**2. Soundness.** A material with a Magnesium Sulfate Soundness Loss exceeding 35 percent will be rejected.~~

~~**3. Composition.** RAP shall not be used.~~

~~F. Glass~~

~~**1. Gradation.** Glass shall be crushed to a maximum particle size of 1/2 inch.~~

~~**2. Characteristics.** Glass may contain up to a maximum of 5 percent by volume of china, ceramics, plate glass products, paper, plastics or other deleterious materials. The material shall be subject to visual inspection by the Regional Geotechnical Engineer and may be rejected based on this inspection. In case of rejection, the inspection must be documented in writing to the Engineer In Charge indicating the basis of rejection.~~

~~G. RAP~~

~~**1. Gradation.** RAP shall have a maximum top size of 2 inches at the time of placement.~~

~~**2. Characteristics.** RAP shall meet the requirements stated in Section 304.~~

~~H. RCA~~

~~**1. Gradation.** RCA shall meet the gradation requirements for the appropriate item of use.~~

~~2. **Characteristics.**—RCA shall meet the requirements stated in Section 304, and the applicable parts of Section 203 herein.~~

~~I. **Sand Backfill.**—Materials furnished under these items shall be suitable and conform to the following requirements:~~

~~1. **Gradation.**—The material shall have the following gradation:~~

Sieve Size	Percent Passing by Weight
1/2 inch	100
1/4 inch	90 to 100
No. 200	0 to 5

~~2. **Soundness.**—The materials shall be substantially free of shale and soft, poor durability particles.~~

~~3. **pH.**—Where the State elects to test for this requirement, a material with pH of less than 5 or more than 10 shall be rejected.²²~~

~~J. Necessary fill material for cleaning, grading and shaping the existing roadside section shall conform to the requirements of Subsection 203-2.02A, Subgrade Area Material.~~

~~203-2.03 **Water.**—Water used for dust control or compaction purposes may be obtained from any source. When used for watering seeded or sodded areas, or surfaces to be seeded or sodded, water shall meet the requirements of §712-01.~~

~~203-2.04 **Embankment Construction Control Devices.**—The materials details for embankment control devices shall be as specified in the current publication issued by the Department covering construction, installation, maintenance and abandonment of these devices.~~

~~203-3 CONSTRUCTION DETAILS~~

~~203-3.01 **General.**—The Contractor shall remove all soil, rock, and other material, and utilize or dispose of these materials as required by the plans and specifications. All excavation and embankment work shall be executed to payment lines shown in the contract documents.~~

~~—All graded earth surfaces outside the roadway limits shall be smoothed and trimmed in reasonably close conformity (plus or minus 6 inches) of true grade. After trimming, the area shall be left in a compact and satisfactory condition, free of large stones or other objectionable materials, as determined by the Engineer.~~

~~—Earthwork construction operations requiring compaction shall not be performed from November 1 thru April 1 except with written permission of, and under such special conditions and restrictions as may be imposed by the Regional Director, after discussion with the Regional Geotechnical Engineer or the Director, Geotechnical Engineering Bureau. Under no conditions will the contractor be permitted to place material that is frozen, or place fill material on frozen ground.~~

~~203-3.02 **Archaeological Salvage.**—Whenever, during the course of construction, historical or prehistoric objects or human remains are encountered, such objects shall not be destroyed or moved. Work shall be stopped and rescheduled to avoid disturbing such areas and the Engineer in Charge of the project shall be notified immediately.~~

~~—The Engineer will, through proper channels, notify the Director of the Office of Construction Division who will notify the DOT Environmental Analysis Bureau and the Regional Cultural Resources Coordinator who will arrange to have an immediate inspection of the site.~~

~~—In the event that the objects are to be removed or salvaged, agreements between the Commissioner and the Contractor will be made to cover the cost of any extra work. Such work will be limited to that~~

performed within the right-of-way, and at any location under direct control of the Contractor used as a source of approved borrow material.

203-3.03 Scheduling of Work to Minimize Soil Erosion and Water Pollution. ~~The Contractor shall ensure effective and continuous soil erosion and sediment control throughout the construction period. The Contractor shall prepare and submit for approval, plans and schedules for all excavation, stripping, embankment, fill and grading operations. Such plans and schedules shall include but are not limited to temporary and permanent erosion control measures specified in Section 209, Soil Erosion and Sediment Control, Section 610, Turf and Wildflower Establishment and Section 612, Sodding.~~

203-3.04 Drainage and Grading. ~~The Contractor shall provide and maintain slopes, crowns and ditches on all excavation and embankments to ensure satisfactory surface drainage at all times. Ditches and other drainage facilities necessary to remove ponded water shall be constructed as soon as practical to have the work area dry during the progression of work. All existing culverts and drainage systems shall be maintained in satisfactory operating condition throughout the course of the work. If it is necessary to interrupt existing surface drainage, sewers or under drainage, then temporary drainage facilities shall be provided until the permanent drainage work is complete. Top of slope interceptor ditches, where shown on the plans, shall be completed before adjacent excavation operations are begun. In earth cuts, the Contractor shall progress excavation operations in such a manner that the portion of the cut immediately adjacent to the design slope is at least 5 feet lower than the general level of the cut at all times until the lower payment line is reached.~~

~~—The construction of these temporary drainage facilities shall be considered as incidental to the construction of the project and no additional payment will be allowed.~~

~~—Any portion of an embankment or subgrade which has, in the opinion of the Engineer, been damaged by the Contractor's equipment during the course of construction, shall be repaired and recompacted by the Contractor to the satisfaction of the Engineer, and no extra payment will be made therefore.~~

~~—Where seepage causes instability of slopes, excavation and backfill or other corrective measures shall be performed as ordered by the Engineer and paid for under the appropriate item. Excavation for the installation of slope protection may be necessary at any time and location throughout the duration of the contract and may not necessarily coincide with the Contractor's performance of the general excavation work.~~

203-3.05 Rock Excavation. ~~Presplitting is required where the design rock slope is one vertical on one horizontal or steeper and the vertical height of the exposed rock slope exceeds 5 feet. Ripping will not be allowed within 10 feet of a slope that requires presplitting. Test sections will be required at the outset of presplit drilling and blasting operations for the evaluation of the presplit rock slopes by a Departmental Engineering Geologist. The Contractor will be required to completely expose the presplit rock face in the test section for evaluation prior to any further presplit drilling.~~

~~—All rock slopes shall be thoroughly sealed and cleaned to the satisfaction of the Engineer. For rock excavations involving multiple lifts, sealing of upper lifts shall be completed prior to drilling and fragmenting of lower lifts. Sealed rock slopes shall be stable and free from possible hazards of falling rocks or rock slides that endanger public safety. If, after sealing, such conditions still exist, a determination of the cause will be made by a Departmental Engineering Geologist and if it is determined that the conditions are the result of poor quality work or improper methods employed by the Contractor, the Contractor shall provide approved remedial treatment, at no expense to the State. Such treatment may include, but is not necessarily limited to, laying back the slope, rock bolting, or shotcreting. In no case shall the subgrade be trimmed prior to the completion of the sealing operation at any location.~~

A. Presplitting. ~~Prior to drilling presplitting holes, the overburden shall be completely removed to expose the rock surface along the presplitting line. The methods of collaring the holes to achieve required inclination and alignment shall be approved by the Engineer.~~

~~—The presplitting holes shall be a maximum of 4 inches in diameter, spaced not more than 3 feet center to center along the slope, and drilled at the designed slope inclination for a maximum slope distance of 60 feet. When excavation operations are conducted in multiple lifts, the presplitting holes for successive lifts may be offset a distance of not more than 3 feet for a design slope of one vertical~~

on one horizontal and not more than 1 foot for slopes of steeper design; however, a presplitting hole shall not be started inside the payment line. If presplitting is conducted in lifts, each lift shall be of approximately equal depth. All presplitting holes shall be checked and cleared of obstructions immediately prior to loading any holes in a round. All presplitting holes shall be loaded with a continuous column charge manufactured especially for presplitting which contains not more than 0.35 pounds of explosive per foot. The top of the charge shall be located not more than 3 feet below the top of rock. A bottom charge of not more than 3 pounds of packaged explosive may be used; however, no portion of any bottom charge shall be placed against a proposed finished slope. Each presplitting hole shall be filled with No. 1A crushed stone stemming meeting the gradation requirements of §703-02, Coarse Aggregates. The presplitting charges shall be fired with detonating cord extending the full depth of each hole and attached to a trunk line at the surface. Detonation of the trunk line shall be with blasting cap(s) and shall precede the detonation of fragmentation charges within the section by a minimum of 25 milliseconds. Presplitting shall extend for a minimum distance equal to the burden plus 3 feet beyond the limits of fragmentation blasting within the section.

B. Fragmentation Blasting. Fragmentation holes, or portions thereof, shall not be drilled closer than 4 feet to the proposed finished slope. Where presplitting is required, fragmentation holes adjacent to the presplitting holes shall be drilled parallel to the presplitting holes for the full depth of the production lift at a spacing not exceeding the spacing of the production pattern. Only packaged explosives shall be used 10 feet or less from a design slope which requires presplitting regardless of the construction sequence.

Fragmentation charges shall be detonated by properly sequenced millisecond delay blasting caps.

C. Explosive Loading Limits. In the absence of more stringent requirements, the maximum quantity of explosives allowed per delay period shall be based on a maximum particle velocity of 2 in/sec at the nearest structure to be protected. In the absence of seismic monitoring equipment, the following explosive loading limits shall apply:

DISTANCE EQUAL TO OR LESS THAN 215 FT. FROM THE NEAREST STRUCTURE

1. When the distance from the proposed blasting area to the nearest structure to be protected is 6 feet or less, no blasting shall be allowed.
2. When the distance between the blasting area and the nearest structure to be protected is greater than 6 feet and equal to or less than 15 feet, a maximum of 0.25 pounds of explosives per delay period (minimum of 25 milliseconds) blasting cap shall be allowed.
3. When the distance between the blasting area and the nearest structure to be protected is greater than 15 feet and equal to or less than 215 feet, a Scaled Distance of 30 feet shall be utilized to determine the maximum amount of explosive allowed per delay period (minimum of 25 milliseconds) blasting cap. The Scaled Distance Formula is as described below:

$$SD = \frac{D}{\sqrt{E_{max}}}$$

where : SD = Scaled Distance
 D = Distance from blasting area to nearest structure to be protected in feet

AND

$$E_{max} = \frac{D^2}{(SD)^2}$$

E_{max} = Maximum pounds of explosive per delay period (minimum of twenty five milliseconds) blasting cap

DISTANCE GREATER THAN 215 FT. FROM THE NEAREST STRUCTURE

~~1. When the blaster elects to utilize more than 50 pounds of explosive per delay period (minimum of 25 milliseconds) blasting cap, a seismograph shall be employed to monitor the blasting vibrations generated. The initial loading shall be computed using a Scaled Distance of 30 feet. The resulting particle velocity measured by the seismograph shall be evaluated by a Department Engineering Geologist. The Geologist's evaluation shall be the basis for adjusting the Scaled Distance.~~

~~—No separate payment shall be made for this work. The cost shall be included in the appropriate excavation item. The above requirements shall in no way relieve the Contractor of liability for any damage incurred as a result of the blasting operations.~~

~~**203-3.06 Suitable Materials.**—Moisture content has no bearing on the suitability of material to be used for embankment construction, however, the moisture content of a material may be such that its use will require manipulation. It is the Contractor's responsibility to determine the economics of using, or disposing and replacing, such materials. Material determined by the Contractor to be un-economical for use may be disposed of as specified under §203-3.08 and replaced with other material at no additional cost to the State.~~

~~—When a contract includes the item “Unclassified Excavation and Disposal”, all excavated suitable materials, including the excavation performed under “Structure Excavation” and “Trench and Culvert Excavation,” shall become the Contractor's property for disposal or use under another item of these specifications.~~

~~**203-3.07 Unsuitable Materials.**—All excavated unsuitable materials shall be the Contractor's property for disposal as surplus materials under the provisions of §203-3.08.~~

~~**203-3.08 Disposal of Surplus Excavated Materials.**—Only unsuitable materials, or that portion of suitable material excavated in excess of the quantity required to construct all embankments on the project, shall be considered as surplus. Where disposal of surplus materials cannot be accommodated within the right of way, the excess shall become the Contractor's property for disposal. Surplus material disposed of within the right of way shall be placed in accordance with §107-10 *Managing Surplus Material And Waste*.~~

~~**203-3.09 Embankment Foundation.**—After completion of the work required under Section 201, Clearing and Grubbing, and Section 202, Removal of Structures and Obstructions, the embankment foundation shall be prepared. Sod and topsoil shall be removed where the final pavement grade is 6 feet or less above the existing ground surface and in other areas designated in the plans or by the Engineer. Prior to embankment construction and subbase course placement, the surface on which the embankment and/or subbase is to be placed shall be thoroughly compacted to the satisfaction of the Engineer. Unsuitable materials other than sod and topsoil shall be removed to the depths shown in the plans or as directed by the Engineer. Underwater areas shall be filled with “Select Borrow or Select Fill,” §203-2.02B, to 2 feet above the water surface at the time of placement, and paid for under its appropriate item. —Where embankments are to be constructed over ground that will not adequately support embankment construction equipment, an initial layer of fill may be allowed to form a working platform. The need, manner of construction, and thickness of such a layer shall be subject to approval of the Engineer, and the layer will be permitted only where the lack of support is, as determined by the Engineer, not due to deficient ditching, grading or drainage practices or where the embankment could be constructed in the approved manner by the use of different equipment or procedures. Thicknesses of up to 3 feet may be permitted for such a layer. Concrete slabs may be used at the bottom of such a layer, provided they are placed horizontally.~~

~~—In locations where embankments are to be constructed on hillsides or against existing embankments with slopes steeper than 1 (vertical) on 3 (horizontal), the slopes shall be benched. Required benches shall be constructed as shown on the Standard Sheet, “Earthwork Transition and Benching Details.”~~

~~—Where old pavement is encountered within 2 feet of the top of the subbase course, it shall be broken up or scarified.~~

~~**203-3.10 Embankments.**—The embankment shall be constructed of suitable material as defined by §203-1.08, Suitable Material. Embankment material shall not be placed on frozen earth, nor shall frozen soils be placed in any embankments. Embankment material shall be placed and spread in lifts (layers) of uniform thickness, then uniformly compacted as specified under applicable portions of §203-3.12, Compaction. During embankment construction operations, earth moving equipment shall be routed so as to prevent damage to any compacted lift. Damage to any compacted lift at any time during the course of construction, such as rutting under the loads imposed by earth moving equipment, shall be fully repaired by the Contractor at his/her own expense prior to placement of any overlying materials. At the close of each day's work, the working surface shall be crowned, shaped and rolled with smooth steel wheel or pneumatic tired rollers, for positive drainage.~~

~~—Particles with a dimension in excess of two thirds of the loose lift thickness are designated as oversized particles. Oversized particles shall be removed prior to compaction of the lift and may be placed in the Embankment Side Slope Area, Subsection 203-1.06.~~

~~—Pieces of concrete may be used provided that the voids between the pieces are completely filled, and the greatest dimension of any piece does not exceed 2/3 the loose lift thickness. Exposed mesh or rebar shall not exceed 1 inch in length.~~

~~—Embankments constructed using rock products or pieces of concrete shall be spread by bladed equipment on each lift to minimize the formation of large voids as the work progresses. The top lift of a rock or concrete fill shall be chinked.~~

~~—When permitted by a note in the plans or proposal, stumps, logs, and other materials may be placed in the Embankment Side Slope Area, §203-1.06, provided that: 1) such matter is deposited and compacted concurrent with the adjacent embankment, and; 2) any stumps or woody material are covered by not less than 2 feet of soil beneath the exposed side slope surface.—~~

~~—Glass shall not be placed in contact with synthetic liners, geogrids, geotextiles or other geosynthetics. Glass incorporated into embankments shall be thoroughly mixed with other suitable material so that Glass constitutes no more than 30 percent by volume anywhere in the embankment as visually determined by the Engineer In Charge.~~

~~**203-3.11 Subgrade Area.**—Where a subgrade area is defined in an embankment by §203-1.05, Subgrade Area, the material placed shall conform to §203-2.02A, Subgrade Area Material, placed and compacted in conformance with §203-3.10 and §203-3.12. Where longitudinal and transverse changes from cut to fill are encountered in the work, a subgrade transition section shall be provided in conformance with Standard Sheet "Earthwork Transition and Benching Details." Where a subgrade area becomes defined by §203-1.05 in a cut section, the materials placed and other details shall be as specified under §203-3.14C, unless otherwise required by the contract documents. Prior to subbase course placement, the surface on which the subbase is to be placed shall be thoroughly compacted to the satisfaction of the Engineer.~~

203-3.12 Compaction

~~**A. General Requirements.**—It shall be the Contractor's responsibility to properly place and compact all materials in the road section and other locations specified in the contract documents, and to correct any deficiencies resulting from insufficient or improper compaction of such materials throughout the contract period. The Contractor shall determine the type, size and weight of compactor best suited to the work at hand, select and control the lift (layer) thickness, exert control over the moisture content of the material, and other details necessary to obtain satisfactory results. During the progression of the work, the Department will inspect the Contractor's operations and will permit the work to continue where:~~

~~1. Lift thickness is controlled and does not exceed the maximum allowed according to the equipment classifications in subparagraph B of this subsection, and the equipment meets all specified class criteria. Thinner lifts and lighter equipment than the maximum allowed may be necessary for satisfactory results on some materials.~~

2. ~~The compactive effort (number of passes and travel speed) is uniformly applied and not less than that specified for the given equipment class and lift thickness. Higher efforts than the minimum allowed may be necessary for satisfactory results on some materials.~~

3. ~~The Engineer concludes from a visual observation that adequate compaction has been attained, with the exception of backfill at structures, culverts, pipes, conduits, and direct burial cables. However, the State reserves the right to perform density tests at any time. When tests are performed, the results shall indicate that not less than 90 percent of Standard Proctor Maximum Density is attained in any portion of an embankment, or 95 percent in a subgrade area, or as specified for other items with a percent maximum density requirement.~~

4. ~~Significant rutting under the action of the compactor is not observed on the final passes on a lift.~~

~~—Whenever the Contractor's operations do not conform to the above criteria, or requirements contained in other subparagraphs of this subsection, the Engineer will prohibit placement of an overlying lift until the Contractor takes effective corrective action.~~

~~—When the Engineer determines that density tests are necessary, the Contractor shall provide any assistance requested to facilitate such tests. Such assistance shall include but will not be limited to excavation and backfill of test pits and holes. This work shall be considered to be incidental construction.~~

~~—Damage to any compacted lift at any time during the course of construction such as rutting under the loads imposed by earth moving equipment, shall be fully repaired by the Contractor at his/her own expense prior to placement of any overlying materials.~~

~~B. Compaction Equipment.~~ ~~The selection of compaction equipment is the Contractor's responsibility, but shall be subject to meeting the requirements of this subparagraph and approval by the Engineer with respect to its provisions. All compaction equipment shall be marked by a permanently attached manufacturer's identification plate designating the name of the manufacturer, model number and serial number of the machine as minimum identification. This plate shall be installed in a readily visible location. Compaction equipment lacking such an original manufacturer's identification plate, or with altered or illegible plates, will not be recognized as acceptable compaction equipment. Any equipment not principally manufactured for compaction purposes and equipment which is not in proper working order in all respects shall not be approved or used. The Engineer will also withhold approval of any compactor for which the Contractor cannot furnish manufacturer's specifications covering data not obvious from a visual inspection of the equipment and necessary to determine its classification.~~

~~—The term, "pass," for any type of compactor, shall denote one direct vertical application of compactor effort over all elemental areas of a lift surface. Terms in common parlance, such as "coverage," "trips," etc., have no significance, equivalence, or application under these specifications.~~

FIGURE 203-1 PNEUMATIC-TIRED COMPACTOR CLASSIFICATIONS				
PNEUMATIC COMPACTOR CLASS	TIRE REQUIREMENTS			RANGE OF BALLASTED WHEEL LOADS (POUNDS PER WHEEL)
	TIRE SIZE	NO. PLYS	INFL. PRESS. (psi)	
A	7.50 x 15	4	35	2000—3000
B	7.50 x 15	6 10	60* 90*	2000—4000
C	7.50 x 15	14	130*	2000—4000
D	9.00 x 20	10 12	75* 90*	4000—6000
E	11.00 x 20	12 18	90*	6000—8000
F	13.00 x 24	18	100*	8000—10,000

* Inflation pressure for not less than the last two passes on each lift. May be reduced during earlier passes and gradually increased to this level.

1. Pneumatic-Tired Compactors. This type of compactor shall be classified for use according to the requirements of Figure 203-1. For the lift thickness selected by the Contractor, the minimum class and wheel load which will be allowed on that lift thickness, shall be as shown in Figure 203-2.

—The minimum effort for all pneumatic compactors shall be 6 passes, at speeds up to 12 fps on no more than the first 2 passes, and all subsequent passes at speeds of 6 fps or less.

2. Smooth-Drum Vibratory Compactors. This type of compactor is defined as a machine which primarily develops its compactive effort from the vibrations created and is classified for use according to the developed compactive force rating per linear inch of drum width (PLI).

—The PLI is defined as follows:

$$PLI = \frac{\text{Unsprung Drum Weight (lbs)} + \text{Dynamic Force (lbs)}}{\text{Drum Width (in)}}$$

—The unsprung drum weight is the static weight of the drum and appurtenances without any reaction transmitted to the drum from the main chassis of the compactor. The dynamic force produced is dependent on the frequency of vibration, and therefore, PLI ratings shall be determined for the actual operating frequency of the compactor. Approval for vibratory compactors shall be confined, however, to equipment operating at not less than 1100 vpm, nor more than 1500 vpm, and those where the actual dynamic force at the actual operating frequency is at least 2.5 times the unsprung drum weight.

FIGURE 203-2 PNEUMATIC-TIRED COMPACTORS

FOR LETTER CLASS DATA SEE FIG. 203-1

— Conversion of manufacturer's published ratings, at a given frequency, shall be made with the following equation:

$$F_2 = \frac{F_1(V_2)^2}{(V_1)^2}$$

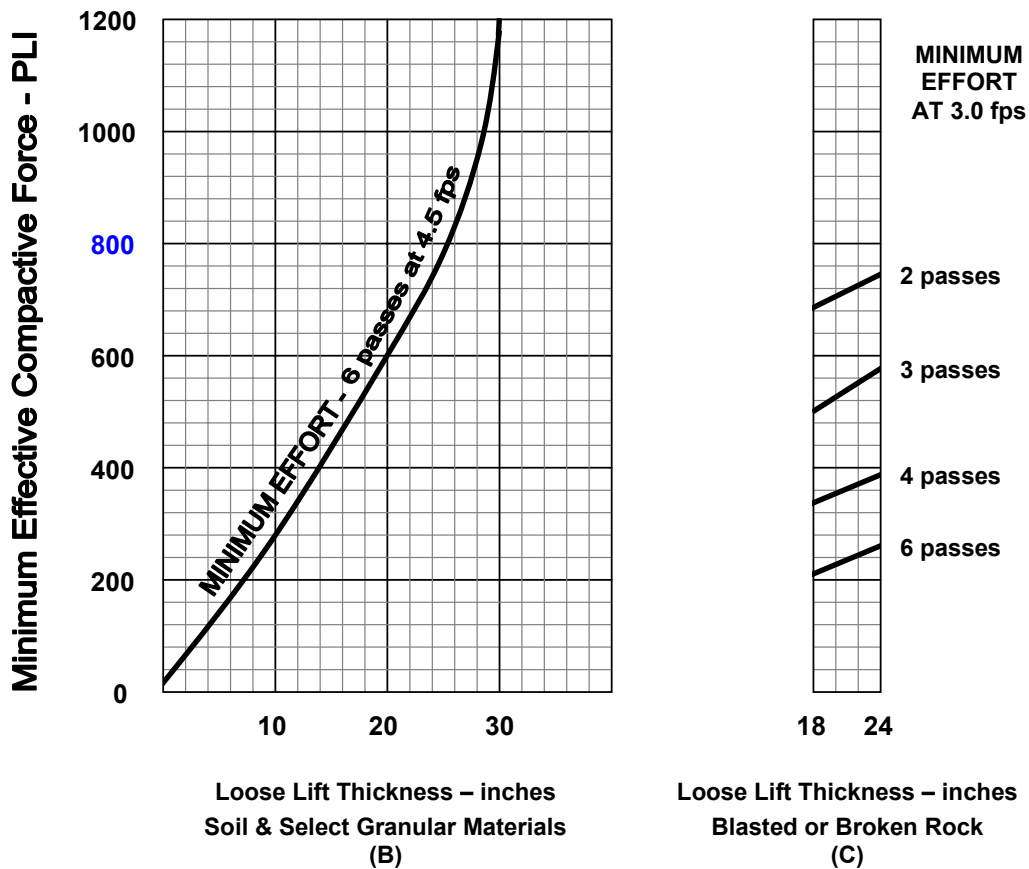

where: F_1 = Dynamic Force at Rated Frequency
 F_2 = Dynamic Force at Operating Frequency
 V_1 = Rated Frequency
 V_2 = Operating Frequency

— For the lift thickness selected by the Contractor, the minimum CFR rating and minimum effort on such a lift, shall be as shown in Figures 203-3B&C, respectively. Non-Centrifugal (Vertical force only) types of vibratory compactors shall be approved as above, less 175 PLI before using Figures 203-3 B&C as a minimum number of passes at a single specified speed. An equivalent effort, relating varying numbers of passes to other speeds is given by the equation:

$$\text{Speed X} = \frac{(\text{Specified Speed}) (\text{Min. Passes at Speed X})}{(\text{Specified Min. Passes})}$$

— The Contractor may choose to alter the specified minimum pass requirement, provided that speed is adjusted to the value given by this equation and does not exceed 6 fps.

FIGURE 203-3 VIBRATORY COMPACTORS

—Where vibratory compactors are used on a project, the Contractor shall furnish for the exclusive use of the Engineer, one vibrating reed tachometer per project, plus one additional tachometer for each group of two vibratory compactors in excess of two per project. Tachometers shall have a frequency range adequate to cover operating frequencies of all vibratory compactors used on the project and shall have scale divisions of 50 vpm or less. Tachometers may be placed on the ground surface near the compactor when making readings, or with suitable damping materials interposed, placed directly on the compactor drum frame.

—The dispensations permitted under this specification for vibratory compactors are contingent upon proper operation of the equipment at all times during compaction operations. In any instance where the Engineer encounters any problems with operators rolling without vibration, for any reason, and immediate and effective corrective action is not taken by the Contractor, the Engineer will halt the work until the problem is resolved. If continuing problems of this nature occur, the Engineer may suspend all provisions of this subparagraph and consider the vibratory compactors as smooth steel wheel rollers classified according to their gross weight.

3. ~~Sheepsfoot Rollers.~~ This type of compactor shall be defined as a machine which is primarily designed to compact a lift from the bottom to the top.

—The maximum loose layer thickness of the material to be compacted shall be equal to the length of the feet plus 15 percent. The end area size and configuration of the feet shall be selected by the Contractor to suit the characteristics of soil being compacted.

—Where sheepsfoot rollers are used, with or without vibration, the number of passes required for job control shall be determined by a jobsite test in which the feet penetrate into the loose lifts and, with further passes, eventually and substantially “walk out” of the layer. This job control shall then be established for that machine, lift thickness and material, provided that adequate moisture control is continuously maintained per §203-3.12C. Sheepsfoot rollers shall be operated at speeds not exceeding 6 fps when towed, and 15 fps when self-propelled.

4. ~~Smooth Steel Wheel Rollers.~~ Smooth steel wheel rollers shall be considered as primary compactors on layers whose maximum thickness, after compaction, is 8 inches. When so used, the roller shall have a nominal gross weight of not less than 10 tons, exert a minimum force of not less than 300 lb/in of width on the compression roll faces, and a minimum of 8 passes shall be applied over each lift with the roller operating at a speed not exceeding 6 fps.

—When the Contractor employs smooth steel wheel rollers exclusively for surface compaction, leveling or finishing operations on lifts previously compacted by other types of primary compactors, the above restrictions shall not apply.

—This section applies to non-vibratory rollers or vibratory rollers operated in the static mode only.

5. ~~Other Type of Compactors.~~ Compactor types other than those classified above, may be employed by the Contractor, subject to approval by the Engineer of the proposed minimum applied effort (minimum number of passes and travel speed) and maximum lift thickness. Such approval by the Engineer will be based upon the results of appropriate on-site field tests.

6. ~~Compaction Equipment for Confined Areas.~~ In areas inaccessible to conventional compactors, or where maneuvering space is limited, impactor rammers, plate or small drum vibrators, or pneumatic buttonhead compaction equipment may be used with layer thickness not exceeding 6 inches before compaction. However, materials placed for subbase course construction shall have a maximum compacted thickness of 6 inches. Hand tampers shall not be permitted. The Engineer may approve or reject any of the above-described mechanical devices based upon the results of appropriate on-site field tests.

C. ~~Moisture Control.~~ All fill or backfill material to be compacted, shall be at a moisture content for adequate compaction of that material using the compactor selected by the Contractor to perform the work. The Contractor shall be responsible for determining the appropriate moisture content, and for controlling it within the proper limits as the work is progressed. When water must be added to a

~~material, it may be added on the lift or in the excavation or borrow pit. Water added on the lift, however, shall be applied by use of an approved pressure distributor. Distributors must be approved and documented by the Engineer.~~

~~—Documentation by the Engineer shall be adequate evidence of approval. Water added shall be thoroughly incorporated into the soil, and manipulation shall be provided whenever necessary to attain uniformity of moisture distribution in the soil. When the moisture content of a lift about to be compacted exceeds the required amount, compaction shall be deferred until the layer has dried back to the required amount. Natural drying may be accelerated by blending in a dry material or manipulation alone, to increase the rate of evaporation. Increased loose lift thickness caused by blending in a dry material, however, may necessitate a change in compaction equipment to meet the minimum provisions of subparagraph B of this subsection.~~

~~**203-3.13 Proof Rolling in Embankment Sections.**—Immediately prior to final trimming of the subgrade surface and placement of subbase materials in embankment sections, all areas of the subgrade surface within roadway limits shall be proof rolled according to the requirements of this subsection. This work, and any delays due to this work, shall be considered incidental to the embankment item.~~

~~**A. (Vacant)**~~

~~**B. Equipment.**—The proof roller shall consist of a chariot type rigid steel frame with a box body suitable for ballast loading up to 50 tons gross weight, and mounted on four pneumatic tired wheels acting in a single line across the width of the roller on its transverse load center line. The wheels shall be equipped with 18.00 x 24 or 18.00 x 25, 24 ply tires, and shall be suspended on articulated axles such that all wheels carry approximately equal loads when operating over uneven surfaces.~~

~~**C. Determination of Roller Stress.**—Initially, the gross ballasted weight and tire inflation pressure of the proof roller shall be adjusted to the highest stress level shown in Figure 203-4 based on:~~

1. The Engineer's general description of the subgrade soils.

2. The Engineer's estimation of the relative subgrade support within the subgrade soil description range. The initial roller stress for embankments constructed of rock shall be the maximum level listed in Figure 203-4 (Gross Tons 50, Tire psi 130).

—The roller shall be operated briefly to establish the acceptability of the initial stress level. Proof rolling of the embankment shall be performed at the next lower stress level whenever operation of the roller at a higher stress level is accompanied by consistent lateral displacement of soil out of the wheel paths.

D. Procedure. After an acceptable stress level is established, two complete passes of the roller shall be applied over all elements of the area to be proof rolled. Any deficiencies disclosed during the proof rolling operation shall be corrected. Subsidence depressions shall be filled with material similar to the subgrade soil and then compacted in a normal manner. After compaction, these areas shall be proof rolled again. Corrective work shall be judged complete and accepted by the Engineer when all elements of the subgrade surface over a given embankment show a satisfactory uniform response to the proof roller.

E. Exceptions. Proof rolling of the subgrade surface in embankment sections will not be required in any area where:

1. Due to restrictions in available access and/or maneuvering space, use of the proof roller may damage adjacent work;
2. The proof roller will approach a culvert, pipe or other conduit closer than 5 feet in any direction.

203-3.14 Proof Rolling in Cut Sections.—Immediately prior to final trimming of the subgrade surface and placement of subbase materials in cut sections, all areas of the subgrade surface within roadway limits shall be proof rolled according to the requirements of this subsection. This work, and any delays due to this work, shall be considered incidental to the excavation item.

A. Purpose.—In cut sections, the purpose of proof rolling is to determine the location and extent of areas below the subgrade surface that require corrective undercutting and are not so specified in the contract plans.

B. Equipment.—The proof roller used in embankment sections, as specified in §203-3.13B, shall be employed for proof rolling in cut sections except that the roller shall be loaded to achieve a single stress level in operation, using a gross ballasted weight of 30 tons and all tires inflated to 40 psi.

C. Procedure.—Two complete passes shall be applied over all elements of the area to be proof rolled. Where any portion of the cut subgrade surface other than that which has been damaged by the Contractor's operations fails to provide a satisfactory support for the proof rolling operation, the Engineer may order corrective undercut and backfill work performed. Backfill of undercuts shown on the plans or ordered by the Engineer shall meet the requirements of Select Granular Subgrade, §203-2.202E, placed and compacted as approved by the Engineer. Where natural soil below this course will not support the weight of the construction equipment, and when ordered by the Engineer, the course shall be placed in one lift. No additional proof rolling shall follow corrective work.

D. Exceptions.—Proof rolling of the subgrade surface in cut sections will not be required in any area where the subgrade surface is in a rock cut, or where undercut and backfill has been previously performed. The Engineer may order undercutting and backfill without proof rolling of any cut where the need for corrective work, as determined by the Engineer, is obvious without actual proof rolling. The Engineer may also delete proof rolling in any cut section where, based upon a written evaluation by a Departmental Geotechnical Engineer, proof rolling would be detrimental to the work.

203-3.15 Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.—The type of material to be used in bedding, filling and backfill at structures, culverts, pipes, conduit and direct burial cable and payment lines therefore shall be in conformance with the details shown on the appropriate Standard Sheet or as noted on the plans or as ordered by the Engineer. Do not use RAP. Do not use slabs or pieces of either concrete or asphalt.

—Fill or backfill material at structures, culverts and pipes shall be deposited in horizontal layers not exceeding 6 inches in thickness prior to compaction. Compaction of each layer shall be as specified under §203-3.12, Compaction. A minimum of 95 percent of Standard Proctor Maximum Density will be required. When placing fill or backfill around culverts and pipes, layers shall be deposited to progressively bury the pipe or culvert to equal depths on both sides. When filling behind abutments and similar structures, all material shall be placed and compacted in front of the walls prior to placing fill behind the walls to a higher elevation. The limits to which this subsection will apply shall be in accordance with the Standard Sheets or as modified on the plans.

—Fill or backfill for conduit or cable placed in a trench shall be carefully placed in a horizontal layer to a depth of 6 inches over the top of the conduit or cable. This layer of material shall not be compacted, however, the remaining portion of the trench shall be backfilled in accordance with the preceding paragraph. Where cables or conduits are placed and backfilled by a machine in one operation, the above requirements for backfilling do not apply.

—Where sheeting has been used for the excavation, and incremental removal of sheeting is not specified in the plans or proposal, sheeting shall be pulled when the trench has been backfilled to the maximum unsupported trench depth allowed by 29 CFR 1926.

~~**203-3.16 Borrow.**—The management of a borrow source and the acceptability of all borrow material shall be subject to the approval of the Engineer at all times. The Contractor shall notify the Engineer at least ten work days in advance of opening any borrow area, and request approval of the source under the pay item involved. Test pits required by the Engineer to evaluate the acceptability and limits of the source, shall be provided by the Contractor at the Contractor's own expense. Concurrent removal of material for more than one pay item from a single source or pit shall be prohibited except with the written permission of, and under such conditions and restrictions as may be imposed by the Engineer. All borrow pits shall be stripped of sod, topsoil and vegetable matter well in advance of any working face. The minimum distance by which stripping shall lead excavation for a given source shall be established by the Engineer to suit local conditions. Where a borrow source is not under direct control of the Contractor or where special conditions exist, the Engineer may waive any of the above requirements and establish alternative provisions for the control and acceptability of borrow.~~

~~—Ordinary borrow will be accepted for use where the material qualifies under the definition of Suitable Material, §203-1.08. The borrow of select granular materials enumerated in §203-2.02 shall be accepted subject to meeting the additional provisions contained, therein. All borrow, whether ordinary borrow or select borrow placed within the limits of Embankment or the Subgrade Area shall be placed in conformance with §203-3.10 or §203-3.11 respectively, as appropriate, or where used for fill or backfill at structures, culverts and pipes, in conformance with §203-3.15.~~

~~**203-3.17 Select Granular Fill, Slope Protection.**—The Contractor shall perform the excavation in accordance with the requirements for “Unclassified Excavation and Disposal” as described elsewhere in these specifications. The Contractor shall then spread material conforming to the requirements given in §203-2.02D, in one layer to its full thickness by a method approved by the Engineer. The work shall be performed where shown on the plans or where directed by the Engineer in accordance with the standard sheets, and details shown on the plans. Compaction of the slope protection is not required. Slope Protection shall be either of two types, as described below:~~

~~**A. Select Granular Fill, Slope Protection – Type A.**—Under this type, the Contractor shall furnish and install the slope protection where shown on the plans in accordance with the details shown on the Standard Sheets.~~

~~**B. Select Granular Fill, Slope Protection – Type B.**—Under this type, the Contractor shall furnish and install the slope protection where directed by the Engineer in accordance with the details shown on the Standard Sheets.~~

~~**203-3.18 Embankment Construction Control Devices**~~

~~**A. Settlement Gages and Settlement Rods.**—Settlement gages and rods shall be constructed, installed, and maintained where shown on the plans and in accordance with the details contained in the current publication issued by the Department covering construction, installation, maintenance, and abandonment of these devices.~~

~~—Where settlement gages are called for, it will be the Contractor's option to install pipe gages or manometer gages, unless a definite type is specified on the plans or in the proposal. Settlement gages and settlement rods will be accepted for conformance with the specification requirements on the basis of an inspection of the installation by the Departmental Geotechnical Engineer.~~

~~**B. Piezometers.**—Piezometers shall be constructed, installed, and maintained at the locations shown on the plans and in accordance with the detailed drawings and specifications included in the proposal.~~

~~**203-3.19 Cleaning Culverts and Closed Drainage Systems.**—Culverts, closed drainage systems, drainage structures and manholes shall be thoroughly cleaned and maintained clean as determined by the Engineer for the duration of the contract. Materials removed shall be disposed of in accordance with §203-3.08 “Disposal of Surplus Excavated Materials.”~~

~~**203-3.20 Subgrade Surface Tolerance.**—After compaction, the subgrade surface shall not be above design elevation at any location.~~

~~**203-3.21 Clean, Grade and Shape Existing Roadside Section.**—The Contractor shall remove earth, turf, brush and debris, or provide necessary fill material to restore adequate roadside drainage. Ditches shall be shaped as shown on the plans. Material removed shall be disposed of in conformance with the provisions of Subsection 203-3.08, Disposal of Surplus Excavated Materials.~~

~~—The Contractor shall protect all fences, markers, culverts, underground structures, utilities and other appurtenances adjacent to the work area. Any damaged facilities and/or disturbed areas shall be replaced in kind at no additional cost to the state.~~

~~**203-4 METHOD OF MEASUREMENT**~~

~~**203-4.01 General.**—Quantities for all items of work with payment units in cubic yards encompassed by this Section, shall be computed from payment lines shown on the plans or standard sheets except where revised payment lines are established by the Engineer prior to performing the work. Work performed beyond any designated payment line, including any offset required for the construction of presplit rock slopes in lifts, shall not be included in the computation of quantities for the item involved.~~

~~—For any item paid for in its final position, no additional quantity shall be measured for payment to make up losses due to foundation settlement, compaction, erosion or any other cause.~~

~~—Cross sectioning, for the exclusive purpose of determining quantities for payment, shall be employed only where payment lines are not shown on the Plans or Standard Sheets, and cannot be reasonably established by the Engineer.~~

~~—Quantities for benching shall be computed for payment from the details and instructions shown on the Standard Sheet, “Earthwork Transition and Benching Details.”~~

~~—The excavation of unsuitable materials designated as topsoil under Section 613, shall be included in the quantity measured for the appropriate unclassified excavation item, without distinction. Separate payment for placing topsoil, however, is made under Section 613.~~

~~**203-4.02 (Vacant)**~~

~~**203-4.03 Unclassified Excavation and Disposal.**—Quantities shall be in cubic yards, computed in the original position for all excavation within right-of-way limits. No deduction shall be made for any pipes, culverts, structures, or other obstructions, unless these are measured for payment under another contract item. Excavation for borrow of suitable materials for embankment construction, shall not be included in the computation for this work.~~

~~**203-4.04 Embankment in Place.**—Quantities shall be in cubic yards, computed in the final compacted position. Any additional quantity of material required to compensate for embankment settlement shall not be included in the measurement of this item. The quantities of embankment shall exclude the total volume of pipes, culverts, other roadway items, and granular backfill within the payment lines for such granular backfill.~~

~~**203-4.05 Ordinary Borrow.**—Where the item, “Embankment in Place,” is designated for the project by the proposal, all borrow of ordinary suitable materials shall be incidental to the work of that item.~~

~~**203-4.06 Select Borrow.**—Quantities shall be in cubic yards, computed in the original position.~~

~~**203-4.07 Select Fill and Select Granular Subgrade.**—Quantities for each of these items shall be in cubic yards, computed in the final compacted position.~~

~~**203-4.08 Select Granular Fill, Select Structure Fill, and Sand Backfill.**—Quantities for this work shall be computed in cubic yards in the final compacted position. A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area~~

exceeds 1.0 square foot unless otherwise shown on plans. No deduction will be made for the cross-sectional area of an existing facility.

~~**203-4.09 Select Granular Fill, Slope Protection.**—Quantities shall be in cubic yards, computed in the final position.~~

~~**203-4.10 (Vacant)**~~

~~**203-4.11 Embankment Construction Control Devices.**—Quantities shall be per each device satisfactorily installed and maintained under their respective items “Surface Settlement Gages,” “Subsurface Settlement Gages,” “Settlement Rods,” or “Piezometers.”~~

~~**203-4.12 Cleaning Culverts and Closed Drainage Systems.**—This work will be measured by the number of linear feet of culvert and/or pipe of the size range indicated in the Contract Documents. —Measurement will be the total length end to end along the invert of culvert or closed drainage system cleaned. Multiple barrel culverts will be measured along each individual barrel. The length of closed drainage systems will be determined by measuring from the inside wall surface to the inside wall surface of the adjacent manhole or other drainage structure. The spans of culverts will be determined as the greatest internal horizontal width of the culvert measured perpendicular to the axis of the structure.~~

~~**203-4.13 Cleaning Drainage Structures and Manholes.**—This work will be measured as the number of drainage structures or manholes cleaned and maintained within the inside walls of the structure, excluding existing structures being altered under Section 604.~~

~~**203-4.14 Applying Water.**—The unit of measurement shall be one operating pressure distributor per calendar day, denoted hereafter as one p.d.d. Where the Contractor works in more than one separate and distinct shift per calendar day, each shift shall be considered as one p.d.d. A single shift plus overtime work, however, shall be considered as one p.d.d. The quantity thus determined shall be applied directly as the quantity to be paid for where the distributors used have a capacity of 3000 gallons or less. —Provided that the Engineer determines that the total operating distributor capacity (number and sizes of all distributors) employed is reasonably commensurate with the needs for water application, additional payment will be allowed for distributors exceeding 3000 gallons in capacity as follows: —Where the distributor capacity exceeds 3000 gallons, but is less than 5000 gallons, the p.d.d.'s shall be multiplied by 1.5, and where the capacity is 5000 gallons or more, multiplied by 2.0 to determine the quantity for payment.~~

~~**203-4.15 Clean, Grade and Shape Existing Roadside Section.**—This work will be measured as the number of linear feet along the edge of the adjacent roadway.~~

~~**203-5 BASIS OF PAYMENT**~~

~~**203-5.01 General All Items.**—The unit price bid for all pay items of work encompassed by this Section, shall include the costs of furnishing all equipment, labor and materials as necessary to complete the work of the item, except where specific costs are designated or included in another pay item of work. —All incidental costs, such as acquisition of borrow pits or material outside of the right of way, rock drilling and blasting, compaction and special test requirements, stockpiling and rehandling of materials, precautionary measures to protect private property and utilities, to form and trim graded surfaces, proof rolling, re-proof rolling, corrective work disclosed by proof rolling and any delays caused by this corrective work, shall all be included in the unit price of the pay item where such costs are incurred. Except that, corrective work ordered in cut sections based on an evaluation of proof rolling will be paid for under the appropriate excavation and backfill items. When there is no pay item for Applying Water in the itemized proposal, the work shall be performed in accordance with the specifications for the appropriate items but the costs thereof shall be included in those pay items that require the application of water. When there is no pay item for Clearing and Grubbing in the itemized proposal, this work shall be~~

§203

~~performed in accordance with the specifications for the appropriate item but the cost thereof shall be included in those pay items that require clearing and grubbing.~~

~~—Cleaning culverts, removing and resetting guiderail and establishing turf and sodding will be paid under their respective specification items.~~

~~—Items with additional provisions to these are listed in subsections sequentially numbered following this subsection. Items with no additional provisions to these above are:~~

- ~~● Embankment In Place~~
- ~~● Select Borrow~~
- ~~● Select Fill~~
- ~~● Select Granular Fill~~
- ~~● Select Granular Fill, Slope Protection (Type A & B)~~
- ~~● Select Granular Subgrade~~
- ~~● Select Structure Fill~~
- ~~● Applying Water~~
- ~~● Sand Backfill~~

~~203-5.02 (Vacant)~~

~~**203-5.03 Unclassified Excavation and Disposal.**—The unit price bid shall cover all costs of required excavation within the right of way limits, and all costs of disposal if the excavated materials are not used under another pay item.~~

~~203-5.04 (Vacant)~~

~~**203-5.05 Embankment Construction Control Devices.**—The unit price bid shall cover all costs of providing, installing and maintaining each device, including excavation, trenching and backfill during the course of the work. No payment will be made under any other item of the contract for any work associated with these items.~~

~~**A. Settlement Gages and Settlement Rods.**—When each installation is completed, 75 percent of the item unit price will be paid. The remaining 25 percent will be paid when each device has been properly maintained and is abandoned according to the procedures of §203-3.18A. Unless otherwise specified in the proposal, the unit price shall also include the costs of removal.~~

~~**B. Piezometer.**—When each installation is completed and the device placed in satisfactory operation, 75 percent of the unit price will be paid. The remaining 25 percent will be paid when all earthmoving and slope work is completed in the vicinity of each installation. Any installation rendered inoperative due to damage by construction equipment after partial or full payment, shall be immediately repaired or the full amount of such payment shall be deducted from other monies due the Contractor under the contract.~~

~~**203-5.06 Cleaning Culverts and Closed Drainage Systems.**—The unit price bid per linear foot shall include the cost of all labor, materials, and equipment necessary to satisfactorily perform the work. —Payment, for cleaning culverts and/or closed drainage systems will be made only for those facilities designated on the plans or by the Engineer. Only one payment for each facility will be made regardless of the number of times it is cleaned. The cleaning of drainage structures and manholes shall be paid for under their respective item.~~

~~**203-5.07 Cleaning Drainage Structures and Manholes.**—The unit price bid for each shall include the cost of all labor, materials and equipment necessary to satisfactorily perform the work. Payment for cleaning drainage structures and manholes will be made only for those facilities designated on the plans or by the Engineer. Only one payment for each facility will be made regardless of the number of times it is cleaned.~~

Payment will be made under:

SECTION 204 - CONTROLLED LOW STRENGTH MATERIAL (CLSM)

204-1 DESCRIPTION. The work shall consist of mixing and placing Controlled Low Strength Material (CLSM) or Controlled Low Strength Material (CLSM) (No Fly Ash) at the locations shown in the contract documents.

204-2 MATERIALS.

204-2.01 Controlled Low Strength Material Requirements. Provide backfill material meeting the requirements of §733-01 *Controlled Low Strength Material (CLSM)*.

204-3 CONSTRUCTION DETAILS.

204-3.01 Submit certification of a mix design for CLSM meeting the unconfined compressive strength requirements to the Engineer.

Mix the materials at a stationary mixing plant which is either a continuous or a batch type plant. A batch is defined as the amount of material that can be mixed at one time. Design the mix of materials to accurate proportions, either by volume or by weight, so that when the materials are incorporated in the mix a thorough and uniform mix will result.

If the CLSM can be placed within 30 minutes of the end of mixing, then open haul units may be used for transport. If it cannot be placed within 30 minutes after the end of mixing, it must be transported by a rotating drum unit capable of 2-6 rpm.

For work involving quantities of CLSM less than 2 ½ yd³, the Contractor may use a small portable mixer. Provide a mixer capable of mixing CLSM that has the specified unconfined compressive strength and flow consistency. Mix all components so as to produce a uniform product.

Narrower trench widths can be employed when using CLSM due to the self-compacting properties of the material. Construction personnel and equipment are not required to be in the trench for compaction operations. For installations that require that construction personnel temporarily occupy the trench, follow OSHA safety requirements for worker safety.

Do not place CLSM that is frozen, or place CLSM on frozen ground. Do not expose CLSM to freezing temperatures until after it has gained its requisite strength, abiding by Cold Weather Curing regulations.

§204

If the CLSM is to be placed via pumps, the placement sequence shall be such that the equipment is able to access the entire volume to be filled without separating the mixture.

Include in the CLSM placement sequence, a procedure to account for subsidence during the settling and curing process.

204-3.02 Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.

Place the CLSM in accordance with the installation details shown on the Standard Sheet.

When placing CLSM for pipe backfill, discharge the material onto the top and at the center of the pipe.

Do not place CLSM in contact with aluminum pipe, including connections, fixtures, etc., unless the aluminum has been thoroughly coated with Zinc Chromate Primer, §708-04 *Zinc Chromate Primer* or an equivalent alternative as approved by the Materials Bureau.

Do not place CLSM containing fly ash in direct contact with cast iron or ductile iron pipes, fittings or appurtenances.

Keep CLSM encapsulated with soil, as it is highly erodible and disintegrates when left exposed to the environment

In situations where CLSM is used as backfill around lightweight pipe, take precautions to counteract the pipe's buoyancy.

204-4 METHOD OF MEASUREMENT. CLSM will be measured for payment in cubic yards measured to the nearest 0.1 cubic yard computed from the payment lines shown on the contract documents.

A deduction will be made for pipes (based on nominal diameters) and other features when the combined cross-sectional area exceeds 1 ft².

No additional quantity shall be measured for payment to make up losses due to foundation settlement, compaction, erosion or any other cause.

Cross sectioning, for the purpose of determining quantities for payment, will be employed only where payment lines are not shown on the contract documents or Standard Sheets, and cannot be reasonably established by the Engineer.

204-5 BASIS OF PAYMENT.

204-5.01 General. The unit price bid shall include the costs of furnishing all labor, material, and equipment necessary to satisfactorily complete the work, including work needed to counteract buoyancy.

Payment will be made under:

Item No.	Item	Pay Unit
204.01	Controlled Low Strength Material (CLSM)	Cubic Yard
204.02	Controlled Low Strength Material (CLSM) (No Fly Ash)	Cubic Yard

~~SECTION 204 – CONTROLLED LOW STRENGTH MATERIAL (CLSM)~~

Comment [c18]:
08-034

~~**204-1 DESCRIPTION.** The work consists of mixing and placing Controlled Low Strength Material (CLSM) or Controlled Low Strength Material (CLSM, No Fly Ash) at the locations shown on the plans or where ordered by the Engineer.~~

~~204-2 MATERIALS~~

~~**204-2.01 Tests and Control Methods.** Provide CLSM containing cement and water. At the Contractor's option, it may also contain fly ash (unless the No Fly Ash item is specified), aggregate, or chemical admixtures in any proportions such that the final product meets the strength and flow consistency requirements included in this specification.~~

~~Provide materials meeting the requirements of the following subsections:~~

~~Portland Cement, Type 1 or Type 2 ————— 701-01~~

~~Water 712-01~~

~~If used, provide materials meeting the following requirements:~~

~~Aggregates: Gradation: 100% passing the No. 10 sieve and a maximum of 20% passing the No. 200 sieve.~~

~~Fly Ash: Provide fly ash that complies with the requirements of §711-10. Waive the loss on ignition requirement.~~

~~Chemical Admixtures: Provide admixtures that comply with §711-08. The mix may include high air generators manufactured for CLSM.~~

~~Certify that the CLSM will have a 28-day compressive strength between 40 psi and 150 psi, and provide this certification to the Engineer.~~

~~Design the CLSM mix so that it sets within the time stated in the contract documents. If no set time is required by the Department, design the set time to conform with the Maintenance and Protection of Traffic scheme and requirements of the project.~~

~~Prior to placement, the CLSM will have a minimum diameter spread of 4 inches as determined from the following procedure performed by the Engineer:~~

- ~~• Fill a hollow plastic or metal cylinder 6 inches in length and 3 inches inside diameter with the CLSM and strike off the surface.~~
- ~~• Raise the flow cylinder 6 inches in a continuous motion without rotation.~~
- ~~• Immediately measure the spread of the CLSM along two diameters which are perpendicular to each other.~~

~~Cast three (3) specimens (cylinders) for each batch in accordance with Materials Method 9.2, and deliver them to the Geotechnical Engineering Bureau within seven days of the pour date for evaluation.~~

204-3 CONSTRUCTION DETAILS

204-3.01 General. ~~Provide all equipment for this work subject to approval of the Engineer.~~

~~Mix the materials at a stationary mixing plant which is either a continuous or a batch type plant, designed to accurately proportion either by volume or by weight, so that when the materials are incorporated in the mix, a thorough and uniform mix will result.~~

~~The mix may be transported in open haul units provided the material is placed within 30 minutes of the end of mixing. Use a rotating drum unit capable of 2–6 rpm to transport material which cannot be placed within 30 minutes after the end of mixing.~~

~~In work involving quantities of CLSM less than 2 cubic yards, the Engineer may permit the Contractor to use a small construction mixer. Provide a mixer capable of mixing CLSM that has the specified compressive strength and flow consistency. Mix all components so as to produce a uniform product.~~

~~Narrower trench widths can be employed when using CLSM due to the self-compacting properties of the material. Construction personnel and equipment are not required to be in the trench for compaction operations. Refer to the current Standard Sheet for Controlled Low-Strength Material (CLSM) Installation Details for Circular and Elliptical Metal Pipes, Structural Plate Pipes and Pipe Arches, and Reinforced Concrete and Other Rigid Pipes. For installations that require that construction personnel temporarily occupy the trench follow all OSHA requirements.~~

204-3.02 Fill and Backfill at Structures, Culverts, Pipes, Conduits and Direct Burial Cables.

~~Place the CLSM using a method approved by the Engineer, in accordance with the appropriate Standard Sheet for additional guidance on the use of CLSM as backfill material.~~

~~When placing CLSM for pipe backfill, discharge the material onto the top of the pipe at the center.~~

~~Do not place CLSM in contact with aluminum pipe, including connections, fixtures, etc., unless the aluminum has been coated with an approved primer.~~

§204

- ~~— Do not place CLSM containing fly ash in contact with cast iron or ductile iron pipes, fittings or appurtenances.~~
- ~~— CLSM should be kept encapsulated with soil, as it is highly erodible and disintegrates when left exposed to the environment.~~
- ~~— In situations where CLSM is used as backfill around lightweight pipe, take precautions to counteract the pipe's buoyancy.~~

204-4 METHOD OF MEASUREMENT

~~**204-4.01 General.** Payment for CLSM will be made for the number of cubic yards of satisfactorily placed CLSM computed between the payment lines shown on the contract documents or from payment lines established in writing by the Engineer.~~

~~— A deduction shall be made for pipes (based on nominal diameters) and other payment items when the combined cross-sectional area exceeds 1.0 square foot unless otherwise shown. No deduction will be made for the cross-sectional area of an existing facility.~~

~~— No additional quantity shall be measured for payment to make up losses due to foundation settlement, compaction, erosion or any other cause.~~

~~— Cross sectioning, for the purpose of determining quantities for payment, shall be employed only where payment lines are not shown on the contract documents or Standard Sheets, and cannot be reasonably established by the Engineer.~~

204-5 BASIS OF PAYMENT

~~**204-5.01 General.** The unit price bid shall include the costs of furnishing all equipment, labor and materials necessary to complete the work, except where specific costs are designated or included in another pay item of work.~~

~~*Payment will be made under:*~~

Item No.	Item	Pay Unit
204.01	Controlled Low Strength Material (CLSM)	Cubic Yard
204.02	Controlled Low strength Material (CLSM) (No Fly Ash)	Cubic Yard

SECTION 205 - CONTAMINATED SOIL

205-1 DESCRIPTION.

205-1.01 General. Soil contamination may include:

- Petroleum products, which may include, but are not limited to: gasoline, heating oils, diesel fuel, kerosene, jet fuel, lubricating oils, motor oils, greases, and other fractions of crude oil;
- Contaminants associated with past Manufactured Coal Gas Plant (MGP) operations;
- Other contamination by organic constituents including volatile organic compounds;
- Metal(s) such as lead, chromium, and/or other heavy metals; and/or
- Any other constituents that require specialty disposal of the soil.

Additional information regarding contaminated soil may be available in a Special Note entitled *Soil Characterization Information* and/or in a *Contaminated Materials Assessment Report*, if such Special Note and/or Report were prepared by the Department during project design.

205-1.02 Segregation and Storage. This work shall consist of segregating contaminated soil from non-contaminated soil during excavation, and the temporary storage and management of contaminated soil (pending sampling, analysis and ultimate disposition) in accordance with an accepted Contaminated Material Handling Plan.

205-1.03 Field Organic Vapor Monitoring. This work shall consist of screening soil for contamination during excavation using field vapor monitoring equipment and observations. This work

shall be performed by an independent firm hired by the Contractor and completed in accordance with an accepted Field Organic Vapor Monitoring Plan.

205-1.04 Sampling and Analysis. This work shall consist of collecting soil samples and arranging for samples to be analyzed at a laboratory in accordance with an accepted Sampling Plan. The laboratory shall be accredited for the specified parameters by the New York State Department of Health (NYSDOH) under the Environmental Laboratory Approval Program (ELAP). The results of the laboratory analysis will determine or confirm the final regulatory classification of the soil for appropriate handling, transportation, treatment and disposal methods and requirements.

205-1.05 Transportation and Disposal. This work shall consist of transporting and disposing of contaminated soil, and completing any other related activities, in accordance with an accepted Disposal Plan. For shipping and disposal purposes, the regulatory classification of the soil (as either contaminated non-hazardous industrial waste or RCRA regulated hazardous waste) will be based on investigations conducted prior to award or based on the results of laboratory analysis included in this section.

205-1.06 Reuse of Contaminated Soil. This work shall consist of the reuse of contaminated soil within the contract limits as embankment, fill or other appropriate on-site use. Contaminated soil areas and reuse locations, if provided, are indicated in the contract documents or shall be determined and approved by the Department. The reuse of contaminated soil may be deemed appropriate based upon the following a) an investigation conducted prior to the contract award and/or sampling and analysis conducted during project construction and the qualification of the soil placement as a generic beneficial use determination (BUD) or b) as a site specific BUD obtained from the NYSDEC. The material must be considered suitable material as per Section 203-1.08.

205-2 MATERIALS.

205-2.01 General. As per the Contaminated Material Handling Plan, (Section 205-1.02).

205-2.02 Segregation and Storage. None Specified.

205-2.03 Field Organic Vapor Monitoring. Field organic vapor monitoring shall be conducted using a photoionization detector (PID) with a 10.2eV or higher ultraviolet lamp. The PID shall have a minimum detection range of 0.1 ppm to 2,000 ppm and shall be calibrated with isobutylene or other appropriate calibration gas.

A flame ionization detector (FID) may be used in lieu of a PID if a written request and justification is submitted by the Contractor and approved by the Department. The FID shall have a minimum detection range of 1.0 ppm to 50,000 ppm and shall be calibrated with appropriate calibration gas.

205-2.04 Sampling and Analysis. None Specified.

205-2.05 Transportation and Disposal. None Specified.

205-2.06 Reuse of Contaminated Soil. None Specified.

205-3 CONSTRUCTION DETAILS.

205-3.01 General. Work activities shall be performed in accordance with the contract documents and with applicable Contaminated Material Handling Plan, Field Organic Vapor Monitoring Plan, Sampling Plan and/or Disposal Plan. The Contractor shall initiate any measures necessary to protect the safety and health of workers and the general public based on the potential hazards associated with the contaminated soil.

A. Regulatory Compliance. The Contractor shall conduct all tasks in accordance with all applicable Federal, State, County, and local regulations including, but not necessarily limited to:

§205

- 29 CFR 1910.120 and 29 CFR 1926.65 - Hazardous Waste Operations and Emergency Response;
- 6 NYCRR 360 - Solid Waste Management Facilities;
- 6 NYCRR 364 - Waste Transporter Permits;
- 6 NYCRR 371 - Identification and Listing of Hazardous Wastes (Defines Resource Conservation and Recovery Act (RCRA) defined hazardous wastes;
- 6 NYCRR 372 - Hazardous Waste Manifest System and Related Standards for Generators, Transporters and Facilities (*applicable to soils regulated as hazardous wastes only*);
- 6 NYCRR Part 375 – Environmental Remediation Program;
- 49 CFR 100 to 180 - USDOT Hazardous Materials Transport and Manifest System Requirements (*applicable to soils regulated as hazardous wastes only*);
- TAGM 4046* - NYSDEC (New York State Department of Environmental Conservation) Division of Hazardous Waste Remediation Technical and Administrative Guidance Memorandum (TAGM) 4046 “Determination of Soil Cleanup Levels”;
- NYSDEC STARS* (Spill Technology and Remediation Series) Memo #1 for petroleum contamination constituents; and
- DER-22* - Division of Environmental Remediation Determination of Soil Cleanup Objectives for Contaminants, not in Part 375.

* Note: DER-22 will replace TAGM 4046 and components of STARS 1 when finalized.

B. Preparation of Plans and Advance Notification Letters. The Contractor shall be required to prepare one or more of the plans described below. Two (2) copies of each applicable plan shall be submitted to the Engineer for acceptance at least 30 calendar days prior to commencing work in areas identified as potentially contaminated.

Plans and notification letters shall be prepared based on the type(s) of contamination and locations identified in the contract documents. If a different type of contamination is encountered during work, and additional plans and notification letters must be written, the 30 calendar day lead time for submittals may be modified by the Engineer as appropriate.

1. Contaminated Material Handling Plan (CMHP). If the segregation and storage item is included in the contract, a CMHP shall be prepared. The CMHP shall describe the procedures to be used to segregate contaminated soil during excavation, soil storage/stockpile procedures, and safety and health issues. The following information shall be included in the CMHP:

- Name and address of the plan preparer;
- Contract name, contract number and description;
- Describe procedures to be used to segregate contaminated soil during excavation;
- Location of intended soil stockpile, trucks, roll-off container and other storage areas;
- Describe how contaminated soil will be moved to soil storage locations;
- Describe how soil storage/stockpile locations will be prepared and managed;
- Describe how potential air quality impacts such creation of dust particulates and vapors will be minimized to protect air quality within, adjacent to or downwind from the project.
- Describe air monitoring procedures to be used during work, define action levels, and explain the response if action levels are exceeded; The protocol and procedures shall consider action levels for both work personnel and also perimeter/community action levels based on the nature of the contamination and activities conducted
- Hazardous substance evaluation - types of chemicals associated with the waste to be generated,
- Hazard assessment - physical and toxic effects associated with the waste to be generated; Personal protective clothing (PPC) and personal protective equipment (PPE) to be used or available on-site;.
- Names of key personnel, emergency contacts and phone numbers;
- List the OSHA training each worker has received. At least one worker must have completed supervisor training per 29 CFR 1910.120(E)(4);

- General and site-specific safety rules, with emergency response procedures and directions to the nearest hospital (with map);
- Decontamination procedures for personnel and equipment; and
- Disposal of contaminated PPC and PPE;

2. Field Organic Vapor Monitoring Plan (FOVMP). If the field organic vapor monitoring item is included in the contract, a FOVMP shall be prepared. The following information shall be included in the FOVMP:

- Name and address of the plan preparer;
- Name, address, experience and qualifications of the independent firm performing the field organic vapor monitoring.
- Name, address, experience and qualifications of each individual who will conduct the field organic vapor monitoring. Each individual shall be thoroughly trained in sampling protocols, organic vapor monitoring procedures, and equipment calibration procedures.
- Type(s) of organic vapor monitoring equipment to be used – model, manufacturer and details of the PID or FID equipment that will be used to conduct field organic vapor monitoring; and
- Description of the field organic vapor monitoring and calibration procedures to be used.

3. Sampling Plan. If a sampling and analysis item is included in the contract, a Sampling Plan must be prepared. The following information shall be included in the Sampling Plan:

- Name and address of the plan preparer;
- Name, address, telephone number, and ELAP certification number of the proposed NYSDOH ELAP accredited laboratory;
- Name, address, experience and qualifications of each individual who will collect soil samples. Each individual shall be thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements.
- List of all laboratory tests required by the disposal/treatment facility
- Describe the sample collection and handling procedures to be used; and
- Sampling schedule or a description of the sampling frequency to be used to facilitate prompt disposal of stored soil.

If sampling and analysis items are not included in the contract, a separate Sampling Plan is not required, and the Contractor shall perform any soil sampling and analysis required under the disposal item.

4. Disposal Plan. If a disposal item(s) is included in the contract, a Disposal Plan shall be prepared. The following information shall be included in the Disposal Plan:

- Name and address of the plan preparer;
- Name of disposal/treatment facility, address, telephone number and contact person;
- Copy of applicable permits and/or licenses held by the disposal/treatment facility;
- EPA Identification Number and/or State Facility Identification Number issued to the disposal/treatment facility;
- Method(s) of disposal/treatment that will be used;
- Signed letter from the disposal/treatment facility stating it is authorized under law to accept the type of waste being generated, their intent to accept the contaminated waste generated by this contract, and a list of the laboratory tests required by the facility;
- Name of waste transporter, address, telephone number and contact person;
- EPA Identification Number and/or State Transporter Identification Number issued to waste transporter; and
- Copies of all waste transporter permits and/or license plate numbers for vehicles that will be used for transport of waste from the site to the intended disposal/treatment facility;

If a sampling and analysis item(s) is not included in the contract, the following information shall be included in the Disposal Plan for any sampling and analysis that will be conducted:

- Name, address, telephone number, and ELAP certification number of the proposed NYSDOH ELAP accredited laboratory.
- Name, address, experience and qualifications of each individual who will collect soil samples. Each individual shall be thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements.
- List of all laboratory tests required by the disposal/treatment facility;
- Describe the sample collection and handling procedures to be used; and
- Sampling schedule or a description of the sampling frequency to be used to facilitate prompt disposal of stored soil.

5. Advance Notification Letters (Letters). At least 10 calendar days prior to commencing work in contaminated areas, the Contractor shall prepare and submit Advance Notification Letters, (Letters) to the Engineer, the appropriate NYSDEC Regional Office (Environmental Remediation, Spill Prevention and Response), and the local fire department. The Letters shall include the dates that work will occur in contaminated areas, work locations, soil storage/stockpile locations, and the name, field office address and phone number of the Engineer. The Contractor shall provide the Engineer with a copy of the Letters sent to the NYSDEC and fire department.

205-3.02 Segregation and Storage. The Contractor shall have an accepted CMHP prior to commencing work within potentially contaminated soil areas. Contaminated soil areas are identified in the contract documents. Soil determined to be contaminated (by PID/FID screening or observation) shall be segregated from non-contaminated soil and stored pending sampling, analysis and disposal. If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil. The Contractor shall notify the Engineer immediately if soil is discovered that appears to contain unknown contaminants or soil that varies significantly from the type of contamination identified in the contract documents. The Department will determine the preliminary regulatory classification of the suspect soil and will determine how the soil is to be managed.

The Contractor shall not store contaminated soil for more than 40 calendar days, with this time limit beginning on the first day soil is placed in a stockpile, truck-bed or roll-off container. If the Engineer approves additional storage time for soil determined to be contaminated non-hazardous industrial waste, the Contractor shall also request approval from NYSDEC for any storage greater than 60 calendar days. If the Engineer approves additional storage time for soil determined to be RCRA regulated hazardous waste, the Contractor shall also obtain approval from NYSDEC for any storage greater than 90 calendar days. Contaminated soil may be placed in stockpiles, trucks or roll-off containers as follows:

A. Stockpiles. The Contractor shall prepare and maintain stockpiles as follows:

1. Preparation of Stockpile Areas.

- The area shall be graded to provide positive drainage away from intended stockpile locations.
- All stones, roots, debris and other objects that may puncture polyethylene ground protection shall be removed.
- The ground surface where soil will be stockpiled shall be covered with a minimum of ~~0.25 millimeter (10-mil)~~ or 2 layers of ~~0.15 millimeter (6-mil)~~ polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
- Stockpile locations shall be within the right-of-way and accepted by the Engineer prior to use.

2. Stockpile Protection.

- At the end of each work day, contaminated soil stockpiles shall be completely covered with a minimum of ~~0.25 millimeter (10-mil)~~ or 2 layers of ~~0.15 millimeter (6-mil)~~ polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.

- Stockpile covers shall be weighted or secured by appropriate means to prevent tearing or removal by weather conditions.
- Stockpiles shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.

3. **Maintenance.**

- Stockpile covers, site grading, signing and security measures shall be properly maintained for the duration of storage.
- Damaged covers and other protections shall be repaired or replaced by the Contractor within 24 hours after notification. If this work is not satisfactorily completed within 24 hours, no further stockpiling shall be allowed until such work is completed.

B. Trucks or Roll-off Containers. The Contractor shall prepare and maintain trucks and roll-off containers as follows:

- The interior of truck-beds and roll-off containers shall be lined with ~~0.25 millimeter (10-mil)~~ or 2 layers of ~~0.15 millimeter (6-mil)~~ polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
- At the end of each work day, trucks and roll-off containers storing soil shall be completely covered with waterproof tarpaulins. Tarpaulins shall be placed over the top of the truck bed or container (rather than over the soil inside) and shall extend over the sides to prevent water accumulation and the evaporation of contaminants.
- Tarpaulins shall be weighted or secured by appropriate means to prevent tearing or removal by climatic conditions.
- Trucks and roll-off containers shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.
- Trucks, roll-off containers and tarpaulins shall be properly maintained for the duration of soil storage.
- Damaged tarpaulins and protections shall be repaired or replaced by the Contractor within 24 hours after notification. If this work is not satisfactorily completed within 24 hours, no further soil storage shall be allowed until such work is completed.
- Trucks and roll-off containers storing contaminated soil shall be located as described in CMHP.

205-3.03 Field Organic Vapor Monitoring. The Contractor shall hire an independent firm to perform field organic vapor monitoring in accordance with the accepted FOVMP. The individual conducting the monitoring, hereafter referred to as the Field Monitor, shall be experienced and thoroughly trained in sampling protocols, organic vapor monitoring procedures, and equipment calibration procedures. The Field Monitor shall screen potentially contaminated soil during excavation using field vapor monitoring equipment (PID/FID) and visual observations. Based on the screening results, the Field Monitor shall direct the Contractor on the proper segregation of the material.

Field organic vapor monitoring shall be conducted when working in the contaminated soil areas identified in the contract documents, or whenever unusual or suspicious soil conditions based on visual or odor evidence are encountered during excavation. The Contractor or Field Monitor shall notify the Engineer immediately if soil is discovered that appears to contain unknown contaminants or soil that varies significantly from the type of contamination identified in the contract documents. (For health and safety reasons, personnel shall not evaluate odor by placing soil directly to the nose or by inhaling vapors from grab or bag samples).

The Field Monitor shall calibrate the PID/FID on a daily basis prior to starting field work and shall determine a background measurement. Excavated soil shall be tested with the PID/FID at intervals that will ensure the soil is being properly assessed for contamination. The PID/FID will be used to take head space readings from bag samples with the soil temperature at least 10°C (50°F). The Field Monitor shall maintain detailed and legible field notes indicating work locations, nature of work being performed, PID/FID head space readings, time of readings, pertinent measurements, visual and odor observations, quantities of both contaminated and non-contaminated soils excavated at each location, storage/stockpile

locations, work hours, weather conditions, and any unusual conditions encountered. The Contractor shall provide the Engineer with a copy of all field notes within 5 work days from their recording.

The segregation threshold established below (25ppm) is based on gasoline being the predominant contaminant. If a different contaminant(s) is present or suspected, a different segregation threshold may need to be established. Alternative segregation thresholds may be designated in the contract documents.

PID/FIDs detect and measure gas concentrations (specifically volatile organic compounds); they do not quantify or identify the contaminants in the soil. Therefore, PID/FID readings can not determine specific contaminant concentrations within the soil.

Segregate soil as follows:

A. Non-Contaminated Soil. Soil with PID/FID head space readings less than 25 ppm and exhibiting no other evidence of contamination (visual or olfactory evidence) shall be considered non-contaminated. Unless further analysis is performed for confirmation of the non-contaminated soil, this soil will be considered uncontaminated.

B. Contaminated Soil. Soil with PID/FID head space readings equal to or greater than 25 ppm and/or soil exhibiting other evidence of contamination (visual or olfactory evidence) shall be considered contaminated. This soil shall be segregated from non-contaminated soil and placed in stockpiles or containers. If sampling and analysis provisions are included for the segregated soil, the results of laboratory analysis will be used to determine its regulatory classification. If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil.

205-3.04 Sampling and Analysis. The Contractor shall have an accepted Sampling Plan prior to commencing work within potentially contaminated areas. Sampling shall be conducted by individuals thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements. Accepted sampling practices shall be used to obtain representative composite sample(s) and/or grab sample(s) as required for the specific analyses to be completed. Representative samples shall be collected from stored soil as soon as possible after excavation. Soil shall be taken from a depth greater than ~~one foot~~ ~~0.3 meters~~ within the stockpile. Each composite sample shall include a minimum of four sample points. Grab samples shall be collected in a manner so as to best characterize the extent of contamination of the soil in question and best characterize the extent of contamination of the pile. If any soil areas are present with field indications of contamination discretely different than the other areas (i.e., significantly elevated PID/FID readings, staining, etc.), the area may require a separate sample and the Engineer ~~HC~~ shall be alerted to approve additional sample and analysis. Analyses shall be completed at a NYSDOH ELAP accredited laboratory that is certified to perform the required tests. Analyses shall be completed within 10 work days of sample collection. The Contractor shall provide the Engineer with a copy of all reports within 2 work days of their receipt from the laboratory.

Soil shall not be added to any stockpile, truck or roll-off container after its contents have been sampled. If soil is added after sampling, or sampled soil is otherwise tampered with, the Contractor shall re-sample the soil at no additional cost to the State.

Conduct specified analyses as follows:

A. Petroleum Contamination Parameter Analysis. Samples shall be analyzed for petroleum contamination constituents (total constituent analysis) in accordance with NYSDEC Spill Technology and Remediation Series (STARS) Memo #1 using USEPA Method 8260 for volatile organics and methyl t-butyl ether (MTBE) and USEPA Method 8270 for base/neutrals.

B. Hazardous Waste RCRA Toxicity Characteristic Analysis. Samples shall be analyzed for Hazardous Waste RCRA Toxicity Characteristics Leaching Procedure (TCLP) constituents. Analysis shall be for full TCLP constituents on the sample extract as prepared by USEPA Method 1311.

C. Ignitability of Solids Analysis. Samples shall be analyzed for ignitability by USEPA Method 1030.

D. pH of Soil and Waste. Samples shall be analyzed for pH measurement by USEPA Method 9045.

E. Polychlorinated Biphenyls (PCB) Analysis. Samples shall be analyzed for PCBs by USEPA Method 8082.

F. Total Petroleum Hydrocarbons (TPH) Analysis. Samples shall be analyzed for petroleum hydrocarbons, USEPA Method 8015, gasoline range organics (GROs) and/or diesel range organics (DROs).

205-3.05 Transportation and Disposal. The Contractor shall have an accepted Disposal Plan prior to the transportation and disposal of contaminated soil. Contaminated soil shall not be transported until all sampling and analysis, as required by the Department or by the Disposal facility, have been performed and laboratory reports have been provided and accepted by the Department.

A. Transportation Off Site.

1. For the duration of transportation, roll-off containers and truck beds shall be completely covered with secured waterproof tarpaulins to prevent water infiltration, evaporation of contaminants and spillage of contaminated soil.
2. The Contractor shall take immediate action to remedy any situation involving a release of contaminated soil during loading or while in transit.
3. Contaminated soil shall not be combined with material from any other source.
4. Contaminated soil shall be transported in vehicles with valid Waste Transporter permits for New York State (and other required permits/licenses from any other states as applicable). The Contractor shall provide a copy to the Engineer of the waste transporter permit documenting that the transporter is authorized to transport waste to the intended disposal/treatment facility. The Contractor shall complete any required shipping papers, labeling, placarding, and weighing/load measurements and shall provide copies of required documentation to the Engineer.
5. Contaminated soil that is determined to be a regulated hazardous waste per the criteria of 6 NYCRR Part 371 shall be shipped with a hazardous waste manifest to a treatment/disposal facility permitted to accept the waste. The Contractor shall complete all required manifests, labeling, placarding, land disposal restriction notifications, and other requirements for shipping and tracking hazardous wastes and shall provide copies of required documentation to the Engineer. The Engineer will provide the Contractor with the EPA Identification Number(s) issued to the Department as the hazardous waste generator and will sign the generator certification statements.

B. Disposal/Treatment. Contaminated soil shall be disposed of by the methods and procedures described in the accepted Disposal Plan. Soil characterization information, field identification and confirmation laboratory analyses, if included in the contract, will be used to determine appropriate classification and category of soil for disposal. Each category of surplus or waste soil shall be handled and disposed of based upon its characterization in accordance with the requirements outlined in §107-10 *Managing Surplus Material and Waste* for the following categories:

- Uncontaminated Soil;
- Contaminated Non-hazardous Industrial Waste; or
- Hazardous Waste regulated by 6 NYCRR Part 371

Soils characterized as contaminated as Hazardous Waste or as Non-hazardous Industrial Waste shall be disposed of and paid for per the items 205.0501 and 205.0502 respectively.

Contaminated soil shall be transported to a disposal/treatment facility within 40 calendar days from the start of storage. The Contractor shall complete under this item any soil sampling and analysis required by the disposal/treatment facility that is not specifically included in the contract.

C. Documentation. The Contractor shall provide the Engineer with copies of all receipts from the disposal/treatment facility which indicate the actual quantity of waste received within 2 work days of

§205

receipt from the facility. For soil determined to be RCRA regulated hazardous waste, the Contractor shall also provide the Engineer with the appropriate copies of each signed manifest within 2 work days of receipt. Any manifest discrepancies, including the need for exception reporting, shall be reported immediately to the Engineer and shall be resolved by the Contractor.

205-3.06 Reuse of Contaminated Soil. The Contractor shall place contaminated soil as embankment, fill or other appropriate on-site use as determined and approved by the Department, and in accordance with the contract documents. Only appropriate soils placed in appropriate locations as included in the contract documents shall be reused.

205-4 METHOD OF MEASUREMENT.

205-4.01 General. (Vacant)

205-4.02 Segregation and Storage. The work under segregation and storage will be measured for payment on a lump sum basis.

205-4.03 Field Organic Vapor Monitoring. The quantity for payment will be in hours of field organic vapor monitoring performed, measured to the nearest one-half hour.

205-4.04 Sampling and Analysis. The quantity to be measured for payment will be the number of soil samples analyzed as included in the contract documents.

205-4.05 Transportation and Disposal. The quantity to be measured for payment will be in tons of contaminated soil transported to a disposal/treatment facility, measured to the nearest 0.1 ton. If measurement of the contaminated soil by weight is not feasible, a conversion factor of 1.4 tons per cubic yard will be used to determine the quantity for payment.

205-4.06 Reuse of Contaminated Soil. The quantity to be measured for payment will be in cubic yards of contaminated soil stockpiled for reuse, computed to the nearest whole cubic yard.

205-5 BASIS OF PAYMENT. The price bid shall include the cost of all labor, materials and equipment necessary to complete the work. Excavation will be paid for separately.

Payment will be made under:

Item No.	Item	Pay Unit
205.02nn	Segregation and Storage of Contaminated Soil	Lump Sum
205.03	Field Organic Vapor Monitoring of Contaminated Soil	Hour
205.0401	Petroleum Contamination Parameter Analysis	Each
205.0402	Laboratory Analysis for Hazardous Waste RCRA Toxicity Characteristic	Each
205.0403	Laboratory Analysis for Ignitability	Each
205.0404	Laboratory Analysis for ph	Each
205.0405	Laboratory Analysis for Polychlorinated Biphenyls (PCB's)	Each
205.0406	Laboratory Analysis for Total Petroleum Hydrocarbons– Gasoline Range Organics	Each
205.0407	Laboratory Analysis for Total Petroleum Hydrocarbons– Diesel Range Organics	Each
205.0501nn	Disposal of Contaminated Hazardous Waste Soil	Ton
205.0502nn	Disposal of Contaminated Non-Hazardous Waste Soil	Ton
205.06nn	Reuse of Contaminated Soil	Cubic Yard

Note: nn ### denotes serialized pay item for each discrete contaminated area of property as indicated on the plans. The serialized items allow for different plans and different disposal procedures for discretely different areas and nature of the contamination.

SECTION 206 - TRENCH, CULVERT AND STRUCTURE EXCAVATION

206-1 DESCRIPTION

206-1.01 General. This work shall consist of the excavation of all materials and backfill or disposal of excavated material required for trenches, culverts, structures, conduit and direct burial cable not otherwise provided for in other sections of these specifications. All such excavation shall be unclassified excavation as defined in Section 203, *Definitions*, ~~§203-1.01~~. The work shall also consist of all required protection necessary to ensure the safety of the workers and the public.

Comment [c19]:
EI09024

206-1.02 Trench and Culvert Excavation and Trench and Culvert Excavation - Original Grade (O.G.) The work specified under these items shall include the excavation for and backfill of all culverts, pipe lines, and other minor structures including but not limited to leaching basins, catch basins, field inlets, manholes and drop inlets.

206-1.03 Structure Excavation. The work specified under this item shall include the excavation for all bridge foundations, walls and other major structures and backfill of suitable excavated material if another item is not specified.

206-1.04 Conduit Excavation and Backfill including Surface Restoration. The work specified under this item shall include the excavation, necessary backfill and surface restoration required for conduits and direct burial cables.

206-1.05 Test Pits. The work specified under this item shall include the excavation and backfill of test pits at locations shown in the contract documents, or as directed by the Engineer. Excavation and backfill methods, limits and equipment used shall be approved by the Engineer. This work will not relieve the contractor of the responsibility to locate underground facilities as required under 16 NYCRR 753.

206-2 MATERIALS. (Not Specified).

206-3 CONSTRUCTION DETAILS

206-3.01 General. The appropriate construction details specified for “Excavation and Embankment” in §203-3.01 *General* through and including §203-3.03 *Embankment In Place*, and §203-3.06 *Select Granular Fill* and §203-3.14 *Select Structural Fill* shall apply to the work specified in this section. ~~The appropriate construction details specified for “Excavation and Embankment” in §203-3.01 through and including §203-3.12, and §203-3.15 shall apply to the work specified in this section.~~

Comment [c20]:
EI09024

The excavation shall be dewatered and kept free from water, snow and ice when necessary.

Special care shall be taken not to disturb the bottom of the excavation, and not to remove the material at final grade until just before the structure is placed.

The Contractor shall carry out all excavation operations in a safe and prudent manner so that the workers, the public, and adjacent public and private property will be protected from unreasonable hazard in accordance with §107-05K. *Open Excavations and Trenches*.

If no support or protective system is shown in the plans or proposal, the Contractor may open the excavation with the sides sloped to a stable slope not steeper than that allowed by 29 CFR 1926 Subpart P. Taking this option, however, does not relieve the Contractor of responsibilities as stated in this subsection. When the Contractor chooses this option, the materials used and method of construction outside the payment lines shall be in accordance with the requirements of this Section.

When excavation is required for the installation of conduit or direct burial cable, the Contractor shall notify the Engineer upon completion of the excavation. No conduit or cable shall be placed in the excavation until the Engineer has approved the depth and cross-section.

206-3.02 Replacement of Pavement Structure Courses. When the Contractor, in placing conduits, direct burial cable or utilities, excavates into the pavement, subgrade, subbase, or shoulder courses, such courses must be replaced in kind, character and condition, to maintain a uniform road section.

206-3.03 Disposal of Excavated Material. The provisions of §203-3.01D *Suitable Materials* and/or §203-3.01E *Unsuitable Materials* shall apply to all material excavated under this section which is not used as backfill.

~~The provisions of §203-3.06 and/or §203-3.07 shall apply to all material excavated under this section which is not used as backfill.~~

Comment [c21]:
E109024

206-3.04 Test Pits. The Contractor shall excavate and backfill test pits in order to determine existing underground utility type, size and/or condition where new utility connections to existing facilities are proposed. The Contractor shall excavate and backfill test pits in a manner approved by the Engineer that prevents damage to wrappings, coatings or other protective coverings, such as by hand digging, vacuum excavation or similar non-destructive locating equipment. The limits of the excavation shall be those sufficient to determine existing utility type, size and/or condition.

206-4 METHOD OF MEASUREMENT

206-4.01 General. The quantity of excavation shall be the number of cubic yards of material computed from payment lines shown on the plans or the appropriate standard sheets, except where revised payment lines are established by the Engineer prior to performing the work. Work performed beyond any designated payment line will not be included in the computation of quantities for the item involved.

206-4.02 Trench and Culvert Excavation. Unless otherwise shown or indicated on the contract plans, payment lines for excavation of pipe and culvert lines, and minor structures will be determined as follows:

A. Bottom Payment Line. The elevation of the bottom payment line shall be the invert elevation of the pipe, conduit, or culvert. For pipes, conduits, or culverts of nominal horizontal dimensions of 12 to 144 inches, the width of the excavations at the bottom payment line shall be the nominal inside horizontal dimension of the pipe, conduit, or culvert plus 4 feet, or three (3) times the nominal inside horizontal dimension, whichever is less; for pipes with a nominal horizontal dimension greater than 144 inches the width will be as shown on the appropriate standard sheets or in the contract documents. For concrete and smooth interior corrugated polyethylene pipe, twice the minimum wall thickness shall be added to the preceding. For concrete pipe, the bottom payment line is the Bedding Control Line shown on the applicable standard sheet.

B. Top Payment Line. Except when otherwise provided in the contract, the payment line in a cut section shall be the surface at the centerline of the pipe, culvert or conduit after completion of the general excavation and prior to excavation to place material paid for under another item of the contract; except that, when an undercut is made for unstable conditions, the payment line will be at the top of the undercut backfill. The payment line in a fill section shall be the ground surface prior to commencing work on the contract.

C. Side Payment Lines. The side payment lines of the excavation shall be vertical to the bottom payment line, regardless of whether sheeting is or is not required or used.

For utility lines, exclusive of conduit and cable lines, of less than 12 inch diameter, the excavation width shall be the actual bottom width necessary, as determined by the Engineer, to properly perform the installation work required, or 3 feet, whichever is less.

D. Payment Lines for Minor Structures. Payment lines for minor structures shall be vertical from the bottom of the footing and shall extend out 2 feet from the perimeter of the structure footing. The top payment line shall be the same as for (B) above.

206-4.03 Conduit Excavation and Backfill including Surface Restoration. The quantity of conduit and/or cable excavation and backfill including surface restoration for payment shall be the number of linear feet measured along the center of the conduit and/or cable placed, in accordance with the methods stated below.

Wherever a pair or group of conduits and/or cables are physically connected together, they shall be considered as a single conduit and/or cable.

A. Wherever conduit and/or cable in the same trench are physically separated laterally by 6 inches or more between centerlines, as shown on the plans or as directed by the Engineer, the linear feet measurement shall be made along the center of each conduit and/or cable.

B. Wherever a pair or group of conduits and/or cable in the same trench are physically separated laterally by less than 6 inches between centerlines of adjacent conduit and/or cable, as shown on the plans or as directed by the Engineer, the linear feet measurement for those conduits and/or cable shall be made along the center of that pair or group of conduit and/or cables.

206-4.04 Trench and Culvert Excavation - O.G. The provisions of §206-4.02 Trench and Culvert Excavation shall apply, except the top payment line shall be the existing ground surface at the centerline of the pipe, culvert or conduit prior to commencing work on the contract.

206-4.05 Test Pits. The quantity to be measured for payment will be the number of test holes excavated and backfilled in accordance with the contract documents.

206-5 BASIS OF PAYMENT

206-5.01 Trench, Culvert and Structure Excavation. The unit price bid for this work shall include the cost of labor, materials and equipment required to satisfactorily complete the work, including the costs of excavation, backfill (except select backfill paid for separately), disposal of excavated material, presplitting rock excavations where required, and keeping the site dewatered and free from earth, water, ice and snow when necessary.

The cost for necessary guarding and protection required to protect the public from open trenches and, that required for the protection to ensure the safety of the workers shall be included in the bid price for Trench, Culvert and Structure Excavation. Progress payments will be made after the excavation has been completed, and prior to the completion of other work included under this item, including but not limited to pumping, fencing and backfilling. Payment will be made, at the unit price bid, for 75% of the quantity excavated within the prescribed payment lines. The balance of the quantity excavated will be paid for upon proper completion of backfill placement.

If the Contractor chooses the slope layback option to satisfy OSHA, no extra payment will be made for the cost of any labor, equipment or material necessary to restore the area outside the payment lines shown on the plans.

206-5.02 Sheet piling, Cofferdams or Temporary Water Diversion Structures. Payment for Sheet piling, Cofferdams or Temporary Water Diversion Structures required by the plans, specifications, or ordered by the Engineer in writing will be made in accordance with the appropriate item.

Where cofferdams are specified for structure excavation, the work required to keep the site free from earth, water, ice and snow shall be included in the item for cofferdams when necessary.

206-5.03 Replacement of Pavement Structure Courses. With exception of the Conduit Excavation and Backfill including Surface Restoration item, the work of replacing pavement, subcourses and shoulder courses shall be paid for and performed under the provisions of their respective items and subsections.

206-5.04 Conduit Excavation and Backfill including Surface Restoration. The unit price bid per linear foot for this work shall include the cost of furnishing all labor, materials and equipment necessary to excavate and backfill the trench and to replace any pavement, shoulder, and sidewalk courses, subcourses, curbs, drives, lawns and other top surfaces as required to complete the work.

206-5.05 Test Pits. The unit price bid for this work shall include the cost of furnishing all labor, materials and equipment necessary to excavate and backfill the test pit and replace any pavement,

§206

shoulder and sidewalk courses, subcourses, curbs, drives, lawns and other top surfaces required to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
206.01	Structure Excavation	Cubic Yard
206.02	Trench and Culvert Excavation	Cubic Yard
206.03	Conduit Excavation and Backfill including Surface Restoration	Foot
206.04	Trench and Culvert Excavation - O.G.	Cubic Yard
206.05	Test Pit Excavation	Each

SECTION 207 – GEOTEXTILES AND PREFABRICATED COMPOSITE DRAINS FOR STRUCTURES

207-1 DESCRIPTION

207-1.01 Geotextiles.—The work shall consist of furnishing and installing approved Geotextile of the Class and Type indicated, at the locations, and in the manner shown on the plans or as directed by the Engineer, in writing, prior to performing the work.

207-1.02 Prefabricated Composite Drains for Structures.—The work shall consist of furnishing and installing an approved Prefabricated Composite Structural Drain (PCSD) or Prefabricated Composite Integral Abutment Drain (PCIAD) as specified at the location (s) shown on the contract documents or as directed by the Engineer, in writing, prior to performing the work.

—Prior to installation, the Contractor shall furnish the Engineer with copies of the manufacturer's literature with details and installation requirements for the PCSD or PCIAD. If not included in the manufacturer's literature, a letter identifying the geotextile wrap shall also be provided to the Engineer.

207-2 MATERIALS

207-2.01 General.—The Geotextile and Prefabricated Composite Drain for Structures shall be the type appropriate for the intended use as shown on the plans and be listed in the Appropriate Approved List issued by Department's Materials Bureau. Evaluation of a Geotextile or Prefabricated Composite Drain for Structures not on the Approved List will be made in accordance with procedural directives of the Geotechnical Engineering Bureau. Evaluation will require a minimum of four months.

—The Contractor shall provide PCSD or PCIAD that is a flexible product consisting of a geotextile bonded to an internal supporting core.

—The Contractor shall provide PCSD or PCIAD that is resistant to deterioration from salts, road oils, fuels and other deleterious substances encountered in this type of application.

—Only approved structural drains with an impermeable core will be permitted for use in installations where fresh concrete is to be placed against the drain.

207-2.02 Basis of Acceptance

A. Geotextiles.—The Geotextiles which are on the Approved List issued by the Department's Materials Bureau will be accepted on the basis of the brand name labeled on the Geotextile or the Geotextile container and verification of the Geotextile by a Departmental Geotechnical Engineer.

B. Prefabricated Composite Drains for Structures.—The Prefabricated Composite Drain for Structures which are on the Approved List issued by the Department's Materials Bureau will be accepted on the basis of the brand name labeled on the drain's packaging and verification by the Engineer of the geotextile wrap being on the approved list for a drainage application.

207-2.03 Quality Assurance

A. Geotextiles.—When the State elects to sample, one ten-square yard sample will be obtained for quality assurance testing. The results of this testing will only affect a product's standing on the Approved List. Payment for this sample will be made at the unit bid price.

B. Prefabricated Composite Drains for Structures.—When the State elects to sample, a 1 yard long by roll width sample will be obtained for quality assurance testing. The results of this testing will only affect a product's standing on the Approved List. No payment will be made for this sample.

207-3 CONSTRUCTION DETAILS**207-3.01 Geotextiles**

A. General.—The Geotextiles shall be protected from exposure to sunlight during transport and storage. After placement, the Geotextile shall not be left uncovered for more than two (2) weeks. —Traffic or construction equipment will not be permitted directly on the Geotextile. Geotextiles may be joined by either sewing or overlapping. Sewn seams shall be lapped a minimum of 4 inches and double sewn. The thread used to sew the seam shall be nylon or polypropylene. Overlapped seams shall have a minimum overlap of 18 inches except when placed under water where the overlap shall be a minimum of 3 feet. All seams shall be subject to the approval of the Engineer. Geotextile which becomes torn or damaged due to the Contractor's operations shall be replaced or patched at no cost to the State. The patch shall extend 3 feet beyond the perimeter of the tear or damage.

B. Bedding and Slope Protection.—The Geotextile shall be placed and anchored on a prepared surface approved by the Engineer. The Geotextile shall be laid loosely, but in intimate contact with the soil so that placement of the overlying materials will not stretch or tear the Geotextile. Where Geotextile is placed above water, the backfill placement shall begin at the toe and proceed up the slope:

—Where Geotextile is placed under water, the long dimension shall be placed parallel to the direction of flow. Successive Geotextile sheets shall be overlapped so that the upstream sheet is placed over the downstream sheet. As the Geotextile is placed under water, the backfill material shall be placed on it to the required thickness. The Geotextile placement shall not progress more than 50 feet ahead of the backfill placement.

—Rip rap, Stone Filling (Heavy) or Stone Filling (Medium) shall not be dropped onto the Geotextile from a height greater than 1 foot. Slope protection and smaller sizes of stone filling shall not be dropped onto the Geotextile from a height exceeding 3 feet.

C. Separation and Stabilization.—The Geotextile shall be placed as directed by the Engineer. The Geotextile shall be laid loosely, but in intimate contact with the soil so that placement of the overlying material will not stretch or tear the Geotextile.

D. Drainage.—The Geotextile shall be placed to conform loosely to the shape of the trench:

—After placing the filter material, the Geotextile shall be folded over the top of the filter material to produce a minimum overlap of 1 foot. The Geotextile shall then be covered with the subsequent course:

207-3.02 Prefabricated Composite Drains for Structures.—The Contractor shall install the drain in conformance with the manufacturer's installation procedures. The drain shall be installed so that the backfill, when placed, will be in contact with the geotextile and forms a continuous drainage layer without interruption within the drain's plane. At all locations, a positive outlet for the water in the drain shall be provided. This may involve making a hole in the core at the weep hole locations for approved drains with an impermeable core. Do not puncture the geotextile. Any damaged geotextile shall be repaired. —Adhesive shall be applied to the wall surface, and not directly to the drain.

~~During all periods of shipment and storage, the drain shall be wrapped and protected from direct exposure to sunlight, mud, dirt and debris.
Care shall be exercised while backfilling to prevent damage to the drain. Repairs or replacements of drain damaged by construction operations shall be performed, as directed by the Engineer, at no cost to the State.~~

207-4 METHOD OF MEASUREMENT

207-4.01 Geotextiles

~~**A. General.** The quantity of Geotextile will be the number of square yards computed from the payment lines shown on the plans or from payment lines established in writing by the Engineer. Measurement will not be made for Geotextile used for repairs, seams, or overlaps. If taken, the amount of quality assurance samples will be added to this quantity.~~

~~**B. Drainage.** The number of square yards shall be computed by multiplying the length of the trench where Geotextile is used by the theoretical perimeter (determined from the typical section).~~

~~**207-4.02 Prefabricated Composite Drains for Structures.** The quantity of PCSD or PCIAD is the number of square yards satisfactorily installed computed from the payment lines indicated in the contract documents or from payment lines established, in writing, by the Engineer.~~

207-5 BASIS OF PAYMENT

~~**207-5.01 Geotextiles.** The unit price bid per square yard for these items shall include the cost of furnishing all labor, equipment, and materials necessary to complete the work, including the cost of preparing the surface upon which the Geotextile is placed. No payment will be made for replacement or repairs.~~

~~**207-5.02 Prefabricated Composite Drains for Structures.** The unit price per square yard for this item includes the cost of furnishing all labor, equipment, and material necessary to complete the work. No payment will be made for repairs or replacement.~~

Payment will be made under:

Item No.	Item	Pay Unit
207.10	Geotextile Bedding	Square Yard
207.11	Geotextile Separation	Square Yard
207.12	Geotextile Drainage	Square Yard
207.13	Geotextile Slope Protection	Square Yard
207.14	Geotextile Stabilization	Square Yard
207.15	Prefabricated Composite Structural Drain	Square Yard
207.16	Prefabricated Composite Integral Abutment Drain	Square Yard

SECTION 207 - GEOSYNTHETICS

207-1 DESCRIPTION

207-1.01 Geotextiles. The work shall consist of furnishing and installing approved Geotextile of the Class and Type indicated, at the locations, and in the manner shown on the plans or as directed by the Engineer, in writing, prior to performing the work.

207-1.02 Geomembranes. The work shall consist of furnishing and installing approved Geomembrane, including the preparation of the surface upon which the Geomembrane is placed, at the locations and in the manner shown on the plans or as directed by the Engineer, in writing, prior to performing the work.

207-1.03 Prefabricated Composite Drains for Structures. The work shall consist of furnishing and installing an approved Prefabricated Composite Structural Drain (PCSD) or Prefabricated Composite Integral Abutment Drain (PCIAD) as specified at the location (s) shown on the contract documents or as directed by the Engineer, in writing, prior to performing the work.

Prior to installation, the Contractor shall furnish the Engineer with copies of the manufacturer’s literature with details and installation requirements for the PCSD or PCIAD. If not included in the manufacturer’s literature, a letter identifying the geotextile wrap shall also be provided to the Engineer.

207-2 MATERIALS. Materials shall meet the requirements specified in the following subsections of Section 700 – Materials.

Geotextiles	§737-01
Geotextile Bedding	§737-01 A.
Geotextile Separation	§737-01 B.
Geotextile Drainage	§737-01 C.
Geotextile Slope Protection	§737-01 D.
Geotextile Stabilization	§737-01 E.
Turbidity Curtain	§737-01 F.
Silt Fence	§737-01 G.
Geomembranes	§737-02
Prefabricated Composite Structural Drains	§737-04
Prefabricated Composite Integral Abutment Drains	§737-05

Materials shall be subject to the Department’s Quality Assurance (QA) program outlined in Section 737.

207-3 CONSTRUCTION DETAILS

207-3.01 Geotextiles

A. General. The Geotextiles shall be protected from exposure to sunlight during transport and storage. After placement, the Geotextile shall not be left uncovered for more than two (2) weeks.

Traffic or construction equipment will not be permitted directly on the Geotextile. Geotextiles may be joined by either sewing or overlapping. Sewn seams shall be lapped a minimum of 4 inches and double sewn. The thread used to sew the seam shall be nylon or polypropylene. Overlapped seams shall have a minimum overlap of 20 inches except when placed under water where the overlap shall be a minimum of 3 feet. All seams shall be subject to the approval of the Engineer. Geotextile which becomes torn or damaged due to the Contractor’s operations shall be replaced or patched at no cost to the State. The patch shall extend 3 feet beyond the perimeter of the tear or damage.

B. Bedding and Slope Protection. The Geotextile shall be placed and anchored on a prepared surface approved by the Engineer. The Geotextile shall be laid loosely but in intimate contact with the soil so that placement of the overlying materials will not stretch or tear the Geotextile. Where Geotextile is placed above water, the backfill placement shall begin at the toe and proceed up the slope.

Where Geotextile is placed under water, the long dimension (provided that the width dimension is wider than the channel width) shall be placed parallel to the direction of flow. If the width dimension is not wider than the channel width, the long dimension shall be placed perpendicular to the direction of flow. Successive Geotextile sheets shall be overlapped so that the upstream sheet is placed over the downstream sheet. As the Geotextile is placed under water, the backfill material shall be placed on it to the required thickness. The Geotextile placement shall not progress more than 50 feet ahead of the backfill placement.

Rip-rap, stone filling (Heavy) or stone filling (Medium) shall not be dropped onto the Geotextile from a height greater than 1 foot. Slope protection and smaller sizes of stone filling shall not be dropped onto the Geotextile from a height exceeding 3 feet.

C. Separation and Stabilization. The Geotextile shall be placed as directed by the Engineer. The Geotextile shall be laid loosely but in intimate contact with the soil so that placement of the overlying material will not stretch or tear the Geotextile.

D. Drainage. The Geotextile shall be placed to conform loosely to the shape of the trench.

After placing the filter material, the Geotextile shall be folded over the top of the filter material to produce a minimum overlap of 12 inches. The Geotextile shall then be covered with the subsequent course.

207-3.02 Geomembranes. The Geomembrane shall be protected during transport and storage. The surface upon which the Geomembrane is to be placed shall be within reasonable conformity to the proposed grade. Traffic or construction equipment will not be permitted directly on the Geomembrane. Care shall be exercised by workers when walking or working on the Geomembrane.

Seams shall be sealed as per the manufacturer's recommendations and to the satisfaction of the Engineer. The edges of the Geomembrane shall be secured in the manner shown on the contract plans or as directed by the Engineer.

Geomembrane which becomes torn or damaged shall be replaced or patched as ordered by the Engineer. The patch shall extend 3 feet beyond the perimeter of the tear or damage and the seams shall be approved by the Engineer.

207-3.03 Prefabricated Composite Drains for Structures. The Contractor shall install the drain in conformance with the manufacturer's installation procedures. The drain shall be installed so that the backfill, when placed, will be in contact with the geotextile and forms a continuous drainage layer without interruption within the drain's plane. In installations where concrete is to be poured against the prefabricated composite drain, only drains with impermeable cores will be allowed. At all locations, a positive outlet for the water in the drain shall be provided. This may involve making a hole in the core at the weep hole locations for approved drains with an impermeable core. Do not puncture the geotextile. Any damaged geotextile shall be repaired.

Adhesive shall be applied to the wall surface, and not directly to the drain.

During all periods of shipment and storage, the drain shall be wrapped and protected from direct exposure to sunlight, mud, dirt and debris.

Care shall be exercised while backfilling to prevent damage to the drain. Repairs or replacements of drain damaged by construction operations shall be performed, as directed by the Engineer, at no cost to the State.

207-4 METHOD OF MEASUREMENT

207-4.01 Geotextiles

A. General. The quantity of Geotextile will be the number of square meters computed from the payment lines shown on the plans or from payment lines established in writing by the Engineer. Measurement will not be made for Geotextile used for repairs, seams, or overlaps. If taken, the amount of quality assurance samples will be added to this quantity.

B. Drainage. The number of square meters shall be computed by multiplying the length of the trench where Geotextile is used by the theoretical perimeter (determined from the typical section).

207-4.02 Geomembranes. The quantity of Geomembrane will be the number of square meters computed from the payment lines shown on the plans or from payment lines established in writing by the Engineer. Measurement will not be made for Geomembranes used for repairs, seams, or overlaps.

207-4.03 Prefabricated Composite Drains for Structures. The quantity of PCSD or PCIAD is the number of square meters satisfactorily installed computed from the payment lines indicated in the contract documents or from payment lines established, in writing, by the Engineer.

207-5 BASIS OF PAYMENT

207-5.01 Geotextiles. The unit price bid per square meter for these items shall include the cost of furnishing all labor, equipment, and materials necessary to complete the work, including the cost of preparing the surface upon which the Geotextile is placed. No payment will be made for replacement or repairs.

207-5.02 Geomembranes. The unit price bid per square meter for this item shall include the cost of furnishing all labor, materials, and equipment necessary to satisfactorily complete the work, including the cost of preparing the surface upon which the Geomembrane is placed and securing the edges of the Geomembrane. No payment will be made for replacement or repairs.

207-5.03 Prefabricated Composite Drains for Structures. The unit price per square meter for this item includes the cost of furnishing all labor, equipment, and material necessary to complete the work. No payment will be made for repairs or replacement.

Payment will be made under:

Item No.	Item	Pay Unit
207.20	Geotextile Bedding	Square Yard
207.21	Geotextile Separation	Square Yard
207.22	Geotextile Drainage	Square Yard
207.23	Geotextile Slope Protection	Square Yard
207.24	Geotextile Stabilization	Square Yard
207.25	Geomembrane	Square Yard
207.26	Prefabricated Composite Structural Drain	Square Yard
207.27	Prefabricated Composite Integral Abutment Drain	Square Yard

SECTION 208 - STORMWATER MANAGEMENT FACILITIES

208-1 DESCRIPTION. The work in this section shall include work required for stormwater management facilities.

208-2 MATERIALS. Materials shall be as specified in the special specifications.

208-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

208-4 METHOD OF MEASUREMENT. As specified in the special specifications.

208-5 BASIS OF PAYMENT. As specified in the special specifications.

~~SECTION 208 (VACANT)~~

Comment [c23]:
EI09-014

SECTION 209 - SOIL EROSION AND SEDIMENT CONTROL

209-1 DESCRIPTION. This work shall consist of furnishing, installing, inspecting, maintaining, and removing soil erosion and sediment control measures as shown on the contract documents or as ordered by the Engineer during the life of the contract to provide soil erosion and sediment control. This work shall be coordinated with the soil erosion and sediment control features specified elsewhere in the contract documents to the extent practical to assure effective and continuous soil erosion and sediment control throughout the construction and post construction period.

209-1.01 Erosion Control. See §101-02 Definitions of Terms, Erosion Control, for the definition of Erosion Control. The following items of work are provided in this section to address soil erosion control - mulch, straw/wood fiber mulch, seed and mulch, seed and straw/wood fiber mulch, all classes and types

§209

of rolled erosion control products, and soil stabilizers. Other items may be provided in the contract documents to provide soil erosion control (e.g., turf establishment, bank and channel protection, etc.).

209-1.02 Sediment Control. Sediment control is any action taken or item used as part of a project or as a separate action to minimize suspended solid material transport by water. The following items of work are provided in this section to address sediment control - haybale/strawbale, strawbale, sediment trap, turbidity curtain, silt fence.

209-2 MATERIALS. Unless otherwise stated elsewhere in the contract documents, materials shall be as stated herein.

209-2.01 Mulch. Mulch shall be §713-19 Straw, or §713-11 Wood Fiber Mulch. Straw/Wood Fiber Mulch shall be §713-19 Straw or §713-11 Wood Fiber Mulch.

209-2.02 Seed. Seed shall be ryegrasses (annual or perennial) or cereal grasses suitable to the area and as a temporary cover which will not compete with the grasses sown later for permanent cover.

209-2.03 Stone Filling. Stone filling shall meet the requirements of §620-2.02 Stone Filling, light.

209-2.04 Strawbale. Strawbale shall meet the requirements of §713-19 Straw. ~~Strawbale shall be §713-19 Straw.~~

All bales shall be tightly bound; loose or broken bales will not be accepted. Hardwood stakes shall be at least 1 1/4 x 1 1/4 inches and a minimum of 2 feet long.

~~**209-2.05 Geotextile.** Geotextiles shall meet the requirements of §207-2 Materials. UV sensitive geotextiles shall be protected from exposure to sunlight during transport and storage.~~

209-2.05 Geotextile. Geotextiles shall meet the requirements of §737-01 Geotextiles. UV sensitive geotextiles shall be protected from exposure to sunlight during transport and storage.

Comment [cjt24]:
EI 08-006

209-2.06 Prefabricated Check Dams and Drainage Structure Inlet Protection. The materials used for prefabricated check dams and drainage structure inlet protection shall be triangular-shaped in cross section, and have a height of at least 8 to 10 inches in the center with two equal sides and a 18 to 24 inch base. The triangular-shaped inner material shall be urethane foam. The outer cover shall be a woven bedding type geotextile placed around the inner triangle and extend 24 to 36 inches beyond each side of the triangle base.

Other materials may be proposed by the Contractor who shall be solely responsible for their performance.

209-2.07 (Vacant)

~~**209-2.08 Silt Fence.** Silt fence shall be listed in the Approved List. A silt fence assembly shall consist of silt fence geotextile, posts, and fasteners and may include mesh support consistent with the Approved List.~~

~~**A. Posts.** Posts shall meet the following requirements:~~

~~1. Either wood, metal, or synthetic posts may be used. Softwood post shall be 1 1/2 x 3 1/2 inches, hardwood post shall be at least 1 1/4 x 1 1/4 inches, steel post shall be "T" or "L" shaped in cross section, with a minimum weight of 1.3 lb/ft.~~

~~2. Posts shall be a minimum of 4 feet long and shall be spaced consistent with the material selected and as indicated in the Approved List.~~

~~**B. Mesh Support.** For those silt fence assemblies on the Approved List that require a mesh support, the support shall consist of 14 gauge (min) welded wire mesh with a maximum 6 x 6 inch opening or polymeric mesh. All mesh support shall be a minimum of 30 inches in height.~~

~~**C. Fasteners.** Fasteners shall be heavy duty staples, hog rings, tie wires, or any other fastener compatible with the post material.~~

209-2.08 Silt Fence. Silt fence shall meet the requirements of §737-01 G. Silt Fence and be listed in the Approved List. A silt fence assembly shall consist of silt fence geotextile, posts, and fasteners and may include mesh support consistent with the Approved List.

A. Posts. Posts shall meet the following requirements:

1. Either wood, metal, or synthetic posts may be used. Softwood post shall be 1 1/2 x 3 1/2 inches, hardwood post shall be at least 1 1/4 x 1 1/4 inches, steel post shall be "T" or "L" shaped in cross section, with a minimum weight of 1.3 lb/ft.
2. Posts shall be a minimum of 4 feet long and shall be spaced consistent with the material selected and as indicated in the Approved List.

B. Mesh Support. For those silt fence assemblies on the Approved List that require a mesh support, the support shall consist of 14 gauge (min) welded wire mesh with a maximum 6 x 6 inch opening or polymeric mesh. All mesh support shall be a minimum of 30 inches in height.

C. Fasteners. Fasteners shall be heavy duty staples, hog rings, tie wires, or any other fastener compatible with the post material.

Comment [cjt25]:
EI 08-006

209-2.09 Gravel Bag. Bags shall be fabricated from reinforced woven geotextile and shall include ties. No burlap bags shall be allowed. Coarse aggregate shall meet the gradation requirements of size designation #1 or #2 of Table 703-4 and shall be used as the fill material. Each gravel bag shall be individually tied and double bagged. The bag with fill material shall be inversely inserted into the second bag in order to prevent leakage.

209-2.10 Sand Bag. Sand bags shall meet the requirements of §209-2.09 Gravel Bag except that sand meeting the gradation requirements of §703-06 Cushion Sand shall be used as the fill material.

209-2.11 Pipe Slope Drain. Pipe slope drain materials may consist of new or used material in satisfactory condition and suitable for the intended use. The Engineer will reject used materials determined to be unsatisfactory. Pipe couplings shall be appropriate for the pipe and as recommended by the Manufacturer. End sections may be steel, aluminum, or polyethylene.

209-2.12 Rolled Erosion Control Products and Soil Stabilizers. These materials shall meet the requirements of §713-07 Rolled Erosion Control Products and Soil Stabilizers and shall be of the Type and Class specified in the contract documents.

~~**209-2.13 Stabilized Construction Entrance.** Construction entrances shall consist of a geotextile, crushed stone or gravel and, if necessary, a drainage pipe to maintain ditch flow.~~

~~**A. Geotextile.** Geotextile shall meet the requirements of §207-2 Materials, Geotextile Stabilization, Strength Class 1.~~

~~**B. Crushed Stone or Gravel.** Crushed stone or gravel shall be 6 inches of coarse aggregate material meeting the gradation requirements of size designation #3 on Table 703-4.~~

~~**C. Drainage Pipe.** The Contractor shall provide a drainage pipe sized with sufficient capacity to carry ditch flow. The pipe dimension shall be consistent with the modified soil erosion and sediment control plan approved by the Engineer. The drainage pipe may consist of new or used material in satisfactory condition and suitable for the intended use. The Engineer will reject any materials determined to be unsatisfactory.~~

209-2.13 Stabilized Construction Entrance. Construction entrances shall consist of a geotextile, crushed stone or gravel and, if necessary, a drainage pipe to maintain ditch flow.

A. Geotextile. Geotextiles shall meet the requirements of §737-01 E. Geotextile Stabilization, Strength Class 1.

B. Crushed Stone or Gravel. Crushed stone or gravel shall be 6 inches of coarse aggregate material meeting the gradation requirements of size designation #3 on Table 703-4.

C. Drainage Pipe. The Contractor shall provide a drainage pipe sized with sufficient capacity to carry ditch flow. The pipe dimension shall be consistent with the modified soil erosion and sediment control plan approved by the Engineer. The drainage pipe may consist of new or used material in satisfactory condition and suitable for the intended use. The Engineer will reject any materials determined to be unsatisfactory.

Comment [cjt26]:
EI 08-006

209-2.14 Temporary Pipe Inlet/Outlet Protection. The materials used shall be as indicated on the standard sheets.

209-2.15 Temporary Sediment Trap. The materials used shall be as indicated on the standard sheets.

A. Impervious Embankment In Place.

1. The impervious embankment material shall have the following gradation:

SIEVE SIZE	PERCENT PASSING BY WEIGHT
6 in	90 - 100
3/4 in	50 - 100
No. 4	40 - 90
No. 40	30 - 85
No. 200	25 - 75

209-3 CONSTRUCTION DETAILS.

209-3.01 General. In the event of conflict between these specification requirements and pollution control laws, rules, regulations or permit conditions by other federal or state or local government agencies, the more restrictive laws, rules or regulations shall apply.

All work done under this section shall be performed consistent with §107-12 Water Quality Protection and included as part of the construction schedule submitted by the Contractor under §108-01 Start and Progress of Work. The Contractor's schedules and methods shall be consistent with the soil erosion and sediment control plan included in the contract documents or the modified plan approved by the Engineer. The Contractor shall begin earthwork only after receiving written approval from the Engineer for the scheduling of earthwork and work covered under this section.

The Contractor shall designate to the Engineer an erosion and sediment control supervisor with adequate training, experience, and authority to implement and maintain all erosion and sediment control measures.

Perimeter sediment controls shall be installed prior to performing grubbing, excavation, and borrow or fill operations. The Contractor shall limit the area of clearing and grubbing, excavation, borrow and embankment operations in progress, commensurate with their capability and progress in keeping the finish grading, mulching, seeding and other temporary and/or permanent control measures current in accordance with the approved schedule. Under no condition shall earth material exposed by grubbing, excavation, borrow or fill or other work be left without application of temporary or permanent erosion

controls for a period of greater than 7 days. The Engineer may determine that a potential for erosion or sediment transport exists and order the Contractor to install temporary erosion controls earlier. When permanent soil erosion and sediment control measures can not be installed due to seasonal or other limitations, temporary soil erosion and sediment control measures shall be installed. Prior to removing or disturbing any erosion or sediment control measure that may be required to be reestablished due to continual grading operations, the Contractor shall verify the proposed progression of operations and the reestablishment of control measures with the Engineer to ensure the continuity of erosion and sediment control.

Sediment control measures shall not be removed without the Engineer's approval.

209-3.02 Inspection and Maintenance. Soil erosion and sediment control measures shall be inspected and maintained by the Contractor during the life of the project, including winter shutdown, etc. Such inspection and maintenance shall continue until after the permanent stabilization measures are in place and the temporary control measures are ordered to be removed by the Engineer. The remaining disturbed area shall be permanently stabilized as indicated in the contract documents.

All temporary controls shall be inspected by the Contractor every seven calendar days, after each rainfall of 1/2 inch or more within a 12 hour period, or daily during prolonged rainfall to determine if the measure is functioning as intended. All inspections shall be completed within one calendar day.

Within 3 calendar days from completion of the inspection, the Contractor shall:

- Repair or rebuild the control measure to function as originally intended.
- Remove sediment deposition which reaches one half the height of the control measure. All sediment deposits shall be considered unsuitable material and disposed of in accordance with [Section 203, Disposal of Surplus Excavated Material](#) ~~§203-3.08, Disposal of Surplus Excavated Materials~~. Material shall be disposed of away from wetlands, water courses or other bodies of water.

Comment [c27]:
EI09024

Torn or punctured silt fence fabric may be repaired by the placement of a patch, on the upstream side, consisting of an additional layer of fabric over the damaged area, or replacement of the damaged section.

Where erosion control materials have been used on final grade that have been permanently seeded, the Contractor shall care for the areas until acceptance of the Contract or acceptance of the turf, whichever is later. Where necessary, such care may include, but is not limited to providing warning signs or barricades for protection against traffic. Any surfaces that have settled, become gullied, or otherwise damaged due to the Contractor's operations shall be repaired at no additional expense to the state to re-establish the grade and soil conditions that existed prior to placing erosion control materials.

209-3.03 Temporary Mulch. The Contractor shall have the capability to mulch any disturbed areas on any given day (e.g., those areas where earthwork operations are ongoing, etc.). The Contractor shall apply mulch on disturbed areas consistent with the approved project schedule.

Mulch shall be spread uniformly in a continuous blanket at an approximate rate of 2 t/acre. Mulch may be spread by hand, mechanical spreaders, or blowers.

209-3.04 Temporary Seed and Mulch. The Contractor shall apply seed and mulch on disturbed areas consistent with the approved project schedule.

Prior to the application of seed, all areas where compaction has occurred shall be scarified. The seed bed shall be loose and friable for positive seed retention.

Ryegrasses shall be spread at a rate of 30 lb/acre to uniformly cover the ground. Cereal grasses shall be spread at a rate of 100 lb/acre to uniformly cover the ground. Seeds shall be evenly distributed by any method of sowing that does not injure the seeds in the process of spreading.

Mulch shall be spread immediately following application of seed. Mulch shall be spread uniformly in a continuous blanket at an approximate rate of 2 t/acre. Mulch may be spread by hand, mechanical spreaders, or blowers. Mulch and seed shall not be placed simultaneously, except in the case of hydroseeding.

209-3.05 Temporary Check Dam. Check dams shall be constructed where shown in the contract documents and in accordance with the standard sheets. A bedding type geotextile or stone scour protection shall be placed as indicated in the contract documents.

A. Prefabricated Check Dam. The length of each prefabricated check dam shall be as indicated in the contract documents. The dam shall be attached to the ground with wire staples. The staples shall be No. 11 gauge wire and be 6 to 8 inches long. Staples shall be placed as indicated in the contract documents.

The geotextile filter material shall be attached to the triangular frame by using wire ties or staples. The ties shall be placed evenly 12 inches on center.

209-3.06 Temporary Strawbale. Bales shall be placed with the cut ends vertical as shown in the contract documents. Each bale shall be embedded into the soil a minimum of 4 inches, and be securely anchored. Hardwood stakes shall be installed a minimum of 1 foot into the ground below the bale. The first stake in each bale shall be driven at an angle toward the previously laid bale to force the bales together.

209-3.07 Temporary Silt Fence. Unless otherwise detailed in the contract documents, silt fence shall be installed as follows:

1. Posts shall be driven into the ground.
2. Geotextile and any mesh support (if applicable) shall be placed on the upstream side of the posts.
3. The geotextile shall be fastened to each post in no less than 4 locations with approved fasteners.
4. The mesh support shall be fastened to each post at the top, bottom, and two additional evenly spaced locations, or by a continuous corded attachment along the top of the assembly.
5. Any geotextile or mesh splices necessary for fence erection shall be continuous between two post sections.
6. Geotextile at the bottom of the fence shall be buried in a trench to a depth of 6 inches. The trench shall be back filled with the excavated soil and the soil compacted by tamping.

209-3.08 Temporary Sediment Trap. Sediment traps shall be constructed where shown in the contract documents and in accordance with the standard sheets.

A. Sand Bag Berm and Earth Berm.

1. The area under which the sand bag berm or earth berm will be constructed shall be cleared, grubbed and stripped of any vegetation and root mat. The pool area shall be cleared. All work shall be performed consistent with the requirements of §201-3 Construction Details.
2. The earth berm embankment shall be constructed consistent with the requirements of §203-Excavation & Embankment, except as herein modified. Immediately prior to placement of the impervious embankment material, the entire earth surface on or against which fill is to be placed, shall be thoroughly scarified to a depth of 6 inches and compacted to not less than 95 percent of Standard Proctor Maximum Density. Impervious embankment material shall then be deposited in horizontal layers not exceeding 8 inches in thickness prior to compaction. Each layer shall be compacted to not less than 95 percent of Standard Proctor Maximum Density. The moisture content of all impervious embankment material shall not be greater than 2 percent above Optimum Moisture Content as determined by A.A.S.H.T.O Designation: T-99, Method C at the time of compaction.

Sand bag and ditch dam sediment traps shall be constructed as shown on the Standard Sheets.

3. All fill slopes shall be 2:1 or flatter. Cut slopes shall be 1:1 or flatter.
4. Temporary mulch and rolled erosion control product shall be applied to earth berm side slopes.
5. Excavate and install light stone at emergency spillway.

B. Riser and Outlet Pipe. The section of the riser above the embedment shall be perforated with 1 inch diameter holes or slits spaced 6 inches vertically and horizontally and placed in the concave portion of the riser pipe. No holes shall be made within 6 inches of the outlet pipe.

The riser shall be wrapped with 1/4 to 1/2 inch hardware cloth wire then wrapped with Class A Geotextile Drainage Fabric. The geotextile shall extend 6 inches above the highest hole and 6 inches

below the lowest hole. Where ends of geotextile come together, they shall be overlapped, folded and stapled to prevent bypass.

Straps or connecting bands shall be used to hold the geotextile and wire fabric in place. They shall be placed at the top and bottom of the cloth.

The riser shall be anchored with a steel plate base to prevent floatation. A 1/4 inch minimum thickness steel plate shall be attached and sealed to the riser by a continuous weld around the bottom to form a watertight connection. 2 feet of suitable material shall be placed on the plate and tamped.

Fill material around the outlet pipe shall be hand compacted in four 4 inch layers. A minimum of 2 feet of hand compacted backfill shall be placed over the outlet pipe before crossing it with construction equipment.

All outlet pipe connections shall be watertight.

C. Sediment Removal. Sediment shall be removed and trap restored to its original dimensions when the sediment has accumulated to ½ the design depth of the trap.

209-3.09 (Vacant)

209-3.10 Temporary Pipe Slope Drain. Pipe slope drain shall be placed where shown in the contract documents and constructed in accordance with the standard sheets.

209-3.11 Drainage Structure Inlet Protection. Drainage structure inlet protection shall be placed where shown in the contract documents and constructed in accordance with the standard sheets.

209-3.12 Rolled Erosion Control Products and Soil Stabilizers. The time and method of placement shall be as specified in the contract documents and/or according to Manufacturer's recommendations.

For areas at final grade, all loose stones, clods, sticks, or other undesirable material shall be removed in accordance with the manufacturer's recommendations or as specified elsewhere in the contract documents. In addition, those areas at final grade shall be scarified to a minimum depth of 1 inch immediately prior to installation, unless topsoil is being placed and the erosion control material will be installed within 2 work days of topsoil placement.

A. Rolled Erosion Control Products.

1. Class II, Type A, Jute Mesh. Jute mesh shall be placed without stretching on the freshly prepared surface so that it lays loosely on the soil and in contact with the soil at all points; and then it shall be rolled or tamped firmly into the soil surface. The upper end of each roll shall be turned down and buried to a depth of 6 inches with the soil firmly tamped against it. Unless otherwise specified in the contract documents, check slots shall be constructed at 50 foot intervals down the slope. The construction procedure shall consist of placing a fold of material 6 inches vertically into the ground and tamping soil firmly against it. Jute mesh shall be placed so that all edges shall have a minimum overlap of 6 inches. The ends of rolls shall be placed with the upgrade section on top. Jute mesh shall be held tightly to the soil by anchors driven firmly into the ground. Anchors shall be spaced not more than 3 feet apart on the sides and along the centerline of all drainage ways. Jute mesh ends and check slots shall have anchors spaced at 1 foot intervals.

2. Class I and Other Class II, Rolled Erosion Control Products. These products shall be placed and firmly anchored as stated in the manufacturer's instructions.

3. Class III Turf Reinforcement Mat (TRM). Class III-Type A and B TRMs shall be completely filled with topsoil immediately after installation. Class III-Type C and D TRMs, which contain a composite, do not need to be filled with topsoil unless recommended by the manufacturer.

§209

To prevent initial soil loss Class III TRM mats Type A and B shall be covered with one of the following materials during installation. (These materials will be paid for separately.)

For Slope application:

1. Class IV-Soil Stabilizer
2. An approved RECP (Class I or II)
3. Mulch

For Channels:

1. An approved RECP (Class I or II)

B. Class IV Soil Stabilizers. These materials shall be applied as recommended by the Manufacturer. Type A & B are intended to be applied with hydroseeding equipment. Type B may also be placed through dry spreading. When dry spreading method is used, the Contractor shall apply the material uniformly. Where applied, Type A shall be minimum of 1/4 inch thick. When Type A is used in conjunction with turf establishment, seeds must be sown separately and prior to the application of the soil stabilizer.

209-3.13 Construction Entrances. Construction entrances shall be placed where shown in the contract documents and constructed in accordance with the standard sheets.

The Contractor shall grade, including excavating or placing fill, to prepare the original ground surface for the placement of a stabilized pad of 6 inches of coarse aggregate material, underlain by a geotextile. If necessary, a drainage pipe shall be installed to maintain the capacity of the ditch. The pipe dimension shall be consistent with the modified soil erosion and sediment control plan approved by the Engineer. All areas cut or filled and not stabilized by the construction entrance material shall be covered with an erosion control treatment (temporary mulch, temporary seed and mulch, etc.) and shall be included in this pay item.

When washing is performed, the washing area within the construction entrance shall be located in an area which will drain into an approved sediment control measure(s).

The construction entrance shall be maintained in a condition which will prevent tracking or flowing of sediment onto the right-of-way. All sediment spilled, dropped, washed or tracked onto the right-of-way shall be removed immediately. In the event the entrance is no longer performing properly (i.e. the entrance aggregate becomes clogged with sediment), the Contractor shall top-dress the entrance with additional coarse aggregate material.

209-3.14 Temporary Pipe Inlet/Outlet Protection, Silt Fence. Temporary pipe inlet/outlet protection, silt fence, shall be placed where shown in the contract documents and constructed in accordance with the standard sheets.

209-4 METHOD OF MEASUREMENT. Measurement will be made for installation or reinstallation of temporary soil erosion and sediment controls shown in the contract documents.

209-4.01 Temporary Mulch. Measurement will only be made for work directed or approved by the Engineer. This work will be measured as the number of ~~square yards~~~~square feet~~ of mulch to the nearest ~~square yard~~~~square foot~~.

209-4.02 Temporary Seed and Mulch. Measurement will only be made for work directed or approved by the Engineer. This work will be measured as the number of ~~square yard~~~~square feet~~ to the nearest ~~square yard~~~~square foot~~.

209-4.03 Temporary Check Dams. Stone, gravel, and sand bag check dams will be measured by the number of check dams. All other check dams will be measured by the number of feet to the nearest foot.

209-4.04 Temporary Strawbale. Bales will be measured by the number of feet to the nearest foot.

209-4.05 Temporary Silt Fence. Silt fence will be measured by the number of feet of silt fence to the nearest foot. No measurement will be made for seams or overlaps.

209-4.06 Temporary Sediment Trap. Sediment traps will be measured by the number of traps.

209-4.07 (Vacant)

209-4.08 Temporary Pipe Slope Drain. Pipe slope drain will be measured by the number of drains.

209-4.09 Drainage Structure Inlet Protection. Silt fence geotextile, and prefabricated drainage structure inlet protection measures will be measured by the number of feet to the nearest foot. Gravel bag measures will be measured by the number of cubic feet to the nearest cubic foot.

209-4.10 Rolled Erosion Control Products and Soil Stabilizers. Rolled erosion control products and soil stabilizers will be measured as the number of ~~square feet~~ **square yards** to the nearest ~~square foot~~ **square yard**.

209-4.11 Construction Entrances. Construction entrances shown in the contract documents will be measured by the number of ~~square feet~~ **square yards** to the nearest ~~square foot~~ **square yard**. Measurement will not be made for construction entrances associated with the contractor's operations (e.g., staging areas, storage yards, borrow sites, etc.).

209-4.12 Temporary Pipe Inlet/Outlet Protection, Silt Fence. Temporary pipe inlet/outlet protection, silt fence, will be measured by the number of feet to the nearest foot.

209-5 BASIS OF PAYMENT.

209-5.01 General. The unit price bid for all work items shall include the cost of furnishing all labor, equipment, and materials necessary to satisfactorily complete the work as shown in the contract documents, including the cost of excavation associated with the removal of accumulated sediment and the installation of erosion and sediment control measures covered by this Section.

Progress payments will be made for check dams, turbidity curtain, silt fence, pipe slope drain, and sediment traps. Fifty percent of the price bid will be paid after installation. The remaining percentage will be paid when the temporary control measure is removed and the remaining area is permanently stabilized.

Payment will not be made for work which is attributed to the Contractor's negligence, carelessness or failure to install temporary or permanent controls in accordance with the contract documents.

209-5.02 Mulch. Mulching will only be paid for when directed or approved by the Engineer.

209-5.03 Seed and Mulch. Seed and mulch will only be paid for when directed or approved by the Engineer. In addition to the provisions of §209-5.01, the unit price bid for this item shall include water.

209-5.04 Sediment Trap - Temporary. In addition to the provisions of §209-5.01, the unit price bid for this item shall include bags, excavation, impervious embankment material, outlet pipe, riser assembly, light stone filling, and geotextile. Temporary mulch and rolled erosion control product will be paid for under their respective items.

209-5.05 Pipe Slope Drain - Temporary. In addition to the provisions of §209-5.01, the unit price bid for this item shall include bales, pipe, pipe end sections, stone, and geotextile.

209-5.06 Construction Entrances. In addition to the provisions of §209-5.01, the unit price bid for this item shall include any erosion control treatments (temporary mulch, temporary seed and mulch, etc.) required to stabilize an erodible surface produced by the installation of the construction entrance, periodic top-dressing with additional coarse aggregate material, and washing station provisions.

§209

Additional sediment control measures (silt fence, strawbale, sediment trap, etc.) required to control a washing area will be paid for under their respective item(s).

Payment will be made under:

Item No.	Item	Pay Unit
209.1001	Mulch - Temporary	Square Yard
209.1002	Straw/Wood Fiber Mulch - Temporary	Square Yard
209.1003	Seed and Mulch - Temporary	Square Yard
209.1004	Seed and Straw/Wood Fiber Mulch - Temporary	Square Yard
209.110101	Check Dam (Ditch Bottom Width 0.0 to 3.0 feet), Stone - Temporary	Each
209.110102	Check Dam (Ditch Bottom Width >3.0 to 6.0 feet), Stone - Temporary	Each
209.110103	Check Dam (Ditch Bottom Width >6.0 to 10.0 feet), Stone - Temporary	Each
209.110104	Check Dam (Ditch Bottom Width >10.0 feet), Stone - Temporary	Each

NOTE: nn denotes serialized pay item, see §101-02 Definition of Terms under "Specifications". These items will be paid for by the each within established size groups.

SECTION 210 - REMOVAL AND DISPOSAL OF ASBESTOS-CONTAINING MATERIAL (BUILDINGS, BRIDGES AND HIGHWAYS)

210-1 DESCRIPTION. This work shall consist of removal and disposal of asbestos- containing material (ACM) from locations designated in the Contract Documents and/or where directed by the Engineer. Additional contract-specific requirements may be found on the plans or in the proposal in a Special Note entitled "Asbestos Remediation Supplemental Requirements."

210-2 MATERIALS. All materials used in the performance of the work shall comply with all applicable regulatory standards. Respirators and filters shall comply with NIOSH and MSHA standards. HEPA filtration systems shall comply with ANSI Z9.2-79.

210-3 CONSTRUCTION DETAILS. Prior to beginning any work under this item, the Contractor shall supply the Engineer with proof that the firm performing the work has a valid asbestos handling license; that its insurance coverage whether provided by the Contractor or the Asbestos Subcontractor, is consistent with §107-06 Insurance and includes an asbestos-specific, occurrence-type policy with no deductible or sunset clause; that its project supervisor is a NYSDOL certified asbestos project supervisor; that all employees engaged in the work are properly certified and have current physical examinations and respirator fit tests; and that the proper notification of work beginning on the asbestos project has been given to the New York State Department of Labor (NYSDOL) and the United States Environmental Protection Agency (USEPA). The Contractor shall schedule a coordination meeting between the Asbestos Subcontractor and the Department contracted Asbestos Project Monitor to be held at least two (2) weeks before the start of any asbestos abatement work. The meeting shall be held at the Engineer's Field Office unless otherwise approved by the Engineer.

The Contractor shall remove and dispose of ACMs in accordance with 12 NYCRR 56 or, if indicated, an approved variance thereof promulgated by the New York State Department of Labor (NYSDOL); the National Emission Standards for Hazardous Air Pollutants (NESHAP), promulgated by the United States Environmental Protection Agency (USEPA); and the Occupational Safety and Health Administration (OSHA). In the event of a conflict between these specification requirements and laws, rules and regulations of Federal, State, or local agencies, the more restrictive shall apply.

ACM shall be disposed of in accordance with 40 CFR Part 61 and all other requirements and laws, rules, and regulations of applicable Federal, State, or local agencies. Disposal sites which accept ACM for disposal shall be permitted by the New York State Department of Environmental Conservation (NYSDEC). If disposed of out-of-state, the rules, regulations, and laws of that state shall apply.

After the work is completed, the Contractor shall provide the Engineer with two copies of Daily Logs, Visitor Logs, Final Visual Inspection Logs and OSHA Air Monitoring records. The Contractor shall also provide the Engineer with a written certification that the material was disposed of in an approved waste disposal site. For friable waste this certification shall be in the form of a Waste Shipment Record. For non-friable waste this certification shall include the name and address of the waste disposal site or sites used.

210-4 METHOD OF MEASUREMENT. The quantity of ACM to be measured for payment will be determined by one of the following methods:

210-4.01 Square Foot. The quantity to be measured will be the area, measured to the nearest 0.1 square foot, of asbestos-containing material removed and disposed of.

210-4.02 Foot. The quantity to be measured will be the length, measured to the nearest 0.1 foot, of asbestos-containing material removed and disposed of.

210-4.03 Lump Sum. The quantity will be measured for payment on a lump sum basis.

§210

210-4.04 Fixed Price Lump Sum. The lump sum shown in the itemized proposal for this item will be considered the price bid even though payment will be made for the work performed. Should the amount shown be altered, the altered figures will be disregarded and the original price will be used to determine the total contract bid amount. Payments will be based on one or both of the following:

A. Agreed Price. An Agreed Price will be based on a cost analysis submitted by the Contractor and agreed to by the State prior to performing the work. The submittal shall include a detailed estimate from the licensed asbestos removal contractor for the cost of the removal and disposal.

B. Force Account. A separate Force Account will be maintained for the total asbestos removal work performed on each building, structure, or highway included in the work.

210-5 BASIS OF PAYMENT. Payment for the work under this specification shall include all labor, materials, equipment, and asbestos-related fees and insurances necessary to satisfactorily complete the work.

Payment shall not include maintenance and protection of traffic devices outside the regulated asbestos work area.

210-5.01 Square Foot, Foot, or Lump Sum Bid Items. Payment for 75% of the completed quantity will be made upon the Project Monitor's written concurrence with the Contractor's certification as to the following: that the building, structure, and/or highway is visually free of asbestos; that the removal of the asbestos containing material was performed as required; that the final clearance air monitoring results meet the acceptable level specified in 12 NYCRR 56; and, that the building(s), bridge(s), and/or highway(s) are certified by the asbestos Contractor to be available for normal demolition.

The remainder of the payment for completed work will be made upon receipt by the Engineer of a certified statement from the disposal facility, signed by an official thereof, that the asbestos-containing material has been accepted and disposed of in accordance with all applicable laws, codes, rules, and regulations.

210-5.02 Fixed Price Lump Sum. The fixed price lump sum published in the proposal is an amount estimated by the State to be adequate to complete the work. Payments under this work will be made by Force Account or by Agreed Price, or by a combination thereof.

Payment for 75% of the Agreed Price or Force Account charges will be made upon the Project Monitor's written concurrence with the Contractor's certification that the building, structure, and/or highway is visually free of asbestos; the removal of the asbestos containing material was performed as required; that the final clearance air monitoring results meet the acceptable level specified in 12 NYCRR 56; and, that the building(s), bridge(s), and/or highway(s) are certified by the asbestos Contractor to be available for subsequent demolition and/or construction.

The remainder of the payment for completed work will be made upon receipt by the Engineer of a written certification that the ACM was disposed of in an approved waste disposal site.

Asbestos-specific insurance premiums will be reimbursed as the actual and identifiable cost of the portion of the premium attributable to the work performed under the Fixed Price Lump Sum Item. No overhead or profit will be allowed on asbestos specific insurance premiums.

Payment will be made under:

Item No.	Item	Pay Unit

SECTION 211 – INTERNALLY STABILIZED CUT STRUCTURES

211-1 DESCRIPTION. This work shall consist of designing, furnishing, installing, and testing an internally stabilized cut structure at the location(s) and to the elevation(s) shown in the contract documents.

211-1.01 Soil Nail Wall System. A Soil Nail Wall System is comprised of cement-grouted steel nail tendons, a drainage network and a facing system to internally stabilize a cut and/or underpin a structure.

A. Soil Nail Wall System (SNWS) Definitions.

1. **Soil Nail.** A passive reinforcing element which develops its reinforcing action through nail tendon/ground interaction. A soil nail includes the SNWS nail tendon, the SNWS nail head, grout, coatings, sheathing, couplers and encapsulation if used.
2. **SNWS Nail Tendon.** A steel bar installed into a slope to reinforce and strengthen the existing ground.
3. **SNWS Nail Head.** The nail head consists of the bearing plate and headed-stud. The bearing plate distributes forces at the nail end to the wall and ground behind the facing. The headed-stud provides anchorage of the nail head into the permanent facing.
4. **Grout.** Grout is used primarily as a transfer mechanism for stresses from the wall to the ground. The grout also provides a level of corrosion protection.
5. **Centralizers.** Centralizers are devices, typically PVC, installed at various locations along the length of the nail tendon to center the bar in the excavated hole to ensure a minimum thickness of grout cover.
6. **Corrosion Protection Elements.** These are physical and/or chemical coatings or systems used to inhibit corrosion. Nail tendons may have a fusion-bonded epoxy coating applied. For maximum protection, encapsulation consists of surrounding the nail tendon with a HDPE or PVC corrugated protective sheathing and filling the internal annulus with grout. Subsequent to installing the encapsulated nail into the excavated hole, the outer annulus is also filled with grout.
7. **Temporary Wall Facing.** This consists of reinforced shotcrete installed to provide a connection between nail tendons, support the exposed soil within the nail tendon grid and provide protection against erosion and sloughing of the soil at the excavation face.
8. **Wall Drainage Network.** A system of drainage devices installed to prevent water pressure from developing behind the wall face. The system typically consists of a series of vertical geocomposite drainage strips and weep holes. Additional devices include footing drains and horizontal drains.
9. **GUTS.** The Guaranteed Ultimate Tensile Strength of the tendon.

211-1.02 Grouted Tieback System. A Grouted Tieback System is comprised of cement-grouted steel tendons installed to internally stabilize and supplement the resisting force of an external support system retaining a cut and/or underpinning a structure.

A. Grouted Tieback System (GTS) Definitions.

1. **Grouted Tieback.** An active reinforcing element which transfers tensile loads from a structure to soil or rock. A grouted tieback includes all prestressing steel (tendon), the anchorage, grout, coatings, sheathing, couplers and encapsulation if used.
2. **GTS Tendon.** The steel used to transfer load from the anchorage to soil or rock.
3. **Anchorage.** That portion of the tieback, including bearing plate, nuts and wedges that is used to transfer load from the structure to a tendon.
4. **Bond Length (Fixed Length).** That portion of the tieback which is bonded to the soil or rock and transfers the tensile force from the tendon to the soil or rock.
5. **Tendon Bond Length.** The length of the tendon which is bonded to the grout. This is usually, but not necessarily, the same as the Bond Length.
6. **Stressing Length (Free Length).** That portion of the tendon which is not bonded to grout.
7. **Sheath.** That portion of the tieback which encases the tendon in the stressing length only.

8. **Encapsulation.** That portion of the tieback which encases or encapsulates the entire length of the tieback, including the sheath, to provide an additional barrier to corrosion.
9. **Pressure Grouting.** Grouting with a pressure greater than 50 psi.
10. **Alignment Load.** That load necessary to maintain position of the stressing and testing equipment.
11. **Total Movement.** The total elongation of the tieback under load, measured at the anchor head.
12. **Residual Movement.** The permanent set of the tieback resulting from stressing and releasing the tieback.
13. **Trumpet.** A steel pipe or tube, integrally attached to the bearing plate that surrounds the tendon in the vicinity of the structure.
14. **Creep Rate.** The magnitude of total movement measured during a load hold per log cycle of time.
15. **Centralizer.** A device used to center the bond length of the tieback in the hole to assure minimum grout cover over the tieback.
16. **Spacer.** A device used in strand tendons to separate each strand in the bond length to permit the grout to bond with each strand.
17. **GUTS.** The Guaranteed Ultimate Tensile Strength of the tendon.

211-2 MATERIALS

211-2.01. Soil Nail Wall System (SNWS). Ensure that the proper materials are supplied for the chosen system design. Not all materials listed are required for each SNWS. Provide materials meeting the following requirements:

A. SNWS Soil Nail Tendon Assembly. Provide components for assembling a soil nail tendon conforming to the requirements of §731-01 *Soil Nail Tendon Assembly*.

B. SNWS Nail Grout. Provide grout manufacture materials conforming to Table 211-1 *SNWS Nail Grout Requirements*:

TABLE 211-1 SNWS NAIL GROUT REQUIREMENTS	
Material	Subsection
Portland Cement Type 2	§701-01
Flyash	§711-10
Water	§712-01

C. SNWS Admixtures. Admixtures which control bleed, improve flowability, reduce water content, and retard set may be used in the grout subject to review and acceptance by the Engineer. Acceptance will be based on the manufacturer’s name appearing on the Department’s Approved List. Accelerators and expansive admixtures are not permitted. Admixtures shall be compatible with the grout and mixed in accordance with the manufacturer’s recommendations.

D. SNWS Shotcrete. Provide shotcrete conforming to the requirements of Section 583 *Shotcrete*.

E. SNWS Welded Wire Fabric. Provide welded wire fabric conforming to the requirements of §709-02 *Wire Fabric for Concrete Reinforcement*. Acceptance will be based on the manufacturer’s name appearing on the Department’s Approved List.

F. SNWS Reinforcing Bars for Shotcrete Facing. Provide No. 5 reinforcing bars for shotcrete facing conforming to the requirements of §709-01 *Bar Reinforcement, Grade 60*. Acceptance will be based on the manufacturer’s name appearing on the Department’s Approved List.

G. SNWS Bearing Plates / Nuts. Provide bearing plates conforming to the requirements of §715-01 *Structural Steel*. Provide hexagonal nuts conforming to AASHTO M 291, fitted with beveled washers or spherical seat to provide uniform bearing.

H. SNWS Geotextile Drainage. Provide geotextile drainage conforming to the requirements of §737-01 *Geotextile, C. Geotextile Drainage*.

I. SNWS Geocomposite Drainage Strip. Provide geocomposite drainage strips conforming to the requirements of §737-04 *Prefabricated Composite Structural Drains*.

J. SNWS Drainage Aggregate. Provide drainage aggregate conforming to the requirements of the Underdrain Filter, Type I portions of Section 605 *Underdrains*.

K. SNWS PVC Connector and Drain Pipes. Provide schedule 80 PVC connector and drain pipes conforming to the requirements of §706-15 *PVC Plastic Drain Pipe System*.

211-2.02. Grouted Tieback System (GTS). Ensure that the proper materials are supplied for the chosen system design. Not all materials listed are required for each GTS. Provide materials meeting the following requirements:

A. GTS Tieback Assembly. Provide components for assembling a grouted tieback conforming to the requirements of §731-02 *Grouted Tieback Assembly*.

B. GTS Anchorage. Provide anchorage capable of developing 95% of the GUTS and set so that only axial loads are applied. Provide bar tiebacks with spherical washers and spherical nuts at the anchorage.

C. GTS Grout. Provide grout manufacture materials conforming to the requirements of §211-2.01 B. *SNWS Nail Grout*. Epoxy resin will not be allowed as a substitute for cement grout.

D. GTS Admixtures. Provide admixtures, if used, conforming to the requirements of §211-2.01 C. *SNWS Admixtures*.

211-3 CONSTRUCTION DETAILS

211-3.01. Soil Nail Wall System (SNWS).

A. SNWS Submittal. Submit a design and design experience to the Engineer a minimum of 30 calendar days prior to start of work. Begin work only after receiving the Departments approval.

1. Experience. Submit as proof to the Deputy Chief Engineer Technical Services (DCETS):

- a.** Three projects for which the Contractor or subcontractor performing the work has successfully installed soil nails within the past five years,
- b.** The foreman and drill rig operators for this work have at least three years of experience, on at least three projects, in the installation of soil nails,
- c.** Written documentation listing at least five permanent structural shotcrete walls successfully completed within the past five years, and
- d.** Written documentation of the finishers and nozzle men's qualifications. Minimum qualifications include experience on at least three projects in the past three years in similar shotcrete application work. In addition, the nozzle men must demonstrate the ability to satisfactorily place the shotcrete. This will be based on either previous ACI certification or satisfactory completion of preconstruction test panels.

2. Working Drawings. Submit the design and methods of construction to the DCETS for approval. The design shall be accomplished by a Professional Engineer.

Determine the soil nail length and grid spacing necessary to develop adequate load capacity to satisfy nail testing acceptance criteria for the design parameters shown in the

contract documents. Provide the required partial safety factors, allowable strength factors, and minimum global stability soil factors of safety in accordance with FHWA's "Geotechnical Engineering Circular No. 7 Soil Nail Walls", Report No. FHWA-IF-03-017.

Provide working drawings conforming to the size and type requirements in accordance with §718-01 *Prestressed Concrete Units (Structural)* A. Size and Type. Include the following:

- a.** The proposed start date and proposed detailed wall construction sequence including:
 - i.** Plan describing how surface water will be diverted, controlled and disposed of.
 - ii.** Proposed methods and equipment for excavating the soil and/or rock to the staged excavation lifts indicated within the submitted design, including the proposed grade elevations for each excavation lift, shown on a wall elevation view.
 - iii.** Measures to ensure wall and slope stability during various stages of wall construction and excavation where discontinuous rows of nails will be installed (if applicable), information on space requirements for installation equipment, temporary shoring plans (if applicable), information on provisions for working in the proximity of underground facilities or utilities (if applicable).
 - iv.** Details of soil nail layout including lengths, grid spacing, encapsulation or epoxy coating details (if applicable) and design load (P) to resist design earth pressures.
 - v.** Proposed nail drilling methods and equipment including drillhole diameter and inclination proposed to achieve the specified pullout resistance values and any variation of these along the wall alignment.
 - b.** Nail grout mix design/shotcrete mix design including:
 - i.** Proportions of mix by weight and water-cement ratio.
 - ii.** Proposed admixtures, manufacturer, dosage, technical literature.
 - c.** Nail grout mix:
 - i.** Compressive strength test results supplied by a qualified independent testing laboratory verifying a minimum 3-day compressive strength of 1500 psi and a minimum 28-day compressive strength of 3000 psi.
 - d.** Shotcrete mix:
 - i.** Compressive strength test results supplied by a qualified independent testing laboratory verifying a minimum 3-day compressive strength of 2000 psi and a minimum 28-day compressive strength of 4000 psi.
 - ii.** Previous strength test results for the proposed mix designs completed within 1 year of the start of construction may be substituted for initial verification of the required compressive strengths at start of production work
 - e.** Proposed nail grout placement procedures and equipment.
 - f.** Proposed nail testing methods and equipment setup including:
 - i.** Details of jacking frame and appurtenant bracing.
 - ii.** Details showing methods of isolating test nails during shotcrete application (i.e., methods to prevent bonding of the soil nail bar and the shotcrete facing during testing).
 - iii.** Details showing methods of providing the temporary unbonded length and of grouting the temporary unbonded length of test nails after completion of testing.
 - iv.** Equipment list.
 - g.** Proposed methods of shotcrete placement, of controlling and maintaining facing alignment, and location and shotcrete thickness.
- 3. Calibrations.** Submit the following documentation to the Engineer at least 15 calendar days prior to the start of work:
- a.** Identification number and certified calibration records for each test jack and pressure gage and load cell to be used. Jack and pressure gauge shall be calibrated as a unit. Calibration records shall include the date tested, device identification number, and calibration test results and shall be certified for accuracy within 2% of the applied certification loads by a qualified independent testing laboratory within 90 days prior to submittal.

B. SNWS Preproduction. Prior to the start of the soil nailed wall installation, install a nail in accordance with the contract documents for preproduction verification testing at the location specified. Test the nail after installation as specified in §211-3.01 E *SNWS Testing*.

Provide positive control and discharge of all surface water that will affect the installation of the soil nail wall throughout the construction of the wall. Include methods and schedules to be consistent with the soil erosion and sediment control plan in accordance with §209-3.01 *General*. Maintain all ditches, pipes, or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost. Upon substantial completion of the wall, remove surface water control pipes or conduits from the site.

C. SNWS Nail Installation. Excavation shall be conducted in accordance with the applicable requirements of Section 206, Trench, Culvert and Structure Excavation, and the details specified in the contract documents. Excavate using procedures that prevent over-excavation, ground loss, swelling, air slaking or loosening, loss of support for completed portions of the wall, loss of soil moisture at the face, or ground freezing.

Drill holes for the soil nail installation using core drilling, rotary drilling, or auger drilling. Percussion drilling is prohibited unless approval for its use is granted by the DCETS. Install casing as required to maintain a clean and open hole. Utilize a drill bit with a diameter not smaller than the specified hole diameter minus $\frac{1}{8}$ in. Extend the hole a minimum of 2 ft. beyond the nail length. Drill the holes to the inclination specified on the approved Working Drawings within a 3° tolerance.

Provide centralizers at a maximum of 10 ft. center-to-center spacing throughout the length of the nail to position the bar within 1 in. of the center of the hole and to provide a minimum 1 in. grout cover over bare or epoxy-coated bars or $\frac{1}{2}$ in. grout cover over the encapsulation of an encapsulated nail. Size the centralizers to allow insertion of a tremie pipe to the bottom of the drillhole and to allow grout to freely flow up the drillhole. Provide a centralizer within 2 ft. of the top and bottom of the nail. Sag of the nail shall be taken into account when selecting centralizer diameter and spacing.

Insert the nail in the casing or hole after the hole is drilled to the final depth. Locate the nail within a 6 in. tolerance, in any direction. Location tolerances are applicable to only one nail and not accumulative over large wall areas.

Repair encapsulated nails that are damaged or defective in accordance with the manufacturer's recommendations or remove them from the site.

Provide grouting equipment capable of continuous mixing and producing grout free of lumps. Equip the grout pump with a grout pressure gage capable of measuring at least twice but not more than three times the intended grout pressure. Size the grouting equipment to enable the entire nail to be grouted in one continuous operation. Place grout within 60 minutes after mixing or within the time recommended by the admixture manufacturer, if admixtures are used. Grout not placed in the allowed time limit will be rejected.

Perform the grouting operation after the nail is inserted. Grout each drillhole within 2 hours of completion of drilling. To prevent air voids, fill the hole with grout progressively from the bottom to the top. Completely fill the drillhole in one continuous operation. Cold joints in the grout column are not allowed except at the top of the test-bond length of proof-tested production nails.

Maintain sufficient grout level within the casing to offset the external groundwater/soil pressure and prevent hole caving during casing removal for drillholes advanced by either cased or auger methods. Maintain grout head or grout pressures sufficient to ensure that the drillhole will be completely filled with grout and to prevent unstable soil or groundwater from contaminating or diluting the grout. Control grout pressures to prevent excessive ground heave or fracturing.

Remove the grout and nail if grouting is suspended for more than 30 minutes or does not satisfy the requirements of this specification or the approved Working Drawings, and replace with fresh grout and undamaged nail bar at no additional cost.

Test nails as specified in §211-3.01 E *SNWS Testing*.

D. SNWS Facing Elements. Install and secure all elements of the wall drainage network as shown on the approved Working Drawings. Secure the geocomposite drainage strips tightly to the excavation face to prevent shotcrete from contaminating the ground side of the geotextile. Geocomposite drainage strips shall be continuous. Splices to the geocomposite drainage strips shall

be made with a 1 ft. minimum overlap such that the flow of water is not impeded. Install all elements of the drainage network, exclusive of the wall footing drains, prior to shotcreting. Clean the face of the excavation, and other surfaces to be shotcreted, of loose material, mud, rebound, overspray, or other foreign matter that could prevent or reduce shotcrete bond. Remove material that loosens as shotcrete is applied.

Provide shotcrete equipment capable of delivering the premixed material accurately, uniformly and continuously through the delivery hose. Control shotcrete application thickness, nozzle technique, air pressure, and rate of shotcrete placement to prevent sagging or sloughing of freshly applied shotcrete.

Ensure that the thickness of shotcrete satisfies the minimum requirements as shown on the approved Working Drawings using shooting wires, thickness control pins, or other acceptable devices. Fill all depressions along the excavated face with shotcrete at no additional cost to the State.

Repair shotcrete surface defects as soon as possible after placement. Remove and replace shotcrete which exhibits segregation, honeycombing, lamination, voids, or sand pockets. In-place shotcrete determined not to meet the specified strength requirements will be subject to remediation.

Finish shotcrete with either an undisturbed gun finish as applied from the nozzle or a rough-screeded finish.

Attach a bearing plate and nut to each nail head as shown on the approved Working Drawings. While shotcrete is still plastic and before its initial set, uniformly seat the plate on the shotcrete by hand wrench tightening the nut. Where uniform contact between the plate and the shotcrete cannot be provided, set the plate in a bed of grout. After grout has set for 24 hours, tighten the nut using a hand wrench. Ensure bearing plates with headed studs are in intimate contact with the construction facing and the studs are located within the tolerances specified herein.

Locate the SNWS facing elements from the contract documents location and dimensions within the tolerances provided in Table 211-3 *SNWS Tolerances for Facing Elements*:

TABLE 211-3 SNWS TOLERANCES FOR FACING ELEMENTS	
Facing Element	Tolerance
Horizontal location of wire mesh, rebar and headed studs	± 5/8 in.
Location of headed studs on bearing plate	± 1/4 in.
Spacing between reinforcing bars	± 1 in.
Reinforcing lap	± 1 in.
Shotcrete thickness	± 3/8 in.
Nail head bearing plate	± 10° deviation from parallel to the wall face

Do not excavate to the next lift until nail installation, reinforced shotcrete placement, attachment of bearing plates, and nuts and nail testing has been completed and accepted in the current lift. Ensure nail grout and shotcrete have cured for at least 72 hours or attained at least their specified 3-day compressive strength before excavating the next underlying lift.

E. SNWS Testing. Perform preproduction verification, verification, and proof testing of designated test nails. Perform a preproduction verification test and verification tests on sacrificial test nails as described herein. Perform proof tests on production nails at locations selected by the Engineer and as described herein. Do not perform nail testing until the nail grout and shotcrete facing have cured for at least 72 hours and attained at least their specified 3-day compressive strength. Testing in less than 72 hours will only be allowed if the Contractor submits compressive strength test results, for tests performed by a qualified independent testing laboratory, verifying that the nail grout and shotcrete mixes being used will provide the specified 3-day compressive strength in the lesser time.

Provide a minimum 3 ft. temporary unbonded length in each test nail. Prior to testing, grout only the bonded length of the test nail. Determine the bonded length of the test nail based on the production nail bar grade and sized such that the allowable bar structural load is not exceeded during testing. The bond length shall not be less than 10 ft.

The maximum test load shall not exceed 80% of the GUTS of the nail. Monitor the jack load with a load cell. Provide the Engineer with the calibration curve for the load cell before start of testing.

Submit two copies of all test data to the Engineer.

1. **PreProduction Verification Test.** Perform a preproduction verification test prior to installation of production nails to verify the Contractor’s installation methods and nail pullout resistance. Testing requirements are contained in §211-3.01 E. 2. *Verification Testing.*
2. **Verification Testing.** Perform a minimum of 2 verification tests in each different soil/rock unit and for each different drilling/grouting method proposed to be used, at each wall location. Verification test nails will be sacrificial and not incorporated as production nails. Bare bars can be used for the sacrificial verification test nails.

Incrementally load verification test nails to a maximum test load of 3 times the design load (P) in accordance with Table 211-4 *SNWS Verification Test Load Schedule*. Record soil nail movements at each load increment.

TABLE 211-4 SNWS VERIFICATION TEST LOAD SCHEDULE	
Load ¹	Observation Period
AL	1 minute
0.25 P	10 minutes
0.50 P	10 minutes
0.75 P	10 minutes
1.00 P	10 minutes
1.25 P	10 minutes
1.50 P (Load Hold) ²	60 minutes
1.75 P	10 minutes
2.00 P	10 minutes
2.50 P	10 minutes maximum
3.00 P (or failure)	10 minutes maximum
AL	1 minute (record permanent set)

¹P = Design Load

AL = Alignment Load. The AL necessary to maintain position of the stressing and testing equipment shall not exceed 0.05 P. Set dial gauges to “zero” after the alignment load has been applied initially.

²The load hold portion of the verification test is a test load of 1.50 P, which shall be held constant for 60 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 1 minute, 2, 3, 5, 6, 10, 20, 30, 50, and 60 minutes. Maintain load during the load hold portion of the test within 2% of the intended load by use of the load cell.

All load increments shall be maintained within 5% of the intended load except as noted for the load hold portion of the test.

The Department will review all verification tests to determine if the nail is acceptable. A nail will be accepted if the following three criteria are met:

- a. A total load hold movement of less than 0.08 in. per log cycle of time between the 6 and 60 minute readings is measured during load hold testing and the creep rate is linear or decreasing throughout the load hold period.
- b. The total measured movement at the maximum test load exceeds 80% of the theoretical elastic elongation of the test nail unbonded length.
- c. A pullout failure does not occur at the maximum test load. Pullout failure is defined as the load at which attempts to further increase the test load simply result in continued pullout movement of the test nail. The pullout failure load shall be recorded as part of the test data.

3. **Proof Testing.** Perform proof testing on a minimum of 5% (1 in 20) of the production nails in each row or a minimum of 1 per row. The locations shall be designated by the Engineer. A verification test nail successfully completed during production work shall be considered

equivalent to a proof test nail and shall be accounted for in determining the number of proof tests required in that particular row.

Production proof test nails shorter than 13 ft. in length may be constructed with less than the minimum 10 ft. bond length with the unbonded length limited to 3 ft.

Incrementally load the proof test nail to a maximum test load of 1.5 times the Design Load (P) in accordance with Table 211-5 *SNWS Proof Test Load Schedule*. Record the soil nail movements at each load increment.

TABLE 211-5 SNWS PROOF TEST LOAD SCHEDULE	
Load ¹	Observation Period
AL	Minimum of 1 minute ²
0.25 P	Minimum of 1 minute ²
0.50 P	Minimum of 1 minute ²
0.75 P	Minimum of 1 minute ²
1.00 P	Minimum of 1 minute ²
1.25 P	Minimum of 1 minute ²
1.50 P (Load Hold) ²	10 minutes (or 60 minutes depending on total movement ³)

¹P = Design Load

AL = Alignment Load. The AL necessary to maintain position of the stressing and testing equipment shall not exceed 0.05 P. Set dial gauges to “zero” after the alignment load has been applied.

²Hold each load increment, except for the 1.5 P load, until the deflection stabilizes.

³The load hold portion of the proof test is a maximum test load of 1.50 P, which shall be held constant for 10 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 1 minute, 2, 3, 5, 6, and 10 minutes. If the total movement between 1 minute and 10 minutes exceeds 1 mm, the test load shall be held for an additional 50 minutes. Total movements shall be recorded at 20, 30, 50 and 60 minutes.

All load increments shall be maintained within 5% of the intended load.

The Department will review all proof tests to determine if the nail is acceptable. A nail will be accepted if the following three criteria are met:

- a. A total load hold movement of less than 0.04 in. measured between the 1 and 10 minute readings or a total load hold movement of less than 0.08 in. is measured between the 6 and 60 minute readings and the creep rate is linear or decreasing throughout the load hold period.
- b. The total measured movement at the maximum test load exceeds 80% of the theoretical elastic elongation of the test nail unbonded length.
- c. A pullout failure does not occur at the maximum test load. Pullout failure is defined as the load at which attempts to further increase the test load simply result in continued pullout movement of the test nail. The pullout failure load shall be recorded as part of the test data.

Successful proof-tested nails meeting the above test acceptance criteria may be incorporated as production nails, provided that:

- 1. The unbonded length of the test nail drillhole has not collapsed during testing.
- 2. The minimum required drillhole diameter has been maintained.
- 3. The specified corrosion protection is provided.
- 4. The test nail length is equal to or greater than the scheduled production nail length.

Test nails meeting the above requirements shall be completed by satisfactorily grouting up the unbonded test length. Maintaining the temporary unbonded test length for subsequent grouting is the Contractor’s responsibility. If the unbonded test length of production proof test nails cannot be satisfactorily grouted subsequent to testing, the proof test nail shall become sacrificial and shall be replaced with an additional production nail installed at no additional cost.

For nails that are unacceptable, the Contractor shall submit a written proposal containing a suggested course of action.

Construct and attach any permanent facing and insulating materials shown in the contract documents.

211-3.02. Grouted Tieback System (GTS).

A. GTS Submittal. Submit a design and design experience to the Engineer a minimum of 30 calendar days prior to start of work. Begin work only after receiving the Departments approval.

1. **Experience.** Submit as proof to the DCETS: (1) the names of two projects for which the Contractor or subcontractor performing the work has successfully installed grouted tiebacks within the past two years, (2) the foreman for this work having supervised the installation of grouted tiebacks on at least two projects in the past two years. Submit proof of prior experience with the subcontractor approval process.
2. **Working Drawings.** Submit the design and methods of construction to the DCETS for approval. The design shall be accomplished by a Professional Engineer.

Determine the tieback type, size and bond length necessary to develop adequate load capacity to satisfy grouted tieback testing Acceptance Criteria for the design loads shown in the contract documents and in accordance with the Post Tensioning Institute *Recommendations for Prestressed Rock and Soil Anchors*. The minimum bond length shall be 10 ft. in rock and 15 ft. in soil. The minimum tendon bond length shall be 10 ft. The minimum stressing length shall be 15 ft. or as shown in the contract documents, whichever is greater. The tieback hole shall remain inside the right-of-way or easement limits shown in the contract documents.

Provide working drawings conforming to the size and type requirements in accordance with §718-01 *Prestressed Concrete Units (Structural)* A. Size and Type. Include the following:

- a. A grouted tieback schedule including:
 - i. grouted tieback number,
 - ii. design load for each tieback,
 - iii. type and size of tendon,
 - iv. total tendon length,
 - v. bond length, and tendon bond length if different from bond length,
 - vi. stressing length.
- b. A drawing of the tieback and corrosion protection including:
 - i. spacers and their location,
 - ii. centralizers and their location,
 - iii. couplers and their location,
 - iv. stressing length corrosion protection,
 - v. bond length corrosion protection,
 - vi. anchorage and trumpet,
 - vii. anchorage corrosion protection system.
3. **Report.** Submit a report to the Engineer within 30 calendar days after completion of the tieback work. The report shall contain:
 - a. as-built drawings showing the locations of the tiebacks, total tendon lengths, stressing lengths and bond lengths,
 - b. prestressing steel manufacturer's mill test reports for the tendons,
 - c. tieback installation notes (hole progression, caving, clean-out),
 - d. grouting records indicating the cement type, quantity injected and grout pressures,
 - e. tieback test results and graphs.

B. GTS Installation. The holes for the tiebacks may be either driven or drilled. The hole shall not be progressed in a location that requires the tendon to be bent in order to enable the bearing plate to be connected to the supporting structure. If operations cause subsidence or physical damage, immediately cease operations and repair the damage. The Contractor shall immediately revise

operations to prevent reoccurrence of such damage. Any and all costs incurred due to this subsidence or physical damage shall be at no additional cost to the State. If the hole will not stand open, casing shall be installed as required to maintain a clean and open hole. The hole diameter shall be no less than 3 in. if using pressure grouting in the bond length and 4 in. if not using pressure grouting. The Contractor shall provide a drill bit with a diameter no less than the specified hole diameter minus $\frac{1}{8}$ in. The hole shall extend a minimum of 2 ft. beyond the tendon length. The holes shall be located in elevation as shown in the contract documents, within a 3 in. tolerance. The holes shall be progressed to the inclination and alignment as specified in the contract documents, within a $\pm 3^\circ$ tolerance. All tieback holes shall be progressed perpendicular to the direction of the wall, as seen in the contract documents. Holes in rock shall be thoroughly cleaned of all dust, rock chips, grease or other material which may affect bond prior to inserting the tendon.

Strands shall not be coupled, except in the case of repairs of installed tendons or for extending stressed strand anchors.

A water-tightness test will be required for all tiebacks bonded in rock if grout is injected at a pressure of less than 50 psi. The water-tightness test shall be performed by filling the entire hole in the rock with water and subjecting it to a pressure of 5 psi as measured at the top of the hole. If the stressing length portion of hole is in soil or fractured rock, a packer or casing shall be used to allow the bond length to be pressure-tested. If the leakage rate from the hole, over a 10 minute period, exceeds 0.001 gal. of water per inch of hole diameter per foot of length of hole per minute, the hole shall be grouted, redrilled and retested. Should the subsequent water-tightness test fail, the entire process shall be repeated until results are attained which are within leakage allowances. If artesian or flowing water is encountered in the drilled hole, pressure shall be maintained on the grout until the grout has reached initial set.

The Contractor may eliminate the requirement for water-tightness tests in rock by using pressure grouting techniques. Pressure grouting requires that the drill hole be sealed and that the grout be injected until a 50 psi grout pressure, measured at the top of the hole, can be maintained on the grout for 5 minutes without further grout injection.

In the bond length, centralizers and their installed locations shall be subject to approval by the Engineer. Centralizers shall be provided at a maximum of 10 ft. center to center spacing throughout the bond length so that not less than $\frac{1}{2}$ in. of grout cover along the bond length is achieved. A centralizer shall be provided at the bottom end of the tendon. Sag of the tendon shall be taken into account when selecting centralizer diameter and spacing. Multi-element tendons shall also employ spacers at maximum 10 ft. intervals throughout the bond length to ensure grout cover on all elements.

When the contract documents require encapsulation to provide double-corrosion protection for the tendons:

1. The tendon shall be encapsulated in a grout-filled corrugated tube of one of the types stated in the Materials section of this specification. The tendon may be grouted inside the encapsulation either before or after inserting the tendon into the drill hole. The bond length of the tendon shall be centralized to provide a minimum grout cover of $\frac{3}{16}$ in. within the tube. Spacers shall be used along the tendon bond length for multi-element tendons to ensure good bond with the encapsulation grout.
2. Centralizers shall be used to provide a minimum of $\frac{5}{16}$ in. of grout cover over the tendon bond length encapsulation. Centralizers shall be securely attached to the encapsulation and shall be spaced at no more than 10 ft. A centralizer shall be provided at the bottom end of the tendon bond length encapsulation. A centralizer shall also be located a maximum of 5 ft. from the top of the bond length.

The bond length of the tendon shall be free of dirt, manufacturer's lubricants, corrosion-inhibiting coatings or other deleterious substances prior to installation.

The tendon shall be inserted in the casing or hole without difficulty. If the tendon cannot be completely inserted, the Contractor shall remove the tendon and clean or redrill the hole to permit insertion. Partially inserted tendons shall not be driven or otherwise forced into the hole. Tendons shall not be subject to sharp bends. Care shall be taken to prevent damage to the tendon's corrosion protection and centralizers during handling and installation.

The grouting equipment shall be capable of continuous mixing and shall produce grout free of lumps. The grout pump shall be equipped with a grout pressure gage capable of measuring the highest working pressures attained plus 50 psi.

The annular space between the tieback and the drilled hole up to the level of the trumpet and between the tendon and encapsulation shall be filled with grout. In order to prevent air voids in the grouting operation, the hole shall be filled with grout progressively from bottom to top. Grouting of the stressing length shall be done at low pressure. The trumpet shall not bear on the top of the stressing length grout column during testing, to ensure that load applied to the tieback during testing is not transferred to the anchorage via the grout column.

The tieback shall be centered in the trumpet so that there is no contact between the two. The corrosion protection surrounding the stressing length of the tendon shall extend up beyond the bottom seal of the trumpet but shall not contact the bearing plate or anchor head during stressing and testing.

The anchor head shall be protected from corrosion during the interim between tieback installation and final corrosion protection installation by installing a temporary cap and filling the trumpet and anchor head with corrosion-inhibiting grease. Any detrimental corrosion shall be caused for rejection.

After installation, testing and acceptance of each tieback, the trumpet shall be filled with grout or corrosion inhibiting grease and the permanent corrosion protection of the anchorage shall be installed. The Contractor shall either:

1. place a water-tight steel cap, filled with corrosion inhibiting grease or grout, over the anchor head, or
2. encase the anchor head in concrete.

C. GTS Testing. Each tieback shall be tested. At no time shall a test or temporary load on any tendon exceed 80% of the GUTS of the tendon. The following tests are required:

1. Performance Tests: The first two anchors installed at each specified design load capacity and 5% of the remaining anchors shall be performance tested. These tests are used to determine residual movements.
2. Creep Tests: Creep tests shall only be performed where specified by a Special Note in the contract documents. These tests are performed to determine long term deformation behavior in plastic soils.
3. Proof Tests: Proof tests shall be performed on all anchors not performance or creep tested. These tests are used to verify load capacity.
4. Lift-Off Readings: Lift-off readings shall be taken on all tiebacks after the load has been transferred to the anchorage but prior to removing the jack.
5. Lift-Off Tests: Lift-off tests shall only be performed on tiebacks in rock. If required, lift-off tests shall be performed on at least 2 tiebacks at locations to be chosen by the Engineer. Additional tests, up to 10% of the total number of tiebacks may be directed by the Engineer.

Copies of all test results and graphs shall be transmitted to the Director, Geotechnical Engineering Bureau as each test is completed.

Jacks shall have ram travel at least equal to the theoretical elastic elongation of the stressing length plus the bond length at the maximum test load, and be sufficient to accommodate wall movements. A pressure gauge shall be used with each jack. Gauges shall be calibrated with a single jack and shall not be used with any other jack. All gauges shall be accurate enough to read 100 psi changes in pressure. For performance and creep tests, the jack used shall have two calibrated gauges; a master gauge and backup gauge. The pump shall be capable of applying each load increment in less than 60 seconds.

A load cell, which has been calibrated by an independent testing laboratory within 14 days prior to the start of work and at least annually thereafter, shall be used to measure the small changes in load during the load hold portion of the performance and creep tests. There will be no substitute for the load cell on testing of the performance and creep tests. Load cells are not required for proof tests. The Contractor shall provide the Engineer with the calibration curve for the load cell prior to testing.

For the performance and creep tests, the master gauge and backup gauge shall be connected to the same pressure hose between the pump and jack and be used to measure the applied loads. If the load

measured by the master gauge and backup gauge differ by more than 10%, the jack, master gauge and backup gauge shall be recalibrated as a unit at no expense to the State.

At the completion of the test the tieback load shall be adjusted to the lock-off load and transferred to the anchorage.

The movement of the tieback tendon at each load increment shall be recorded to the nearest 0.001 in. relative to an independent, fixed reference point.

- I. Performance Tests: Performance tests shall be performed by incrementally loading and unloading the tieback in accordance with Table 211-6 *GTS Performance/Creep Test Load Schedule*. Residual movements shall be taken at the alignment load for each cycle. Total movement measurements shall be taken at each load in each cycle.

TABLE 211-6 GTS PERFORMANCE/CREEP TEST LOAD SCHEDULE

Cycle	Load ¹	PERFORMANCE TEST	CREEP TEST
		Observation Period	Observation Period
1	AL	Maximum of 1 minute ²	Maximum of 1 minute ²

	1.50 P (Load Hold)	10 minutes (or 60 minutes depending on total movement ⁵)	300 minutes
	AL	Maximum of 1 minute ²	Maximum of 1 minute ²
Adjust to the lock-off load of 0.80 P (or as specified in the contract documents)			

¹P = Design Load

AL = Alignment Load. The AL necessary to maintain position of the stressing and testing equipment shall not exceed 0.05 P. Set dial gauges to “zero” after the alignment load has been applied.

²The load shall be held at each increment just long enough to obtain the total movement reading but no longer than 1 minute.

³Creep tests determine the long-term load carrying capacity of a grouted tieback. This test is not applicable to temporary tiebacks.

⁴The load hold portion of the performance test for a temporary tieback is a test load of 1.33 P, which shall be held constant for 50 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 0, ½, 1, 2, 5, 10, 30, and 50 minutes. If the total movement between 1 minute and 10 minutes is less than 0.04 in., the temporary tieback will be accepted and the test may be terminated without taking the 30 and 50 minute readings.

⁵The load hold portion of the performance test for a permanent tieback is a test load of 1.50 P, which shall be held constant for 10 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 1 minute, 2, 3, 4, 5, 6, and 10 minutes. If the total movement between 1 minute and 10 minutes exceeds 0.04 in., the test load shall be held for an additional 50 minutes. Total movements shall be recorded at 15, 20, 25, 30, 45 and 60 minutes.

The Contractor shall plot the tendon movement versus load for each load increment. He shall also plot the creep movement for the load hold as a function of the logarithm of time.

2. Creep Tests: The creep test shall be made by incrementally loading and unloading the tendon in accordance with Table 211-6 *GTS Performance/Creep Test Load Schedule*. At the highest load in each cycle the load shall be held constant in accordance with the observation periods. A load cell shall be used to monitor the constant load.

Residual movement measurements shall be taken at the alignment load for each cycle. Total movement readings shall be taken at each load in each cycle.

The times for reading the total movement during an observation period shall be 1 minute, 2, 3, 4, 5, 6, 10, 15, 20, 25, 30, 45, 60, 75, 90, 100, 120, 150, 180, 210, 240, 270, and 300 minutes.

The observation period shall begin when the pump starts to load the tieback from the next lower increment.

The Contractor shall plot the tendon movement and the residual movement measured in a creep test as described for the performance test. The Contractor shall also plot the creep movement for each load hold as a function of the logarithm of time.

If the creep rates are not acceptable as defined under §211-3.02 C 6. *Acceptance Criteria*, the Contractor shall modify his installation method and perform creep tests until two successive acceptable creep tests on two different tiebacks have been performed.

3. Proof Tests: The proof tests shall be performed by loading the tieback in accordance with Table 211-7 *GTS Proof Test Load Schedule*.

Load ¹		Observation Period
AL		Maximum of 1 minute ²
0.25 P		Maximum of 1 minute ²
0.50 P		Maximum of 1 minute ²
0.75 P		Maximum of 1 minute ²
1.00 P		Maximum of 1 minute ²
1.25 P		Maximum of 1 minute ²
Load Hold ^{3,4}	<i>Permanent Tieback</i> 1.50 P	10 minutes (or 60 minutes depending on total movement ³)

TABLE 211-7 GTS PROOF TEST LOAD SCHEDULE			
	Temporary Tieback	1.33 P	5 minutes (or 50 minutes depending on total movement ⁴)
Adjust to the lock-off load of 0.80 P (or as specified in the contract documents)			

¹P = Design Load

AL = Alignment Load. The AL necessary to maintain position of the stressing and testing equipment shall not exceed 0.05 P. Set dial gauges to “zero” after the alignment load has been applied.

²The load shall be held at each increment just long enough to obtain the total movement reading but no longer than 1 minute.

³The load hold portion of the proof test for a permanent tieback is a test load of 1.50 P, which shall be held constant for 10 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 1 minute, 2, 3, 4, 5, 6, and 10 minutes. If the total movement between 1 minute and 10 minutes exceeds 0.04 in., the test load shall be held for an additional 50 minutes. Total movements shall be recorded at 15, 20, 25, 30, 45 and 60 minutes.

⁴The load hold portion of the proof test for a temporary tieback is a test load of 1.33 P, which shall be held constant for 5 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 0, ½, 2, and 5 minutes. If the total movement between ½ minute and 5 minutes exceeds 0.08 in., the test load shall be held for an additional 45 minutes. Total movements shall be recorded at 10, 15, 20, 25, 30, 40 and 50 minutes.

The Contractor shall plot the tendon movement versus load for each load increment. He shall also plot the creep movement for the load hold as a function of the logarithm of time.

4. Lift-Off Readings: Lift-off readings shall be taken and recorded directly after testing on all tiebacks. The load required to relieve the load from the tieback head shall be measured and recorded. If the lift-off load is not within 5% of the lock-off load the anchorage shall be reset and another lift-off reading taken.
5. Lift-Off Tests: Lift-off tests shall be performed on rock tiebacks only. Locations for lift-off tests shall be selected randomly by the Engineer prior to the commencement of any tieback testing. For each tieback subjected to a lift-off test, the Contractor shall leave an adequate length of tendon protruding over the anchorage to permit jacking.
 Lift-off tests shall be performed at least 24 hours but no more than 7 days after the tieback has been set to lock-off load. The results of all lift-off tests shall be recorded.
 If the lift-off load is not within 10% of the lock-off load, the anchorage shall be reset and another lift-off test performed according to the requirements in this specification.
6. Acceptance Criteria: For all grouted tiebacks:
 - a. All tiebacks and components shall be free of detrimental corrosion.
 - b. Lift-off readings shall show a load within 5% of the specified lock-off load.
 - c. Lift-off tests shall show a load within 10% of the specified lock-off load.
 - d. The total movement at the maximum test load shall exceed 80% of the theoretical elastic elongation of the unbonded length, from the alignment load to the test load.

For performance or proof tested tiebacks with a 10 minute load hold, the tieback shall also resist the maximum test load with a creep rate that does not exceed 0.04 in. between 1 and 10 minutes.

For performance or proof tested tiebacks with a 60 minute load hold, the tieback shall also resist the maximum test load with a creep rate that does not exceed 0.08 in. per log cycle of time.

For creep tested tiebacks, the tieback shall also resist the maximum test load with a creep rate that does not exceed 0.08 in. per log cycle of time.

For unacceptable tiebacks, the Contractor shall submit a written proposal containing a suggested course of action. The action to be taken will be subject to written approval by the Department. Tiebacks which do not meet the total movement criteria shall not be permitted to carry any load.

Conditional Acceptance Criteria: Tiebacks which meet the total movement criteria but do not meet the creep rate criteria may be accepted by the Department and locked-off at a load equal to

½ P_f. To determine P_f (failure load), allow the load to stabilize for 10 minutes after the tieback has failed. The load after stabilization is the failure load.

A supplemental tieback shall be installed and tested at a location approved by the Department. The combined test capacity of the tiebacks shall equal or exceed 1.5 times the original design load. That is:

$$1.5 P = 1.5 P_s + 0.5 P_f$$

Where: *P* = the design load for the original tieback
P_s = the design load for the supplemental tieback
P_f = the failure load for the original tieback

For tiebacks that do not meet the lift-off reading (or test) criteria, the anchorage shall be reset and another lift-off reading (or test) taken.

211-4 METHOD OF MEASUREMENT

211-4.01. Soil Nail Wall System. A SNWS will be measured in square feet of face area measured in a vertical plane between the payment lines shown in the contract documents. Excavation will be measured under a separate item.

211-4.02. Grouted Tieback System. A GTS will be measured by the number of grouted tiebacks installed.

211-4.03. Grouted Tieback Creep Test. A GTS Creep Test will be measured by the number of tests performed.

211-5 BASIS OF PAYMENT

211-5.01 Soil Nail Wall System. The unit bid price shall include the cost of all labor, materials, and equipment required to satisfactorily complete the work including the wall drainage network, the temporary shotcrete construction facing and preproduction verification tests, verification tests, and proof tests of the soil nails. Excavation will be paid for separately to the temporary shotcrete-soil interface and to the limits shown in the contract documents. Permanent wall facing will be paid for separately.

211-5.02. Grouted Tieback System. The unit bid price shall include the cost of all labor, materials, and equipment required to satisfactorily complete the work including performance tests, proof tests, lift-off readings and lift-off tests of the tiebacks. For tiebacks which do not meet all the acceptance criteria but do meet the conditional acceptance criteria, the original tieback and any required supplemental tiebacks(s) are, in sum, considered to be one tieback for payment purposes. No payment will be made for any additional wall connections required for installation of supplemental tiebacks. Permanent wall facing will be paid for separately.

211-5.03. Grouted Tieback Creep Test. The unit bid price shall include the cost of all labor, materials, and equipment required to satisfactorily complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
211.01 M	Soil Nail Wall System (Temporary)	Square Feet
211.02 M	Soil Nail Wall System (Permanent)	Square Feet
211.10 M	Grouted Tiebacks (Temporary)	Each
211.11 M	Grouted Tiebacks (Permanent)	Each
211.12 M	Creep Test for Grouted Tiebacks	Each

SECTION 212 – ROCK SLOPE REINFORCEMENT AND CATCHMENT SYSTEMS

212-1 DESCRIPTION. This work shall consist of furnishing and installing rock slope stabilization techniques or roadside protective measures in conformance with payment lines, type, size, and at the locations specified in the contract documents.

212-1.01 Definitions.

A. General. As outlined in Section 203 *Excavation and Embankment*, all rock slopes shall be thoroughly scaled and cleaned of unsound material and loose masses of rock. This section provides requirements for specific techniques developed to address situations where a hazardous rock slope situation still exists after stripping and scaling in order to control a rockfall within a designated rockfall catchment area.

B. Rock Fall. A rockfall is the movement of rock from a slope that is so steep the rock continues to move down slope. The movement may be by free falling, bouncing, rolling or sliding.

C. Rock Catchment Area. The rockfall catchment area is defined as the area between the edge of roadway pavement and the base of an adjacent rockslope that is used to restrict rockfall from reaching the roadway. The term catchment area is synonymous with ditch, rockfall ditch, rockfall catch ditch and rock fallout area. The catchment area width is the horizontal distance between the roadway edge of pavement and the base (toe) of a rockslope.

D. Rock Catchment Fences. Rock catchment fences are techniques to control rockfalls within the R.O.W. Rock catchment fences are wire or cable mesh draped from support columns situated to define the catchment area. The catchment fence, or impact section, attenuates the rockfall energy to capture the falling rock and maintain it within the catchment area.

E. Rock Mesh Slope Protection. Rock mesh slope protection is a technique to control rockfalls within the R.O.W. Rock mesh slope protection is the placement of wire or cable mesh on a slope face. The mesh controls the descent of falling rock, which accumulates near the base of the slope within the catchment area.

212-2 MATERIALS

212-2.01 Wire Rope Rock Catchment Fence. The rock catchment fence system, as obtained from the manufacturer, shall have a tested capability of retaining a rock impact of 155 kip-ft of kinetic energy. The result of demonstration tests shall be furnished as required by the Engineer.

A. Net Assembly. Provide a fence consisting of a net conforming to §710-06 *Rock Slope Net and Wire Mesh Assemblies*, Net Assembly.

Cover all nets with chain link mesh fencing material of a minimum 11 gauge, 2 in. zinc coated mesh, conforming to the requirements of §710-02 *Galvanized Steel Fence Fabric*.

B. Wire Ropes. Provide the following wire ropes:

1. Net Supporting Wire Rope. Provide net supporting wire rope conforming to §710-27 *Rock Slope Wire Ropes*, Net Supporting Wire Rope.

2. Seam Rope. Provide seam rope conforming to §710-27 *Rock Slope Wire Ropes*, Seam Rope for Wire Rope Rock Catchment Fence.

3. Tieback Restraining Cables. Provide tieback restraining cables conforming to §710-27 *Rock Slope Wire Ropes*, Tieback Restraining Cable.

4. Anchor Cables. Provide anchor cables conforming to §710-27 *Rock Slope Wire Ropes*, Anchor Cable.

Braking elements in the tieback restraining cable shall incorporate a protective, crushable sleeve as recommended by the manufacturer.

C. Support Columns. Fabricate the net support columns from W8 x 48 wide flange members conforming to the requirements of §715-18 *Soldier Piles*.

D. Miscellaneous Appurtenances. All steel bolts, nuts and washers shall conform to the requirements of §723-60 *Anchor Bolts*. All miscellaneous appurtenances such as wire rope clips, thimbles, bolts, etc., shall be galvanized as supplied by the manufacturer.

212-2.02 Chain Link Rock Catchment Fence.

A. Fence Fabric. Provide aluminum coated steel fence fabric a minimum of 6 gauge, chain link type with twist selvage edges, conforming to the requirements of §710-04 *Aluminum Coated Steel Fence Fabric*, except for gauge.

Vinyl coated steel fence fabric shall be 9 gauge, chain link type with twist selvage edges, conforming to the requirements of §710-03 *Vinyl Coated Steel Fence Fabric*, Class A Wire Diameter, except color. The color shall be black unless otherwise specified in the contract documents.

B. Cables. Provide galvanized guide rail cables a minimum $\frac{3}{4}$ in. in diameter, consisting of 3 strands (7 wires per strand) conforming to the requirements of §710-22 *Cable Guide Railing* and having a minimum tensile strength of 25 kips.

C. Posts. Provide No. 11 steel rebar posts and No. 9 hook bar anchors conforming to the requirements of §709-01 *Bar Reinforcement, Grade 420*. The rebar posts and hook bar anchors shall be galvanized in accordance with the requirements of §719-01 *Galvanized Coatings and Repair Methods*, Type I. Exposed cut ends shall be field repaired in accordance with §719-01 *Galvanized Coatings and Repair Methods*. Hook bar anchors shall have a 180° hook with an outside diameter of 11 in.

No. 11 steel rebar posts shall also conform to the requirements of §709-04 *Epoxy-Coated bar Reinforcement*, except color. The color shall be as specified on the plans or by the Engineer.

D. Grout. Provide grout to fill the annular space around the No. 11 steel rebar posts, No. 9 hook bar anchors and for backfilling below the anchor angle, conforming to the requirements of §701-05 *Concrete Grouting Material*.

E. Anchor Angles. Provide 2 ft. long sections of anchor angles of 8 in. by 6 in. by 1 in. steel angle. The steel shall conform to the requirements of §715-01 *Structural Steel* and shall be galvanized in accordance with §719-01 *Galvanized Coatings and Repair Methods*, Type I. The anchor angle shall have two 2 in. diameter holes (for the bolts) bored through the 8 in. side. The holes shall be centered 4 in. in from each end along a line 3 in. in from the edge opposite the angle. The anchor angle shall also have three $\frac{7}{8}$ in. diameter holes drilled on 4 in. centers along the centerline, with the middle hole located in the center of the 6 in. side for attachment of the steel turnbuckles.

F. Rock Bolt Assembly. Provide 1 $\frac{1}{4}$ in. nominal diameter, 5 ft. long, rock bolt assembly conforming to the requirements of §731-03 *Rock Bolt Assembly*.

Provide galvanized and Epoxy-coated $\frac{3}{8}$ in. x 2 $\frac{1}{2}$ in. throat by 4 $\frac{1}{2}$ in. depth “U” bolts as shown in Detail’s C1 & C2 of the Standard Sheet 212-4 *Chain Link Rock Catchment Fence* with $\frac{1}{8}$ in. thread length to clamp $\frac{3}{4}$ in. guide rail cables to No. 11 rebar posts.

G. Miscellaneous Appurtenances.

1. Thimbles. Provide galvanized thimbles for $\frac{3}{4}$ in. guide rail cable conforming to the requirements of §710-22 *Cable Guide Railing* and as shown in Detail F of the Standard Sheet 212-5 *Chain Link Rock Catchment Fence*.

2. Clips. Provide galvanized cable clips for $\frac{3}{4}$ in. guide rail cable conforming to the requirements of §710-22 *Cable Guide Railing* and as shown in Detail F of the Standard Sheet 212-5 *Chain Link Rock Catchment Fence*.

3. Turnbuckles. Provide galvanized steel turnbuckle cable end assemblies conforming to the requirements of §710-22 *Cable Guide Railing* and as shown in Detail G of the Standard Sheet 212-5 *Chain Link Rock Catchment Fence*.

4. Cable Splices. Provide galvanized cable splices conforming to the requirements of §710-22 *Cable Guide Railing* and as shown in Detail H of the Standard Sheet 212-5 *Chain Link Rock Catchment Fence*.

5. Wedges. Provide wedges for cable splices and cable ends conforming to the requirements of §710-22 *Cable Guide Railing* and as shown in Detail X of the Standard Sheet 212-5 *Chain Link Rock Catchment Fence*.

6. Wire Ties. Provide galvanized steel wire ties (12 gauge).

212-2.03 Wire Mesh Slope Protection.

A. Wire Mesh. Provide wire mesh conforming to §710-06 *Rock Slope Net and Wire Mesh Assemblies*, Wire Mesh.

B. Cables. Provide galvanized mesh support cables having a minimum diameter of $\frac{3}{4}$ in., 6 x 19 Independent Wire Rope Core (IWRC) construction (or equivalent), conforming to the requirements of §710-22 *Cable Guide Railing*.

C. Anchors. Provide galvanized $\frac{3}{4}$ in. diameter wire rope anchors conforming to the requirements of §710-22 *Cable Guide Railing*.

Furnish anchor centralizers consisting of plastic, steel or any material not detrimental to the anchor. Do not use wood.

D. Grout. Provide grout conforming to the requirements of §701-05 *Concrete Grouting Material*.

E. Miscellaneous Appurtenances.

1. Seam Wire Rope. Provide seam rope conforming to §710-27 *Rock Slope Wire Ropes*, Seam Rope for Wire Mesh Slope Protection.

2. Steel Rings. Provide 1 in. x 4 in. steel rings conforming to the requirements of Federal Specification RR-C71D Type VI.

3. Clips. Provide $\frac{3}{4}$ in. wire rope clips conforming to the requirements of §710-22 *Cable Guide Railing*.

4. Thimbles. Provide $\frac{3}{4}$ in. thimbles conforming to the requirements of §710-22 *Cable Guide Railing*.

212-2.04 Wire Mesh Drape.

A. Wire Mesh Drape. Provide wire mesh drape conforming to the requirements of §710-06 *Rock Slope Net and Wire Mesh Assemblies*, Rock Slope Wire Mesh Drape Assembly.

B. Cables. Provide galvanized mesh support cables a minimum $\frac{3}{4}$ in. in diameter, consisting of 3 strands (7 wires per strand) conforming to the requirements of §710-22 *Cable Guide Railing* and having a minimum tensile strength of 25 kips.

C. Miscellaneous Appurtenances. Provide appurtenances, galvanized as supplied by manufacturer, as follows:

1. Tie Wire. Provide $\frac{1}{12}$ in. minimum diameter steel tie wire.

2. Hog Rings. Provide $\frac{1}{8}$ in. minimum diameter (11 gauge) hog rings or other steel fasteners.

3. Steel Rings. Provide welded forged steel rings with a stock diameter of 1 in. and a maximum inside diameter of 4 in.

D. Rock Bolt Assembly. Provide 1 ¼ in. nominal diameter, 6 ½ ft. long (min.), rock bolt assembly conforming to the requirements of §731-03 *Rock Bolt Assembly* except resin packages of one setting time only shall be utilized for installation of the mesh support and cable anchor rock bolts.

212-2.05 Temporary Rock Catchment Barrier.

A. Precast Concrete Barrier Units. Provide precast concrete barrier units consisting of three (3) components: precast concrete column supports, precast temporary concrete barriers, and precast concrete beams as detailed on the Standard Sheet 212-9 & 10 *Temporary Rock Catchment Barrier*.

1. Precast Concrete Column Supports. Provide precast concrete column supports conforming to the requirements of §704-05 *Precast Concrete Barrier* and to the dimensions and details “F”, “G”, “H”, “I”, and “N” on the Standard Sheet 212-10 *Temporary Rock Catchment Barrier*. Additional joint connection details shall be as shown on Standard Sheet 619-01 *Temporary Concrete Barrier*.

Each column support shall have cast-in-place a 6 in. x 6 in. x ¼ in. structural steel tube to be used for support of the wire rope rock fence. The tube steel shall conform to the requirements of ASTM A500, Grade B or C, and shall conform to the dimensions and detail “N” on the Standard Sheet 212-10 *Temporary Rock Catchment Barrier*.

2. Precast Temporary Concrete Barriers. Provide precast temporary concrete barriers conforming to the requirements of §704-05 *Precast Concrete Barrier* and to the dimensions, joint connections, material details, and anchoring details shown on Standard Sheet 619-01 *Temporary Concrete Barrier*.

3. Precast Concrete Beams. Provide precast concrete beams conforming to the requirements of §704-05 *Precast Concrete Barrier* and to the dimensions and details “K”, and “M” shown on the Standard Sheet 212-10 *Temporary Rock Catchment Barrier*.

The Engineer will inspect all precast concrete barrier unit components upon delivery to the project site for conformance to specifications. Any barrier unit component having damage and/or defects in the concrete and/or joint connections will be rejected.

The precast concrete barrier units shall form a smooth and continuous barrier when joined together. Any sections damaged or misaligned while in service shall be corrected or replaced.

B. Net Support Columns. Fabricate the net support columns from W5 x 16 wide flange members conforming to the requirements of §715-18 *Soldier Piles*

Each support column shall have four (4) pairs (eight holes) of 1 in. diameter holes drilled on the side facing the rock slope. Two (2) holes shall be situated 3 in. from the top of the post and the remaining three (3) pairs spaced equally approximately 40 in. apart.

After any required drilling, welding and/or cutting, all support columns and related hardware shall be hot dipped galvanized in accordance with the requirements of §719-01 *Galvanized Coatings and Repair Methods*, Type I.

C. Net Support Ropes. Provide net support ropes conforming to §710-27 *Rock Slope Wire Ropes*, Net Supporting Wire Rope.

D. Wire Rope Netting. Provide wire rope netting conforming to §710-06 *Rock Slope Net and Wire Mesh Assemblies*, Net Assembly.

Two (2) aluminum stop sleeves shall be used at all locations where two individual wire ropes are joined together.

The 8 in. x 8 in. mesh size shall be fabricated using high strength, hot dipped, galvanized steel clips, which are attached so that they are non-moveable. Nets damaged during clipping shall be rejected by the Engineer.

E. Chain Link Fence Fabric. Provide a minimum of 9 gauge chain link fence fabric conforming to the requirements of §710-02 *Galvanized Steel Fence Fabric*. The galvanized chain link fence fabric shall be 12 ft. high and have a 2 in. mesh size. The chain link fence fabric shall be continuous between wire rope net panels.

F. Synthetic Fabric Layer. Provide a synthetic fabric, 10 ½ ft. in height conforming to the requirements of §737-01A *Geotextile Bedding*.

G. Cushion Sand. Provide sand conforming to the requirements of §703-06 *Cushion Sand*.

H. Miscellaneous Material. Provide miscellaneous hardware such as shackles, thimbles, wire clips, bolts, etc. which shall be hot dipped galvanized in accordance with §719-01 *Galvanized Coatings and Repair Methods*, Type I.

212-2.06 Move Temporary Rock Catchment Barrier. None Specified.

212-3 CONSTRUCTION DETAILS

212-3.01 Wire Rope Rock Catchment Fence. Assemble the wire rope rock catchment fence as detailed on the Standard Sheet 212-1, 2 & 3 *Wire Rope Rock Catchment Fence*.

Submit to the Engineer for approval not less than two weeks prior to the installation of the wire rope rock catchment fence. Do not begin work prior to approval. Provide the following:

- a) Proposed start date, completion date and detailed construction sequence.
- b) Proposed anchor drilling method and equipment including hole diameter, method of keeping holes open, and hole clean out procedures.
- c) Proposed anchor installation procedure including grout placement procedures, grouting equipment, and the procedure for setting the wire rope anchor centralizers.
- d) Method of verifying anchor capacity and equipment setup including details of the jacking frame and appurtenant bracing. Include the calibration data for the stressing device. The calibration shall be performed by an independent testing laboratory within 60 calendar days of the submittal date.

Install grouted wire rope anchors with accompanying centralizers at the top of the rock slope on 12 ft. centers or as indicated by Engineer. Mix grout per manufacturer's instructions. Wait a minimum of 7 days after grouting before applying any load to the anchors. Proof test each anchor in accordance with §212-3.03 A. *Anchor Testing*.

Fasten all net braiding with high strength, corrosion resistant clips or other fasteners to produce a permanent, non-movable joint. Damage to the wire rope resulting from the installation of the clips, insofar as it affects the integrity of the system, in the opinion of the Engineer, shall be cause for rejection of the net panel.

Cut the chain link material to fit each wire rope netting panel. Attach the chain link mesh fencing material to the inside face of the wire rope nets with clips to extend a minimum of 3 ft. beyond the bottom of the fence.

Provide and install one braking element per top and bottom net supporting rope per 20 ft. net section. Position the braking element not more than 3 ft. from the column.

Use seam ropes to fasten adjacent wire rope nets and the nets to the net support wire ropes, with at least 1 wrap per 16 in.

The column spacing shall be 20 ft.

Install a tie-back restraining cable to extend from the top of each column in a direction perpendicular to the length of the fence and on the slope side of the fence. Install a braking element in each cable not more than 3 ft. from the column.

For a fence whose length is 120 ft. or less, both end columns shall have a lateral restraining cable without the braking element. This cable shall extend from the top of the column at an angle of 60° from the vertical to the ground. For a fence which is longer, install lateral restraining cables at every multiple of 120 ft., or approximately midway for a fence less than 240 ft.

Paint the fence installation where specified, with the appropriate material and color as directed by the Engineer.

212-3.02 Chain Link Rock Catchment Fence. Assemble the chain link rock catchment fence as detailed on the Standard Sheet 212-4 & 5 *Chain Link Rock Catchment Fence*.

Install galvanized No. 11 steel rebar posts in 2 in. diameter vertical holes drilled to a minimum depth of 2 ft. into rock. Post spacing shall be 8 ft. Pour a sufficient amount of concrete grouting material into the hole before inserting the post to allow overflow after insertion.

Install anchor angles for terminal sections. The location of the anchor angles shall be in line with the corresponding fence section and shall be determined by the angle (60° minimum) between the top longitudinal cable and the end post. The angle between any longitudinal cable and the end post shall not exceed 90° . Drill bolt holes for anchor angles into the rock spaced 16 in. on-center to a depth of 4 ft. The bolt hole diameter shall be compatible with the bolt/drill hole/resin cartridge diameter, as recommended by the bolt manufacturer, but in no case shall the bolt hole diameter exceed the resin cartridge diameter by more than $\frac{3}{8}$ in. Install the anchor angle within $90^\circ \pm 15^\circ$ to the axis of the rock bolt and in intimate contact with the rock surface for its entire contact area. Acceptable methods of leveling the rock surface include the following:

- a) Chipping the rock surface.
- b) Applying a special mix supplied by the bolt manufacturer for leveling purposes.
- c) A combination of chipping and leveling.

Clean out the bolt hole to its full depth with air or water. Place the appropriate amount of resin in the hole. Insert the bolt into the hole and rotate at approximately 100 rpm while pushing the bolt down through the resin cartridges to the bottom of the hole by a means approved by the Engineer. Rotate the bolt in this position for 30 to 60 seconds to insure mixing of the resin in the hole. Do not rotate the bolt longer than the setting time of the resin. Leave the bolts undisturbed in the hole for the time required for the resin to harden. Place the anchor angle over the bolts on the prepared surface and add the appurtenances. Tension the bolts to 40 kips by means of hollow-ram hydraulic jack, or as ordered by the Engineer. Support the base of the jack at $90^\circ \pm 2^\circ$ to the axis of the bolt.

If a failure of the bolt or anchorage occurs, a determination of the cause of failure will be made by a Departmental Engineering Geologist. Correct, as ordered by the Engineer, at no cost to the State, failures attributable to causes other than failure of the rock in the anchorage zone.

The State reserves the right to sample and test delivered materials.

Install No. 9 hook bar anchors on the uphill side of the fence, one hook bar anchor at each post located in a direction normal to the fence alignment. The location of the hook anchor on the ground surface shall be determined by the angle ($60^\circ \pm 5^\circ$) between the tie-back cable and the post at the top longitudinal cable. Construct hook bar anchorage according to depth of overburden.

Install No. 9 hook bar anchors at intermediate fence sections. The location of the hook bar anchors shall be in line with the corresponding fence section and shall be determined by the angle between the longitudinal cables and the intermediate anchorage post. This angle shall be between a minimum of $60^\circ \pm 5^\circ$ and a maximum of 90° . Construct hook bar anchorages according to depth of overburden.

Secure longitudinal cables to anchor angles at terminal sections with steel turnbuckle cable end assemblies. Secure longitudinal cables at intermediate fence sections to hook bar anchors with one (1) thimble, and four (4) cable clips per cable loop. The maximum distance between terminal sections, and/or intermediate anchorage sections, shall be 200 ft.

Secure $\frac{3}{4}$ in. longitudinal guide rail cables to rebar posts with "U" bolts so as to have minimum sag without bending posts. Cable splices shall be staggered a minimum of 20 ft. on adjacent cables. Splices shall be spaced a minimum of 100 ft. on the same cable.

Recommended installation sequence:

- a) Start with lowest longitudinal cable working from one terminal anchorage toward another or toward an intermediate anchorage, if used.
- b) Draw cable taut and secure with "U" bolt to posts.
- c) Complete tightening entire length of lower cable between anchorages before starting next higher cable.

Install aluminum fence fabric on uphill side of posts. Attach fence fabric to longitudinal cables with 12 gauge galvanized steel wire ties at 1 ft. intervals. Fence fabric splices shall be overlapped a minimum of four chain link rows. Attach fabric sections by tying both ends of the overlap at 1 ft. intervals, or by a method approved by the Engineer.

Install vinyl coated fence fabric on roadway side of posts. Attach fence fabric to longitudinal cables with 9 gauge vinyl coated steel wire ties at 1 ft. intervals. Fence fabric splices shall be overlapped a

minimum of four chain link rows. Attach fabric sections by tying both ends of the overlap at 1 ft. intervals, or by a method approved by the Engineer.

Bottom of fence fabric shall be in contact with the ground surface. Add fence fabric material as necessary. Added material shall be overlapped a minimum of four chain link rows. Tie both ends of the overlap at 1 ft. intervals, or as approved by the Engineer.

Attach tie-back cables on uphill side of rebar posts after longitudinal cables have been tightened and chain link fence fabric has been installed. Tie-back cables shall have a maximum sag of ¾ in. measured at the center.

212-3.03 Wire Mesh Slope Protection. Assemble the wire mesh slope protection as detailed on the Standard Sheet 212-6 & 7 *Wire Mesh Slope Protection*.

Design the grouted wire rope anchors so that the design load (P) is at least equal to 30 kips.

Submit shop drawings to the Engineer for approval not less than two weeks prior to the installation of the wire mesh slope protection. Do not begin work prior to approval. Provide drawings including the following:

- a) Proposed start date, completion date and detailed construction sequence.
- b) Details of the wire mesh and anchor layout on the existing slope.
- c) Proposed anchor drilling method and equipment including hole diameter, method of keeping holes open, and hole clean out procedures.
- d) Proposed anchor installation procedure including grout placement procedures, grouting equipment, and the procedure for setting the wire rope anchor centralizers.
- e) Method of verifying anchor capacity and equipment setup including details of the jacking frame and appurtenant bracing. Include the calibration data for the stressing device. The calibration shall be performed by an independent testing laboratory within 60 calendar days of the submittal date.

Install grouted wire rope anchors with accompanying centralizers at the top of the rock slope on 12 ft. centers or as indicated by Engineer. Mix grout per manufacturer’s instructions. Wait a minimum of 7 days after grouting before applying any load to the anchors. Proof test each anchor in accordance with §212-3.03 A. *Anchor Testing*.

Connect vertical wire rope tag lines to the anchors. Connect the horizontal support cable(s) to the vertical tag lines with steel rings as shown on the attached drawing for this specification. Do not draw cable taut. Maintain a minimum cable sag of ¾ in. on the horizontal support cable between vertical tag lines.

Attach the mesh to the horizontal support cable by a continuous weave through each of the mesh openings with galvanized 5/16 in. seam wire rope, as shown on the attached drawing for this specification.

Install the wire mesh in vertical strips. Overlay horizontal and vertical laps a minimum of 1 ft. and connect with a continuous weave through each of the mesh openings with galvanized 5/16 in. seam wire rope along the edge of the upper mesh strip. The mesh shall be installed in such a manner that the end of a roll curls into the rock face.

Install the wire mesh to cover the specified area of rock face.

A. Anchor Testing. Proof test each anchor. Perform the proof test by incrementally loading and unloading the anchors to 1.5 times the design load (P) in accordance with Table 212-1 *Wire Mesh Slope Protection Proof Test Load Schedule*. Record the anchor movements to the nearest 0.025 mm at each load increment.

TABLE 212-1 WIRE MESH SLOPE PROTECTION PROOF TEST LOAD SCHEDULE	
Load ¹	Observation Period
AL	Minimum of 1 minute ²
0.25 P	Minimum of 1 minute ²
0.50 P	Minimum of 1 minute ²
0.75 P	Minimum of 1 minute ²
1.00 P	Minimum of 1 minute ²

TABLE 212-1 WIRE MESH SLOPE PROTECTION PROOF TEST LOAD SCHEDULE	
1.25 P	Minimum of 1 minute ²
1.50 P (Load Hold) ²	10 minutes (or 60 minutes depending on total movement ³)

¹P = Design Load

AL = Alignment Load. The AL necessary to maintain position of the stressing and testing equipment shall not exceed 0.05 P. Set dial gauges to “zero” after the alignment load has been applied.

²Hold each load increment, except for the 1.5 P load, until the deflection stabilizes.

³The load hold portion of the proof test is a maximum test load of 1.50 P, which shall be held constant for 10 minutes. The load hold time shall start when the pump begins to load the anchor from the 1.25 P load to the test load. A load cell shall be used to monitor the constant load. Total movements with respect to an independent fixed reference point shall be recorded at 1 minute, 2, 3, 4, 5, 6, and 10 minutes. If the total movement between 1 minute and 10 minutes exceeds 1/24 in., the test load shall be held for an additional 50 minutes. Total movements shall be recorded at 15, 20, 25, 30, 45 and 60 minutes.

No part of the temporary yoke or load frame shall bear within 3 ft. of the anchor.

Plot the movement versus load for each increment.

An anchor will be accepted by the Engineer if the creep rate at 1.5P does not exceed 1/24 in. between the 1 and 10 minute readings or for a load hold time of 60 minutes, the creep rate does not exceed 1/12 in. per log cycle of time. If an anchor fails the proof test, install a new anchor at no cost to the State.

212-3.04 Wire Mesh Drape. Assemble the wire mesh drape as detailed on the Standard Sheet 212-8 *Wire Mesh Drape*.

Install untensioned resin rock bolts at the top of the rock slope on 50 ft. centers (maximum) or as shown in the contract documents. Proof test the first rock bolt per resin lot number to 20 kips in accordance with §212-3.03 A. *Anchor Testing*.

Place 3/4 in. diameter guide rail cable horizontally across the top of the rock slope, secured by 1 1/4 in. diameter resin rock bolts. Maintain a minimum cable sag of 2 ft. to 3 ft. between rock bolts. Do not draw cable taut. Splices of the guide rail cable will not be allowed.

Fold the mesh over or under the guide rail cable a minimum of 1 ft. and connect the horizontal lap with galvanized tie wire with a continuous weave through each of the mesh openings.

Install the wire mesh in vertical strips, each lapped over the other by a minimum of 1 ft. Connect the adjacent vertical strips by either a continuous weave of galvanized tie wire along the edge of the outer mesh strips only, or with hog rings or metal ties on a 6 in. staggered pattern along the edges of both panels. When used, overlay horizontal laps a minimum of 1 ft. and connect with a continuous weave of galvanized tie wire along the edge of the upper mesh strip.

Install the wire mesh to cover the area of rock face identified in the contract documents.

Repair all damaged galvanized surfaces in accordance with §719-01 *Galvanized Coatings and Repair Methods*.

212-3.05 Temporary Rock Catchment Barrier. Assemble and maintain the temporary rock catchment barrier as detailed on the Standard Sheet 212-9 & 10 *Temporary Rock Catchment Barrier*.

A. Precast Concrete Barrier Units. Each run, or bay, of precast concrete barrier units (precast concrete column support, precast temporary concrete barrier and precast concrete beam) shall be fastened together to form a continuous chain. After placement, each successive unit shall be moved longitudinally to remove any slack in the connecting joint. The units at each end of a run or bay shall be connected as shown on Standard Sheet 619-01 *Temporary Concrete Barrier*. To reduce movement of the barrier in

areas where limited deflection is desired, one of the anchoring methods shown on Standard Sheet 619-01 *Temporary Concrete Barrier* shall be used. Where shown in the contract documents, the ends of the barrier run shall be fitted with an impact attenuation device or a tapered end section and flared back.

The empty space within each concrete barrier unit shall be filled with sand for the full height (32 in.) of the unit. The back of the concrete barrier units shall also be covered with sand to the full height of the unit. The sand shall then be laid back at the angle of repose of the material to a minimum sand thickness of 18 in. as shown in detail "E" on Standard Sheet 212-9 *Temporary Rock Catchment Barrier*. The cost of installing and removing the sand, including the final cleaning of the pavement and shoulder, shall be included in the bid price for this Item.

The Contractor shall provide and maintain delineation of temporary barriers. This delineation shall make the barrier visible to approaching traffic, as well as to traffic which is adjacent to the barrier. The Contractor shall have the choice of using one or more of the following: warning lights, delineators, pavement marking, reflective tape placed on the barrier, reflective paint, or any other device subject to the approval of the Engineer. The delineation devices shall be maintained dirt and snow free, and be visible throughout the term of the contract including shutdown periods.

B. Net Support Columns. The W5 x 16 posts shall be installed in the 6 in. x 6 in. x ¼ in. structural steel tubes cast in the precast concrete column support units. The columns shall be inserted flush with the bottom of the precast concrete column supports.

C. Net Support and Lateral Anchor Ropes. The 5/8 in. net support wire ropes shall be installed as shown in detail "B" on Standard Sheet 212-9 *Temporary Rock Catchment Barrier*. The net support wire rope shall have maximum sag of 2 in. At both end sections and at every 125 ft. section of temporary catchment barrier (five precast concrete barrier units) install lateral anchors as shown in detail "C" on Standard Sheet 212-9 *Temporary Rock Catchment Barrier*. The wire rope loop at a ¾ in. shackle connection shall be secured with three (3) wire rope clips as shown in detail "J" on Standard Sheet 212-10 *Temporary Rock Catchment Barrier*.

D. Rock Catchment Fence Fabric. The rock catchment fence fabric (wire rope net, chain link fence fabric and synthetic fabric) shall be attached to the support rope after the concrete barrier units have been installed.

The wire rope net panels shall be attached to the support ropes with ¾ in. shackles spaced approximately 3 ft. apart. The chain link fence fabric, 12 ft. in height, shall be attached to the wire rope net with hog rings or twist ties. The area between two adjacent wire rope net panels shall be covered with chain link fence fabric. The layer of synthetic fabric, with a minimum height of 10 ½ ft., shall be attached to the chain link fence.

212-3.06 Move Temporary Rock Catchment Barrier. Move and reset the temporary rock catchment barrier in accordance with the requirements of §212-3.05 *Temporary Rock Catchment Barrier*.

212-4 METHOD OF MEASUREMENT

212-4.01 Wire Rope Rock Catchment Fence. Wire rope rock catchment fence will be measured as the number of linear feet of fencing, measured from center-to-center of end posts.

212-4.02 Chain Link Rock Catchment Fence. Chain link rock catchment fence will be measured as the number of linear feet of fence, measured along the top of the fence between the terminal posts. An allowance of 10 linear feet will be added for each terminal section anchorage and for each intermediate section anchorage installed.

212-4.03 Wire Mesh Slope Protection. Wire mesh slope protection will be measured as the number of square feet of rock face satisfactorily covered. No measurement will be made of wire mesh used in any overlap.

212-4.04 Wire Mesh Drape. Wire mesh drape will be measured as the number of square feet of rock face satisfactorily covered. No measurement will be made of wire mesh used in any overlap.

212-4.05 Temporary Rock Catchment Barrier. Temporary rock catchment barrier will be measured as the number of linear feet of barrier, measured along the centerline of the uppermost concrete barrier surface, from one end anchor to the other.

212-4.06 Move Temporary Rock Catchment Barrier. Moving temporary rock catchment barrier will be measured as the number of linear feet of barrier moved, measured along the centerline of the uppermost concrete barrier surface, from one end anchor to the other.

212-5 BASIS OF PAYMENT

212-5.01 Wire Rope Rock Catchment Fence. The unit price bid per linear feet for wire rope rock catchment fence shall include the costs of furnishing all labor, material and equipment necessary to complete the work.

212-5.02 Chain Link Rock Catchment Fence. The unit price bid per linear feet for chain link rock catchment fence shall include the costs of furnishing all labor, material and equipment necessary to complete the work.

212-5.03 Wire Mesh Slope Protection. The unit price bid per square feet for wire mesh slope protection shall include the costs of furnishing all labor, material and equipment necessary to complete the work, including anchor testing and disposal of any material removed from the slope.

212-5.04 Wire Mesh Drape. The unit price bid per square feet for wire mesh drape shall include the costs of furnishing all labor, material and equipment necessary to complete the work, including anchor testing and disposal of any material removed from the slope.

212-5.05 Temporary Rock Catchment Barrier. The unit price bid per linear feet for temporary rock catchment barrier shall include the costs of furnishing all labor, material and equipment necessary to erect, maintain, and remove the required barrier, including any required connection devices, end treatments, delineation or guiding devices, and devices for pinning and connecting temporary precast concrete barrier units.

After placement, 90% of the item unit price will be paid. The remaining 10% will be paid when the rock catchment barrier has been removed.

212-5.06 Move Temporary Rock Catchment Barrier. The unit price bid per linear feet for moving temporary rock catchment barrier shall include the costs of furnishing all labor, material and equipment necessary to remove, transport, erect, and maintain the required barrier, including any required connection devices, end treatments, delineation or guiding devices, and devices for pinning and connecting temporary precast concrete barrier units.

Movements necessary to maintain, realign, or replace damaged units will not be considered as moving temporary rock catchment barrier and shall be done at no additional cost to the State.

Payment will be made under:

Item No.	Item	Pay Unit
212.0106	Wire Rope Rock Catchment Fence (Medium Impact – 6 ft.)	Feet
212.0108	Wire Rope Rock Catchment Fence (Medium Impact – 8 ft.)	Feet
212.0110	Wire Rope Rock Catchment Fence (Medium Impact – 10 ft.)	Feet
212.0112	Wire Rope Rock Catchment Fence (Medium Impact – 12 ft.)	Feet
212.0201	Chain Link Rock Catchment Fence	Feet
212.0202	Vinyl Coated Chain Link Rock Catchment Fence	Feet

§302

212.03	Wire Mesh Slope Protection	Square Feet
212.04	Wire Mesh Drape	Square Feet

Section 300

BASES AND SUBBASES

SECTION 301 (VACANT)

SECTION 302 - BITUMINOUS STABILIZED COURSE

302-1 DESCRIPTION. This work shall consist of furnishing and placing a course of bituminous stabilized granular material and stabilized reclaimed asphalt pavement shoulder in conformance with this specification, the payment lines, and typical sections shown on the plans or as specified by the Engineer.

302-2 MATERIALS

302-2.01 General. The Contractor has the following options in furnishing a bituminous stabilized course:

Option A. Furnish a granular material conforming to the requirements of Option A under §302-2.03, mixed with an asphalt emulsion conforming to §702-3201. Requests to use any asphalt emulsion other than that specified must be approved by the Director, Geotechnical Engineering Bureau. The written request must state the type of asphalt emulsion for the proposed use and be accompanied by a sample (one quart minimum) of such. The Geotechnical Engineering Bureau will require at least fourteen days to act upon the request, after receipt of the request and the sample.

Option B. Furnish a 3/4, 1 or 1 1/2 inch hot mix asphalt (HMA), mixed and placed in conformance with the Materials and Construction Details specified in Section 402, Hot Mix Asphalt (HMA) Pavements, except as modified herein.

Option C. Furnish a granular material conforming to the requirements of Option C under §302-2.03, mixed with the appropriate P.G. Binder specified in the contract and placed in accordance with the requirements of Section 402 except as modified herein. The amount of P.G. Binder for this option will be as ordered by the Engineer, but shall range between 6 and 8 percent by weight. Unless otherwise indicated by a Special Note in the Proposal, this option will be permitted only in Nassau and Suffolk Counties.

Before any Bituminous Stabilized Course is prepared, the Contractor shall take one of the following two actions:

- Notify the Engineer in writing as to which option is selected to furnish material under. Only this option will then apply for the entire project unless written approval is received from the Engineer.
- Submit to the Engineer for approval, a plan of the project delineating the areas where each option will apply. Exceptions to the approved plan during the course of the work shall be subject to advance written approval by the Engineer.

302-2.02 Tests and Control Methods. Materials tests and quality control methods pertaining to the work of this Section will be performed in conformance with the procedures contained in the appropriate Department publications which are current on the date of advertisement for bids. These publications are available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau.

302-2.03 Granular Material Requirements for Options A and C. All borrow sources of granular materials for Options A and C shall be managed in accordance with the applicable provisions of Section 203, ~~Borrow~~ §203-3.16, ~~Borrow~~.

A. Gradation Requirements. The material for Options A and C shall conform to Table 302-1.

Comment [c30]:
E109024

B. Soundness. Granular materials will be accepted on the basis of a Magnesium Sulfate Soundness Loss after 4 cycles of 20 percent or less, unless other values are specified by a Special Note in the Proposal.

TABLE 302-1 GRADATION OF OPTIONS A & C, % PASSING BY WEIGHT								
Sieve Option	2 in	1 in	1/2 in	1/4 in	# 10	# 40	# 100	# 200
A	100			30-65		5-40		0-10
C		100	85-100	65-85	55-75	20-40	5-18	4-12

C. Plasticity Index. The plasticity index shall not exceed 5.0 for the granular material unless otherwise stated in the Proposal by a Special Note.

302-3 CONSTRUCTION DETAILS

302-3.01 Weather Limitations for Option A. This work will not be permitted on a subbase or subgrade containing frost, nor when the temperature of the surface on which the mixture is to be placed is below 45°F. All material placed under this section during any calendar year shall be mixed after March 1 of that year. No material shall be placed from the last Saturday of September to May 15, except with written permission of and under such special limitations and conditions as may be imposed by the Deputy Chief Engineer (Technical Services).

302-3.02 Equipment for Mixing Option A. All equipment for this work shall be subject to approval of the Engineer at all times. No work under this section will be permitted until all equipment and the processing facilities are established, inspected and approved.

Mixing shall be done with a rotating paddle shaft pugmill, providing suitable pressure-kneading action in mixing. Mixing by blading, shoveling and/or scooping will not be permitted.

The materials shall be mixed either at a central twin shaft pugmill mixing plant by the plant mix method, or on the roadbed (or some other area approved by the Engineer) by a traveling twin shaft pugmill, whichever equipment the Contractor elects to use.

The mixer shall be either a continuous or a batch type pugmill, designed to accurately proportion either by volume or by weight, so that when the granular material and bituminous material are incorporated in the mix, a thorough and uniform coating of the granular material will result. The pugmill mixer shall be provided with weighing, volumetric or other gauging equipment which shall be capable of providing accurate control at all times of the amount of granular material entering the mixer per time interval. The mixer shall be equipped to mechanically interlock the bituminous feed with the granular material feed, such that uniformity of the mixture is assured at all times. A water pump with meter shall be available to add water to the granular material, just prior to the addition of the bituminous material.

The mixer shall be equipped with a positive displacement meter for totalizing the quantity of bituminous material applied to the mixing chamber. A by-pass valve shall be placed on the bituminous line between the positive displacement meter and the spray bar in the pugmill to permit determination of the accuracy of the positive displacement meter. The Contractor shall furnish a clean 55 gallon drum having one end completely open, and a length of flexible hose to permit filling from the by-pass valve on the bituminous line.

Traveling pugmill mixing equipment shall not be operated at speeds greater than those recommended by the manufacturer for the depth of treatment and quantity of material used.

Where the materials are mixed at a central twin shaft pugmill mixing plant, the pugmill mixing chamber shall extend at least 4 feet beyond the last point where the granular material, binder, and water are fed into the mixer, so that all materials will be completely and thoroughly mixed in the pugmill for a distance of at least 4 feet. The pugmill paddles shall be of a type adjustable for angular position on the shaft, and shall be reversible to allow retardation of the flow of the mixer, in order to control the mixing time. A dam or baffle, if approved in writing by the Director, Geotechnical Engineering Bureau may be used for the purpose of retarding flow. A mechanically operated discharge hopper of at least 1 cubic yard

capacity shall be provided. Sufficient clearance for a ten wheel dump truck shall be provided beneath the discharge hopper to permit calibration.

302-3.03 Stockpiling and Sampling for Option A. Before mixing with the bituminous material, the granular material shall be stockpiled, sampled and tested for approval as stipulated in §302-2.02.

302-3.04 Mixing for Option A. The proportion of bituminous material that shall be mixed with the granular material will range between 16 and 19 gallons per cubic yard, loose (uncompacted) measure. The actual proportion within this range, however, shall not be less than that determined by the Geotechnical Engineering Bureau and specified by the Engineer after the stockpiled granular material is sampled and tested. In computing the rate of application, the loose measure volume shall be determined by level filling a truck, having a minimum capacity of 8 cubic yards, with granular material. No mixing will be allowed until the temperature of the granular material is 45°F or higher.

The moisture content of the granular material, based on the material passing 3/4 inch sieve, just prior to the addition of the bituminous material, shall be in the range of 4 to 8 percent. The acceptable moisture content within this range shall be determined by the Engineer.

All granular material removed from stockpiles for introduction into continuous twin shaft or traveling twin shaft pugmill mixers shall be by side excavation for the full height of the stockpile unless otherwise approved in writing by the Director, Geotechnical Engineering Bureau.

If mixed in a traveling plant, the method of transporting and introducing granular material from approved stockpiles into the mixer shall be as approved by the Engineer.

The application temperature of the bituminous material shall be designated by the Engineer and within the range specified in §702 for the bituminous material used.

After the granular material and bituminous material have been introduced into the pugmill, the mixing shall continue for a length of time necessary to uniformly coat the particles and to obtain a homogeneous mixture.

The discharge gates in a central plant shall not remain open during production of the stabilized mixture and shall only be opened in order to empty the hopper after the hopper becomes full. The discharged mixture may be immediately transported directly to the grade or stockpiles for later use.

The material shall be transported to the stockpile by dump truck haul. If the Contractor wishes to utilize a method other than dump truck haul to construct stockpiles, a request shall be submitted to the Director, Geotechnical Engineering Bureau. The request shall include the proposed method and type of equipment to be used.

Approval, if granted, will be based on the opinion of the Director, Geotechnical Engineering Bureau as to the capabilities of the proposal to provide a stockpile of uniformly mixed, uncontaminated material. If granted, such a waiver will remain in force only so long as all conditions for which the waiver is granted remain unchanged and a satisfactory material results.

302-3.05 Transporting, Spreading, Compacting and Finishing of Option A. If a central mixing plant is used, the mixture shall be transported from the mixing plant or stockpiles to the point of use in pneumatic tired vehicles, having tight bodies previously cleaned of all other materials. Approved mechanical spreading equipment shall be used for placing.

The mixture shall be spread in a thickness sufficient to produce the final compacted thickness shown on the plans. The maximum compacted thickness of any layer shall not exceed 4 inches.

After spreading, the mixture shall not be compacted until properly cured. Adequate curing shall be the responsibility of the Contractor, who shall take into account all factors, including weather and time of the year. Material that cannot be properly and adequately compacted to a stable condition shall be removed and replaced at no expense to the State. Compaction of the course shall be in accordance with the applicable provisions of §402-3.07, Compaction.

Successive layers shall not be placed until the underlying layer has been satisfactorily compacted and approved by the Engineer.

302-3.06 Traffic. The movement of highway traffic and construction equipment over this course may be permitted at locations designated by and in a manner under such restrictions as are ordered by the

§302

Engineer. Any damage occurring to the course as a result of traffic shall be repaired at no expense to the State as ordered by the Engineer.

302-3.07 Care of Adjoining Pavement. Where this course constitutes a base course for a shoulder, the Contractor shall organize the work and conduct the various operations so as to keep the surface of the adjacent pavement clean at all times, or shall bear the full expense of cleaning the pavement as ordered by the Engineer.

302-3.08 Tolerance. Where used as a base course supporting other pavement courses, the final surface elevation of this course shall not vary more than 1/4 inch above or below the design grade elevation at any location.

Where used as a shoulder base course, the surface elevation of this course shall not vary more than 1/4 inch above or below, true grade at any location.

302-3.09 Maintenance. The Contractor shall be required to maintain the bituminous stabilized course in good condition and in a manner satisfactory to the Engineer from the time work is begun until all work has been completed and accepted. Maintenance by the Contractor shall include immediate repairs of any defects, regardless of cause, that may occur.

302-3.10 Repairs. Repairs to the bituminous stabilized course shall be made in a manner that will assure restoration of a uniform surface and durability of the part repaired. A stabilized course that is either faulty, damaged or with low areas shall be repaired by replacing the stabilized course material to the full depth of treatment. When the extent of damage is essentially at the surface of the course and where the areas are low, the Contractor may elect to repair the course with a surface application of an approved, suitable, top course bituminous concrete mix, in lieu of a full depth material replacement.

302-4 METHOD OF MEASUREMENT. The quantity of Bituminous Stabilized Course to be measured for payment, will be the number of cubic yards of compacted material computed from the payment lines shown on the plans, the specifications, or as ordered by the Engineer.

302-5 BASIS OF PAYMENT. The unit price bid per cubic yard shall include the cost of furnishing all labor, materials and equipment, including bituminous material and water necessary to complete the work.

Any work by the Contractor required for the maintenance or repair of bituminous stabilized course prior to acceptance of the contract, shall be done at the Contractor's expense.

Payment will be made under:

Item No.	Item	Pay Unit
302.01	Bituminous Stabilized Course	Cubic Yard

SECTION 303 - OPTIONAL FLEXIBLE SHOULDER

303-1 DESCRIPTION. The work shall consist of furnishing and placing flexible shoulders where shown on the plans or where directed by the Engineer. The Contractor shall have the option of selecting from five (5) alternative flexible shoulder systems.

303-2 MATERIALS. Materials which shall be used and individual component course thickness are specified in the table below for the five options:

Material	Option 1	Option 2	Option 3	Option 4	Option 5
Asphalt Concrete Type 6, (Type 7 if Indicated on Plans) §403-2	1	1	1	3	-
Bituminous Stabilized Course §302-2 (opt A or C)	3	-	-	-	-
Asphalt Concrete Type 3, Binder Course, §403-2	-	-	2	-	3

Asphalt Concrete Type 1, Base Course, §403-2	-	3	-	-	-
Subbase Course §304-2	-	-	1	1	1

Where the adjacent pavement is asphalt concrete and the new overlay surface course is 1 1/2 inch thick, then the thickness of the surface course of the shoulder may be increased to 1 1/2 inch and the course of Bituminous Stabilized Course (option 1), Type 1 Base Course (option 2), or Type 3 Binder Course (option 3) may be decreased by 1/2 inch.

Material requirements and quality control methods pertaining to this work shall be as required under Sections 302, 304, and 403 in conformance with the procedures contained in appropriate Department publications in effect on the date of advertisement for bids.

303-3 CONSTRUCTION DETAILS. The construction details shall be the same as those in Subsections 302-3, 304-3 and 403-3. Under Options 3, 4 & 5, the Subbase Course material shall be placed at the same time as the underlying Subbase Course. For Option 5, vibratory compaction equipment appearing on the current “Approved List - Bituminous Concrete Vibratory Compaction Equipment” shall be required if the entire 3 inch lift of asphalt concrete Type 3 is to be placed as a single lift. For Option 4, the asphalt concrete shall be placed in two lifts.

303-4 METHOD OF MEASUREMENT. The quantity of Optional Flexible Shoulder shall be the number of square yards of satisfactorily completed shoulder computed from the payment lines on the plan or from revised payment lines established in writing by the Engineer.

303-5 BASIS OF PAYMENT. The unit price bid for this work shall include the cost of furnishing all labor, material and equipment necessary to complete the work.

When an asphalt concrete material is placed in one operation in both the shoulder and pavement area, a deduction from the weight delivered shall be made for the asphalt concrete placed in the shoulder. The quantity to be deducted will be determined by multiplying the computed volume of such material placed in the shoulder within the payment lines times a factor of 1.9 tons/cubic yard.

Payment will not be made for losses of material resulting from compaction, foundation settlement, erosion, or any other causes. The cost of such losses shall be included in the price bid for this item.

If the Contractor elects to use Options 3, 4 or 5, the cost of the additional 1 inch of subbase course material necessary to bring the section to grade shall be included in the price bid for this item.

If there is an asphalt price adjustment provision in the contract, the adjustment to be made shall be computed assuming a conversion factor of one hundredth (0.01) of a ton of asphalt per square yard of Optional Flexible Shoulder.

Payment will be made under:

Item No.	Item	Pay Unit
303.01	Optional Flexible Shoulder	Square Yard

SECTION 304 – SUBBASE COURSE

304-1 DESCRIPTION

304-1.01 General. The work consists of furnishing, placing and compacting a subbase course of the specified type in conformity with the lines, grades, thicknesses and typical sections shown in the contract documents.

304-1.02 Optional Type. When the Optional Type subbase item is specified, select any of the four (4) options as follows:

Option A. Subbase construction consisting of two (2) separate layers of Type 4 and Type 3 Subbase Course.

Option B. Subbase construction consisting of a single layer of Type 1 Subbase Course.

Option C. Subbase construction consisting of a single layer of Type 2 Subbase Course.

Option D. Subbase construction consisting of a single layer of Type 4 Subbase Course.

304-1.03 Definitions. Deleterious: Any material that does not consist of concrete, asphalt, glass, brick, stone, sand, gravel, blast furnace slag, or other materials deemed acceptable, when these materials are used in subbase in conformance with the specification requirements, OR any material which will adversely affect the performance of the product either during handling, during construction, or in its final application.

304-2 MATERIALS. Provide subbase material meeting the requirements of §733-04 *Subbase Course*.

Provide a subbase material meeting the specification requirements and is within the Contractor's capabilities to place and fine grade to the required tolerances. Should the subbase course become unstable at any time prior to the placement of the overlying course, correct the unstable condition at no additional cost to the State. Perform any required modification prior to placing the material on the grade.

RAP will not be allowed as an acceptable alternate to Types 1, 3 and 4 at intersection locations or in areas with a high percentage of truck traffic as shown in the contract documents, unless Portland Cement Concrete pavement is to be installed as part of the pavement structure. A high percentage of trucks is defined to be 10% or more. For interstates and other freeways, a DDHV of 250 vph is used to indicate a high percentage of trucks.

Earthwork construction operations performed from November 1st thru April 1st with an approved Winter Earthwork submittal as outlined in §203-3.01 A. *Winter Earthwork Submittal*, allows a transition period where standard earthwork materials can be used only if the air temperature, ground temperature, and material temperature are all above 32° F at the time of placement. This transition stipulation also applies to subbase material. However, when either the air temperature, ground temperature, or material temperature is at or below 32° F at the time of placement, the transition period ends and no subbase shall be placed regardless of material composition.

304-3 CONSTRUCTION DETAILS

304-3.01 General. Notify the Engineer in writing of which placement option, material option (if applicable) and/or material type is proposed for use, at least 14 calendar days prior to performing the work. If it is proposed that more than one option or type is to be used, submit a plan to the Engineer describing where each option or type is proposed for use. This plan must be approved by the Engineer prior to incorporating it into the project. The State reserves the right to disapprove the use of more than one option on a project. Use uniform subbase types and materials within the limits of the roadbed as defined in §101-02 *Definition of Terms*.

304-3.02 Placement

- Place the upper course material on the grade in a manner to minimize segregation, using equipment and procedures approved by the Engineer. Do not perform uncontrolled spreading from piles dumped on the grade.
- The maximum compacted layer thickness shall be as shown in the contract documents. In confined areas, the maximum compacted layer thickness is 6 in. The minimum loose lift thickness is 1.5 times the maximum particle size.
- Place Type 1 with a minimum compacted layer thickness of 6 in.
- Do not place Type 3 material within 4 in. of the bottom of a pavement course.
- Do not place materials blended with glass in contact with synthetic liners, geogrids, geotextiles or other geosynthetics. Ensure that glass incorporated into subbase is thoroughly mixed so that glass constitutes no more than 30 percent by weight anywhere in the subbase.
- When placing material under Option A, place and compact each material in a separate lift.

304-3.03 Compaction. When the moisture content is within the limits for proper compaction, compact the material in accordance with the requirements of §203-3.03 C. *Compaction*. Density tests are not required for the acceptance of these courses.

If a subbase course is disturbed by frost action prior to paving, re-compact the subbase.

304-3.04 Traffic and Contamination. The movement of highway traffic over the final surface of the subbase may be permitted at locations designated by, and under such restrictions as shown in the contract documents, provided such movements take place prior to the final finishing of this course to the specified tolerance. Do not allow highway traffic to move over subbase containing glass. The movement of construction equipment on this course may be permitted at locations designated by and under such restrictions as ordered by the Engineer. At locations where permission is granted for such movement, place and maintain the temporary surface of the course, upon which the construction traffic is running, at least 2 in. above the final surface of the course. Just prior to paving and after all construction traffic not required for the removal has ceased, remove the 2 in. protective layer, and prepare and compact the exposed surface of the course to the specified tolerance.

No payment will be made for furnishing, placing, maintaining, removing and disposing of the 2 in. thick protective layer. Include the cost thereof in the price bid for Subbase Course.

If the subbase is damaged or mixed with the subgrade or any other material due to the Contractor's operation, remove such material and replace it with the appropriate subbase material at no additional cost to the State.

304-3.05 Tolerance. Place Types 1, 2 or 4 so that after compaction the top surface of the course does not extend more than ¼ in. above nor more than ¼ in. below true grade for the course at any location. Place Type 3 course so that the finished surface does not extend above the true grade and surface for this course at any location.

304-4 METHOD OF MEASUREMENT

304-4.01 Subbase Course. The quantity is the number of cubic yards of material, computed from payment lines shown in the contract documents.

304-5 BASIS OF PAYMENT

304-5.01 Subbase Course. The unit price bid for this work includes the cost of furnishing all labor, material and equipment necessary to complete the work. Include the cost of adding water in the price bid unless the item for applying water is included in the contract. No direct payment will be made for losses of material resulting from compaction, foundation settlement, erosion, or any other cause. No deductions will be made for the volumes occupied by manholes, catch basins and other such objects.

No additional payment will be made for the protective layer, as stated in 304-3.04.

Progress payments will be made after the subbase course has been properly placed and compacted. Payment will be made at the unit price bid for 75% of the quantity. The balance of the quantity will be paid for after the final finishing to the required tolerance and just prior to the placing of the next course.

Payment will be made under:

Item No.	Item	Pay Unit
304.11	Subbase Course, Type 1	Cubic Yards
304.12	Subbase Course, Type 2	Cubic Yards
304.13	Subbase Course, Type 3	Cubic Yards
304.14	Subbase Course, Type 4	Cubic Yards
304.15	Subbase Course, Optional Type	Cubic Yards

SECTION 304 – SUBBASE COURSE

304-1 DESCRIPTION

Comment [c31]:
E109025

304-1.01 General. ~~The work consists of furnishing, placing and compacting a subbase course in conformity with the lines, grades, thicknesses and typical sections shown on the plans, or as determined by field conditions and ordered in writing by the Engineer.~~

304-1.02 Optional Type. ~~Unless otherwise stated in the plans or in the proposal, select any of the four options as follows:~~

~~**Option A.** Subbase construction consisting of two separate layers of Type 4 and Type 3 Subbase Course.~~

~~**Option B.** Subbase construction consisting of a single layer of Type 1 Subbase Course.~~

~~**Option C.** Subbase construction consisting of a single layer of Type 2 Subbase Course.~~

~~**Option D.** Subbase construction consisting of a single layer of Type 4 Subbase Course.~~

304-1.03 Definitions. ~~Deleterious: Any material that does not consist of concrete, asphalt, glass, brick, stone, sand, gravel or blast furnace slag, when these materials are used in subbase in conformance with the specification requirements, OR any material which, in the opinion of the Director, Geotechnical Engineering Bureau, may adversely affect the performance of the product either during handling, during construction, or in its final application.~~

304-2 MATERIALS

304-2.01 Test and Control Methods. ~~The Department will perform materials tests and quality control methods pertaining to the work of this section in conformance with the procedures contained in the appropriate Departmental publications which are current on the date of advertisement for bids. These publications are available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau.~~

304-2.02 Material Requirements. ~~Provide suitable material conforming to the requirements of Section 203 and to the requirements contained herein.~~

~~— Provide a subbase material which meets the specification material requirements and is within the Contractor's capabilities to place and fine grade to the required tolerances. Should the subbase course become unstable at any time prior to the placement of the overlying course, correct the unstable condition to the satisfaction of the Engineer at no additional cost to the State. Perform any required modification prior to placing the material on the grade.~~

~~— If used, glass shall conform to the applicable paragraph of Section 203.~~

~~— If Recycled Portland Cement Concrete Aggregate (RCA) is used and it comes from other than a Department of Transportation project, provide documentation showing that the material obtained is from a NYSDEC registered or permitted construction and demolition (C&D) debris processing facility as specified in Section 360-16.1 of 6NYCRR Part 360, "Solid Waste Management Facilities".~~

~~— If Blast Furnace Slag is to be used, provide documentation showing that it has undergone a NYSDEC beneficial use determination (BUD) prior to its use as specified in 6NYCRR Part 360-1.15, "Solid Waste Management Facilities".~~

~~— For Types 1, 3 and 4 furnish materials consisting of approved Blast Furnace Slag, Stone, Sand, and Gravel, or blends of these materials with not more than 30 percent by weight of glass. Alternately, the following materials are also acceptable under these types as a replacement for the materials mentioned above:~~

~~— *Alternate A.* At least 95 percent, by weight, of Recycled Portland Cement Concrete Aggregate (RCA), and free from organic and other deleterious material. This material may contain up to 5% by weight asphalt and/or brick.~~

~~— *Alternate B.* A mixture of Recycled Portland Cement Concrete Aggregate (RCA) conforming to Alternate A above mixed with stone, sand, gravel or blast furnace slag. This material may contain up to 5% by weight asphalt and/or brick.~~

~~—Alternate C. Bituminous material that is reclaimed from bituminous pavement and/or shoulders (Reclaimed Asphalt Pavement, or RAP) on a project constructed by the Department of Transportation and is well graded from coarse to fine and free from organic or other deleterious material, including tar. This material is at least 95 percent, by weight, reclaimed bituminous material and has a maximum top size, at time of placement, of 2 inches. The gradation requirements for the different Types listed below do not apply when the material consists of RAP. No soundness or Plasticity Index testing will be required for this Alternate.~~

~~—If, in the opinion of the Regional Geotechnical Engineer, this material becomes unstable during construction, it may be necessary to add a mixture of natural suitable material to the RAP. Acceptance of the final product shall be based on an evaluation by the Regional Geotechnical Engineer. Provide written documentation that the reclaimed bituminous material originated on a Department of Transportation project. Include an identifier, such as State Highway, Construction Contract or Departmental Project Identification Number (PIN).~~

~~—For Type 2, furnish materials consisting of approved Blast Furnace Slag or of Stone which is the product of crushing or blasting ledge rock, or a blend of Blast Furnace Slag and of Stone.~~

~~**A. Gradation.**—Gradation shall conform to Table 304-1.~~

TABLE 304-1 PERCENT PASSING BY WEIGHT				
Sieve Size Designation	Type			
	1	2	3	4
4 inch	-	-	100	-
3 inch	100	-	-	-
2 inch	90-100	100	-	100
1/4 inch	30-65	25-60	30-75	30-65
No. 40	5-40	5-40	5-40	5-40
No. 200	0-10	0-10	0-10	0-10

~~**B. Soundness.**—Material for Types 1, 2 and 4 will be accepted on the basis of Magnesium Sulfate Soundness Loss after four cycles of 20 percent or less, unless material meeting the requirements of Alternate C (304-2.02) is used. Material for Type 3 will be accepted on the basis of a Magnesium Sulfate Soundness Loss after four cycles of 30 percent or less.~~

~~**C. Plasticity Index.**—The required Plasticity Index of the material passing the No. 40 sieve is 5.0 or less.~~

~~**D. Elongated Particles.**—A flat or elongated particle is defined herein as one which has its greatest dimension more than three times its least dimension. Provide material consisting of particles where not more than 30 percent, by weight, of the particles retained on a 1/2 inch sieve are flat or elongated. When the State elects to test for this requirement, material with a percentage greater than 30 will be rejected. Acceptance for this requirement will normally be based on a visual inspection by the Engineer.~~

~~**304-2.03 Stockpiling.**—Stockpile all material except as noted herein.~~

~~A. Material furnished under Type 3 will not be required to be stockpiled unless it contains RCA or glass.~~

~~B. Stockpiling of the reclaimed bituminous material for Alternate C is not required.~~

~~—Stockpile construction requirements, sampling, testing and acceptance/rejection procedures are stipulated in the appropriate Departmental publication.~~

304-2.04 Material for Temporary Work.—Material used as a subbase for the construction of temporary work may be approved by a Departmental Geotechnical Engineer by visual inspection in accordance with the procedure in the current Departmental publication. Do not incorporate material so approved into the final project without following the appropriate acceptance procedure for the item of intended use.

304-3 CONSTRUCTION DETAILS

304-3.01 General.—Notify the Engineer in writing of which placement option, material option (if applicable) and/or material type is proposed for use, at least 14 calendar days prior to performing the work. If it is proposed that more than one option or type is to be used, submit a plan to the Engineer describing where each option or type is proposed for use. This plan must be approved by the Engineer prior to incorporating it into the project. The State reserves the right to disapprove the use of more than one option on a project. Use uniform subbase types and materials between the roadbed limits.

304-3.02 Placement

- Place the upper course material on the grade in a manner to minimize segregation, using equipment and procedures approved by the Engineer. Do not perform uncontrolled spreading from piles dumped on the grade.
- The maximum compacted layer thickness is 15 inches, or as shown on the plans. In confined areas as defined by the Engineer the maximum compacted layer thickness is 6 inches. The minimum loose lift thickness is 1.5 times the maximum particle size.
- Place Type 1 with a minimum compacted layer thickness of 6 inches.
- Do not place Type 3 material within 4 inches of the bottom of a pavement course.
- Do not place materials blended with glass in contact with synthetic liners, geogrids, geotextiles or other geosynthetics. Ensure that glass incorporated into subbase is thoroughly mixed so that glass constitutes no more than 30 percent by weight anywhere in the subbase.
- When placing material under Option A, place and compact each material in a separate lift.

304-3.03 Compaction.—When the moisture content is within the limits for proper compaction, compact the material in accordance with the requirements of §203-3.12, Compaction. Density tests are not required for the acceptance of these courses.

—If a subbase course is disturbed by frost action prior to paving, re-compact the subbase where directed by the Engineer.

304-3.04 Traffic and Contamination.—The movement of highway traffic over the final surface of the subbase may be permitted at locations designated by, and under such restrictions as ordered by the Engineer, provided such movements take place prior to the final finishing of this course to the specified tolerance. Do not allow highway traffic to move over subbase containing glass. The movement of construction equipment on this course may be permitted at locations designated by and under such restrictions as ordered by the Engineer. At locations where permission is granted for such movement, place and maintain the temporary surface of the course, upon which the construction traffic is running, at least 2 inches above the final surface of the course. Just prior to paving and after all construction traffic not required for the removal has ceased, remove the 2 inches protective layer, and prepare and compact the exposed surface of the course to the specified tolerance.

—No payment will be made for furnishing, placing, maintaining, removing and disposing of the 2 inches thick protective layer. Include the cost thereof in the price bid for Subbase Course.

—If, in the opinion of the Engineer, the subbase is damaged or mixed with the subgrade or any other material due to the Contractor's operation, remove such material and replace it with the appropriate subbase material at no additional cost to the State.

~~**304-3.05 Tolerance.**— Place Types 1, 2 or 4 so that after compaction the top surface of the course does not extend more than 1/4 inch above nor more than 1/4 inch below true grade for the course at any location. Place Type 3 course so that the finished surface does not extend above the true grade and surface for this course at any location.~~

~~**304-4 METHOD OF MEASUREMENT**~~

~~**304-4.01 Subbase Course.**— The quantity is the number of cubic yards of material, computed from payment lines shown on the plans or, where changes have been ordered, from payment lines established by the Engineer.~~

~~**304-5 BASIS OF PAYMENT**~~

~~**304-5.01 Subbase Course.**— The unit price bid for this work includes the cost of furnishing all labor, material and equipment necessary to complete the work. Include the cost of adding water in the price bid unless the items for furnishing and applying water are included in the contract. No direct payment will be made for losses of material resulting from compaction, foundation settlement, erosion, or any other cause. Include the cost of such losses in the price bid for this item. No deductions will be made for the volumes occupied by manholes, catch basins and other such objects.~~

~~— No additional payment will be made for the protective layer, as stated in 304-3.04.~~

~~— Progress payments will be made after the subbase course has been properly placed and compacted. Payment will be made at the unit price bid for 75 percent of the quantity. The balance of the quantity will be paid for after the final finishing to the required tolerance and just prior to the placing of the next course.~~

~~*Payment will be made under:*~~

SECTIONS 305 AND 306 (VACANT)

SECTION 307 - HYDRATED LIME STABILIZED SUBGRADE

307-1 DESCRIPTION. Hydrated lime stabilized subgrade shall consist of the in-place subgrade soil mixed uniformly with hydrated lime and moistened, compacted and cured in accordance with these specifications, the plans and as specified by the Engineer.

307-2 MATERIALS

307-2.01 Lime Stabilization. Materials for lime stabilization shall meet the requirements of the following:

Water	712-01
Hydrated Lime	712-04

Hydrated lime which has slaked prior to mixing, for any reason, shall not be incorporated in the work.

307-2.02 Surface Treatment. When a surface treatment is required to protect the completed lime stabilized course as specified in §307-3.11, the materials for surface treatment shall meet the following requirements:

§307

Asphalt Emulsion - (RS-2) 702-3101
Coarse Aggregate - 1A size 703-02

307-3 CONSTRUCTION DETAILS

307-3.01 Equipment. No work will be permitted until all necessary equipment is on hand, inspected and approved by the Engineer.

A. Scarifiers. A grader-scarifier, heavy disc harrow, heavy plow or rotary pulverizing mixer shall be used for the initial scarification of the soil. The equipment shall be capable of scarifying the soil to the full depth of stabilized treatment.

B. Mixers. A rotary pulverizing mixer or heavy plow shall be used for all mixing of the hydrated lime with the subgrade soil. The use of a heavy plow will be permitted only if the rotary pulverizing mixer is not capable of adequately mixing the lime-soil mixture to the full depth of treatment. Rotary mixers shall be equivalent to the Seaman Duo-Stabilizer Model DS730 or the Brothers Master Mixer Model LSPRM84A.

C. Lime Spreaders. Spreading equipment shall be capable of uniformly distributing the lime without excess loss and at a specified rate.

D. Compactors. Compaction equipment shall be selected as specified in [Section 203](#), ~~Compaction~~ [§203-3-12, Compaction](#).

E. Shaping. Shaping of the stabilized course shall be accomplished with a motor-grader or equivalent equipment capable of shaping the surface to the required tolerances specified.

F. Finish Rolling. A smooth steel wheel tandem roller weighing between 8 to 10 tons shall be used for the finish rolling.

G. Water Equipment. Water shall be added to the soil with a pressure distributor or other suitable equipment capable of uniformly distributing the required amount.

307-3.02 Weather Limitations. Lime stabilization of the subgrade shall not be done when the subgrade temperature is below 40°F, nor in the period from October 15 to May 15, except by written permission of and under such special limitations as set forth by the Deputy Chief Engineer (Technical Services). The hydrated lime shall not be mixed with frozen subgrade soil or when the subgrade contains frost. Lime shall not be applied when wind conditions, as determined by the Engineer, are such that blowing lime becomes objectionable or hazardous to traffic, workers, and adjacent property owners.

307-3.03 Protection and Safety. Before lime is spread, the Contractor shall take necessary precautions and provide necessary equipment to protect all personnel and adjacent properties from lime dust created by the lime application and mixing operations. Safety goggles and lightweight filter masks shall be provided by the Contractor to all working personnel and shall be worn at all times during these operations.

307-3.04 Preparation of Foundation. Prior to the addition of any lime to the subgrade, the area to be stabilized shall be graded and shaped in close conformity to the typical sections, lines and grades as shown on the plans or as specified by the Engineer. Where the depth of lime stabilization exceeds 6 inches, the subgrade soil in excess of the 6 inches depth shall be removed, placed in windrows and processed as an additional lift.

307-3.05 Scarifying. The subgrade soil shall be scarified 6 inches deep to the width required for stabilization. The scarified material shall be partially pulverized by making one pass through the area with a pulverizing rotary mixer. The pulverizing portion of the scarifying operation may be deleted in some

Comment [c32]:
EI09024

areas, where, as determined by the Engineer, the subgrade soils are excessively wet and sticky so that pulverizing with a rotary mixer is impractical.

307-3.06 Application of Lime. The hydrated lime shall be applied to the scarified material by an approved method and at the rate stipulated in the plans or as specified by the Engineer. A lime slurry, applied by an approved method and suitable equipment, will be permitted. Spreading equipment shall uniformly distribute the lime without excess loss. No equipment except that used for spreading and mixing shall be permitted to pass over the spread lime until it is mixed. The Engineer may require the spread lime to be sprinkled with water to reduce dusting.

307-3.07 Primary Mixing. After the required amount of lime has been uniformly spread, it shall be mixed into the subgrade to the full depth of treatment using a traveling rotary mixing machine or heavy plow. A minimum of three passes will be required to assure uniform incorporation of the hydrated lime. Water shall be added at the rate of up to 500 gallons/ton of lime as required for the proper consistency.

The primary mixing operation shall be completed within four hours after application of the lime. At this time, all of the lime shall be thoroughly and uniformly incorporated into the subgrade to the full depth of treatment in such a manner that the result is a homogeneous, friable mixture of subgrade soil and lime, free from clods or lumps exceeding 2 inches in size. Where the required depth of stabilization exceeds 6 inches, the windrowed material in excess of the 6 inches depth shall be spread to the required lift thickness and processed, by the addition of lime and primary mixing, as specified for the first layer. Each additional layer, where required, shall be processed similarly.

Immediately after the primary mixing operations are completed for the full depth of treatment, the surface of the subgrade shall be shaped and lightly sealed with a pneumatic tired or smooth steel wheel roller. The surface shall be crowned so as to properly shed water if rain occurs.

307-3.08 Curing. Following primary mixing operations, the stabilized course shall be allowed to cure for at least 24 hours plus any additional time required for the lime to properly react with the subgrade soil. Curing periods in excess of 24 hours shall be as determined and specified by the Engineer. During the curing period, the surface of the material shall be kept moist to prevent drying and cracking, and maintained in a properly sealed and crowned condition as specified by the Engineer.

307-3.09 Secondary Mixing. Immediately after the completion of the curing period, the stabilized course shall again be completely mixed and pulverized to the full depth of stabilization by a rotary pulverizing mixer. Secondary mixing shall continue for at least three passes or until, as determined by the Engineer, the material is properly mixed and blended. Adjustments in water content shall be made during the secondary mixing operation to obtain the proper moisture content required for compaction.

307-3.10 Compaction, Shaping and Finishing. Compaction of the mixture shall begin immediately after completion of the secondary mixing operations and after the proper moisture content for compaction has been obtained. Compaction shall be in accordance with the requirements of [Section 203, *Compaction*](#) ~~§203-3.12, *Compaction*~~. After compaction and shaping, the surface of the course shall be finished-rolled by a smooth steel wheel tandem roller weighing between 8 to 10 tons. The secondary mixing, compaction, shaping and finishing operations shall be completed within eight hours after the start of the secondary mixing.

The surface of the finished stabilized subgrade course shall not extend above design grade at any location.

The thickness of the complete hydrated lime stabilized subgrade will be determined from measurements made in test holes located at random intervals not to exceed 500 feet. The measured thickness shall not deviate from that shown on the plans or specified by the Engineer, by more than plus 1 1/2 inches or minus 1 inch. Areas of hydrated lime stabilized subgrade not meeting the specified thickness requirements shall be reconstructed.

The subbase course material shall be placed and compacted within two days after the lime stabilized subgrade course has been compacted, shaped and finished at that location. The surface of the treated subgrade shall be kept continuously moist up to the time of subbase material placement.

Comment [c33]:
E109024

§307

307-3.11 Surface Treatment Option. The Contractor may elect to defer placement of the subbase materials up to two weeks by placing a bituminous membrane, cationic asphalt emulsion, over the treated subgrade. The bituminous membrane must be placed within two days after the stabilized subgrade has been compacted and finished. The stabilized subgrade must be kept continuously moist prior to application of the bituminous membrane. The bituminous material shall be applied at a uniform rate of ~~0.2 gal/sy~~ ~~0.02 gallons/square yard~~ of treated subgrade. Where traffic is to operate on the treated subgrade, the bituminous membrane shall be chipped with a uniform coating of Size 1A aggregate applied at a rate of 15 lb/sy of treated subgrade.

307-4 METHOD OF MEASUREMENT

307-4.01 Hydrated Lime Stabilized Subgrade. The quantity of hydrated lime stabilized subgrade to be paid for will be the number of cubic yards of lime stabilized subgrade computed within the payment lines shown on the plans or otherwise specified in writing by the Engineer.

307-4.02 Furnishing and Applying Hydrated Lime. The quantity of hydrated lime to be paid for will be the number of tons of hydrated lime furnished and applied. Lime that has slaked prior to application and additional lime applied because of reduced lime content resulting from excessive thickness of the lime stabilized layer will not be measured for payment.

307-5 BASIS OF PAYMENT

307-5.01 Hydrated Lime Stabilized Subgrade. The unit price bid per cubic yard shall include the cost of furnishing all labor, equipment and materials necessary to complete the work, except that furnishing and applying water and hydrated lime will be paid for separately. No payment will be made for the asphalt emulsion or 1A stone chips, nor for any maintenance, repairs or reconstruction of the stabilized subgrade made before acceptance, nor for any losses of material which may result from compaction, erosion or any other causes.

307-5.02 Furnishing and Applying Hydrated Lime. The unit price bid for hydrated lime shall include the cost of all material, labor and equipment necessary to furnish, store, handle and apply hydrated lime in accordance with these specifications.

Payment will be made under:

Item No.	Item	Pay Unit
307.01	Hydrated Lime Stabilized Subgrade	Cubic Yard
307.02	Furnishing and Applying Hydrated Lime	Ton

SECTION 308 - SOIL CEMENT COURSE

308-1 DESCRIPTION. This work shall consist of furnishing and placing a course of Portland cement stabilized soil in accordance with these specifications and in reasonably close conformance to the lines, grades, and typical sections shown on the plans or as ordered by the Engineer.

308-2 MATERIALS. Materials used for this item shall conform to the following Sections of these Specifications:

Portland Cement, Type 2	701-01
Asphalt Emulsion (RS-2)	702-3101
Coarse Aggregate - 1A size	703-02
Water	712-01
Calcium Chloride	712-02

Soil shall be graded from coarse to fine, free of topsoil, organic matter, and substances deleterious to the normal hardening of the soil cement mixture, and shall be subject to the approval of the Engineer at all

times. The soil will be sampled by the Engineer prior to use and submitted to the Geotechnical Engineering Bureau to determine both its suitability and the cement content to be used. Frozen soil or soil containing frost shall not be used.

The soil material shall be stockpiled, sampled and tested before mixing in conformance with material tests and quality control methods contained in the appropriate Department publications which are current on the date of advertisement for bids. These publications are available upon request to the Regional Director or the Director, Geotechnical Engineering Bureau.

308-3 CONSTRUCTION DETAILS

308-3.01 Equipment. No work under this item will be permitted until all equipment and facilities involved are established, inspected and approved by the Engineer.

The materials shall be mixed in a central twin-shaft pugmill mixing plant or mixed on the roadbed by a traveling pugmill, whichever equipment the Contractor elects to use. Traveling pugmill mixing equipment shall not be operated at speeds greater than those recommended by the manufacturer for the depth of treatment and quantity of materials to be mixed.

Where the materials are mixed in a central twin-shaft pugmill mixing plant, the mixing area of the pugmill shall extend at least 4 feet beyond the last point where the soil, cement, or water are fed into the mixer, so that all materials will be completely and thoroughly mixed in the pugmill for a distance of at least 4 feet. The paddles of the pugmill shall be adjustable for angular position on the shaft, and shall be reversible to retard the flow of mixture in order to control the mixing time. Where the materials are mixed at a central twin-shaft mixing plant, a hydraulically or mechanically operated discharge hopper of at least 1 cubic yard capacity shall be provided. Sufficient clearance for a ten-wheel dump truck shall be provided underneath the hopper.

The central mixer shall be either a continuous or batch type pugmill, and shall be designed to accurately proportion the mix either by volume or by weight. The pugmill mixer shall be provided with weighing, volumetric or other gauging equipment, which shall be capable of providing accurate control at all times of the amounts of soil and cement entering the mixer per time interval. The mixer shall be equipped with a method of mechanically interlocking the cement feed with the soil feed so that uniformity of the mixture will be assured at all times. A water pump and meter arrangement shall be available for addition of water to the soil and cement. The water supply line shall have a 90° T connection with a valve immediately downstream of the flow meter for calibration purposes. The meter shall be calibrated at least once a year under the direction of Department personnel.

A smooth steel wheel roller and a self-propelled pneumatic tired or self-propelled vibratory compactor shall be used for compaction. The minimum number of passes shall be determined by the Engineer, after field tests, and shall be such as to produce the specified minimum density for the full depth of the course. Cleated or tracked equipment will not be permitted on the soil cement course. In areas inaccessible to pneumatic tired compactors, or where maneuvering space is limited, impact rammers and/or vibratory equipment may be used provided the required density is obtained.

Equipment suitable for storing, handling, weighing, measuring, proportioning, controlling and applying or spreading the cement shall be used.

Equipment suitable for accurately metering, controlling and applying the water shall be used. If a pugmill mixer is used, all necessary water for mixing shall be added in the pugmill. If a rotary mixer is permitted and used, water for mixing shall be added through a spray bar in the mixing chamber.

308-3.02 Weather Limitations. Soil Cement Course shall not be placed between October 15 and May 15 nor when the air temperature in the shade is 40°F or lower. Soil cement course shall not be placed upon a frozen surface.

308-3.03 Preparation of Foundation. Before soil cement operations are begun, the area upon which the soil cement course is to be placed shall be graded, shaped, and compacted as required in conformance with the grades, lines, thicknesses and typical sections shown on the plans or as ordered by the Engineer.

The subgrade and any preceding course shall be compact and suitable to support the construction and compaction equipment without settlement or displacement. Soft or yielding subgrade shall be corrected and made stable before the soil cement course is placed.

308-3.04 Application of Calcium Chloride and Cement. Where required by a Special Note in the Proposal, the specified quantity of calcium chloride ordered by the Engineer in flake form shall be uniformly added to the soil before adding the cement.

Portland cement, in the amount ordered by the Engineer, shall be added uniformly to the soil material. The amount of cement ordered by the Engineer will range generally between 8 percent and 10 percent by weight.

The percentage of moisture in the soil, at the time of cement application, shall not exceed the quantity that will permit a uniform mixture of soil and cement during mixing operations and shall not exceed the optimum moisture content for the soil cement mixture, as determined by the Engineer.

Where a traveling pugmill mixer is used, cement that has been displaced or removed from the windrow regardless of cause, shall be replaced before mixing is started, at the Contractor's expense.

308-3.05 Mixing and Spreading. Immediately prior to mixing, the soil shall have a minimum temperature of 40°F. After the cement has been applied to the soil, it shall be immediately mixed with the soil. Mixing shall continue until the cement has been thoroughly blended with the soil to prevent the formation of cement balls when the water is applied. Immediately after the soil and cement have been thoroughly mixed, the full amount of water shall be applied uniformly and mixing shall be continued until an intimate and homogeneous blend of soil, cement and water has been obtained.

When water application and mixing have been completed, the percentage of moisture in the mixture based on oven-dry weights, shall not be below, nor more than 2 percent above, the specified optimum moisture content determined by the Engineer.

In order to minimize segregation of the mix, the discharge gates shall be kept closed until the hopper is filled to at least one-half of its capacity. After the hopper is emptied, the gates shall be closed until the hopper is refilled. The material shall then be discharged into clean trucks and transported directly to the grade.

The soil cement shall be spread on an accepted subgrade or preceding course immediately after mixing. If mixed in a central plant, approved mechanical spreading equipment shall be used and not more than 30 minutes shall elapse between the time of mixing the cement and the start of the compaction operation.

In case of rain between the time of adding cement and final finishing, the Engineer shall be the sole judge of what areas involved are satisfactory and what areas are not acceptable. Areas not acceptable to the Engineer shall be removed to the full depth of the soil cement course and properly replaced at the Contractor's expense for all labor, materials and equipment involved.

308-3.06 Compaction. Prior to the beginning of compaction, the mixture shall be in a loose condition for its full depth on the subbase course. As an immediate continuation of mixing operations, and after an initial breakdown pass with a smooth steel wheel roller, the loose mixture then shall be uniformly compacted, by a self-propelled pneumatic tired or self propelled vibratory compactor, to the specified density. All areas and portions of this course shall be thoroughly and uniformly compacted for the full thickness of the course to a minimum dry density of 95 percent of the maximum density. During compaction, water shall be applied to the surface as determined and ordered by the Engineer, to maintain the optimum moisture content.

308-3.07 Finishing. During the compaction operations, shaping will be required to obtain the required surface and cross-section. During shaping operations it may be necessary to lightly scarify and broom-drag the surface in order to remove ridges or depressions in excess of the permitted tolerance. The resulting surface shall then be rolled with a smooth steel wheel roller, weighing not less than ~~10 tons~~^{nine metric tons}, or pneumatic tire rollers, or both. The final rolling shall be done by a smooth steel wheel roller. Several applications of water may be required to keep the surface at the proper moisture content, as ordered by the Engineer, during the finishing operation. Water shall be applied by the pressure spray bar method. Compaction and finishing shall be done in such a manner as to produce, in not longer than 2 1/2 hours after completion of mixing, a smooth, dense surface, free of surface compaction planes, cracks, ridges or loose material. Immediately after rolling, the surface of the course shall be tested for trueness, transversely and longitudinally. The finished surface of the course shall not extend above, nor be greater

than 1/2 inch below, true grade and surface at any location. Surface finishing shall be completed in daylight hours.

Any portion of this course which has a density less than that specified shall be corrected or removed and replaced to its full depth to meet these specifications, at the Contractor's expense.

308-3.08 Construction Joints. At the end of each day's construction, a straight transverse and/or longitudinal construction joint shall be formed by cutting back into the completed work to form a true vertical face, which shall be properly maintained until the abutting section is completed.

308-3.09 Curing and Surface Treatment. After the soil cement course has been finished as specified herein, it shall be continually protected against drying by the application of water, until the bituminous seal is applied. At least 48 hours shall elapse between the completion of the finishing operations and the application of the bituminous seal.

At the time the bituminous seal is applied, the soil cement surface shall be dense, free of all loose and extraneous material, and shall contain sufficient moisture to prevent penetration of the bituminous material. Water shall be applied in sufficient quantity to fill the surface voids of the soil cement immediately before the bituminous seal is applied. The bituminous seal shall be uniformly applied to the surface of the completed soil cement at the rate of approximately 0.15 to 0.30 gal/sy with approved heating and distributing equipment. The exact rate and temperature of application to give complete coverage without excessive run-off will be as determined and ordered by the Engineer. No traffic, nor placement of an overlying course, will be permitted over the soil cement course within 5 days from the application of the bituminous seal. Where this course is utilized for maintaining traffic, the application of the bituminous material shall be immediately followed by the application of approved cover aggregate of 1A size at the rate of 20 to 30 lb/sy. The aggregate will be broomed and rolled as ordered by the Engineer.

When the air temperature may be expected to reach the freezing point, sufficient protection from freezing shall be given the soil cement for 7 days after its construction and until it has hardened to the satisfaction of the Engineer.

308-3.10 Traffic. No traffic or hauling equipment other than that necessary for sealing, chipping or for placing the next course will be permitted over this course, unless specifically permitted by a Special Note in the Proposal.

308-3.11 Maintenance. The Contractor shall be required, within the limits of the contract, to maintain the soil cement in good condition and in a manner satisfactory to the Engineer from the time he first starts work until all work has been completed and accepted. Maintenance by the Contractor shall include immediate repairs of any defects, regardless of cause, that may occur. This work shall be done by the Contractor at its own expense, and repeated as often as may be necessary to keep the course continuously intact. Repairs are to be made in a manner to insure restoration of a uniform surface and durability of the part repaired. Faulty and damaged work, regardless of cause, shall be replaced for the full depth of the course by the Contractor at its own expense. Any low areas, regardless of cause, shall be remedied by replacing the material for the full depth of the course and not by adding a thin layer of soil cement to the completed work.

308-4 METHOD OF MEASUREMENT. The quantity to be paid for under this item will be the number of cubic yards of material computed within the payment lines shown on the plans or otherwise ordered in writing by the Engineer, and completed in accordance with the plans and specifications. The thickness of the surface treatment will not be included in the volume measured for payment.

308-5 BASIS OF PAYMENT. The unit bid price per cubic yard for this item will include the cost of furnishing all labor, equipment and materials necessary to complete the work, except that furnishing Portland cement, calcium chloride (where required), bituminous material, water equipment and applying water, will be paid for separately under their respective items.

No direct payment will be made for any maintenance, repairs and replacements made before acceptance, nor for any losses of material which may result from shrinkage, compaction, foundation

§308

settlement, waste, overflow, erosion, leakage or any other causes: the cost of such will be included in the price bid for this item.

Payment will be made under:

Item No.	Item	Pay Unit
308.01	Soil Cement Course	Cubic Yard

Section 400

HOT MIX ASPHALT

SECTION 401 - PLANT PRODUCTION

401-1 DESCRIPTION. The contractor is responsible for Quality Control (QC). QC is defined as all activities required to produce HMA that meets all specification requirements. The contractor will incorporate a Quality Control system for all plant production of hot mix asphalt (HMA) and assume responsibilities for all QC activities at the production facilities.

The contractor shall produce the HMA according to the specifications herein and provide production documentation. Quality Adjustment Factors (QAFs) will be used to assess HMA production quality and these factors will be applied to calculate a quality payment adjustment.

The State is responsible for Quality Assurance (QA). QA is defined as all activities performed by the State to assure that HMA production meets the specification requirements. The State will determine quality payment adjustments for each day's production using a daily QAF obtained from the calculations of the average absolute values for volumetric and non-volumetric mixes in accordance with Materials Procedure (MP) 401, Quality Control and Quality Assurance Procedures for Quality Control Hot Mix Asphalt Production. The daily QAFs measure production variation from the mean of the specification limits.

401-2 MATERIALS. The provisions of §402-2, Materials, apply and are as modified herein. Produce HMA in accordance with the requirements outlined in this specification, including all applicable Test Methods and Materials Procedures. HMA mixture designs must be acceptable to the State prior to any HMA production.

The State reserves the right to suspend any mixture design when the mixture demonstrates unacceptable paving quality or exhibits properties that will affect the anticipated pavement performance.

401-2.01 Hot Mix Asphalt Designs. Produce HMA in accordance with the procedures outlined in NYSDOT's Materials Method (MM) 5.16, Superpave Hot Mix Asphalt Mixture Design and Mixture Verification Procedures.

Formulate and submit a HMA design to the Regional Materials Engineer (RME) that satisfies all design criteria outlined in MM 5.16. When the submitted HMA design is assigned verification status, the design must be verified during production as outlined in MM 5.16. Notify the RME at least 24 hours prior to the start of verification status production. When producing under Verification Status, make necessary adjustments to control the process. Apply daily QAFs to both verification and production status mix designs. Mixtures produced under Verification Status, as outlined in MM 5.16, are allowed for use on State projects.

For any HMA permeable base and shim mixtures required by the contract documents, formulate and submit to the RME a job mix formula that satisfies the General Limits imposed by Table 401-1, Composition of Hot Mix Asphalt Mixtures.

401-2.02 Aggregates. Aggregate must be from a source approved by the State. Use fine aggregate that consists of materials conforming to the requirements of §703-01, Fine Aggregate. In addition, fine aggregate may consist of screenings, free from deleterious materials and manufactured from sources of stone, gravel, or slag meeting the requirements of §703-02, Coarse Aggregate.

Use coarse aggregate that consists either of crushed stone, crushed gravel, or crushed slag conforming to the requirements of §703-02, Coarse Aggregate and the requirements outlined in MM 5.16.

Use slag aggregate on State projects only when an alternate pay item which takes the mix yield differential into account is included on the plans or in the itemized proposal.

When coarse aggregates for the mixture are from more than one source or of more than one type of material, proportion and blend them to provide a uniform mixture.

SECTION 401 - PLANT PRODUCTION

TABLE 401-1 COMPOSITION OF HOT MIX ASPHALT MIXTURES						
Mixture Requirements	Permeable Base				Shim	
	Type 1		Type 2		Type 5

Mixing and Placing Temperature Range °F	225-300		225-300		250-325	

NOTES:

1. All aggregate percentages are based on the total weight of the aggregate.
2. The asphalt content is based on the total weight of the mix. When using slag aggregates in the mix, the asphalt content shall be increased accordingly, a minimum of 25 percent for an all slag mix.
3. Use the PG binder listed in the proposal or as designated by the Region Materials Engineer following the guidance specified in the Comprehensive Pavement Design Manual, Chapter 6, Section 6.2.5 – Performance Graded Binder Selection.

A. Coarse Aggregate Type F1 Conditions

1. Limestone, dolomite or a blend of the two having an acid-insoluble residue content of not less than 20.0%.
2. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.
3. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:

- a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 30.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 95.0% of plus 3/8 inch particles must be non-carbonate.
- b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 30.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 95.0% of plus No. 4 particles must be non-carbonate.

B. Coarse Aggregate Type F2 Conditions

1. Limestone, dolomite, or a blend of the two having an acid-insoluble residue content of not less than 20.0%.
2. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.
3. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:

- a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 3/8 inch particles must be noncarbonate.
- b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus No. 4 particles must be noncarbonate.

C. Coarse Aggregate Type F3 Conditions

1. Limestone or a blend of limestone and dolomite having an acid-insoluble residue content of not less than 20.0%.
2. Dolomite.
3. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.
4. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:

- a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 3/8 inch particles must be noncarbonate.
- b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus No. 4 particles must be noncarbonate.

D. Coarse Aggregate Type F9 Conditions. Use coarse aggregate meeting the requirements of §703-02, Coarse Aggregate.

401-2.03 Mineral Filler. Mineral filler will conform to the requirements of §703-08, Mineral Filler.

401-2.04 Performance-Graded Binder. Use the Performance-Graded Binder (PG Binder) in the production of these mixtures that meets Section 702 – Bituminous Materials.

Initial acceptance of the PG Binder is based on the primary source appearing on the State's Approved List for Bituminous Material Primary Sources, A. Performance-Graded Binders for Paving. Acceptance of the PG Binder is contingent upon satisfactory test results from samples taken, as required by the State's procedural directives, at the location where the material is incorporated into the work. A primary source is defined as a firm that samples, tests, and certifies by Production Lot that the PG Binder is in conformance with the specifications. The procedural directives for sampling, testing, and certifying the PG Binder, and for achieving and maintaining approved list status, are available from the Materials Bureau.

The temperature of PG Binder delivered to the HMA Production Facility will not exceed 350°F, unless the PG Binder supplier recommends it.

401-2.05 Reclaimed Asphalt Pavement. Reclaimed Asphalt Pavement (RAP) will meet the requirements as written in MM 5.16.

401-3 CONSTRUCTION DETAILS.

SECTION 401 - PLANT PRODUCTION

401-3.01 Quality Control. Perform all sampling and testing in accordance with Materials Procedure 401. Document all QC test results and records in a legible manner and provide them to the State at the end of each production season or when requested by the RME. HMA produced without the required sampling, testing and documentation may be rejected.

401-3.02 Production Facility Laboratory. Maintain an approved production facility site laboratory to perform all required HMA sampling and testing according to MP 401.

401-3.03 Plant Lots and Sublots. Determine plant lots and sublots on a daily basis in accordance with MP 401.

401-3.04 Quality Control Sampling and Testing. Obtain and test QC samples as outlined in MP 401.

401-3.05 Production Control. Produce HMA according to MP 401. Make necessary process control adjustments during production according to MP 401.

401-3.06 Production Quantities. Whenever production is made for the State, notify the Regional Materials office by 3:00 p.m. the day before the day of production.

Maintain a record of each day's production quantity for each mix design supplied to the project site daily. Retain these records at the production facility. These records must be available to the State's representative for review. Ship all production quantities to the project site as outlined in §401-4 Method of Measurement.

401-3.07 Documentation. Record all QC test data for each plant on the appropriate forms provided by the State according to MP 401. Also, keep a copy of the plant automation printout at the plant facility for each mix type produced and make them available for review at all times. Transmit a summary of all test data weekly to the RME.

401-3.08 HMA Mixing Plant. HMA mixing plants must meet the requirements in MP 401.

401-3.09 Hot Mix Asphalt Holding Bins. HMA mixtures may be held in holding bins which meet the requirements in MP 401.

401-4 METHOD OF MEASUREMENT. Determine the quantities daily for each plant. The quantity is the number of actual tons determined from the automated proportioning system, the delivery vehicle weigh system, or the HMA holding bin weigh system. Measure or calculate the quantity based on the measured amount and report to the nearest 0.01 of a ton.

A delivery ticket indicating the total quantity in tons being delivered must accompany each delivery vehicle supplying HMA. The method of determining the delivered quantity is subject to the approval of the RME. Make one legible copy of the delivery ticket available to the State's paving inspector prior to the placement of the mixture. The delivery ticket shall show the following minimum information:

- Ticket number
- Plant identification
- Contract number
- SiteManager Mix ID (as outlined in MP 401)
- Mix Code (as outlined in MP 401)
- Quantity of material in vehicle
- Date and Time

The quality assurance technician (QAT) will determine the quality adjustment factor (QAF) for each day's production in accordance with MP 401 and this section.

The Engineer will use the Daily QAF to calculate the quality payment adjustment for each day's production according to 402-4 Method of Measurement.

401-4.01 Certified Production, Production Less Than 500 Tons, and Highway Permit Production. Production meeting the specification requirements will be assigned a QAF of 1.00. Production failing to meet the specification requirements will be subject to evaluation according to 401-4.03 Evaluation of Sublots Represented by 0.85 QAF.

401-4.02 Production Greater Than 500 Tons. The QAT will determine each Sublot QAF according to MP 401 and this section. Sublots represented by a 0.85 QAF will be subject to evaluation according to 401-4.03 Evaluation of Sublots Represented by 0.85 QAF.

The Daily QAF will be calculated according to the following formula:

$$\text{Daily QAF} = \frac{[(\text{Tonnage} * \text{QAF})_{\text{Sublot A}} + (\text{Tonnage} * \text{QAF})_{\text{Sublot B}} + \text{etc.}]}{\text{Total Tonnage Produced}}$$

The Daily QAF applies to all production quantity deemed acceptable by the Engineer. A sublot represented by a 0.85 QAF will only be included in the Daily QAF calculation if determined that it will be left in place.

A. Sublot QAF Based on Air Voids (volumetric top and binder course mix designs). The QAT will determine each Sublot QAF based on Table 401-2, Sublot QAF Based on Air Voids and Table 401-3, Pre-Qualification for Incentive Based on Air Voids.

TABLE 401-2 SUBLOT QAF BASED ON AIR VOIDS	
Absolute Difference Value (Test Value - 3.5)¹	Quality Adjustment Factor (QAF)
0.00 - 0.17	1.05 ²
0.18 - 0.33	1.04 ²
0.34 - 0.50	1.03 ²
0.51 - 0.67	1.02 ²
0.68 - 0.83	1.01 ²
0.84 - 1.00	1.00
1.01 - 1.10	0.99
1.11 - 1.20	0.98
1.21 - 1.30	0.97
1.31 - 1.40	0.96
1.41 - 1.50	0.95
1.51 - 1.60	0.94
1.61 - 1.70	0.93
1.71 - 1.80	0.92
1.81 - 1.90	0.91
1.91 - 2.00	0.90
over 2.00	0.85

1. For 6.3 mm mix - Absolute Difference Value is (Test Value - 4.0).
2. A sublot QAF of 1.00 will be assigned if any of the QC or QA gradation or asphalt content test results for the sublot exceed the maximum tolerances listed in Table 401-3 - Pre-Qualification for Incentive Based on Air Voids. When there are not any QC or QA gradation results for a sublot, use the nearest results, in terms of tonnage, to determine the sublot's eligibility for incentive payment.

SECTION 401 - PLANT PRODUCTION

TABLE 401-3 PRE-QUALIFICATION FOR INCENTIVE BASED ON AIR VOIDS	
Test Property	Difference From Target Value
Gradation – Sieve # 200 (% passing)	± 3.0 %
Gradation – Sieve # 8 (% passing)	± 8.0 %
Gradation – Sieve # 4 (% passing)	± 8.0 %
Asphalt Binder Content (%)	± 0.2% ¹

1. Asphalt binder content, based on automation, cannot be more than 0.1% below the minimum design requirement in MM 5.16 for the appropriate nominal maximum aggregate size. If the binder content is below the minimum design requirement, the QCT must make necessary adjustments to increase the binder content to the minimum required and should strive to meet the mix design target value.

B. Sublot QAF Based on Gradation (37.5 mix and non-volumetric mix designs). For each job mix formula sieve having a design target value less than 90 percent passing, the QAT will determine the Sieve QAF based on Table 401-4, Sieve QAF and Table 401-5, Pre-Qualification for Incentive Based on Gradation. The Sublot QAF will be the same as the lowest Sieve QAF for the subplot if any Sieve QAF is less than 1.00. If all Sieve QAFs for the subplot are equal to or greater than 1.00, the Sublot QAF will be the same as the highest Sieve QAF.

TABLE 401-4 SIEVE QAF			
PERCENT PASSING			
Absolute Difference Value (Test Value - JMF Target Value)			Quality Adjustment Factor (QAF)
Sieve Size #50 and Larger	Sieve Size #80 and #100	Sieve Size #200	
0.0 - 0.8	0.0 - 0.5	0.0 - 0.3	1.05 ¹
0.9 - 1.5	0.6 - 1.0	0.4 - 0.5	1.04 ¹
1.6 - 2.3	1.1 - 1.5	0.6 - 0.8	1.03 ¹
2.4 - 3.0	1.6 - 2.0	0.9 - 1.0	1.02 ¹
3.1 - 4.5	2.1 - 3.0	1.1 - 1.5	1.01 ¹
4.6 - 6.0	3.1 - 4.0	1.6 - 2.0	1.00
6.1 - 6.2	4.1 - 4.2	2.1	0.99
6.3 - 6.4	4.3 - 4.4	2.2	0.98
6.5 - 6.6	4.5 - 4.6	2.3	0.97
6.7 - 6.8	4.7 - 4.8	2.4	0.96
6.9 - 7.0	4.9 - 5.0	2.5	0.95
7.1 - 7.2	5.1 - 5.2	2.6	0.94
7.3 - 7.4	5.3 - 5.4	2.7	0.93
7.5 - 7.6	5.5 - 5.6	2.8	0.92
7.7 - 7.8	5.7 - 5.8	2.9	0.91
7.9 - 8.0	5.9 - 6.0	3.0	0.90
over 8.0	over 6.0	over 3.0	0.85

1. A subplot sieve QAF of 1.00 will be assigned if any of the QC or QA asphalt content test results for the subplot exceed the maximum tolerance listed in the Table 401-5 - Pre-Qualification for Incentive Based on Gradation, below.

TABLE 401-5 PRE-QUALIFICATION FOR INCENTIVE BASED ON GRADATION	
Test Property	Difference From Target Value
Asphalt Binder Content (%)	± 0.2 ¹

1. Asphalt binder content, based on automation, cannot be more than 0.1% below the minimum design requirement in MM 5.16 for the appropriate nominal maximum aggregate size. If the binder content is below the minimum design requirement, the QCT must make necessary adjustments to increase the binder content to the minimum required and should strive to meet the mix design target value.

401-4.03 Evaluation of Sublots Represented by 0.85 QAF. When any material results in a QAF of 0.85, the Engineer will evaluate the subject material to determine if it will be left in place. The Engineer may require the Contractor to core the pavement to determine if the in-place density is acceptable. When cores are required, the Engineer will divide the pavement area being evaluated into 4 sublots. Follow the requirements of Section 402-3.08, Pavement Density Samples, at no cost to the State. The material will be left in-place when either of the following sets of conditions is met.

- The calculated plant air voids used for payment are greater than 5.5% and less than or equal to 7.0%, the asphalt content, based on automation, is within 0.2% of the production target, the contractor achieved field density of 92% to 97%, and there are no defects such as, but not limited to, cracking, raveling, rutting, shoving, or bleeding.
- The calculated plant air voids used for payment are greater than or equal to 1% and less than 1.5%, the validated QC and QA plant air void test results, according to MP 401, average 1.5% to 5.5%, the asphalt content, based on automation, is within 0.2% of the production target, the contractor achieved field density of 92% to 97%, and there are no defects such as, but not limited to, cracking, raveling, rutting, shoving, or bleeding.

If the material does not meet the above conditions or it is unknown, such as for mixes accepted based on gradation or if QA testing was not required, the Engineer will determine if the material in question may remain in-place considering, but not limited to, the following:

- Type of material produced
- The layer in which the material was placed
- The location and traffic volume
- Laboratory test results
- Field test results, such as density

If the subject material is left in-place, it will be assigned a Sublot QAF of 0.85 and be included in the Daily QAF calculation. If determined the subject material will not be left in-place, the Contractor shall remove and replace the material at no cost to the State and the material will not be included in the Daily QAF calculation.

SECTION 401 – PLANT PRODUCTION

401-1 DESCRIPTION. ~~The contractor is responsible for Quality Control (QC). QC is defined as all activities required to produce HMA that meets all specification requirements. The contractor will incorporate a Quality Control system for all plant production of hot mix asphalt (HMA) and assume responsibilities for all QC activities at the production facilities.~~

~~—The contractor shall produce the HMA according to the specifications herein and provide production documentation. Quality Adjustment Factors (QAFs) will be used to assess HMA production quality and these factors will be applied to calculate a quality payment adjustment.~~

~~—The State is responsible for Quality Assurance (QA). QA is defined as all activities performed by the State to assure that HMA production meets the specification requirements. The State will determine quality payment adjustments for each day's production using a daily QAF obtained from the calculations~~

Comment [c34]:
EI09-006

of the average absolute values for volumetric and non-volumetric mixes in accordance with Materials Procedure (MP) 96-02, Quality Control and Quality Assurance Procedures for Quality Control Hot Mix Asphalt Production. The daily QAFs measure production variation from the mean of the specification limits.

401-2 MATERIALS. The provisions of §402-2, Materials, apply and are as modified herein. Produce HMA in accordance with the requirements outlined in this specification, including all applicable Test Methods and Materials Procedures. HMA mixture designs must be acceptable to the State prior to any HMA production.

— The State reserves the right to suspend any mixture design when the mixture demonstrates unacceptable paving quality or exhibits properties that will affect the anticipated pavement performance.

401-2.01 Hot Mix Asphalt Designs. Produce HMA in accordance with the procedures outlined in NYSDOT’s Materials Method (MM) 5.16, Superpave Hot Mix Asphalt Mixture Design and Mixture Verification Procedures.

— Formulate and submit a HMA design to the Regional Materials Engineer (RME) that satisfies all design criteria outlined in MM 5.16. When the submitted HMA design is assigned verification status, the design must be verified during production as outlined in MM 5.16. Notify the RME at least 24 hours prior to the start of verification status production. When producing under Verification Status, make necessary adjustments to control the process. Apply daily QAFs to both verification and production status mix designs. Mixtures produced under Verification Status, as outlined in MM 5.16, are allowed for use on State projects.

— For any HMA permeable base and shim mixtures required by the contract documents, formulate and submit to the RME a job mix formula that satisfies the General Limits imposed by Table 401-1, Composition of Hot Mix Asphalt Mixtures.

401-2.02 Aggregates. Aggregate must be from a source approved by the State. Use fine aggregate that consists of materials conforming to the requirements of §703-01, Fine Aggregate. In addition, fine aggregate may consist of screenings, free from deleterious materials and manufactured from sources of stone, gravel, or slag meeting the requirements of §703-02, Coarse Aggregate.

— Use coarse aggregate that consists either of crushed stone, crushed gravel, or crushed slag conforming to the requirements of §703-02, Coarse Aggregate and the requirements outlined in MM 5.16.

— Use slag aggregate on State projects only when an alternate pay item which takes the mix yield differential into account is included on the plans or in the itemized proposal.

— When coarse aggregates for the mixture are from more than one source or of more than one type of material, proportion and blend them to provide a uniform mixture.

TABLE 401-1 COMPOSITION OF HOT MIX ASPHALT MIXTURES						
Mixture Requirements	Permeable Base				Shim	
	Type 1		Type 2		Type 5	
Screen Sizes	General Limits % Passing[†]	Job Mix Tolerance %	General Limits % Passing[†]	Job Mix Tolerance %	General Limits % Passing[†]	Job Mix Tolerance %

No. 40	-	-	-	-	18-52	±7
No. 80	-	-	-	-	7-26	±4
No. 200	0-4	±2	-	-	2-12	±2
Asphalt Content, % ^{2,3}	2.0-4.0	NA	2.5-4.5	NA	7.0-9.5	NA
Mixing and Placing Temperature Range °F	225-300		225-300		250-325	

NOTES:

- 1.— All aggregate percentages are based on the total weight of the aggregate.
- 2.— The asphalt content is based on the total weight of the mix. When using slag aggregates in the mix, the asphalt content shall be increased accordingly, a minimum of 25 percent for an all slag mix.
- 3.— Use a PG binder appropriate for the project location as specified in Table 6-4 of the Comprehensive Pavement Design Manual.

A. Coarse Aggregate Type F1 Conditions

1. Limestone, dolomite or a blend of the two having an acid insoluble residue content of not less than 20.0%.

2. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.

3. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:

a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 30.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 95.0% of plus 3/8 inch particles must be non-carbonate.

b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 30.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 95.0% of plus No. 4 particles must be non-carbonate.

B. Coarse Aggregate Type F2 Conditions

1. Limestone, dolomite, or a blend of the two having an acid insoluble residue content of not less than 20.0%.

2. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.

3. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:

a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 3/8 inch particles must be noncarbonate.

b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus No. 4 particles must be noncarbonate.

C. Coarse Aggregate Type F3 Conditions

~~1. Limestone or a blend of limestone and dolomite having an acid-insoluble residue content of not less than 20.0%.~~

~~2. Dolomite.~~

~~3. Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.~~

~~4. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:~~

~~a. 12.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 3/8 inch particles must be noncarbonate.~~

~~b. 9.5 Nominal Maximum Size Aggregate Mixes. Noncarbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus No. 4 particles must be noncarbonate.~~

~~**D. Coarse Aggregate Type F9 Conditions.**—Use coarse aggregate meeting the requirements of §703-02, Coarse Aggregate.~~

~~**401-2.03 Mineral Filler.**—Mineral filler will conform to the requirements of §703-08, Mineral Filler.~~

~~**401-2.04 Performance Graded Binder.**—Use the Performance Graded Binder (PG Binder) in the production of these mixtures that meets the AASHTO MP1—Standard Specification for Performance Graded Asphalt Binder.~~

~~—Initial acceptance of the PG Binder is based on the primary source appearing on the State's Approved List for Bituminous Material Primary Sources, A. Performance Graded Binders for Paving. Acceptance of the PG Binder is contingent upon satisfactory test results from samples taken, as required by the State's procedural directives, at the location where the material is incorporated into the work. A primary source is defined as a firm that samples, tests, and certifies by Production Lot that the PG Binder is in conformance with the specifications. The procedural directives for sampling, testing, and certifying the PG Binder, and for achieving and maintaining approved list status, are available from the Materials Bureau.~~

~~—The temperature of PG Binder delivered to the HMA Production Facility will not exceed 350°F, unless the PG Binder supplier recommends it.~~

~~**401-2.05 Reclaimed Asphalt Pavement.**—Reclaimed Asphalt Pavement (RAP) will meet the requirements as written in MM 5.16.~~

~~401-3 CONSTRUCTION DETAILS.~~

~~**401-3.01 Quality Control.**—Perform all sampling and testing in accordance with procedures supplied by or approved by the State. Document all QC test results and records in a legible manner and provide them to the State at the end of each production season or when requested by the RME. HMA produced without the required sampling, testing and documentation may be rejected.~~

~~**A. Control Plan.**—Provide a control plan for each HMA mixing plant. Only one control plan is needed when more than one plant is located at the same site. Identify all plants at the site in the control plan.~~

~~—List the personnel associated with HMA production, including the names and their functions necessary to implement the QC program. Include in the list, the control plan administrator, designated assistant, QC personnel, and phone numbers. Assume the responsibility of administration of the control plan.~~

—Submit the control plan to the RME for initial approval at least 15 working days prior to HMA production for the State from the facility. After the control plan has been assigned initial approval, submit a statement outlining the control plan status to the RME each subsequent year at least 15 working days prior to any HMA production. Also, submit amendments to the control plan, or personnel changes for approval annually prior to production and as changes occur during the construction season. The State reserves the right to suspend production in the event the control plan is not followed. Control plan guidelines are available from the RME.

7

B. Quality Control Organization

1. Plan Administrator. The plan administrator is a representative of the HMA manufacturer and will have full authority to institute all operations of the control plan. The plan administrator is responsible to ensure all requirements are in conformance with the specification. The plan administrator's signature will be legally binding. One plan administrator is allowed to be responsible for multiple production locations. An assistant plan administrator may be designated in the absence of the plan administrator. The plan administrator or assistant must be available to communicate with the State personnel at all times. The State reserves the right to stop production when the plan administrator or designee is not available. In addition, the plan administrator is responsible for the following:

- a. Location and control of friction aggregate stockpiles.
- b. Outlining testing frequencies, testing procedures, and documentation procedures.
- c. Periodic verification during production that the proper friction aggregate and the correct amount of friction aggregate is being included into the State mixes as outlined in NYSDOT's Materials Method (MM) 28, Friction Aggregate Control and Test Procedures.
- d. Documentation of all friction related activities (e.g. corrections to problems, modifications to friction aggregate mix controls and routine friction aggregate inspections during production) on NYSDOT form BR 303 Quality Control Daily Diary.

2. Quality Control Technician (QCT). The QCT must possess a current New York Construction Materials Association Certification or its equivalent, as determined by the Director, Materials Bureau.—The production facility must have a sufficient number of QCTs to perform QC sampling and testing, but at least one certified QCT at each production facility site. Non-certified technicians may be utilized to augment the certified QCT. HMA production is not acceptable unless the certified QCT is present during production. A certified QCT is not required to be present for HMA production of 150 tons or less, if approved by the RME. Technicians associated with private testing organizations must meet the requirements specified above.—The State reserves the right to stop plant production in the event unacceptable technician performance is noted. The RME or representative will immediately inform the plan administrator regarding the reasons for stopping production operations.—The State may require the HMA manufacturer to replace unacceptable technicians before HMA production is allowed to continue.

401-3.02 Production Facility Laboratory.—Maintain an approved production facility site laboratory to perform all required HMA sampling and testing. All sampling and testing equipment must meet the requirements pertaining to test procedures detailed in this specification. Unless otherwise outlined in the MM 5.16, calibrate all testing equipment requiring calibration annually and certify that all testing equipment meets the required operational tolerances. The State will perform verification of the production facility site laboratory and testing equipment annually. Additional verification will be performed when deemed necessary. Make laboratory sampling and testing equipment available to the State's QA personnel. The requirements specified in §401-3.08 A.13, Inspection Facilities, apply.

401-3.03 Plant Lots and Sublots. Determine plant lots and sublots on a daily basis in accordance with MP 96-02.

— A plant lot is defined as the quantity in tons of HMA produced per plant for each mix design in one day. When different mix designs are produced on the same day, then each mix design represents a separate plant lot. For each mix design produced, number the plant lots consecutively (1-200) throughout the production season starting with the number one at the beginning of each calendar year's production and increase the lot number by one for each day's production.

— Plant lots are subdivided into sublots and are based on anticipated daily production. A subplot is defined as a portion of a plant lot not to exceed 1250 tons. When production exceeds 1250 tons and the excess is not greater than 150 tons, incorporate the excess into the previous subplot. Sublots are assigned a consecutive letter (A-E) and begins with "A" each production day.

— QC testing is allowed on any portion of a plant lot, including any production less than 150 tons, as documented in the Control Plans, when an option of testing quantities less than 150 tons is selected.

— QC testing is not required on the first or last 150 ton portion of a lot. This testing exclusion does not apply for lots greater than 150 but less than 300 tons, retest samples, or any sample obtained when production is terminated before the anticipated production for that plant lot. When a lot is greater than 150 but less than 300 tons, obtain a sample from the portion greater than 150 tons.

— When production stops before a subplot sample is obtained, incorporate the untested subplot quantity into the previous subplot of the same day. If there is no previous subplot to incorporate it into, the untested subplot quantity is considered a plant lot and the QAF for that amount will be 1.00. Do not incorporate untested subplot quantities into any subsequent or previous day's plant lot production. When production stops after a subplot sample is obtained and the quantity is less than 1250 tons, it is still considered a subplot.

— A retest may be performed on any portion of a plant subplot providing the retest sample is obtained after the required random sample. The retest sample does not have to be obtained randomly. When a subplot is retested, average the absolute difference test value from the retest sample with the required random sample's absolute difference test value. This average represents the subplot's test value in the calculation of the daily QAF. When a retest is performed, document all actions on NYSDOT form BR303, Quality Control Plant Diary.

— When the daily plant lot quantity is between 150 tons and 500 tons, report the daily QAF as 1.00 providing the required QC sample yields a QAF between 0.90 and 1.00. If the required test result yields a QAF greater than 1.00, report the actual QAF. If the required test result yields a QAF less than 0.90, the State will evaluate the subject production in accordance with procedures outlined in §401.4, Method of Measurement.

A. Certified Lot Production.— HMA production without the required QC testing is allowed to be certified for plant lot quantities of 150 tons or less. Certified plant lots have a QAF of 1.00. All certified production must meet the requirements outlined in this specification. Obtain friction aggregate samples as outlined in MM 28 for all certified production placed in pavement courses requiring friction aggregate. Transmit BR-307, Quality Control HMA Certification, to the Project Engineer on a daily basis for the quantity of certified production.

B. Volumetric Mixture Storage.— When volumetric mixtures are stored prior to delivery, incorporate the stored quantity into the plant lot associated with the date of delivery. If there is no production to incorporate into, consider the stored quantity a new plant lot.

C. Non-Volumetric Mixture Storage.— When non-volumetric mixtures are stored prior to delivery, incorporate the stored quantity into the plant lot associated with the date of production. The lot number and daily QAF determined during production will be associated with the stored quantity.

D. Night Production.— During night production, associate the plant lots as specified in this subsection. If continuously producing for a calendar day or more, the plant lot will be defined when the plant's employee shift change occurs. Notify the RME which option will be used at least one day prior to any production of this type.

~~E. Highway Permit Production.~~—HMA production supplied to highway permit projects will meet all requirements outlined in this specification. Quality payment adjustments are not applicable. However, all HMA production placed is subject to rejection as outlined in §401-2 Materials.

~~401-3.04 Quality Control Sampling and Testing.~~—Obtain QC samples as outlined in MP 96-02. The QCT will perform QC sampling and testing meeting the requirements outlined in §401-3.01 B. 2, Quality Control Technician. The State will determine Daily QAFs using the QCT's test results as outlined in §401-3.03 and §401-3.04.

—QC test procedures are verified by the Quality Assurance Technician (QAT), a State's representative, on a random basis by split sample testing. The QC sample is split into two representative samples and individually tested by the QCT and the QAT. The QAT's test results are compared to the QCT's test results.

—The QCT/QAT test results must be within the allowable tolerances outlined in Table 401-2, Allowable Split Sample Testing Tolerances.

Test Property	Tolerance	
	Within Lab	Lab to Lab
Gradation — \geq No. 40 Sieve	$\pm 5.0\%$	$\pm 7.0\%$
Gradation — $<$ No. 40 Sieve	$\pm 2.0\%$	$\pm 3.0\%$
Bulk Specific Gravity	± 0.020	± 0.028
Maximum Specific Gravity	± 0.011	± 0.019

—When the test results exceed the allowable tolerance, perform a split sample retest on the test property that exceeded the allowable tolerance. The retest must be performed on the day the material is produced or delivered. When the retest exceeds the allowable tolerance, the State will terminate the production and all QC test results up to this point will be used to determine the daily QAF. Production is not allowed until the RME is satisfied that the cause for the excessive deviation in the split sample verification is resolved.

—Obtain all required HMA samples, including the maximum specific gravity and a composite aggregate (hot bin) split sample. Obtain a minimum of one aggregate split sample per day for each mix type produced. Prepare the HMA specimens and reduce the aggregate split sample to testing size in accordance with MM 5.16. Dry the composite aggregate samples and air dry the compacted specimens and the maximum specific gravity samples prior to packaging. Package hot bin aggregate samples separately by hot bins and retain all samples together. Identify and retain all the samples at the production site for a minimum of ten (10) business days. The identification of the retained samples will include the facility number, production date, plant lot, subplot, and mix description.

—Unless directed by the RME, discard all retained specimens and samples at the end of the specified time period. The State reserves the right to witness any or all QC sampling and testing, and test any or all retained samples.

—Perform all sampling and testing using test procedures and frequencies outlined in Table 401-3, Quality Control Sampling and Testing.

~~A. Random Sampling.~~—Obtain QC samples for aggregate and HMA randomly using the procedures outlined in MP 96-02. Random sample numbers may be re-selected to accommodate changes in anticipated production quantity. Obtain other required QC samples as outlined in B. Quality Control Testing, and Table 401-3, Quality Control Sampling and Testing.

~~B. Quality Control Testing~~

~~1. Aggregate Gradation.~~—Perform the aggregate gradation analysis using the procedures outlined in AASHTO T 27, Standard Method of Test for Sieve Analysis of Fine and Coarse

Aggregate. An ignition furnace can be used to prepare samples for an aggregate gradations analysis using the procedures outlined in Test Method NY 400-13C.

a. Volumetric Design Mixes. Perform an aggregate gradation analysis on every other subplot produced. Perform a minimum of one gradation analysis per day for each HMA mix design used for production. Determine aggregate consensus properties and specific gravities at the beginning of each production season and subsequently at the midpoint of the production season using test methods outlined in MM 5.16. Coarse aggregate specific gravity may be determined on a composite aggregate blend in lieu of testing each aggregate size designation (i.e., 1A's, 1's, and 2's).

TABLE 401-3 QUALITY CONTROL SAMPLING AND TESTING			
Plant Test Property	Sample Location	Test Method	Quality Control Frequency
Aggregate Gradation	NYSDOT MM 5.0	AASHTO T27	Note 1
Aggregate Moisture ⁶	NYSDOT MM 5.0	NYSDOT MM 5.0	1 every other subplot Minimum 2 per day
Air Voids ³	NYSDOT MM 5.0	AASHTO T166 & T209 MM 5.16M	1 per subplot
Mix Moisture ^{2,4}	NYSDOT MM 5.0	NYSDOT MM 5.0	1 minimum per day
Mix Temperature	Plant and Haul Vehicle	N/A	Routinely, minimum 4 per day
Asphalt Binder Content	NYSDOT MM 5.0	NYSDOT MM 5.0	Routinely, minimum 4 per day/mix
RAP Binder Content	NYSDOT MM 5.0	NYSDOT MM 5.0 NY 400-13C	2 per week
RAP Gradation	NYSDOT MM 5.0	AASHTO T 27	2 per week
RAP Moisture	NYSDOT MM 5.0	NYSDOT MM 5.0	1 per day
Asphalt Binder Sampling ⁵	NYSDOT MM 8.1	NYSDOT MM 8.1	1 per day
Friction Aggregate	NYSDOT MM 28	NYSDOT MM 28	As outlined in MM 28

NOTES:

1. Volumetric design mixes — one test every other subplot, minimum one per day.
- Non-Volumetric design mixes — one test every subplot.
2. Required for drum mix plants, or as requested by the RME for batch plants.
3. Required for volumetric design mixes.
4. Required for batch and drum mix plants when producing recycled mixes.
5. The State is responsible for sample submission.
6. Required for drum mix plants only.

b. Non-Volumetric Design Mixes. Perform an aggregate gradation analysis on every subplot for each HMA mix design used for production.

2. Air Void Analysis – Volumetric Design Mixes. Perform an air void analysis for each subplot of volumetric HMA mix design used for production. Use HMA samples obtained from the delivery vehicle. When holding bins are used for storage, perform the air void analysis on HMA samples taken after storage. Perform the air void analysis using procedures outlined in MM 5.16. — When performing the air void analysis, use Table 401-4, Allowable Specimen Tolerance Range, to determine if sample specimens are valid for analysis. The Allowable Specimen Tolerance Range listed in Table 401-4 is applicable to all QC and retest samples. The difference

between the specimen test results should not exceed the tolerance range values in Table 401-4. If the results exceed the allowable tolerance range, the specimens are not valid and the test results will not be used in the calculation of the daily QAF.

TABLE 401-4 ALLOWABLE SPECIMEN TOLERANCE RANGE			
Mix Types	All Mix Types except the 37.5 Maximum Sp.Gr		37.5
Number of Specimens	Bulk Sp.Gr.	Maximum Sp.Gr.	Maximum Sp.Gr.
2	.020	.011	.019
3	.023	-----	-----
4	.025	-----	-----

—When a plant lot consists of one subplot and the test specimen value exceeds the allowable tolerance, perform a retest. If production is terminated before a retest sample can be obtained, the QAF for that plant lot will be reported as 1.00. When a plant lot consists of multiple sublots and the test specimen value for a subplot exceeds the allowable tolerance, perform a retest on the material within that subplot. If a retest is not or cannot be performed, use an absolute difference value of 0.92 for that subplot to calculate the plant lot daily QAF in accordance with MP 96-02.

3. Determination of Asphalt Binder Content. Determine the asphalt binder content using the procedures outlined in Materials Method (MM) 5, Plant Inspector’s Manual for Bituminous Concrete Production. Calculate the asphalt binder content during initial production and then routinely throughout production for a minimum of four times per day per HMA mix design used for production.

4. Mixture Temperature. Determine the mix temperature for each mix type at the beginning of each production day starting with the first or second delivery vehicle and then routinely throughout the production day. Determine a minimum of four temperatures per day independent of HMA mix design used for production. Record the temperature on the delivery ticket and transmit to the project paving site with the delivery vehicle. When holding bins are loaded for storage, determine the mix temperature routinely throughout the loading time.

5. Aggregate and Mix Moisture Content. Determine moisture content of the aggregate, the recycled mixtures, and the HMA mixture in accordance with procedures outlined in MM 5.0. Aggregate moisture testing of individual components is allowed. Determine the aggregate moisture content daily in accordance with the frequency detailed in Table 401-3. Perform one test during the initial production and at least one test per day on a composite aggregate sample. The frequency for determining the moisture content in the HMA and HMA with RAP mixtures is a minimum once per day. If excessive mix moisture results are obtained, the testing frequency may be increased as directed by the RME. The moisture content of the mixtures upon discharge from the mixing unit will not exceed 0.5 percent.

6. Asphalt Binder Sampling. Obtain asphalt binder samples in accordance with procedures outlined in Materials Method (MM) 8.1, Quality Assurance Procedure for Paving Asphalt Cement. Obtain a minimum of one sample for each production day. The frequency may be increased at the discretion of the RME. Asphalt binder samples are not required when production is 150 tons or less. Identify all samples as determined by the RME and store them at the facility site. The State will supply sample containers, document and submit these samples for testing.

7. Friction Aggregate. The friction aggregate will meet the requirements outlined in §401-2.02, Aggregates. Perform sampling and testing of friction aggregate at the production facility using procedures outlined in MM 28.

8. Recycled Mixes. Perform sampling and testing of HMA containing reclaimed asphalt pavement (RAP) using procedures outlined in MM 5.0. The frequency of sampling and testing is outlined in §401-3.04, Quality Control Sampling and Testing, except perform the following tests at frequencies outlined in MM 5.0 and Table 401-3.

- a. RAP Moisture Test
- b. RAP Binder Content
- c. Recycled Mix Moisture Test

C. Air Void and Gradation Reporting. Report the air void test values to the nearest 0.01 of a percent and aggregate gradation test value to the nearest 0.1 of a percent. When determining test results acceptability, the air void test value is referenced to the mix design median of 3.5 percent and the gradation test value is referenced to the Job Mix Formula (JMF) target value.

D. Significant Decimals. For reporting the results, use the following rules for rounding off for all calculations:

1. When the digit to be dropped (1 digit beyond the significant digit) is less than 5, the preceding digit will not change.
2. When the digit to be dropped (1 digit beyond the significant digit) is 5 or greater, the preceding digit will be increased by 1.

E. Volumetric Plant Production Tolerances. Determine the volumetric properties outlined in Table 401-5, Volumetric Plant Production Tolerance, for every subplot of HMA volumetric design produced. When any mix design test property consistently falls outside any tolerance value, the design may be rescinded as outlined in MM 5.16.

TABLE 401-5 VOLUMETRIC PLANT PRODUCTION TOLERANCES	
Test Property ¹	Tolerance ²
Voids in the Mineral Aggregate, VMA	-1.0 %
Voids Filled with Binder, VFB	± 5.0 %

NOTES:

1. Compact all gyratory specimens to N_{design} .
2. Tolerances are referenced to the specification value.

F. Sampling and Testing Disputes. The State will perform referee sampling and testing to settle all disputes. Referee samples will be obtained randomly and independently from the QC samples and tested at the Regional or Central Office laboratory. If production is terminated, the State will test the samples retained at the production facility. The State's independent referee test results are final, and will be used to determine the daily QAF for the disputed quantity and the acceptance of the in-place production material.

401-3.05 Production Control. Make necessary process control adjustments during production as long as the target values do not exceed the specification general limits. However, strive for the mix design target values when making necessary process control adjustments. Only the aggregate gradation production tolerance is allowed to exceed the general limits. Also, when adjustments are made to any volumetric mixture design during production, all specified properties must remain within the specified production limits. Record all adjustments, including new target values, on BR-303 QC Daily Diary. When any test value consistently falls outside the allowable production tolerance, take corrective actions. In addition, notify the RME prior to production of any subsequent adjusted subplot. — Production may be terminated at any time, in which case, notify the RME immediately. When production is terminated, the HMA quantity produced up to that point is considered a plant lot and the daily QAF is determined using all required and all additional QC test values. HMA in storage from any

terminated plant lot having a QAF less than 0.90, or any required testing not in conformance with the specification requirements, will be considered unacceptable.

—When the daily QAF is less than 0.90 for two consecutive production days, terminate production. When production is terminated due to unacceptable production quality, demonstrate by trial production that the production process yields a QAF of 0.90 or greater before resuming production for the State. Also, notify the RME when any subplot yields a QAF of less than 0.90.

—The State may rescind a “Production Status” of a mix design if the design consistently produces a mixture that yields a daily QAF less than 1.00 and/or has volumetric properties outside the plant production tolerances.

—During production of any HMA design assigned “Verification Status” as outlined in MM 5.16 or the first production day of the construction season for any HMA design assigned “Production Status”, the State will report a daily QAF of 1.00 provided the required test results yield a daily QAF between and including 0.90 and 1.00. When the required test results yield a daily QAF greater than 1.00, the State will report the actual daily QAF. When the required test results yield a daily QAF less than 0.90, the State will evaluate the subject production in accordance with procedures outlined in §401-4, Method of Measurement.

A. Mixing Plant Control.—All mix production must be in the automatic mode. If any material is produced and shipped to State projects in a non-automatic mode, notify the RME immediately. Do not ship any material produced in the automatic mode that exceeds twice the production tolerance. Material produced in the automatic mode that is between the single and double production tolerance may be shipped. However, the RME will determine if the material is acceptable to the State.

B. Friction Aggregate Control. Use the following friction aggregate criteria:

1. If the friction aggregate test results are greater than the JMF requirements, continue friction aggregate controls.
2. If the friction aggregate test results are greater than the State’s minimum specifications, but less than the JMF requirements, perform aggregate adjustments and retest.
3. If the friction aggregate test results are less than the State’s minimum specifications, stop production, notify the RME, correct the problem and retest before resuming production.

401-3.06 Production Quantities.—Whenever production is made for the State, notify the Regional Materials office by 3:00 p.m. the day before the day of production.

—Maintain a record of each day’s production quantity for each mix design supplied to the project site daily. Retain these records at the production facility. These records must be available to the State’s representative for review. Ship all production quantities to the project site as outlined in §401-4 Method of Measurement.

401-3.07 Documentation.—Record all QC test data for each plant on the appropriate forms provided by the State. Update the QC test data within 24 hours following each plant lot production and retain these records at the plant site laboratory. Also, keep a copy of the plant automation printout at the plant facility for each mix type produced and make them available for review at all times. Transmit a summary of all test data weekly to the RME.

401-3.08 HMA Mixing Plant.—HMA mixing plants must be of sufficient design and capacity to produce HMA as specified. HMA mixing plants that differ from conventional designs will be considered for use by the Director, Materials Bureau.

A. Requirements for All Plants

- 1. Acceptance.**—Each HMA mixing plant requires initial and annual approval by the Director, Materials Bureau. The RME may disapprove use of a previously approved mixing plant at any

time for non-conformance with specifications. Once disapproved, production for State projects will not be allowed until corrective measures have been implemented satisfactory to the RME.

2. Friction Aggregate Management. Provide training to plant process control personnel regarding friction aggregate stockpiling, blending and batching procedures and/or verification testing at the plant facility. If necessary, provide additional training midway through the production season. Also, list the names of each individual and the training received and maintain this record at the plant facility for review by State's representative. As a minimum the following personnel must be thoroughly familiar with all friction aggregate control procedures:

- a. Plant Superintendent
- b. Quality Control Technician
- c. HMA Plant Operator
- d. Loader Operator/Truck Driver feeding HMA plant

3. Failure of Equipment

a. Printer Breakdown. When the automated proportioning system or delivery weigh system printer is not properly working, the producer must notify the QAT at the plant site. However, when a QAT is not present, the producer must notify the RME immediately. Production is allowed during the breakdown period providing the tons produced are properly documented as outlined by the RME. The breakdown period shall not exceed 48 hours.

b. Gyratory Compactor Breakdown. When a breakdown of gyratory compactor occurs, the RME will be notified immediately. The RME may allow production to continue for an initial limited time period (not to exceed 48 hours). Mix type, placement location, test results and/or any problems occurring with the mixture at the plant or project will be primary considerations for determining if, and how long, production will be allowed to continue. When permitted during the breakdown period, the following shall apply:

- 1.— HMA samples (enough for at least 2 specimens) will be taken at the normal specified required frequency, retained until the gyratory compactor is repaired, then tested for informational purposes.
- 2.— Aggregate gradations will be performed and recorded for each subplot produced during the breakdown period.
- 3.— The final QAF shall be 1.00 for all mix accepted by the Project Engineer during the breakdown period.

4. Scales, Continuous Weigh Systems and Meters. Perform tests on scales, continuous weigh systems, and meters for accuracy, at no cost to the State. These tests must be performed by a qualified technician using procedures outlined in Materials Method (MM) 27, Plant Equipment Inspection Manual. Perform the test as follows:

- a. Annually, prior to use for State work.
- b. At intervals of not more than 90 calendar days.
- c. Whenever the plant changes location.
- d. At any time directed by the RME.

— Provide standard test weight and a platform, cradle or hanger approved by the RME or the authorized representative for testing each scale. Provide at least 10 standard 50 lb test weights for testing the springless dial or load cell type scales. Provide a sufficient number of test weights to test belt scales within production range.

5. Equipment for PG Binder Material. Tanks for the storage of PG Binder must be capable of heating and maintaining the required binder temperature. Where meters are used, the binder

temperature at the meter must be within $\pm 25^{\circ}\text{F}$ of the temperature for which the meter is calibrated. Provide separate tanks and pipe lines when asphalt binder and other liquid asphaltic materials are mixed in the same mixer.

— Equip all mixing plants with a sampling valve designed to be non-clogging, safe and completely divorced from any solvent clean-out operations. For plants having multiple tanks, locate the sample valve in the line between the tanks and the mixing plant or in the return line. When plants have only one tank, locate the sample valve directly on the tank. Clearly label “Sample Valve”. The type and location of the valve requires the RME’s approval.

6. Aggregate Cold Feed Bins. Use separate cold feed bins for each aggregate size for the production of HMA mixes. The RME may permit methods of blending. The cold feed bins must be of sufficient size to maintain a continuous and uniform flow of material during HMA production.

7. PG Binder Control Unit. Provide a satisfactory means to add the proper amount of PG Binder to the mixture. Maintain the required temperatures of the PG Binder in the pipelines, meters, weigh buckets, spray bars, and other containers or flow lines. When a meter system is used, provide a by pass so that the binder quantity and flow rate can be checked in accordance with MM 27.

8. Thermometric Equipment. All plants must have provisions to determine the asphalt binder temperature prior to entry into the mixing unit. Batch plants must have provisions to determine the aggregate temperature during discharge from the dryer. Drum mix plants must have provisions to determine the HMA mixture temperature during discharge from the mixing unit. All temperature measuring devices must be accurate within $\pm 5^{\circ}\text{F}$.

9. Dust Collector. Equip all plants with adequate dust collectors constructed to remove or return uniformly all or portions of the collected dust to the system.

10. Truck Scales. Truck scales used, or required to be used at a plant site, must be a platform type scale conforming to the requirements of National Institute of Standards and Technology Handbook 44. Test the truck scales as outlined in §401.3.08 A.4. Scales, Continuous Weigh Systems and Meters. All truck scales must have sufficient capacity and size to weigh the largest loaded vehicle in one weighing.

— Equip truck scales used for determining delivered quantity at the mixing plant site with a recording device approved by the Director, Materials Bureau. The recording device must produce a ticket with a time-date print and any two of the following weights:

- a. Gross weight
- b. Net weight
- c. Tare weight

— Print tare weights by weighing each truck empty for each delivery. Do not manually manipulate truck scales during the printing process. In addition, the truck scale weigh system must be interlocked to allow printing only when the scale has come to a complete rest.

11. Safety Requirements. All mixing plants must be in compliance with all applicable state and federal safety requirements. Provide a platform(s) or other suitable device for accessibility to the top of truck bodies to obtain HMA samples and mix temperatures.

12. RAP Delivery System. Feed RAP into the plant using equipment specifically designed for recycling. All RAP equipment requires approval of the Director, Materials Bureau. Install scalping screens, grizzlies or similar devices on RAP feed bins. These devices must be capable of removing foreign material in excess of 4 inches.

13. Inspection Facilities. At each HMA mixing plant site, provide a weatherproof building or trailer type unit for use as a QC/QA inspection facility consisting of a testing laboratory and office. The inspection facility must meet all applicable uniform fire prevention and building code requirements. Partition the QA office area from the testing laboratory. The inspection facility will have a minimum gross area of 25 square yards with a layout providing a minimum internal width of 7 feet and a ceiling height of not less than 8 feet. The laboratory must have tables, work benches, shelving, and other necessary equipment required for testing HMA. Should the HMA manufacturer elect or be required to provide additional testing equipment, increase the internal area proportionally to house and operate the additional testing equipment.

—When multiple plants are located at one site, the inspection facility will be proportionally larger. The laboratory and office space must be of a sufficient size to accomplish an acceptable performance of QC/QA duties during all HMA production. The inspection facility's use will be exclusively for its intended purpose and have protection from a noise level greater than an 8 hour time-weighted average of 85 dBA. The State will have priority use when more than one inspection authority is using the inspection facility.

—The inspection facility and the location requires the approval of the RME. The inspection facility must have the following well-maintained items: (Note: The *Gyratory Compactor*, *Specimen Mold Assembly*, and *Specimen Extractor* are not required to be onsite at the facility during the inspection; however, they must be onsite during production.)

a. Office Equipment. A standard size office desk having a minimum surface size of 2 1/2 feet by 5 feet with drawers and a chair. A fireproof file cabinet with at least two lockable drawers and two keys with access only to State personnel.

b. First Aid Kit. An adequately stocked first aid kit will be available at the plant site. The laboratory area will have an emergency eye wash station.

c. Toilet. A flush type toilet and necessary supplies. The toilet must be enclosed in a separate room properly vented and complying with applicable sanitary codes. Provide a lavatory with running water. When a plant is set up on a temporary basis for a specific project, a portable toilet is acceptable in lieu of the above.

d. Lighting. Electric lights, non-glare type to provide a minimum illumination level of 1100 lux at the desk and work bench level.

e. Laboratory Sink. Sink and faucet having an adequate supply of clean running water.

f. Heating and Cooling. Adequate heating and cooling equipment to maintain an ambient temperature of 70° F ± 5°.

g. Ventilation. Adequate ventilation system to remove dust and fumes from the laboratory. A 200 cubic feet per minute (cfm) (minimum) exhaust hood vented to the atmosphere will be located over the extractor, sample drying area and aggregate sieve shakers when located inside.

h. Telephone. A telephone for the exclusive and private use of State personnel located in the laboratory office. A fax machine must be available for State use.

i. Potable Water. A water cooler or other source of potable water will be available at the inspection facility or plant site.

j. Maintenance. Maintain the inspection facility, office, and testing equipment such that they are in good operating condition. Also, keep the facility clean.

~~k. Fire Extinguisher.~~ Furnish and locate a properly maintained 10-lb capacity multi-class ABC fire extinguisher in the laboratory area.

~~l. Extractor.~~ For plants producing recycled mixtures, equip the laboratory facility with a chemical extractor or an ignition oven to determine the binder content.

~~m. Coarse and Fine Aggregate Sieve Shaker.~~ Sieve shakers must meet the requirements of AASHTO T27. When a shaker is located outside the inspection facility, fully enclose and weatherproof it.

~~n. Sample Splitter.~~ The sample splitter meeting the requirements of AASHTO T248.

~~o. Balances.~~ Balances meeting the requirements of AASHTO M231, Class G2.

~~p. Sample Drying Appliance.~~ Oven, stove or hot plate of sufficient size for rapidly drying aggregate samples.

~~q. Miscellaneous Equipment.~~ Miscellaneous items including but not limited to, sample containers, scoops, and other equipment deemed necessary by the RME. Sieves of proper size for all mix types produced.

~~r. Gyrotory Compactor.~~ Gyrotory compactor meeting the requirements of AASHTO TP4 calibrated at a frequency outlined in MM 5.16. When a compactor is used at a remote location during a breakdown period, outline the details in the Control Plan.

~~s. Specimen Mold Assembly.~~ Mold assembly will meet the requirements of AASHTO TP4. Provide a minimum of four mold assemblies and an adequate supply of paper discs.

~~t. Specimen Extractor.~~ The extractor will meet the requirements of AASHTO TP4.

~~u. Oven.~~ Supply a thermostatically controlled convection type oven having a minimum capacity of 5 cubic feet to preheat the specimen mold assemblies and asphalt mix samples. The oven must have a controlled temperature range up to 390°F with a $\pm 5^\circ\text{F}$ accuracy throughout the range.

~~v. Maximum Specific Gravity Equipment.~~ Equipment meeting the requirements of AASHTO T209.

~~w. Bulk Specific Gravity Equipment.~~ Equipment meeting the requirements of AASHTO T166.

B. Requirements for Batching Plants

1. Drier. Equip the plant with a drier or driers which continuously agitate the aggregate during the heating and drying process. The drier equipment must be capable of supplying uniformly heated and dried material in sufficient quantities equivalent to the operating capacity of the plant.

2. Screens. Provide plant screens with nominal capacities in excess of the full capacity of the mixer. The screens must be capable of screening all aggregates to the specified sizes.

3. Hot Bins. The plant storage bins must be of sufficient storage capacity to supply the mixer when it is operating at full capacity. The plant must have at least four storage bins so arranged as to assure separate and adequate storage of the appropriate fractions of the aggregates required to give proper proportioning to the mix. Each bin must include an overflow chute of such size and at such location as to prevent backing up of material into other compartments or bins. Each

compartment must have an individual outlet gate so that there is no leakage when closed. The gates must quickly and completely cut off the flow of material. Equip bins with devices in the bins at the lower quarter points to indicate when the aggregates fall below this point. Provide a separate dry storage for mineral filler or baghouse fines when they are added to the mixture as a separate material.

4. Hot Bin Sampling Devices. Provide adequate facilities to obtain representative aggregate samples from the full width and depth of the discharge area from each aggregate hot storage bin while the plant is in operation. The device must consist of a sampling tray of adequate capacity which is structurally supported during the sampling operation. Alternative sampling device may be provided subject to approval of the RME. Access to sampling facilities must meet the requirements of §401-3.08 A.11. Safety Requirements.

5. Weigh Hopper. The equipment must include some means for accurately weighing each size of aggregate in a weigh hopper suspended on scales and of ample size to hold a full batch. When the weigh hopper gate is closed, material must not leak into the mixer while weighing a batch.

6. Aggregate and Asphalt Binder Scales. Scales must conform to the requirements of the National Institute of Standards and Technology Handbook 44, except that the number of scale divisions must not be less than 500 or greater than 2000. Scales installed on or after January 2, 1987 must be either the springless dial or load cell type and must indicate the load at all stages of the weighing operation from zero to full capacity. Scales installed after January 2, 2003 shall be only load cell type scales which indicate the load at all stages of the weighing operation from zero to full capacity. The minimum resolution of repeating dials or digital displays must be equivalent to or less than the minimum graduations on the primary scale. Repeating dials or digital displays must match the primary scale within one graduation. Locate the scales, repeating dials, or digital displays so they are easily readable from the operator's work station by direct sight. Prevent any manipulation of scale weight.

7. Asphalt Binder Bucket. The asphalt binder bucket must be large enough to handle a batch in a single weighing. Configure the filling system and bucket so that the asphalt binder will not overflow, splash, or spill outside the bucket during filling and weighing. The bucket must be steam or oil jacketed or equipped with electric heating units. The equipment shall deliver the asphalt binder in a thin uniform sheet or in multiple sprays over the full length of the mixer.

8. Proportioning Control. All batch plants must proportion materials by an automatic proportioning system approved by the Director, Materials Bureau. Install the system in a dust and weather protected area of at least 5 square yards with no internal dimension less than 6 feet. The system must accurately proportion various mixture components by mass or volume, and control the cycle sequence and timing during the mixing operation. The entire batching and mixing cycle shall be continuous without any manual operations. There must be an interlock system that will interrupt and stop the automatic batching operations whenever a component proportion exceeds the allowable batching tolerance.

— The automatic proportioning system must be capable of consistently delivering individual design components within the full range of batch sizes with the following batching tolerances:

Each Aggregate Component	±1.5%	Zero Return (Aggregate)	±0.5%
Mineral Filler	±0.5%	Zero Return (Asphalt Binder)	±0.1%
Asphalt Binder	±0.1%		

— The preceding percentages are based on the total batch weight of the HMA mixture, except that the zero return tolerance is based on the minimum batch size.

— If mineral filler is used, the allowable tolerance for the aggregate component weighed prior to the filler in a cumulative weighing system is ±0.5 percent. If a separate tolerance control is not provided for mineral filler, then reduce all aggregate tolerances to ±0.5 percent.

9. Recording of Batching. Equip all plants with automatic digital recording devices approved by the Director, Materials Bureau, and locate these devices such that the operator can access and read them from the work station. The recording device must be able to record the quantities of aggregate, mineral filler, asphalt binder, and the total weight of each batch of HMA mixture produced. All recording of batches must show the day, month, year and time to the nearest minute for each batch. The printout must permanently identify each batch. Provide the State with a clear and legible copy of the recording for each batch.

— Record asphalt binder quantities separate from aggregate and filler and record as weight. If measured in volume (gallons), convert the volume to weight in pounds at 60°F.

— Record the weights as indicated on the batching scale or display within an accuracy of 1 scale graduation or increment. The minimum resolution of digital recorders shall be equivalent to or less than the minimum graduation or increment on the scale or display.

— Automation systems installed on or after January 2, 1987 shall clearly identify on the recordation when a batch is initiated without satisfying all conditions of fully automated production under these specifications. The recordation shall also identify when the system is taken out of the fully automated mode during the batching sequence. The recordation must provide a clear identification when an out of tolerance condition is accepted during batching, when a system produces a “demonstration” or “simulated” batch, and when a system reprints a batch ticket.

— In addition to the above information, if the automation is capable of making batches other than standard sizes (full, 1/2 or 1/4 ton increments), the recordation must show for each aggregate (mineral filler and RAP, if used) and asphalt material, the target weight and the calculated over and under weights, OR, the calculated over and under weights and the theoretical batch total. The State requires this heading to be printed once for each load, regardless of the number of batches per load. If loading storage silos, consider each full ticket as a load.

10. Mixer Unit. The plant must include a batch mixer of an approved pugmill type capable of producing a uniform mixture within the permissible job mix tolerances. The mixer must have a capacity of not less than 2000 pounds. The blades of the mixer shall have a clearance not in excess of 3/4 inch from all fixed and moving parts. Replace paddle blades which are worn in excess of 25 percent in face area from their new condition. If not enclosed, the mixer must be equipped with a dust hood to prevent loss of dust. The mixer must be constructed to prevent leakage of the contents and must not cause significant segregation during the mixture discharge.

11. Control of Mixing Time. The mixer must be equipped with an accurate time lock properly coordinated with the automation of batching equipment to control the operations of a complete mixing cycle. It must lock the aggregate weigh hopper after charging of the mixer until the closing of the mixer gate at the completion of the cycle. It must lock the asphalt binder delivery system throughout the dry mixing period and lock the mixer gate throughout the complete mixing period. The following are terms related to the timing of the mixing cycle:

- **Cycle Time**—the interval of time between successive openings of the mixer discharge gate for succeeding batches.
- **Mixing Time**—the interval of time between the opening of the aggregate weigh box gate and the opening of the mixer discharge gate.
- **Dry Mixing Time**—the interval of time between the opening of the aggregate weigh box gate and the beginning of application of asphalt binder.
- **Wet Mixing Time**—the interval of time between the beginning of application of asphalt binder and the opening of the mixer discharge gate.
- **Finish Mixing Time**—the interval of time between the termination of application of asphalt binder and the opening of the mixer discharge gate.

— The control of the timing must be flexible and capable of being set at intervals of five seconds or less throughout the total cycle time. Once the cycle times are set, manipulation of the set times is not allowed.

C. Requirements for Drum Mix Plants

1. Aggregate Feed Bins. Aggregate feed bins shall have adequate separation to keep aggregates from overflowing from one bin to another. Configure the feed bins so that material in excess of 4 inches cannot be placed into the bin. Clearly label all feed bins to identify the aggregate size used.

— Each feed bin shall proportion aggregate accurately and uniformly. The section of the bin that controls the feed rate flow must be adjustable and have a method to identify the opening. Interlock each feed bin so that HMA production is interrupted within five seconds if any feed bin becomes empty or the flow is obstructed.

2. Mineral Filler System. Mineral filler shall be delivered to the mixing plant independently from the aggregates. The filler system shall proportion the mineral filler at adjustable rates accurately and uniformly. The filler system must be accurate to 0.25 percent based on the total weight of the HMA mixture. Interlock the filler system so that HMA production is interrupted within five seconds if the system becomes empty or the flow is obstructed.

3. Aggregate Weigh System. The plant shall weigh the aggregates continuously with a system meeting the requirements of National Institute of Standards and Technology Handbook 44. The weigh system will be tested as outlined in §401-3.08 A.4. Scales, Continuous Weigh Systems and Meters. Provide means for diverting the aggregate after passing over the weigh system and prior to entry into the drum. The weigh system must be readable to the nearest 0.01 ton during testing.

— The Director, Materials Bureau will consider other weighing systems different from conventional designs. The following tolerances apply to all continuous weigh systems:

a. Acceptance tolerance. Acceptance tolerance is 0.5% of the test load and applies to initial installation of the weigh system, to the annual approval prior to production, and whenever the equipment is tested because it fails to meet the maintenance tolerance during production.

b. Maintenance tolerance. Maintenance tolerance is 1.0% of the test load and applies during all times other than those where acceptance tolerance apply.

4. PG Binder System. The plant shall continuously proportion PG Binder at adjustable rates accurately and uniformly. The binder system must be accurate to 0.1 percent based on the total weight of the HMA mixture. The binder system will be tested as outlined in §401-3.08A.4. Scales, Continuous Weigh Systems and Meters. The binder system must be interlocked so that production is interrupted within five seconds if the PG Binder flow to the mixer unit ceases. Install a temperature compensating device in conjunction with the meter to correct the quantity of asphalt binder at 60°F.

5. Proportioning Control. All drum mix plants shall proportion materials by an automatic proportioning system that will increase and decrease the production rate using a single input. Install the system in a dust and weather protected area of at least 5 square yards with no internal dimensions less than 6 feet. The system shall accurately proportion various mixture components by mass or volume.

a. Aggregate Feed Rate Control. The plant must have an adjustable feed rate control for each aggregate bin feeder and mineral filler feeder. The controls must maintain an aggregate flow accuracy such that the total variation of all materials being drawn per interval of time must not exceed an amount equal to 1.5 percent of total weight of HMA mixture per interval of time. Add mineral filler with a maximum variation of 0.5 percent of the total weight of HMA mixture per interval of time.

—The flow rates of aggregate and mineral filler must be continuously displayed in the control room in tons per hour. The maximum resolution will be 1 ton per hour for dry aggregate and 0.1 tons per hour for mineral filler.

b. Aggregate Weight Indicators. Weight indicators in the control room must display the weights of dry aggregate and mineral filler in tons. They must continuously accumulate weights of material during the production period. The maximum resolution will be 0.1 tons for dry aggregate and 0.01 tons for mineral filler if added separately. The indicators must be resettable to zero and have provisions to prevent manipulation.

c. Aggregate Moisture Compensator. A moisture compensation device must be capable of electronically converting the wet weight of aggregate to dry aggregate weight. The moisture compensation may be input based on composite or individual aggregate bin moisture. The maximum graduations on the compensator shall be 0.1 percent.

d. PG Binder Control. The PG Binder control must be capable of inputting the binder content as a percentage based on total weight of mixture. The maximum graduation on the binder input control is 0.1 percent. The asphalt binder delivery system must be linked with the aggregate delivery system to automatically maintain the required proportions as the aggregate flow varies. The delivery tolerance for asphalt binder is ± 0.1 percent based on the total HMA mixture weight. The flow rate of asphalt binder must be continuously displayed in the control room in tons per hour and have a maximum resolution of 0.1 ton per hour.

e. PG Binder Quantity Indicator. The PG Binder quantity indicator in the control room must display the quantity of the binder in tons and must continuously accumulate the quantity of binder during the production period in the day. The maximum resolution will be 0.01 tons. The indicator must be resettable to zero and have provisions to prevent manipulation.

6. Recordation of Proportions. The mixing plant must be equipped with an automatic digital recording device approved by the Director, Materials Bureau, which simultaneously records the accumulated weights of dry aggregate, mineral filler and PG Binder at five minute intervals during production and on demand. The recordation must include the actual PG Binder content as a percentage of the total HMA mixture weight. The maximum resolution will be 0.1 tons for dry aggregate, 0.01 tons for mineral filler, if added separately, 0.01 tons for PG Binder, and 0.1% for PG Binder content. All recordation must show the day, month, year, and time to the nearest minute for each print. Provide a clear and legible copy of the recordation to the State. —Automation systems installed on or after January 2, 1992 must clearly identify on the recordation when a batch is initiated without satisfying all conditions of fully automated production under these specifications. The recordation should also identify when the system is taken out of the fully automated mode during the batching sequence.

7. Automatic Aggregate Sampling Device. Provide an automatic aggregate sampling device which will divert a representative combined aggregate sample into a hopper or container for the purpose of gradation testing. The device shall effectively sample the full width and depth of the aggregate flow without losing any portion of the sample. The sampling point must be after the aggregate is proportioned and prior to its mixing with asphalt binder.

8. Mixer Unit. The plant shall include a continuous mixer of a type approved by the Director, Materials Bureau, having an automatic burner control and being capable of producing a uniform mixture within the job mix tolerances. Repair or replace flights within the drum which are missing, loose, broken, bent, scalloped or worn excessively from their new condition to the satisfaction of the RME. Discharge the HMA mixture into a HMA holding bin meeting the requirements of §401 3.09, Hot Mix Asphalt Holding Bins.

~~9. **Truck Scales.** Each drum mix plant site shall have a platform scale conforming to the requirements outlined in §401-3.08A.10. Truck Scales.~~

~~**401-3.09 Hot Mix Asphalt Holding Bins.** HMA mixtures may be held in holding bins which are especially designed for that purpose. The holding bins require initial approval by the Director, Materials Bureau.~~

~~**A. Holding Times.** Holding time is defined as the time interval beginning with the introduction of HMA mixture into the bin to the time of completion of discharge from the bin. Standard holding times are 12, 24, and 48 hours. Standard surge time is six hours.~~

~~**B. Acceptance Criteria.** The HMA mixture, after storage, must meet the criteria outlined in Table 401-6, HMA Holding Bin Acceptance Criteria.~~

~~**C. Quantity Documentation.** The quantity of the mixture drawn from holding bins and delivered to State projects shall be measured and recorded by one of the following:~~

- ~~1. A truck scale conforming to the requirements of §401-3.08A.10. Truck Scales.~~
- ~~2. A weight box or hopper suspended beneath the holding bin. The Director, Materials Bureau must approve all scale systems or other weighing devices prior to State use. Scales installed after January 2, 2003 must be load cell type scales which indicate the load at all stages of the weighing operation from zero to full capacity. The scale shall measure the actual weight to within an accuracy of 0.1 percent of full scale or one graduation, whichever is less. The minimum graduation will have a value not exceeding 20 lbs or 0.01 tons. The minimum resolution of repeating dials or digital displays will be equivalent to or less than the minimum graduations on the primary. There must be an interlock cutoff circuit to prevent the~~

TABLE 401-6 HMA HOLDING BIN ACCEPTANCE CRITERIA	
Property	Acceptance Criteria
Mix Temperature	±20°F from pugmill discharge temperature.
Aggregate Gradation	Within Job Mix Formula tolerances (applies to pugmill discharge mean gradation).
Asphalt Binder Content	±0.4% (applies to pugmill discharge mean asphalt binder content).
Asphalt Binder Recovered from Mixtures	
Dynamic Shear (TP5)	$G^*/\sin \delta$, min., 2.20 kPa

~~commencement operation if the scale is outside of the zero return tolerance. The zero return tolerance will be from 0 to a maximum of plus 150 lbs or 0.08 tons whichever is applicable.~~

~~— Each installation shall be equipped with a recording device approved by the Director, Materials Bureau. The recorder shall produce a ticket with a time-date print and the total amount of mixture discharged into the truck. The minimum resolution of the recorder must be equivalent to or less than the minimum graduations on the scale or digital display. Manual manipulation of the scales during weighing and printing process is not allowed. In addition, interlock the system to allow printing only when the scale has come to a complete rest.~~

~~**D. Holding Bin Evaluation and Approval.** Prior to use on State projects, the Director, Materials Bureau must evaluate and approve each holding bin. The scope of the evaluation conducted will depend upon the standard holding times request. The evaluation is based on sampling and testing of HMA mixtures held in the bin.~~

~~— If the HMA mixture from a holding bin shows signs of aggregate segregation, PG Binder migration, PG Binder hardening, or improper temperature control, delivery from the holding bin shall~~

be discontinued until satisfactory results can be achieved to the satisfaction of the RME. The State reserves the right to evaluate any approved bin any time.

401-3.10 Preparation of PG Binder. Heat the PG Binder to the temperature recommended by the PG Binder supplier in a manner that will avoid overheating and provide a continuous supply to the mixer at a uniform temperature.

401-3.11 Preparation of Aggregates.

A. Requirements for All Plants.—Keep all State approved aggregates from different sources separate from each other unless approved by the RME. Separate all State approved aggregates from non-approved aggregates.

B. Requirements for Batch Plants.—Stockpile all aggregates, including RAP, on free draining and clean bases such that the aggregates are not contaminated with foreign materials. When a batch plant is located at an approved aggregate processing facility, aggregate is permitted to be transferred from the facilities discharge point to the plant's cold feed bin. However, if the RME determines that non-uniform aggregate gradation or moisture content results, this transfer of aggregate will no longer be permitted.

—Dry the aggregates for the mixture and heat to the required temperature. Aggregates are considered dry when the moisture content just prior to batching does not exceed 0.5 percent of oven dried weight. Drying and heating must not damage or contaminate the aggregate. After heating and drying, screen the aggregates into fractions and place into separate compartments.

—RAP will be last in the aggregate weigh sequence and the RAP design batch weight must be increased to compensate for moisture content. All requirements pertaining to aggregates apply to RAP, including the equipment requirements for automated proportioning and recordation stipulated for aggregates in §401-3.08, HMA Mixing Plant.

C. Requirements for Drum Mix Plants.—Stockpile all aggregates, including RAP, on free draining and clean bases such that the aggregates are not contaminated with foreign materials. Direct transfer of aggregates from the processing facility's discharge point to the plant's cold feed bin is not permitted.

—The aggregates for the mixture must be from supplies having a uniform gradation and moisture content. The aggregates must have stable moisture contents as determined by the QCT.

—Determine the final acceptance for aggregate gradation from samples of the composite aggregate taken by the automatic sampling device described in §401-3.08 C.7. Automatic Aggregate Sampling Device.

—Introduce RAP into the drum so that it will not come in direct contact with the burner flame. Mixing RAP with other aggregates must occur before the asphalt binder introduction point. All requirements pertaining to aggregates apply to RAP including the equipment requirements for automated proportioning and recordation outlined in §401-3.08, HMA Mixing Plant. In addition, add RAP with a maximum variation of 0.5 percent of the total weight of HMA per interval of time. RAP shall be accumulatively recorded as dry material separately from other aggregates.

401-3.12 Mixing.—The mixer must be capable of producing a well-coated and homogeneous mixture at the specified temperature. The finished mixture must contain a minimum percentage of fully coated particles of 85 percent for base course and 95 percent for binder and surface course. The procedure for determining particle coating is available from the RME.

A. Requirements for Batch Plants.—The volume of aggregates and PG Binder in the mixer shall not extend above the tips of the mixing blades and shall not exceed the manufacturer's rated capacity of the mixer. In addition, the total quantity of material mixed shall not be less than 50 percent of the manufacturer's rated capacity of the mixer.

~~—The standard dry and wet mixing times for batch plants are 15 and 45 seconds, respectively. Any deviation from standard mixing times must meet the requirements outlined below and be approved by the RME.~~

~~**1. Base Course Mixes.** Dry mix the base course mixes for at least the period of time necessary to discharge all aggregates into the mixer. The wet mixing period must then commence and continue until at least 85 percent of the coarse aggregate particles are fully coated or the finish mixing time exceeds ten seconds, whichever is longer.~~

~~**2. Top and Binder Course Mixes.** Dry mix the top and binder course mixes for at least the period of time necessary to discharge all aggregates into the mixer or 10 seconds, whichever is longer. The wet mixing period must then commence and continue until at least 95 percent of the coarse aggregate particles are fully coated or the finish mixing time exceeds 10 seconds, whichever is longer.~~

~~**B. Requirements for Drum Mix Plants and for Recycle Mixes in Batch Plants.** The moisture content of the mixture upon discharge into the haul unit will not exceed 0.5 percent when tested in accordance with procedures outlined in MM 5.0.~~

401-4 METHOD OF MEASUREMENT. Determine the quantities daily for each plant. The quantity is the number of actual tons determined from the automated proportioning system, the delivery vehicle weigh system, or the HMA holding bin weigh system. Measure or calculate the quantity based on the measured amount and report to the nearest 0.01 of a ton.

—A delivery ticket indicating the total quantity in tons being delivered must accompany each delivery vehicle supplying HMA. The method of determining the delivered quantity is subject to the approval of the RME. Make one legible copy of the delivery ticket available to the State’s paving inspector prior to the placement of the mixture. The delivery ticket shall show the following minimum information and the HMA coded as outlined in Table 401-7, Delivery Ticket Mix Coding.

- SiteManager Mix ID
 - Ticket number
 - Plant identification
 - Contract number
 - Mix Codes
 - Quantity of material in vehicle
 - Date and Time

Comment [cjt35]:
E108023

—The QAT will determine a daily QAF for each day’s production from either Table 401-8, Air Voids in Plant Mixture (Volumetric Designs) or Table 401-9, Percent Passing (Non Volumetric Designs) using the calculations of the average absolute difference values in accordance with MP 96-02. The Engineer will use the daily QAF to calculate the quality payment adjustment for each day’s production.

~~**A. Volumetric Designs**—Quality payment adjustment for volumetric design mixtures is based on plant mixture air voids. The Engineer will obtain the daily QAF for volumetric design mixtures from Table 401-8, Air Voids in Plant Mixture. When hot mix asphalt holding bins are used for volumetric design mixtures, the Engineer will determine the daily QAF for the stored mixture on the day of delivery.~~

Mix Type	Code	Code ¹	Design ESAL	Code	Consensus Properties ²	Code	PG Binder Type	Code
9.5	09	F1	<0.3 million	1	<4 in	Y	PG-58-34	A
12.5	12	F2	<3.0 million	2	>4 in	N	PG-64-22	B
19.0	19	F3	<10 million	3			PG-64-28	C
25.0	25	F9	<30 million	4			PG-70-22	D

37.5	37	—	>30 million	5		PG-76-22	E
						OTHER	G

NOTES:

1. — Friction Aggregate Classification Codes
2. — When at least 75% of a layer is deeper than 4 inches below the pavement surface, the >4 inches aggregate consensus properties apply for that layer.
3. — Delivery Ticket Mix Coding Example: 12.5, <30 million design, <4 inches from surface, PG-64-28 Mix Coding on-Delivery Ticket: 12F24YC.

Average Absolute Value (Test Value—3.5)	Quality Adjustment Factor (QAF)	Average Absolute Value (Test Value—3.5)	Quality Adjustment Factor (QAF)
0.00—0.17	1.05	1.31—1.40	0.96
0.18—0.33	1.04	1.41—1.50	0.95
0.34—0.50	1.03	1.51—1.60	0.94
0.51—0.67	1.02	1.61—1.70	0.93
0.68—0.83	1.01	1.71—1.80	0.92
0.84—1.00	1.00	1.81—1.90	0.91
1.01—1.10	0.99	1.91—2.00	0.90
1.11—1.20	0.98	over—2.00	0.85
1.21—1.30	0.97		

B. Non-Volumetric Designs—Quality payment adjustment for non-volumetric design mixtures is based on plant mixture aggregate gradation. The daily QAF will be calculated for non-volumetric design mixtures for all Job Mix Formula sieves having design target values less than 90 percent passing. The daily QAF for non-volumetric design mixtures will be the lowest factor obtained from Table 401-9, Percent Passing. If each individual QAF is equal to or greater than 1.00, the highest calculated QAF will be used.

—When any material with plant air voids of less than 1.5% and greater than 5.5% which results in a QAF of 0.85, the Engineer will evaluate the subject material to determine if it will be left in place. The considerations for determining whether the material in question is left in place are, but not limited to:

- Type of material produced
- The layer in which the material was placed
- The location of the project

—If the subject material is left in place, the Engineer will use a daily QAF of 0.85 to calculate the quality payment adjustment. If the subject material is not left in place, remove and replace the material at no cost to the State. The daily QAF for the replaced material shall be determined as outlined in this subsection. The daily QAF applies to all production quantity deemed acceptable by the Engineer.

SECTION 402 - HOT MIX ASPHALT (HMA) PAVEMENTS

402-1 DESCRIPTION. These specifications apply to all plant mixed Hot Mix Asphalt (HMA) produced at an approved production facility under Section 401, Plant Production, irrespective of aggregate gradation, type, and amount of HMA material or use.

This work will consist of one or more courses of HMA pavement constructed on the prepared foundation in accordance with these specifications, the specific requirements of the item under contract, and as shown in the contract documents or as directed by the Engineer.

Prior to routine paving, the Engineer will conduct a pre-paving meeting with all parties working under this specification.

402-2 MATERIALS

402-2.01 General. Obtain State approval of materials before any material is mixed at any HMA plants. Obtain approval of aggregate sources for coarse and fine mineral aggregates from the Regional Materials Engineer. Performance-Graded Binder (PG Binder), mineral filler or any other materials that are used in the mix will be accepted according to the State’s written instructions. The PG Binder and the Design Estimated Traffic in 18,000 pounds ESALs will be specified by a special note in the contract documents.

402-2.02 Composition of Mixtures. Formulate and submit, to the Regional Materials Engineer, a Superpave Mix Design that satisfies the requirements of §401-2 and the mixture design procedure as written in Materials Method (MM) 5.16, Superpave Hot Mix Asphalt Mixture Design and Mixture Verification Procedures.

Table 402-1, General Description, lists the specification types of compaction methods and their use.

Specification Types		50 Series	60 Series	70 Series	80 Series
Coarse Agg. Type = F1 & Coarse Agg. Type = F2	Use	Mainline paving for controlled access highways, i.e., interstate, parkways.	Mainline paving other than 50 or 70 Series.	Mainline paving on low volume roadways.	Miscellaneous repairs, bridge approaches, trenches, etc.
	Compaction Monitoring	Compaction monitoring using 4 cores every day.	Compaction monitoring using PTD based on average of 4 cores.	Compaction monitoring using a density gauge.	Compaction based on number of passes.
Coarse Agg. Type = F3	Use		Mainline paving other than 70 Series.	Mainline paving on low volume roadways.	Miscellaneous repairs, bridge approaches, trenches, etc.
	Compaction Monitoring		Compaction monitoring using PTD based on average of 4 cores.	Compaction monitoring using a density gauge.	Compaction based on number of passes.

Coarse Agg. Type = F9	Use	Mainline paving for controlled access highways, i.e., interstate, parkways.	Mainline paving other than 50 or 70 Series.	T&L, mainline paving on low volume roadways.	T&L, shoulders, miscellaneous repairs, bridge approaches, trenches, etc.
	Compaction Monitoring	Compaction monitoring using 4 cores every day.	Compaction monitoring using PTD based on average of 4 cores.	Compaction monitoring using a density gauge.	Compaction based on number of passes.

For 50, 60, and 70 Series compaction methods, notify the Engineer of a desired mix temperature to be delivered to the project. For the 80 Series compaction method, the Engineer will specify the desired mix temperature. The mixtures will be produced, delivered to the work site, and incorporated into the work within 20°F of the specified temperature. The specified temperature must be within the mixing and compaction range of 250°F and 325°F, or as recommended by the PG Binder manufacturer.

402-3 CONSTRUCTION DETAILS

402-3.01 Weather and Seasonal Limitations. Do not place HMA plant mix on any wet surface or when the surface temperature is less than specified in Table 402-2, Temperature and Seasonal Requirements, or when weather conditions will prevent proper handling or finishing of the HMA mixtures.

Discontinue paving as soon as the surface temperature falls below the requirements which are shown in Table 402-2 and applies for all pavement and shoulder courses.

TABLE 402-2 TEMPERATURE AND SEASONAL REQUIREMENTS		
Nominal Compacted Lift Thickness	Surface Temperature Minimum (Note 1)	Seasonal Limits
≥ 4 in	40°F	None
≥ 2 in but < 4 in	45°F	(Notes 2 & 3)
< 2 in	50°F	(Notes 2 & 3)

NOTES:

- 1.— Measure all temperatures on the surface where the mixture is to be placed and the controlling temperature will be the average of three temperature readings taken at locations 25± feet apart.
- 2.— Place Top Course only during the period of April 1st up to and including the third Saturday of November in the counties of Dutchess, Orange, Rockland, Putnam, Westchester, Nassau, Suffolk, and the City of New York.
- 3.— Place Top Course only during the period of May 1st up to and including the third Saturday of October in all counties except as noted in Note 2.

TABLE 402-2 TEMPERATURE AND SEASONAL REQUIREMENTS		
Nominal Compacted Lift Thickness	Surface Temperature Minimum (Note 1)	Seasonal Limits
≤ 1 in	50°F	(Notes 2 & 3)
1 in < Thickness ≤ 3 in	45°F	(Notes 2 & 3)
> 3 in	40°F	None

NOTES:

1. Measure all temperatures on the surface where the mixture is to be placed and the controlling temperature will be the average of three temperature readings taken at locations a minimum of 25 ft apart.
2. Place Top Course only during the period of April 1st up to and including November 30th in the counties of Dutchess, Orange, Rockland, Putnam, Westchester, Nassau, Suffolk, and the City of New York.

3. Place Top Course only during the period of April 15th up to and including October 31st in all counties except as required in Note 2.

Comment [cjt36]:
EI08028

HMA pavement for temporary detours, which are not and will not become part of the permanent pavement, will not be subject to the above requirements in regard to temperature and seasonal limitations, but must be placed as approved by the Engineer.

Place HMA paving mixtures for curbs, driveways, sidewalks, gutters, and other incidental construction on surfaces having a minimum temperature of 50°F. The Engineer may allow the placement of these mixtures below the minimum temperature to expedite the completion of the project.

Schedule the paving operations such that all paving necessary to provide safe and adequate maintenance and protection of traffic or for protection of previously laid courses is completed within the weather and seasonal limitations. Such scheduling will include expediting construction operations to permit paving within the seasonal limitations or by limiting the length of work to that which can be completed before the seasonal shut-down. The cost of scheduling and sequencing of work to conform with the seasonal limitations will be reflected in the unit bid prices for the related contract items. Should paving operations not be completed within weather and seasonal limitations, provide all temporary materials and work necessary, such as the shimming of castings and protrusions, drainage of the roadway, providing acceptable rideability, and other work needed for the adequate maintenance and protection of traffic until paving operations can be completed the following paving season, and will not be reimbursable by the State.

Repair any damage to the base and binder course which has been placed and which will be permanently incorporated into the work and left open to traffic over the winter, at no additional expense to the State. In addition, clean this pavement course in accordance with Section 633, Conditioning Existing Pavement, at no additional expense to the State, immediately prior to applying a tack coat and overlaying. Apply tack coat in accordance with Section 407, Tack Coat, immediately prior to overlaying.

The contractor may propose to place surface course HMA pavement outside seasonal and/or weather limitations by providing a limited warranty against defects in such work. Warranty information can be provided by the Engineer.

402-3.02 HMA Pavers. Provide a self-powered HMA paver with an activated screed or strike-off assembly. The machine shall be capable of spreading and finishing courses of HMA plant mix material in lane widths applicable to the specified typical section and thicknesses shown on the plans. When screed extensions are necessary for placement of mainline pavement, such extensions shall be of the same design as the main screed. Auger and tunnel extensions are required to be mounted on the paver when the screed is extended more than 1 foot for fixed paving widths wider than 12 feet. Pavers used for shoulders and similar construction shall be capable of spreading and finishing courses of HMA plant material in widths shown on the plans. The paver shall have a receiving hopper with sufficient capacity for uniform spreading operation and with automatic flow controls to place the mixture uniformly in front of the screed. Heat the screed or strike-off assembly as necessary to produce a finished surface of the required smoothness and texture without tearing, shoving or gouging the mixture. When laying mixtures, the paver shall be capable of operating at forward speeds consistent with satisfactory placement of the mixtures.

HMA pavers used for placing the initial paving layer, base, binder, and surface courses shall be equipped with approved automatic transverse slope and longitudinal grade screed controls. The controls shall automatically adjust the screed and increase or decrease the mat thickness to compensate for irregularities that are in the surface being paved. The controls shall be capable of maintaining the proper transverse slope and be readily adjustable so transitions and super-elevated curves can be satisfactorily paved. The controls shall operate from suitable fixed or moving references as prescribed in §402-3.06, Spreading and Finishing. When paving width is in excess of 17 feet, a paver must have approved automatic transverse slope and longitudinal grade screed controls that operate from both sides of the paver.

The transverse slope and longitudinal grade screed controls of the HMA paver may be manually adjusted according to the requirements of §402-3.06, Spreading and Finishing. The HMA pavers must be at the project site prior to the start of paving operations to allow examination and approval by the

§402

Engineer. Repair or replace immediately any paver found to be worn or defective either before or during its use.

402-3.03 Hauling Equipment. Transport HMA mixtures to the work site in vehicles having clean, smooth and tight metal beds. Cover the HMA mixture with waterproof covers during transportation. If a flexible cover is used, it must overlap the vehicle's sideboards and back by a minimum of 6 inches and be securely fastened. The inside surface of the vehicle body may be lightly coated with a release agent. Release agents must meet all applicable State and Federal environmental requirements. Petroleum products or solvents having an adverse effect upon the HMA pavement will not be permitted for use as release agents. All hauling equipment is subject to the approval of the Engineer.

402-3.04 Rollers. All rollers shall be an approved vibratory, static steel wheel type, or pneumatic tire type used according to the requirements of §402-3.07, Compaction. All rollers shall be in good mechanical condition, free from excessive backlash, and capable of operating at speeds slow enough to avoid displacement of the mixture. The number and weight of rollers must be sufficient to satisfactorily compact the mixture while it is still in a workable condition. The use of equipment which results in excessive crushing of aggregate will not be permitted.

A. Vibratory Rollers shall be of a type that are specifically designed for the compaction of HMA mixture. Vibratory roller models satisfying the specification requirements contained herein will be evaluated by the Materials Bureau to determine compaction capabilities. If acceptable, the roller model will be placed on the State's current Approved List for Hot Mix Asphalt Vibratory Compaction Equipment. For all State projects, use only the vibratory roller models appearing on this list. Alternate types of rollers may be approved by the Director, Materials Bureau, for 50, 60, 70, and 80 series compaction methods, if, upon reviewing the specification of the rollers and demonstration that satisfactory results can be achieved.

Vibratory rollers shall meet the following requirements:

Nominal Amplitude	0.05 inch maximum.
Vibration Frequency	1500 vpm minimum.
Drum Width (dual vibrating drums)	54 inches, minimum
(single vibrating drum)	84 inches, minimum

When the rollers have pneumatic drive wheels, apply release agents to the tires to prevent material pickup.

All vibratory rollers shall be equipped with a speedometer that accurately indicates roller speed in either 1/2 mph or 50 fpm increments (maximum) throughout the specified operating range. Vibratory rollers must also be equipped with a speed control device that can be set to prevent the roller from traveling in excess of 2 1/2 mph or 220 fpm when the roller is in vibratory mode. The type of speed control device will be subject to the approval of the Director, Materials Bureau.

B. Static Steel-Wheel Rollers shall be self-propelled and be either 10 to 12 ton tandem three axle type or 8 to 10 ton tandem two axle type.

C. Pneumatic Rubber-Tired Rollers shall be self-propelled and consist of two axles on which multiple pneumatic-tired wheels are mounted in such a manner that the rear wheels shall not follow in the tracks of the forward wheels and will be spaced to give essentially uniform coverage with each pass. The axles will be mounted in a rigid frame provided with means for adding ballast. The wheels shall be mounted so as to oscillate individually or in pairs. The tires must be smooth and show no tread pattern, be of equal size and diameter, and be uniformly inflated. Pneumatic rollers shall meet the following requirements unless otherwise approved:

Maximum Wheel Load	5,600 lbs
Tire Compression on Pavement	80 ±5 psi

Maximum Axle Load

22,400 lbs

402-3.05 Conditioning of Existing Surface. When specified in the contract, clean the surface of the existing pavement, fill joints and cracks, and level the surface to a uniform grade and cross slope prior to the application of a new HMA concrete course. Clean the surface and fill the joints and cracks under the provisions of Section 633, Conditioning Existing Pavement. Clean any foreign material resulting from construction operations from the pavement at no additional cost to the State. Leveling of the pavement surface prior to new HMA placement will be in conformance with the requirements stated below:

- a. Apply a thin, uniform tack coat as specified in Section 407, Tack Coat, to all contact surfaces of existing HMA and Portland Cement Concrete layers including such areas as adjacent pavement edges, curbing, gutters, manholes, and other structures, immediately prior to placing the HMA mixture against them.
- b. Fill depressions and wheel path ruts prior to the paving of the truing and leveling course, as directed by the Engineer. For wheel path ruts with a depth of 1/4 inch, but less than 3/4 inch, use Shim Course. For ruts greater than 3/4 inch, use a 9.5 mixture.
- c. If a truing and leveling course is specified on the plans or in the itemized proposal, place the course(s) of a minimum variable thickness of proper plant mix necessary to bring the surface of the existing pavement to the same transverse slope and longitudinal grade required for the finished pavement surface. Test the surface of this course in the same manner prescribed in §402-3.10, Surface Tolerance, except that the allowable variation from the true surface after compaction must not exceed 3/8 inch. Unless a mixture type is specified in the plans, use Table 402-3, Mixture Selection for T&L Course, to select the appropriate mix type such that dragging of stones is minimized during placement of the mixture.

TABLE 402-3 MIXTURE SELECTION FOR T&L COURSE	
Compacted Thickness Range (in)	Mixture Type
≤ 1 1/2	9.5 or 12.5
> 1 1/2	19.0 or 25.0

NOTE: 37.5 mixture may be used when the compacted thickness is greater than or equal to 3 inches.

When constructing wedges for super-elevation, select a mixture such that dragging of stones at the thin edge is minimized. If dragging is excessive in any T&L course, as determined by the Engineer, the selected mixture will be disallowed for use for the application. Pay special attention to the proper compaction of thin sections.

402-3.06 Spreading and Finishing. Apply tack coat on the contact surfaces between all HMA pavement lifts in accordance with Section 407, Tack Coat, prior to placing HMA mixture regardless of time period between lifts. The only exception to this is the surface of permeable base courses. Paving over a tack coat should not commence until the emulsion has broken (goes from brown to black) or is tacky when touched.

Lay the mixture upon an approved clean, tack coated surface. Spread and strike off to the established grade and elevation. Use HMA paver(s) to distribute the mixture either over the entire width or over such partial width as may be practicable. Upon arrival at the site, the trucks will dump the mixture into the paver. Immediately spread and strike off to the required width and appropriate loose depth to obtain the required compacted thickness at completion of the work.

When the initial pavement course is laid with automatic HMA pavers, guide the paver by a taut reference line positioned at or near the pavement centerline or edge. Erect and maintain the reference line to the satisfaction of the Engineer. Support the reference line at approximately 25 foot intervals on tangent sections and at closer intervals on curves. Tension the line sufficiently to remove any sags. The Engineer may permit a moving reference of at least 30 feet in length in lieu of a reference line. The moving reference may be a floating beam, ski, or other suitable type such that the resulting pavement layer surface is sufficiently even. A short ski or shoe may also be used for the initial course with the approval of the Engineer if a satisfactory fixed reference such as a curb, gutter, or other fixed reference is adjacent to the pavement. When the proposed floating beam or the short ski does not produce the results

§402

similar to those obtained using a taut reference line, the Engineer shall disapprove the use of these devices.

Place subsequent pavement courses over the initial course using one of the above methods. In addition, any course in an adjacent lane may be used as the reference for the use of a short ski. The Engineer has final approval of the method chosen by the Contractor.

The automatic screed controls will not be required where existing grades at roadway intersection or drainage structure must be met, for shoulders, temporary detours, behind curbs, or in other areas where its use is impractical.

If there are less than 1500 square yards in the contract, or the areas to be paved are small and scattered, the HMA mixture may be spread by hand methods. For these areas, dump and spread the mixture such that the compacted thickness meets the specified thickness in the plans.

Prior to the beginning of rolling, check the loose mat, adjust any irregularities, and remove and replace all unsatisfactory material.

When placing the Shim Course to fill wheel ruts in an existing pavement, each wheel path rut must be paved separately. The placement equipment will be a drag box configuration or approved equal having side forms. Use the equipment to spread and strike off the shim course material to a uniform width of approximately 4 feet. The intent of the operation is to fill the low area only and not to place the material for the pavement's full lane width. The placement equipment wheels and/or other appurtenances must not interfere with the distribution and placement of the shim course material. Deliver the placement equipment to the project site prior to the placing operation to allow sufficient time for examination and approval by the Engineer.

402-3.07 Compaction. Compact the HMA mixture using the appropriate compaction method specified in Table 402-4, Compaction Methods, associated to specific items being placed.

TABLE 402-4 COMPACTION METHODS	
Compaction Methods	Item Number
A=50 series	402.XX5ZQR
B=60 series	402.XX6ZQR
C=70 series	402.XX7ZQR
D=80 series	402.XX8ZQR & other

NOTES: XX = 37, 25, 19, 12, 09, 05, 01
 Z = Friction requirement (1, 2, 3, 9)
 Q = Quality item number
 R = Revision number

Immediately after the HMA mixture has been spread, struck off, and surface irregularities adjusted to uniformity, compact it using rollers meeting the requirements of §402-3.04, Rollers. Roll the surface when the mixture is in the proper condition and when the rolling does not cause displacement, cracking, or shoving. Initially roll all courses with the roller traveling parallel to the centerline of the pavement, beginning at each edge and working toward the center. Roll banked curves starting at the low-side edge and working toward the superelevated edge.

Correct at once any displacement occurring as a result of reversing the direction of the roller, or from other causes, by the use of rakes and addition of fresh HMA mixture as required. Exercise care in rolling so as not to displace the line and grade of the edges of the HMA mixture. To prevent adhesion of the mixture to the rollers, keep the wheels properly moistened with water, water mixed with small quantities of detergent or other approved material. Petroleum products or solvents having an adverse effect upon the HMA pavement will not be permitted.

When the rolling operation is complete, defects, such as shallow ruts, ridges, roller marks, cracking, tearing, segregation, or any other irregularities, as determined by the Engineer, shall not be visible in the pavement. If these defects are present, correct these defects to the satisfaction of the Engineer or replace the pavement at no additional cost to the State.

Along forms, curbs, headers, walls, and other areas not accessible to rollers, thoroughly compact the mixture with mechanical tampers. On depressed areas, use a trench roller or a small vibratory roller with

the approval by the Engineer. Cleated compression strips also may be used under the roller to transmit compression to the depressed area.

Remove and replace any mixture that becomes loose and broken, mixed with dirt, or is in any way defective, with fresh HMA mixture. Compact the mixture to conform with the surrounding area. Correct any area showing an excess or deficiency of HMA material.

When Shim Course is used for filling wheel ruts, compact with a minimum of three passes of a pneumatic rubber tire roller. When Shim Course is used as a skim coat, use pneumatic rubber tire rollers unless other rollers are approved by the Engineer.

Vibratory compaction is not permitted when compacting HMA mixtures on structural bridge decks, or other structures with less than 2 feet of cover. When using vibratory compaction, repair all damages which may occur to the highway components and adjacent property, including buried utility and service facilities, at no cost to the State.

When placing HMA mixture using either 50, 60, or 70 Series compaction methods, control the operation of the rollers including the speed, the amplitude settings, the vibration frequency, and the weight of the rollers.

For 60 and 70 Series compaction methods, use density gauges specified in §402-3.07 E, Density Gauges. The density gauge operator shall possess a current Density Gauge Inspector Certification from The Associated General Contractors, New York State Chapter, or its equivalent, as determined by the Director, Materials Bureau.

Any pavement section that is monitored by a non-certified gauge operator or by a gauge operator, whose certification is revoked for reasons outlined in the New York State Inspector Certification Program manual under "Decertification", may be rejected by the Department based on the evaluation of the pavement.

Additional gauge readings and/or sampling and testing of pavement cores in accordance with §402-3.08, Pavement Density Samples may be required. Evaluated pavement sections are subject to payment adjustment in accordance with Table 402-9, Density Quality Adjustment Factors.

The above requirement also applies when a density gauge is used for monitoring pavement density in the areas other than mainline under 50 Series compaction method.

Use the following compaction methods based on the item numbers for HMA placements on all Department Contracts.

A. 50 Series Compaction Method. On the first day of mainline paving, select one of the following options:

1. Option 1: Test Section. Prior to routine paving of this item, construct a test section on the project site at a location approved by the Engineer. The test section will be a maximum of 1500 lane feet on the mainline. Construct the full width of the pavement if necessary. The test section will be the same depth specified for the construction of the course which it represents. Use the first 300 linear feet of the test section to stabilize the paving operation. There is no maximum length if the test section is not on the mainline. The first 200 tons of quantity placed on a test section will be paid at a factor of 1.5 times the bid price. The remaining quantity will be paid at the bid price. A maximum of two test sections per item will be paid at the 1.5 adjustment. Pavement density Quality Adjustment Factors (QAFs) will not apply to the first two test sections. If more than two test sections are required, the pavement density QAF will apply when the additional test sections are located on the mainline. Only one test section per item per day will be placed. Subsequent test sections after the initial passing test section will be subject to approval by the Engineer. Once the test section is completed, the Engineer will select core locations and have cores taken in accordance with §402- 3.08, Pavement Density Samples. When the average density of the cores is less than 88% of the maximum theoretical density, the Engineer will evaluate the test section to determine its acceptability. If found acceptable, payment will be adjusted by a factor of 0.60. If found unacceptable remove and replace at no additional cost to the State and the 1.5 factor will not apply.

Routine paving operations for this item will not be permitted until the results of the cores from the test section has a minimum pavement density QAF of 1.00. If the pavement density QAF is less than 1.00, construct another test section in accordance with Option 1.

2. Option 2: Routine Paving. Begin paving operations. Test Section Adjustment of 1.5 for the first 200 tons will not apply. All material placed will be subject to a pavement density QAF. If the pavement density QAF on the first day of paving is less than 1.00, construct a test section in accordance with Option 1.

During the placement of HMA mixture under this method, including the test section, take cores and loose mix samples in accordance with §402-3.08, Pavement Density Samples.

A paving lot is defined as a day's production which must be a minimum of 200 tons. Each paving lot will be equally divided into four sublots in accordance with Materials Procedure (MP) 96-04, Asphalt Concrete Statistical Pavement Density Determination. When paving is continuous within a 24-hour period, a new lot will result when a change occurs in the paving crew. When a single plant is supplying to multiple paving operations or multiple plants are supplying to multiple paving operations, each paving operation will be evaluated separately. Multiple plants will not be allowed to supply HMA mixture to a single paver. If less than 200 tons are placed on any day, pavement cores will not be required and the density QAF will be reported as 1.00 for that day, provided that the Engineer is satisfied that the procedures used in these areas obtain pavement densities similar to previously placed pavement sections.

Compact the pavement sufficiently to achieve densities, expressed as a percentage of the mixture's average daily maximum theoretical density (%MADMTD), in a range of 92% to 97%. Pavement cores and loose mix samples will be tested and analyzed by the Department in accordance with MP 96-04 to determine the pavement density QAF.

When consecutive lots are found to have a density QAF equal to or less than 0.85, stop paving operations and immediately construct a new test section in accordance with Option 1, described previously in this section.

The density QAF will not be applied to material placed on ramps with a uniform full-width section of less than 1200 feet in length, shoulders, maintenance widenings and crossovers, and bridges. Payment for these areas will be based on satisfactory placement and compaction. Placement and compaction procedures will be satisfactory when the procedures used in these areas obtain pavement density similar to that obtained on the mainline pavement sections. If the shoulder shows signs of distress at this level of compaction, decrease the compaction effort until no further damage occurs to the shoulder or subbase. If a density gauge(s) is used to monitor mainline paving, use the same gauge(s) to monitor density of the above referenced areas.

B. 60 Series Compaction Method. On the first day of paving, select one of the options specified below:

1. Option 1 - Test Section Only. The test section is constructed to determine a Project Target Density (PTD) for this item and correlation of a density gauge. Prior to routine paving operations for this item, construct a test section at a location approved by the Engineer. Construction of the test section will not be allowed unless both a density gauge and the operator are present. The test section will be a maximum of 1500 lane feet on the mainline. The Contractor will construct the full width of the pavement if necessary. The test section will be the same depth specified for the construction of the course which it represents. Use the first 300 linear feet of the test section to stabilize the paving operation. The remainder of the length will be used to determine the PTD.

During construction of the test section, take samples in accordance with §402-3.08, Pavement Density Samples. These samples should represent the material placed on the test section. At the conclusion of the test section, the Engineer will randomly select four 6 inch core locations on the test section (excluding the initial 300 linear feet) in accordance with §402-3.08, Pavement Density Samples. Take density readings with a density gauge(s) at each core location prior to drilling the cores. A density gauge reading is the average of multiple density gauge measurements taken in accordance with the appropriate Materials Procedure. Deliver the samples and the four density gauge readings with the gauge type, model, and serial number for each gauge to be correlated to the Regional Laboratory in accordance with §402-3.08, Pavement Density Samples. The Regional Materials Engineer will use the test section cores and density gauge readings to

establish a PTD for each density gauge within one business day of the delivery of the samples and density gauge readings. When the average of the cores is less than 88% of the maximum theoretical density, the Engineer will evaluate the test section to determine its acceptability. If found acceptable, payment will be adjusted by a factor of 0.60. If found unacceptable remove and replace at no additional cost to the State and the 1.5 factor will not apply.

The first 200 tons of quantity placed on a test section will be paid at a factor of 1.5 times the bid price. The remaining quantity will be paid at bid price. A maximum of two test sections per item will be paid at the 1.5 adjustment. Place only one test section per item per day. Subsequent test sections after the initial test section will be subject to approval by the Engineer.

Routine paving will only begin after a PTD has been established by the Regional Materials Engineer based on testing of the pavement cores.

2. Option 2 - Test Section immediately followed by Routine Paving. Inform the Engineer when this option is selected. Construct a test section as described in Option 1 and continue paving. Take additional loose-mix samples in accordance with §402-3.08. Store these samples at the plant. The 1.5 adjustment for the test section does not apply when this option is selected. Determine an Interim PTD to monitor pavement density as described in the appropriate Materials Procedure. If nuclear density readings over two consecutive locations fall below 96% or above 103% of the PTD or if the moving average of the last 10 nuclear density readings falls below 98% of the PTD, stop routine paving operations and immediately construct a new test section in accordance with requirements of Option 1 - Test Section Only.

At the end of the first day's paving, submit a copy of the appropriate BR form, as described in MP 96-01 or MP 03-001, to the Engineer. The Engineer will determine whether the density readings taken using the Interim PTD are acceptable based on the Actual PTD in accordance with MP 96-01 or MP 03-001. If not, the Engineer will select core locations randomly over the entire first day's production excluding the test section. Prior to drilling these cores, take density readings at each core location. Deliver the core samples, density gauge readings, and the loose mix samples to the Regional Laboratory in accordance with §402-3.08, Pavement Density Samples.

If the average density of the pavement cores is not between 92% and 97% of the mixture's maximum theoretical density, the Engineer will make a payment adjustment in accordance with Table 402-9, Density Quality Adjustment Factors, to the material placed on that day excluding the material placed on the test section.

Use only the gauge(s) correlated during the construction of the test section for monitoring pavement density during routine paving operations.

Compact the pavement sufficiently to achieve the PTD value. The minimum acceptable density reading is 96% and no greater than 103% of the PTD at a single test location and 98% of the PTD calculated as a moving average of the last 10 test locations as determined by a density gauge. Take density gauge readings at each location, randomly selected by the Engineer in accordance with the appropriate Materials Procedure, every 200 feet along the length of the pavement for each pass of the paver. Record these density values on the appropriate BR form.

If density gauge readings over two consecutive locations fall below 96% or above 103% of the PTD or if the moving average of the last 10 density gauge readings falls below 98% of the PTD, stop routine paving operations and immediately construct a new test section in accordance with requirements of Option 1 - Test Section Only.

Placement and compaction on shoulders, ramps, maintenance widenings and crossovers, and bridges will be deemed satisfactory by the Engineer when the procedures used in these areas obtain pavement density similar to that obtained on the mainline pavement sections. Monitor and record the density of the above-referenced areas with the same density gauge to insure the PTD is achieved. If the shoulder subbase is structurally insufficient to sustain the level of compaction such that the shoulder shows signs of distress, decrease the compaction effort until no damage occurs to the shoulder or subbase.

Additional pavement core samples may be required for daily density verification from the previously placed HMA. The requirement of these samples shall be based on the following situations:

- Insufficient number of density readings recorded, either at a specific location or at the required frequency.
- Paving without a density gauge on site.
- Paving completed after the only calibrated density gauge on site breaks down.
- Gauge readings do not seem to accurately represent the HMA density.

When pavement samples are required, take cores and density gauge readings at each core location in accordance with §402-3.08, Pavement Density Samples, and deliver them to the Regional Laboratory. The Regional Materials Engineer may establish a new PTD based on these cores. The material placed under the above situations will be subject to a payment adjustment.

Pavement samples may be required to verify PTD used on the contract for the following situations:

- When the contract includes multiple paving locations.
- Changes in existing pavement condition being overlaid.
- Excessive plant mix variations.
- Using a Job Mix Formula different from the mix produced for the Test Section or producing the mix in a plant different from the plant used during the Test Section.

When pavement samples are required, take cores, density gauge readings at each core location, and loose-mix samples in accordance with §402-3.08, Pavement Density Samples, and deliver them to the Regional Laboratory. The material placed under these situations will not be subject to payment adjustment. The Regional Materials Engineer will establish a new PTD if different from the original PTD.

C. 70 Series Compaction Method. On the first day of paving, construct a test section on the project site at a location approved by the Engineer, using the same equipment and procedures to be used in the construction of the remainder of the course being laid. The test section is constructed to determine the Project Target Density (PTD). Routine paving operations may begin immediately following the construction of the test section once a PTD has been established based on the evaluation of density readings. Paving operations will not be allowed unless both a density gauge and an operator are present.

Test Section. Construct a test section maximum of 1500 linear feet on the mainline which has the same depth specified for the construction of the course it represents. Use the first 300 feet of the test section to stabilize the paving operation. The remainder of the length will be used to determine the Project Target Density (PTD). Once a sufficient amount of material has been placed in the remaining test section, compact the pavement initially with a breakdown roller making four vibratory passes or as recommended by the Engineer. The Engineer will select three random locations in accordance with the appropriate Materials Procedure, and mark these sites so that subsequent density testing can be performed at the same locations. Take density readings at the three selected sites. A density gauge reading is defined as the average of multiple density gauge measurements taken in accordance with the appropriate Materials Procedure. Make additional machine passes using either the intermediate or the finish roller and take additional density readings at the three previously selected sites after each pass until the increase in density is less than 2 pcf, or until the Engineer stops further compaction because the pavement shows signs of distress.

The Engineer will calculate the average of the highest density reading from each of the random locations. The resulting average will be set as the PTD.

Compact the pavement sufficiently to achieve the PTD value. The minimum acceptable density reading will be 96% or maximum of 103% of the PTD in a single test location and 98% of the PTD

calculated as a moving average of the last 10 test locations as determined by a density gauge. Take density gauge readings at each location, randomly selected by the Engineer in accordance with the appropriate Materials Procedure, approximately every 200 feet along the length of the pavement for each pass of the paver. Record these values on the appropriate BR form.

If density gauge readings over two consecutive locations fall below 96% or above 103% of the PTD or if the moving average of the last 10 density gauge readings falls below 98% of the PTD, stop routine paving operations and immediately construct a new test section in accordance with requirements of the Test Section.

Placement and compaction on shoulders, ramps, maintenance widenings and crossovers, and bridges will be satisfactory when the procedures used in these areas obtain pavement density similar to that obtained on the mainline pavement sections. Monitor the density of areas with the same density gauge to insure the PTD is achieved. If the shoulder subbase is structurally insufficient to sustain the level of compaction such that they show signs of distress, decrease the compaction effort until no damage occurs to the shoulder or subbase.

D. 80 Series Compaction Method. For this compaction method, use either of the compaction options listed below:

1. Option 1 - Static Compaction. Use this option only when the compacted thickness of the finished mat is 4 inches or less. The roller speeds shall not exceed 3 mph and will move at a slow and uniform speed. The roller drive wheel or drum will be nearest to the paver. When paving multiple lanes simultaneously, increase the required number of rollers proportionately for each additional full lane width unless otherwise approved by the Engineer. Under this option, initially roll all HMA mixtures with an approved steel-wheel roller operating in a static mode. Overlap the previous roller pass by one-half the width of the roller.

Immediately following the initial rolling, roll the mat with an approved pneumatic rubber-tired roller. A minimum of 3 passes of the rubber-tired roller will be required. One pass is defined as one movement of the roller over any point of the pavement in either direction.

Immediately following the pneumatic rubber-tired rolling, finish rolling the mat with a steel-wheel roller to remove all shallow ruts, ridges, roller marks, and other irregularities from the surface.

To prevent adhesion of the mixture to the drum(s) and pneumatic tires, keep the drum(s) and the pneumatic tires properly moistened with water, or water mixed with small quantities of detergent or other approved materials.

When the compaction procedure fails to produce acceptable results, adjust the procedure to obtain the desired results.

2. Option 2 - Vibratory Compaction. Under this option, furnish a vibrating-reed tachometer for the exclusive use of the Engineer. The vibrating-reed tachometer must have a frequency range of 1000 to 4000 vpm with a minimum reed interval of 50 vpm between 1000 and 2000 vpm and a minimum reed interval of 100 vpm between 2000 and 4000 vpm.

Operate vibratory rollers at a uniform speed not exceeding 2 1/2 mph (220 fpm) on all pavement courses. Complete all turning of the compaction equipment on material which has had a minimum of one roller pass.

The number of passes listed in Table 402-5, Number of Passes, are recommended and may be increased or decreased to obtain adequate density. Complete all breakdown roller passes before the mat temperature falls below 250° F. One vibratory pass is defined as one movement of one drum of the roller over the pavement in either direction. One static pass is defined as one movement of the roller over the pavement in either direction. Remove all ruts, ridges, roller marks, or other irregularities from the surface using static rolling. The Engineer may approve alternate compaction procedures for areas where the specified procedures are not practical.

If satisfactory compaction is not obtained, or damage to highway components and/or adjacent property occurs using vibratory compaction equipment, immediately cease using this equipment and proceed with the work in accordance with the conventional compaction procedures stipulated under Option A at no additional cost to the State.

TABLE 402-5 NUMBER OF PASSES				
Pavement Courses	Option 1 Three Roller Train (Static)		Option 2 Vibratory Rollers	
	Steel Wheel Rollers	Pneumatic Roller	Vibratory Passes	Static Passes
37.5 Base (Each Lift)	8	3	6	4
25.0 Binder	8	3	6	4
19.0 Binder	6	3	4	2
12.5 Top	6	3	4	2
9.5 Top	4	3	4	2

For the permeable base course, compact the mixture between the temperatures of 140°F and 230°F by applying two static roller passes. Up to 2 additional passes may be required to obtain adequate density.

E. Density Gauges

1. Nuclear Density Gauge. Use a nuclear density gauge to monitor the pavement density in accordance with this subsection and Materials Procedure (MP) 96-01, Nuclear Gauge Density Data Collection for Hot Mix Asphalt. A nuclear density gauge shall consist of a radioactive source, scaler, and other basic components housed in a single backscatter unit. The gauge must be operated by personnel trained in the principles of nuclear testing and safety practices.

2. Nonnuclear Density Gauge. Use a nonnuclear density gauge to monitor the pavement density in accordance with this subsection and Materials Procedure (MP) 03-001, Nonnuclear Density Gauge Data Collection for Hot Mix Asphalt. The nonnuclear density gauge shall function in the temperature and moisture levels experienced during HMA paving. The nonnuclear density gauge shall contain the internal circuitry to determine the density of HMA pavements by measuring changes in the electromagnetic field resulting from the HMA compaction process.

402-3.08 Pavement Density Samples .

A. Pavement Cores. The Engineer will select one pavement core location for each subplot in accordance with MP 96-04, to represent each paving subplot. The Engineer will define a total of four 6 inch diameter coring locations. The pavement core samples must come from within the 6 inch diameter circles outlined. Under no circumstances will the Engineer designate the coring locations before the rolling operation is completed. The rolling operation is completed when all compaction equipment has moved off the subplot designated for coring. Obtain the 6 inch diameter pavement core samples no later than a day following placement of the lot. If necessary, cool the pavement so that the core samples are not damaged during coring. Do not intentionally separate the pavement core from the underlying material if it does not debond during coring. The State will separate the pavement core required for testing from the underlying material by sawing, if necessary. Backfill the core holes with a similar HMA material before opening the lane to traffic.

B. Loose Mix Samples. On each paving day, take four loose mix samples in accordance with AASHTO T168, Standard Test Method for Sampling Bituminous Paving Mixtures. Take these samples periodically throughout the day so as to represent the entire day’s production. When a low production day is anticipated, it is recommended that a minimum of three loose mix samples be obtained before production is terminated. When operational conditions cause production to be terminated before the specified number of samples have been taken, the following procedures will be used:

1. If only three samples are taken, the loose mix maximum theoretical density (MTD) will be based on the average of the three samples taken.
2. If only one or two samples are taken, the day's production will be added to the next day's production and sublots determined based on the total quantity placed during the two days. Therefore a maximum of six loose mix samples will be used to determine the loose mix MTD.

Deliver the loose mix samples to the Regional Laboratory no later than the end of the following day's placement. If, for any reason, a delay occurs in the delivery of the lot samples for three consecutive lots, paving operations for the item will not be permitted to continue until the samples are delivered and tested.

C. Security Procedure. After procuring the pavement cores, secure them in accordance with MP96-04. Cores arriving at the Regional Laboratory for testing with a damaged or missing security seal will not be tested, and new cores will be taken within one foot from the original core location at the same offset.

D. Sample Delivery. Deliver the pavement core samples to the State Regional Laboratory no later than the end of the following day's placement. If, for any reason, a delay occurs in the delivery of the lot samples for three consecutive lots, paving operations for the item will not be permitted to continue until the samples are delivered and tested.

E. Core Testing. The option of testing pavement samples taken under §402.3-08, Pavement Density Samples, for 50 and 60 Series compaction methods may be selected with the approval of the Regional Materials Engineer. Under this provision, perform all sample testing as outlined in accordance with the requirements of Materials Procedure (MP) 98-01, Procedure for Testing Cores Taken from All Hot Mix Asphalt (HMA) Performance-Related Specifications. In addition, when this option is selected, the Engineer will define one additional core from two of the sublots within one foot from the original core location at the same offset.

402-3.09 Joints. The finished pavement at all joints must comply with the surface smoothness requirements and exhibit the same uniformity of texture and compaction as other sections of the course. Do not pass rollers over the unprotected edges of a freshly laid mixture unless permitted by the Engineer.

In the formation of all joints, excluding the tapered wedge joint, the exposed edge of the newly placed layer that will become part of the joint shall be the full thickness of the layer and straight. If the edge of the newly placed layer is unacceptable, correct the edge by using a power driven saw or other approved tools to cut a neat line. Apply a light coat of HMA material meeting the requirements of Section 702 to the existing pavement edges in order to provide bonding with the newly laid pavement.

The pavement of successive courses will be such that all joints are offset no more than 6 inches from the joint of the lower pavement course, unless otherwise approved by the Engineer.

A. Transverse. Place the courses as continuously as possible to limit the number of transverse joints. Stagger the transverse joints in adjacent lanes a minimum of 10 feet. Form the transverse joint by cutting back on the previous run to expose the full depth of the course.

Set up the paver such that material is laid to overlap the previously placed edge by 2 to 3 inches. The thickness of the overlap material will be approximately 1/4 the compacted thickness of the course, so as to result in a smooth and well compacted joint after rolling. Broom the overlapped material back onto the hot mat so that the roller operator can crowd the small excess into the hot side of the joint. If the overlap is excessive, trim off the excess material so that the material along the joint is uniform. Remove and discard the coarse particles of aggregate in the overlap material if deemed necessary by the Engineer.

Compact the transverse joint in static mode with the roller parallel to the joint and perpendicular to traffic. Place boards of proper thickness at the edge of the pavement for the off pavement movement of the roller. Make the first pass with the roller operating on the previously laid material with 6 to 8 inches of its drum(s) projecting onto the non-compacted mix. Then make successive

passes with the roller drum(s) moving approximately one foot per pass onto the hot material until half the width of the roller is on the hot mat.

If a vibratory roller with pneumatic drive wheels is used, align the first pass with one of the pneumatic wheels directly on the joint and the drum operating in static mode. Then make successive passes with the roller drum moving approximately one foot per pass onto the hot mat until half the width of the roller is on the hot mat.

B. Longitudinal. Carefully plan the placement of the surface course to ensure that the longitudinal joints in the surface course will correspond with the edges of the proposed traffic lanes. Other joint arrangements will require approval of the Engineer. When traffic is maintained on the roadway during paving operations, place the mixture such that no more than 100 feet of the longitudinal pavement joint will be exposed at the end of the working day unless a greater length is permitted in the contract documents. An exposed joint in excess of 100 feet must be a tapered wedge joint. If an exposed joint in excess of 100 feet is allowed overnight, place warning signs at a maximum spacing of 1000 feet to alert drivers of the uneven edge. Approval to leave an exposed edge must be requested in writing in advance of paving operations. If approval is granted to leave a longitudinal pavement joint exposed to traffic, plan the paving operation so that the edge is only exposed to traffic for one night and is not exposed over weekends or holidays.

If permission is granted to expose a longitudinal pavement joint overnight and the joint becomes damaged or provides an unsafe condition for motorists, the Engineer will rescind the approval to expose the longitudinal pavement joint overnight. Then, no more than 100 feet of the longitudinal pavement joint may be exposed at the end of the work day.

Use the following options when paving adjoining lanes:

1. Option A - Butt Joint. Under this option lay the HMA mixture such that it uniformly overlaps the adjacent cold mat 2 to 3 inches. The thickness of the overlap material will be approximately one-fourth the compacted thickness of the course, so as to result in a smooth and well compacted joint after rolling. Broom or rake back the overlapped material onto the adjacent hot lane so that the roller operator can crowd the small excess into the hot side of the joint. Broadcasting of the overlap material onto the lane is not allowed. If the overlap is excessive, trim off the excess material so that the material along the joint is uniform. Remove and discard the coarse particles of aggregate in the overlap material if deemed necessary by the Engineer.

2. Option B - Tapered Wedge Joint. Under this option, place the HMA mixture for the first mat with an attachment to the paver to provide a sloping wedge with a vertical stepdown at the longitudinal pavement joint. Extend a wedge of material from the bottom of the stepdown to the existing surface at a slope of 1 on 8 or flatter. Compact the first mat such that the roller compacts up to but does not extend past the stepdown. The vertical stepdown will be 1/2 inch minimum after compaction of the mat. Place the second mat such that it uniformly overlaps the adjacent cold mat 1 to 1 1/2 inches. The thickness of the overlap material will be approximately 1/4 the compacted thickness of the HMA layer, so it results in a smooth and well compacted joint after rolling. Broom or rake back the overlapped material onto the adjacent hot lane so that the roller operator can crowd the small excess into the hot side of the joint. Broadcasting of the overlap material onto the lane is not allowed. If the overlap is excessive, trim off the excess material so that the material along the joint is uniform. Remove and discard the coarse particles of aggregate in the overlap material if deemed necessary by the Engineer.

TAPERED WEDGE JOINT

If a dual-drum vibratory roller is used during construction of a longitudinal joint using either Option A or B, operate the roller in vibratory mode and as close to the paver as practicable. Make the first pass with the roller traveling toward the paver and operating on the hot mat with 6 to 8 inches of the roller drum protruding onto the cold mat. The roller will apply a second pass to the joint as it travels back away from the paver. If a single-drum vibratory roller with pneumatic drive wheels is used, operate the roller in vibratory mode and follow the same procedure except that the roller will be aligned on the joint so that the pneumatic drive wheels travel on the joint. All turning movements of the roller will be done on previously compacted material. After applying two roller passes on the longitudinal joint, proceed with the roller to the low side of the lane and compact as described in §402-3.07, Compaction.

402-3.10 Surface Tolerance. Construct the pavement surface to a 1/4 inch tolerance. If the pavement surface is not being constructed or has not been constructed to this tolerance based upon visual observation or upon riding quality, the Engineer may test the surface with a 16 foot straight edge or string line placed parallel to the centerline of the pavement and with a 10 foot straight edge or string line placed transversely to the centerline of the pavement on any portion of the pavement. Variations exceeding 1/4 inch will be satisfactorily corrected or the pavement relaid at no additional cost to the State.

402-3.11 Thickness Tolerance. The thickness indicated for each of the various courses of HMA pavement is the nominal thickness. Construct the pavement so that the final compacted thickness is as near to the nominal thickness as is practical, and within the tolerances specified below.

The Engineer may request cores to determine the thickness of the completed pavement layer for final acceptance and payment. Provide traffic control for safety purposes at no additional cost to the State when the pavement is cored. Fill all core holes with HMA mixture and compact the mixture in a manner satisfactory to the Engineer. The Engineer may use another acceptance method such as yield calculations to determine the final thickness for acceptance and payment.

HMA mixture, placed as a truing or leveling course as described in §402-3.05, Conditioning of Existing Surface, will not be considered in pavement thickness determinations.

A tolerance not to exceed 1/4 inch from the nominal thickness required for the course specified under one pay item will be acceptable where the required nominal thickness is 4 inches or less. A tolerance not to exceed 1/2 inch from the nominal thickness required for the course or courses specified under one pay item will be acceptable where the required nominal thickness is over 4 inches. The total thickness of all HMA mixture courses will not vary from the total of the nominal thickness indicated on the plans by more than 1/4 inch where the total nominal thickness is 4 inches or less; or more than 1/2 inch where the total nominal thickness is over 4 inches but not more than 8 inches; and by not more than 5/8 inch where the total nominal thickness is more than 8 inches.

When the HMA mixture is placed on newly constructed subbase material, an additional tolerance of plus 1/4 inch will be allowed both in the nominal thickness of the course placed directly on the subbase and the total pavement thickness.

No payment will be made for any material placed in excess of the permissible tolerance except as provided herein. Tolerances indicated for the thicknesses of individual layers of multilayer pavements (including composite pavements) are guides which should be met as closely as practical. Tolerance for the total thickness of such pavement is also a guide. In order to attain a smooth riding pavement true to line and grade, pavements which substantially conform to the plans and specifications, even though the thickness tolerance may not be exactly met, may be accepted and paid for under the following conditions:

335

Where the total thickness of such pavements is less than the specified thickness including tolerances, the Regional Director, may with approval of the Director, Office of Construction ~~Division~~, approve, accept and pay for such pavements; where the total thickness of such pavements is greater than the specified thickness, the Regional Director may accept and pay for such pavements when the excess thickness was necessary to attain a smooth riding pavement surface. Payment for excess thickness necessary to achieve a smooth riding surface will be considered only in cases where an existing pavement surface has been resurfaced.

402-3.12 Paver and Equipment Cleaning. Cleaning tools and equipment used for HMA placement is not allowed on the pavement surface. Also, do not conduct cleaning near streams, ponds, drainage structures or other areas that are tributaries to waterways. Use an area designated by the Engineer for cleaning all paving equipment and tools. If possible, remove solid pieces of asphalt by scraping or other mechanical means prior to application of a cleaning agent. If a petroleum product is used for cleaning, contain all liquid products during cleaning operations using tarpaulins, sand pads, pails, or other collection methods to prevent spillage or accidental release. Use hand sprayers or other similar devices to minimize the amount of petroleum product applied. Properly dispose of sand and collected petroleum products as petroleum contaminated soil. Dispose solid, dry asphalt fragments as exempt construction and demolition waste. Report any petroleum product spillage to the ground to the NYS Department of Environmental Conservation.

402-4 METHOD OF MEASUREMENT. Provisions of §401-4 Method of Measurement apply, including the following:

The HMA will be measured by the number of tons of compacted mixture in the accepted work. In addition, quality payment adjustments are applicable for all hot mix asphalt in accordance with these specifications herewith and the provisions outlined in the contract documents. All quality payment adjustments are measured in Quality Units. Quality Units will be determined for each day’s production and placement by using the daily Quality Adjustment Factor (QAF) for plant production, pavement density, longitudinal joint density and pavement smoothness and the appropriate tons accepted by the Engineer.

Quality Units = (Quality Adjustment Factor - 1.00) x Appropriate Accepted HMA Tons

When the pavement density QAF applies, use one of the following methods of measurements in Table 402-6, Methods of Measurements, corresponding to the item used on the project:

TABLE 402-6 METHOD OF MEASUREMENT		
Method Type	Pay Item Number	Description
A=50 Series	402.XX5FZR	QAF based on calculated PWL using four cores.
B=60 Series	402.XX6FZR	QAF based on average of four core densities.

A. 50 Series Method. The Engineer will determine the paving lot’s Percent Within Limits (PWL) in accordance with MP 96-4. This PWL will be used to determine the density QAF as shown in Table 402-7, Quality Schedule. The quantity of the HMA mixture subject to possible adjustment will be determined from actual quantity placed on the mainline and ramps of uniform width longer than 1200 feet. When shoulders and mainline are placed together, the mainline quantity may be determined using typical sections shown in the contract documents.

The pavement density QAF from Table 402-7, Quality Schedule, will apply to the paving lot to determine the payment adjustment. The pavement density QAF will not apply to material placed on ramps with a uniform full width section of less than 1200 feet in length, shoulders, maintenance widenings and crossovers, and bridges. Payment in these areas will be a QAF of 1.00 based on satisfactory placement and compaction as determined by the Engineer.

B. 60 Series Method. The State will test all pavement density samples for this item when Option 2 on the initial paving day is selected or if the Engineer requests additional cores on any day after the

first day as outlined in the specifications. Full payment will be made when the average density of the four cores is between 92% and 97% of the mixture's average daily maximum theoretical density. If the average density fails to meet this limit, a payment adjustment will be made based on bid price and in accordance with Table 402-9, Density Quality Adjustment Factors, to all the material placed on the mainline for the day the cores represent, excluding the material placed on the test section.

TABLE 402-7 QUALITY SCHEDULE	
Percent Within Limits (PWL)	Quality Adjustment Factor (QAF)
PWL ₉₂₋₉₇ > 93	1.05
PWL ₉₂₋₉₇ ≤ 93	$\sum (PWL_{Segment} \times PayFactor_{Segment})^{1,2}$

NOTES:

1. Where PWL_{Density Range} will be calculated for each of the nine density ranges in Table 402-8, Density Segment Pay Factors, using the standard deviation and average density for the lot.
2. If the QAF is determined to be 0.60 or less, then the lot will be evaluated by the Engineer to determine if it may remain in-place. The type of material produced (i.e. binder, top), the layer in which it was used, and the location of use (i.e., mainline or a non-critical area) will be primary considerations in the determination of whether the HMA can be left in-place. If the HMA cannot be left in-place, it will be removed at no cost to the State. However, if the Engineer determines that the HMA can be left in-place, the QAF will be 0.60.

TABLE 402-8 DENSITY SEGMENT PAY FACTORS	
Density Segment	Segment Pay Factor
88 - 89	0.60
89 - 90	0.70
90 - 91	0.80
91 - 92	0.90
92 - 93	1.00
93 - 96	1.05
96 - 97	1.00
97 - 98	0.90
98 - 99	0.80

TABLE 402-9 DENSITY QUALITY ADJUSTMENT FACTORS	
Average Core Density	Quality Adjustment Factor
91.0 ≤ Density < 92.0 or 97.0 < Density ≤ 98.0	0.95
90.0 ≤ Density < 91.0	0.90
88.0 ≤ Density < 90.0	0.85
Density < 88.0 or Density > 98.0	0.60*

*The lot will be evaluated by the State to determine if it may remain in-place. The type of material produced (i.e. binder, top), the layer in which it is used, and the location of use (i.e., mainline or a non-critical area) will be primary considerations in the determination of whether the HMA can be left in-place. If the HMA cannot be left in-place, it will be removed at no cost to the State. However, if the State determines that the HMA can be left in-place, the Quality Payment Adjustment will be calculated using a QAF of 0.60.

The quantity of the HMA mixture subject to possible adjustment will be determined from actual quantity placed in the accepted work on the mainline and ramps of uniform width longer than 1200 feet. When shoulders and mainline are placed together, the mainline quantity may be determined using typical sections shown in the plans. The payment adjustments will be applied to material placed on mainline but not shoulders, ramps, maintenance widenings and crossovers, and bridges.

402-5 BASIS OF PAYMENT. The unit price bid per ton for all pavement courses shall include the cost of all material, labor and equipment necessary to complete the work, including any cleaning pursuant to §402-3.01; cleaning of foreign material from the pavement as a result of construction operations; all necessary repairs to highway components and/or adjacent property caused by construction operations; any

§402

necessary work to correct surface tolerances per §402-3.10; the scheduling and sequencing of work to conform with weather and seasonal limitations, and all temporary materials and work and/or repairs associated with paving operations outside the specified weather and seasonal requirements; and any removal and replacement of HMA pursuant to §401-4 and §402-4 Method of Measurement. The unit bid price also includes the cost of all necessary traffic control, equipment, labor and materials required in obtaining the pavement cores, filling all core holes with HMA, and compacting these core holes to the satisfaction of the Engineer. In addition, Quality Units may apply to the hot mix asphalt items as calculated in §402-4. Payment of Quality Units will be made based on the Index Price listed in the contract documents. The index price shown in the itemized proposal for each Quality Unit is considered the price bid. The unit (index) price is NOT to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded and the original price will be used to determine the total amount bid for the Contract.

Payment will be made under:

Item No.	Item	Pay Unit
402.010901	Type 1 F9, Asphalt-Treated Permeable Base Course	Ton
402.010911	Plant Production Quality Adjustment to 402.010901	Quality Unit

SECTION 403 - HOT MIX ASPHALT (HMA) PAVEMENTS FOR MUNICIPALITIES

§403

403-1 DESCRIPTION. These general specifications apply to plant mixed Hot Mix Asphalt (HMA) for use by municipalities such as Towns, Counties, etc. Modifications of these general requirements will be indicated in the specific requirements for each item. These mixes are suitable for low to moderate traffic volumes.

This work will consist of one or more courses of HMA constructed on the prepared foundation in accordance with these specifications and the specific requirements of the item under contract, and in reasonably close conformance with the lines, grades, thickness and typical sections shown on the plans or established by the Engineer.

Appropriate mix types with corresponding friction aggregates and Performance Graded Binder (PG Binder) grades must be specified and used based on the traffic levels and the project location. When the traffic levels exceed an AADT of 8,000 for two lanes or 13,000 for three or more lanes, then Items in Section 402 must be specified.

403-2 MATERIALS

403-2.01 General. Use all materials for HMA production such as aggregates, PG Binder, Reclaimed Asphalt Pavement (RAP), mineral filler or any other materials meeting the State's requirements.

403-2.02 Composition of Mixtures. The HMA plant mix will generally be composed of a mixture of aggregate, Reclaimed Asphalt Pavement (RAP), filler if required, and PG Binder. For any HMA required by the plans or itemized proposal, formulate a job mix formula that satisfies the General Limits imposed by Table 403-1, Composition of Hot Mix Asphalt Mixtures. In addition, the formula will state the mineral aggregate sources, and the PG Binder used in the mixture. For Type 6F2, 6F3, 7F2, and 7F3 mixtures, determine the optimum asphalt content for the proposed gradation using the Marshall Mix Design Method (50 blows).

The resultant mixture shall meet the following Marshall Mix Properties:

Mix Property	Type 6F2, 6F3	Type 7F2, 7F3
Air Voids, %	3.0 - 5.0	3.0 - 5.0
Voids in Mineral Agg. (VMA), %, min.	14	16
Voids Filled with Binder (VFB), %	65 - 78	65 - 78

Produce, deliver to the work site, and incorporate the mixture into the work within 20°F of the temperature specified by the Engineer but within the mixing and placing temperature range imposed by Table 403-1, Composition of Marshall Designed Plant Mixtures.

The aggregates will be those noted in the job mix formulas. The PG Binder will be accepted on the basis of PG Binder supplier's certification.

Perform quality control tests during HMA production to ensure specification compliance. The plant mixed material will be accepted after blending and mixing at the plant. The pavement courses will be accepted after all paving operations are completed.

403-2.03 Aggregates. Fine aggregate will consist of materials conforming to the requirements of §703-01, Fine Aggregate. In addition, fine aggregate may consist of screenings, free from deleterious materials and manufactured from sources of stone, gravel, or slag meeting the requirements §703-02, Coarse Aggregate. Coarse aggregate will consist of crushed stone, crushed gravel, or crushed slag conforming to the requirements of §703-02, except for gradation.

When aggregates from approved natural fine sand sources are combined with coarse aggregates in the mixture, aggregate particles will meet additional requirements as follows:

- Particles in the No. 1A and No. 1 primary sizes will meet the quality requirements of §703-02 and will have a minimum of 85 percent, by weight, of the particles with at least two fractured faces.
- Particles in the No. 2, No. 3 and No. 3A primary sizes will meet the quality requirements of §703-02 and will have a minimum of 75 percent, by weight, of the particles with at least one fractured face.

Slag aggregate may be used only when an alternate pay item which takes the mix yield differential into account is included on the plans or in the itemized proposal.

Aggregates for all mixtures specified in Table 403-1, including Type 6 or 7 (F9), shall meet the requirements of §703-02, Coarse Aggregate. In addition, the aggregate requirements for Type 6F2, 6F3, 7F2, and 7F3 mixtures shall meet one of the following requirements based on the mix type specified in the contract documents:

A. Coarse Aggregate Type F2 Conditions

1. Limestone, dolomite, or a blend of the two having an acid-insoluble residue content of not less than 20.0%.
2. Sandstone, granite, chert, traprock, ore tailings, slag or other similar non-carbonate materials.
3. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:
 - a. Type 6F2 Mixes. Non-carbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 1/4 inch particles must be non-carbonate.
 - b. Type 7F2 Mixes. Non-carbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 1/8 inch particles must be non-carbonate.

Mixing & Placing Temp. Range, °F ⁵	250-325		225-300		250-325		250-325		250-325		250-325	
Description and Typical Uses	Dense Base: For general use		Open Base: For permeable base layer		Dense Binder: Intermediate layer for general use		Shim: Fine HMA mixture for shimming ruts and leveling		Top Course: Dense course for single course resurfacing of rural, suburban, and urban roadways			

NOTES:

1. All aggregate percentages are based on the total weight of the aggregate.
2. The asphalt content is based on the total weight of the mix. When using slag aggregates in the mix, increase the PGB content accordingly, a minimum of 25 percent for an all slag mix.
3. 6F2, 6F3, 7F2, 7F3 mix types require friction coarse aggregates., and are required for mainline driving surface courses.
4. For Type 6 and Type 7 (F9) aggregate requirements, Marshall design will not be required.. These mix types are suitable where the State's requirements for F9 aggregate apply.
5. Introduce the PG Binder into the pugmill between 225°F and 350°F, or as recommended by the PG Binder supplier.

B. Coarse Aggregate Type F3 Conditions

1. Limestone or a blend of limestone and dolomite having an acid-insoluble residue content of not less than 20.0%.
2. Dolomite
3. Sandstone, granite, chert, traprock, ore tailings, slag or other similar non-carbonate materials.
4. Gravel, or a natural or manufactured blend of the following types of materials: limestone, dolomite, gravel, sandstone, granite, chert, traprock, ore tailings, slag or other similar materials, meeting the following requirements:
 - a. Type 6F3 Mixes. Non-carbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 1/4 inch particles must be non-carbonate.
 - b. Type 7F3 Mixes. Non-carbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities). Additionally, a minimum of 20.0% of plus 1/8 inch particles must be non-carbonate.

When coarse aggregates for these mixes are from more than one source or of more than one type of material, proportion and blend them to provide a uniform mixture.

403-2.04 Mineral Filler. Mineral filler, if required in the mix to meet gradation requirements, will conform to the requirements of §703-08, Mineral Filler.

403-2.05 Performance-Graded Binder. The PG Binder will meet the requirements of §401-2.04, Performance Graded Binder. Unless the type of PG Binder is specified in the Contract Documents, use PG64-22, or a PG Binder specified in Table 6-4, Performance Graded Binder Selection, of Chapter 6 of the Comprehensive Pavement Design Manual, or other suitable PG Grade as approved by the Engineer.

403-2.06 Reclaimed Asphalt Pavement. Reclaimed Asphalt Pavement (RAP) will meet the requirements as written in Materials Method (MM) 5.16, Superpave Hot Mix Asphalt Mixture Design and Mixture Verification Procedures.

403-3 CONSTRUCTION DETAILS. The contractor is responsible for Quality Control (QC). QC is defined as all activities required to produce HMA that meets all specification requirements. The Contractor will produce HMA in accordance with the State approved Control Plan and assume responsibilities for all QC activities at the production facilities. If specified in the contract documents, The Quality Control provisions of Section 401 shall apply.

Unless modified in the contract document, the details of §401-3, Construction Details, will apply except for the gyratory compactor, specimen mold assembly, and the extractor of §401-3.08 HMA Mixing Plant are not required. In addition, the oven's capacity will be a minimum of 1 1/2 cubic feet. The HMA mixing plant inspection facilities shall include mixture design equipment for Marshall method as detailed below.

The details of §402-3 Construction Details will apply except for §402-3.05 Conditioning of Existing Surface and §402-3.07 Compaction, and §402-3.08 Pavement Density Samples. The requirements for conditioning of the existing surface and compaction are detailed below.

403-3.01 Equipment for Marshall Design Method

A. Marshall Compactor. A compactor will meet the requirements of AASHTO T245. Mount the compactor on a solid base. The compactor will be automatically driven, have a stroke counter, and be capable of automatically stopping after applying the desired number of strokes. The compaction hammer shall weigh 10 pounds (± 0.02 pounds).

B. Marshall Specimen Mold Assembly. The specimen mold assembly will meet the requirements of AASHTO T245. The assembly shall consist of a compaction mold, base plate, and collar. Provide a minimum of three specimen mold assemblies and an adequate supply of 4 inch paper discs.

C. Marshall Specimen Extractor. Supply an extractor, meeting the requirements of AASHTO T245, to extract the 4 inches Marshall specimens from the compaction molds.

D. Hot Plate. Supply a hot plate suitable for heating the Marshall compaction hammer. A hot plate meeting the requirements of §401-3.08, 13. p. Sample Drying Appliance, will be acceptable.

403-3.02 Conditioning of Existing Surface. Clean the surface of the existing pavement prior to placing any HMA. When specified in the contract documents:

- Clean and fill the joints and cracks under the provisions of Section 633, Conditioning Existing Pavement.
- Apply a thin, uniform tack coat under the provisions of Section 407, Tack Coat, to all contact surfaces of existing HMA and Portland Cement Concrete layers including such areas as adjacent pavement edges, curbing, gutters, manholes and other structures, immediately prior to placing the HMA mixture against them.
- If the pavement surface is rutted, fill all depressions and wheel path ruts prior to the paving of the truing and leveling course, as directed by the Engineer. For wheel path ruts 1/4 inch or greater, but 3/4 inch or less, use Shim Course. Otherwise, for ruts greater than 3/4 inch, use a Type 7 mixture or other appropriate mixture.
- Place a truing and leveling course of a minimum variable thickness of proper plant mix necessary to bring the surface of the existing pavement to the same transverse slope and longitudinal grade required for the finished pavement surface. For compacted thickness up to 2 inches, use a Type 6 or Type 7 mixture. For compacted thickness in excess of 2 inches, use a Type 3 mixture. Pay special attention to the proper compaction of thin sections.

403-3.03 Compaction Immediately after the HMA mixture has been spread, struck off and surface irregularities adjusted, thoroughly and uniformly compact it by rolling. Roll the surface when the mixture is in the proper condition and when the rolling does not cause undue displacement, cracking or shoving. Initially roll all courses with the roller traveling parallel to the centerline of the pavement beginning at each edge and working toward the center. Roll the banked curves starting at the low side edge and working toward the super-elevated edge.

Correct at once any displacement occurring as a result of reversing the direction of the roller, or from other causes, by the use of rakes and addition of fresh mixture as required. Exercise care in rolling so as not to displace the line and grade of the edges of the HMA mixture. To prevent adhesion of the mixture to the drum(s) and pneumatic tires, keep the drum(s) and the pneumatic tires properly moistened with water or water mixed with small quantities of detergent or other approved material. Any petroleum products or solvents having an adverse effect upon the HMA pavement will not be permitted for use.

There shall be no visible defects, such as shallow ruts, ridges, roller marks, cracking, tearing, segregation, or any other irregularities as determined by the Engineer, in the pavement when the rolling operation is complete. If these defects are present, correct these defects to the satisfaction of the Engineer or relay the pavement at no additional cost.

Along forms, curbs, headers, walls and other areas not accessible to the rollers, thoroughly compact the mixture with mechanical tampers as directed by the Engineer. On depressed areas, use a trench roller or a small vibratory roller with the approval by the Engineer. Cleated compression strips also may be used under the roller to transmit compression to the depressed area.

Remove and replace any mixture that becomes loose and broken, mixed with dirt, or is in any way defective with fresh HMA mixture which shall be compacted to conform with the surrounding area. Correct any area showing an excess or deficiency of HMA material to the satisfaction of the Engineer.

When using vibratory compaction, assume full responsibility for the cost of repairing all damages which may occur to the highway components and adjacent property including buried utility and service facilities.

Use either of the two compaction options listed below except that the shim course must be compacted with a minimum of three passes of a pneumatic rubber tired roller unless otherwise approved by the Engineer for variance. Option B - Vibratory Compaction is not permitted when compacting HMA concrete courses on structural bridge decks, or other structures with less than 2 feet of cover.

A. Option A. Three Roller Compaction Train. Under this option, initially roll all HMA mixtures with an approved steel-wheel roller operating in a static mode. Overlap the previous roller pass by one-half the width of the roller.

Immediately following the initial rolling, roll the mat with an approved pneumatic rubber-tired roller. A minimum of 3 passes of the rubber-tired roller will be required. One pass is defined as one movement of the roller over any point of the pavement in either direction.

Immediately following the intermediate rolling, finish roll the mat with a steel-wheel roller to remove all shallow ruts, ridges, roller marks, and other irregularities from the surface.

Use this option only when the compacted thickness of the finished mat is 4 inches or less. Unless approved by the Engineer, the roller speeds shall not exceed 3 mph. When paving multiple lanes simultaneously, increase the required number of rollers proportionately for each additional full lane width unless otherwise permitted by the Engineer.

B. Option B - Vibratory Compaction. Under this option, use vibratory rollers appearing on the current Approved List - HMA Concrete Vibratory Compaction Equipment. For each project where a vibratory roller is used, furnish a vibrating reed tachometer for the exclusive use of the Engineer. The vibrating reed tachometer must have a frequency range of 1000 to 4000 vpm with a minimum reed interval of 50 vpm between 1000 and 2000 vpm and a minimum reed interval of 100 vpm between 2000 and 4000 vpm.

Operate vibratory rollers at a uniform speed not exceeding 2 1/2 mph (220 fpm) on all pavement courses. Complete all turning of the compaction equipment on material which has had a minimum of one roller pass.

The required number of passes listed in Table 403-2, Number of Passes, is recommended and may be increased or decreased if, in the opinion of the Engineer, adequate density can be achieved. Complete all breakdown roller passes before the mat temperature falls below 250°F. One vibratory pass is defined as one movement of one drum of the roller over any point of the pavement in either direction. One static pass is defined as one movement of the roller over any point of the pavement in either direction. Remove all ruts, ridges, roller marks or other irregularities from the surface using static rolling. The Engineer may alter the compaction procedures for small areas where the specified procedures are not practical.

If the Engineer determines that unsatisfactory compaction is being obtained or damage to highway components and/or adjacent property is occurring using vibratory compaction equipment, then immediately cease using this equipment and proceed with the work in accordance with the conventional compaction procedures stipulated under Option A at no additional cost.

TABLE 403-2 NUMBER OF PASSES

Pavement Courses	Option A		Option B	
	Three Roller Train (Static)		Vibratory Rollers	
	Steel Wheel Roller	Pneumatic Roller	Vibratory Passes	Static Passes
Base (Open Graded Each Lift)	4	3	4	2
Base (Dense-Graded)	4	3	4	2
Binder (Dense-Graded)	2	3	2	2
Top (Dense-Graded All Types)	2	3	2	2

When the compaction procedure being used fails to produce results acceptable to the Engineer, adjust the procedure to obtain the desired results. Rollers will move at a slow and uniform speed. The roller drive roll or wheel will be nearest the paver.

403-4 METHOD OF MEASUREMENT. The Engineer shall measure the quantity of the HMA placed and compacted in the accepted work. The quantity shall be measured in tons to the nearest 0.01 and determined from the delivery ticket.

Each delivery vehicle supplying HMA mixture shall be accompanied with a delivery ticket indicating the total quantity in tons being delivered. The quantity on the delivery ticket shall be determined from the automated proportioning system or the delivery vehicle weigh system. The delivery ticket shall contain the following minimum information:

- Ticket Number
- Plant Identification
- Contract Number
- Material Description, (including the PG-Binder Grade)
- Quantity of Material in Vehicle
- Date and Time

Make one legible copy of the delivery ticket available to the project inspector prior to the placement of the mixture.

403-5 BASIS OF PAYMENT. The unit bid price per ton for all pavement courses shall include the cost of all material, labor and equipment necessary to complete the work, including any cleaning pursuant to §403-3.02; cleaning of foreign material from the pavement as a result of construction operations; all necessary repairs to highway components and/or adjacent property caused by construction operations; any necessary work to correct surface tolerances per §402-3.10; and the scheduling and sequencing of work to conform with weather and seasonal limitations, and all temporary materials and work and/or repairs associated with paving operations outside the specified weather and seasonal requirements. Cleaning, sealing, and filling the cracks will be paid under Section 633. Tack coat will be paid under Section 407, Tack Coat.

Payment will be made under:

Item No.	Item	Pay Unit
403.118902	Hot Mix Asphalt, Type 1 Base Course	Ton
403.128902	Hot Mix Asphalt, Type 2 Base Course	Ton
403.138902	Hot Mix Asphalt, Type 3 Binder Course	Ton
403.158902	Hot Mix Asphalt, Type 5 Shim Course	Ton
403.178202	Hot Mix Asphalt, Type 6 F2 Top Course	Ton

403.178902	Hot Mix Asphalt Type 6 Top Course	Ton
403.198202	Hot Mix Asphalt, Type 7 F2 Top Course	Ton
403.198302	Hot Mix Asphalt, Type 7 F3 Top Course	Ton
403.198902	Hot Mix Asphalt Type 7 Top Course	Ton
403.218902	Hot Mix Asphalt, True and Leveling Course	Ton

SECTION 404 (VACANT)

SECTION 405 - COLD MIX BITUMINOUS PAVEMENT (OPEN GRADED)

405-1 DESCRIPTION. This work shall consist of constructing one or more courses of cold mix bituminous pavement on a prepared base in accordance with these specifications and in substantial conformance with the lines, grades, thicknesses, and typical cross-sections shown on the plans or established by the Engineer.

405-2 MATERIALS

405-2.01 Bituminous Material. The bituminous materials required for mixing and for sealing shall meet the requirements of section 702, Bituminous Materials. The type and grade of bituminous material shall be that indicated on the plans or in the proposal.

405-2.02 Aggregates. The aggregates shall be Department approved aggregates meeting the requirements of § 703-02, Coarse Aggregates, for the sizes specified. Screened gravel shall not be permitted unless specified on the plans or in the proposal.

405-2.03 Composition of Mixtures. The bituminous cold mix shall be composed of a mixture of aggregate and bituminous material as ordered and approved by the Engineer. The mix shall be proportioned as specified in Table 405-1, Composition of Cold Bituminous Mixtures.

TABLE 405-1 COMPOSITION OF COLD BITUMINOUS MIXTURES			
Sieve Size	Mixes		
	Type 1 General Limits % passing¹	Type 2 General Limits % passing¹	Type 3 General Limits % passing¹
2 in	-	-	100
1 1/2 in	-	100	75-100
1 in	100	90-100	50-80
1/2 in	90-100	15-45	0-15
1/4 in	15-45	0-10	-
1/8 in	0-10	-	-
No. 200	0-1.0	0-1.0	0-1.0
Bituminous Material ^{2,3}	4.7-7.0	4.0-6.0	3.5-5.5
Description	Open, Coarse Texture	Open, Coarse Texture	Open, Coarse Texture
Typical Uses	Surface Course	Intermediate	Base Course

1 Percentage based on total aggregate weight.

2 Total Emulsion Percentage based on total mix weight.

3 When crushed air-cooled blast furnace slag aggregate is selected, the above bituminous material content shall be increased approximately 25%.

405-3 CONSTRUCTION REQUIREMENTS

405-3.01 Weather Limitations. Bituminous material or mixture shall not be applied on any soft surfaces, when the surface is wet, when the temperature of the surface on which the mixture is to be placed is below 45°F, or when other weather conditions would prevent proper construction of the pavement.

405-3.02 Equipment. The following equipment shall be required:

- Either central pugmill mixer and bituminous paver or Travel plant mixer
- Bituminous material distributor
- Steel wheeled roller, 8-12 Ton or Approved vibratory roller
- Chip spreader
- Power broom
- Motor grader, if required
- Miscellaneous equipment to perform the work

All equipment and the condition of the equipment for this work shall be subject to approval of the Engineer at all times.

Mixing shall be done with a rotating twin paddle shaft pugmill providing suitable pressure-kneading action in mixing. Mixing by blading, shoveling and/or scooping will not be permitted.

The materials shall be mixed either by the travel mix plant method or in a central pugmill mixer.

The mixer shall be either a continuous traveling type, central continuous or batch type pugmill designed to accurately proportion wither by volume or by weight, so that when the aggregate and bituminous materials are incorporated in the mix, a thorough and uniform coating will result. The mixer shall be equipped to mechanically or electrically interlock the bituminous feed with the aggregate feed such that uniformity of the mixture is assured at all times. The pugmill mixer, either traveling or central type, shall be provided with weighing, volumetric or other gauging equipment which shall be capable of providing accurate control at all times of the amount of aggregate entering the mixer per time interval. On the central continuous type pugmill a mechanically operated discharge hopper of at least 1 cubic yard capacity shall be provided. The mixer shall be equipped with a positive displacement metering system capable of totalizing the quantity of bituminous material applied to the mixing chamber.

405-3.03 Preparation of the Base. The roadway surface to be covered shall be free from holes, depressions, bumps, waves and corrugations. Any unsuitable surface areas shall be repaired by replacement of the unstable materials or by patching with a material to produce a tight surface having the same elevation as the surrounding surface. The roadway surface shall be broomed when ordered by the Engineer to remove loose material.

405-3.04 Mixing and Spreading. The aggregate and asphalt shall be thoroughly mixed so that the bituminous material is uniformly distributed throughout and all aggregate particles are uniformly coated.

The mixture shall be deposited on the prepared base either in a windrow at the back of the travel mixer or mechanically spread in a uniform layer so as to produce the specified thickness after compaction. If deposited in a windrow, it shall be spread over the entire roadway surface by motor grader or other approved spreader to produce the specified thickness after compaction. The maximum allowable compacted thickness shall be 2 inches for the Type 1 mix (Table 405-1) and 4 inches for the Type 2 and Type 3 mixes (Table 405-1).

405-3.05 Compaction. After spreading, the mixture shall be thoroughly and uniformly compacted with a self-propelled steel-wheeled roller or an approved vibratory roller to obtain a thoroughly compacted pavement. The number of roller passes to achieve the desired compaction shall be approved by the Engineer.

405-3.06 Surface Testing. The finished surface of the pavement shall be tested with a 16 foot straight edge laid parallel with the center line of the pavement. Any area exceeding a 1/4 inch variation from the surrounding area shall be satisfactorily corrected or removed and replaced.

405-3.07 Pavement Sealing. Either prior to initial compaction or immediately after compacting the mix, No. 1A size key stone meeting the requirements of § 703-02, Coarse Aggregates, shall be uniformly spread upon the surface at the rate of 10 to 15 lb/sy and the course rolled. No. 1 size key stone meeting the requirements of § 703-02, Coarse Aggregates, at the rate of 10 to 20 lb/sy, may be used for key stone on the base course mixes. After placement of the No. 1A size key stone, the pavement shall be opened to traffic for a minimum of 3 days before placing the seal coat.

Prior to the application of the seal coat, the pavement surface shall be thoroughly swept and cleaned of all excess material. The seal coat shall be bituminous material asphalt emulsion meeting the requirements of § 702-3101 or § 702-4101 applied at the rate of 0.3 to 0.5 gal/sy (Type 1 mix, Table 405-1) or 0.5 to 0.65 gal/sy (Type 2 mix, Table 405-1). This shall be immediately followed by an application of No. 1A cover aggregate at the rate of 15 to 20 lb/sy which shall then be rolled. In the case where multiple lifts of Cold Mix Bituminous Pavements are used, only the surface of the top course shall require a seal coat. In multiple lift construction, each lift requires an application of key stone to fill voids in the mat.

§405

405-4 METHOD OF MEASUREMENT. The bituminous cold mix pavement shall be measured by the number of tons of compacted aggregate, including key and cover stone, placed in accordance with the specifications.

The liquid bituminous material shall be measured by the liter.

405-5 BASIS OF PAYMENT. The unit price bid per ton shall include the preparation of base, the cost of furnishing all the aggregate, the mixing, placing, compaction and all labor and equipment necessary to complete the work. The bituminous material will be paid for under its appropriate item.

Payment will be made under:

Item No.	Item	Pay Unit
405.01	Cold Mix Bituminous Pavement (Open Graded)	Ton

SECTION 406 (VACANT)

SECTION 407 - TACK COAT

407-1 DESCRIPTION. This work shall consist of preparing and treating an existing portland cement concrete surface or hot mix asphalt surface, excluding the surface of permeable base material with tack coat in accordance with the Contract documents and as directed by the Engineer.

407-2 MATERIALS. The tack coat shall meet the requirements of Table 702-10 *Tack Coat*. This material will be sampled and tested in accordance with the Department's Materials Method (MM) 8.2 *Asphalt Emulsion - Quality Assurance*.

Rapid setting emulsions modified with chemical additives for fast breaking may be used as a tack coat at no additional cost to the state. Requests made to the Engineer to use these chemically modified rapid setting tack coats shall be done a minimum of 14 days prior to use. The Materials Bureau will be informed by the Engineer to determine if the proposed tack coat is acceptable for use.

407-3 CONSTRUCTION DETAILS.

407-3.01 Equipment. A distributor shall be used for applying tack coat. The distributor shall be capable of applying the tack coat uniformly on variable widths of surface up to 15 feet, with uniform pressure, and with an allowable variation from any specified rate detailed in Table 407-1 *Tack Coat Application Rates* not exceeding 0.02 to 0.03 gallons per square yard. Distributor equipment shall include a quantity measuring system and a thermometer for measuring temperature of tank contents. This equipment shall be calibrated within the last 12 months in accordance with ASTM D 2995 *Standard Practice for Estimating Application Rate of Bituminous Distributors*. A copy of the signed and dated calibration certification detailing the equipment by its serial number or other unique identifier shall be given to the Engineer prior to use.

Distributors shall be equipped with a power unit for the pump and full circulation spray bars shall be adjustable both laterally and vertically. An attached bristle broom designed such that it drags on the pavement behind the spray bars may be attached to the distributor. If the broom is used, it shall be adjustable laterally and vertically so that the full width of the applied tack coat is bristled uniformly into the pavement surface.

A bituminous material sampling valve shall be attached to the distributor. When samples are taken through such valves, they shall be considered representative of all material in the distributor tank. The distributor tank will be equipped with an agitator that is capable of ensuring the emulsion is homogenous. It is preferred that the asphalt emulsion stored in the distributor tank be heated and maintained at a temperature range between 85°F and 160°F.

Smaller hand operated power spray units will be permitted only in areas where the use of a distributor is impractical.

The Engineer will determine the final acceptance of all equipment used for applying the tack coat.

407-3.02 Application of Emulsion Material. The asphalt emulsion contained in the distributor tank shall be homogenous. Emulsified asphalts held in storage tanks, drums, or distributors for long periods are subject to settlement. The asphalt emulsion shall be sufficiently agitated or circulated to ensure a homogenous emulsion prior to sampling or application. The tack coat shall be applied to a prepared clean pavement and in a manner to offer the least inconvenience to traffic and to reduce pickup or tracking of the bituminous material. Upon application the material shall be as uniformly spread across the width of the designated area.

The tack coat shall not be applied on a wet pavement surface or when the pavement surface temperature is below the temperature requirements outlined in Table 402-2 *Temperature and Seasonal Requirements*. The Engineer will approve the temperature and areas to be tack coated prior to application. To avoid “boil-off” of the water, the asphalt emulsion shall not be heated above 195°F. The application rate shall be as determined in Table 407-1. These are recommended application rates for tack coat on various surfaces types and may be modified by the Engineer based on prior experience.

TABLE 407-1 TACK COAT APPLICATION RATES	
Surface Type	Application Rate (gallons per square yard)
New Hot Mix Asphalt	0.03 - 0.04
Milled Surfaces and Existing Hot Mix Asphalt	0.05 - 0.06
Portland Cement Concrete	0.05 - 0.06
Vertical Surfaces (curbs, drainage structures, and appurtenances)	0.06 - 0.07

407-4 METHOD OF MEASUREMENT. The quantity to be measured for payment will be in gallons of asphalt emulsion for tack coat measured at 60°F to the nearest gallon. The following formula will be used to calculate material quantity at 60°F:

$$\text{Volume}_{60^{\circ}\text{F}} = \text{Volume}_{\text{D}} \times [1 - (\Delta\text{T} \times 0.00025 \text{ } \cancel{0.00045})]$$

$$\Delta\text{T} = \text{Delivered Temperature } (^{\circ}\text{F}) - 60$$

$$\text{Volume}_{\text{D}} = \text{Quantity Delivered (gallons)}$$

407-5 BASIS OF PAYMENT. The unit price bid per gallon for tack coat shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
407.0101	Tack Coat	Gallon

SECTIONS 408 AND 409 (VACANT)

SECTION 410 - BITUMINOUS SURFACE TREATMENT - SINGLE COURSE

410-1 DESCRIPTION. The work shall consist of the construction of a single bituminous surface treatment for both pavements and shoulders in accordance with these specifications in substantial conformance with the limits shown on the plans or established by the Engineer.

410-2 MATERIALS

410-2.01 Bituminous Materials. All the provisions of Section 618 shall apply with the following additions:

A. Bituminous Material Approval. The bituminous material shall be obtained from a storage facility that has been approved by the Director, Materials Bureau within the current calendar year, before the start of work.

B. Bituminous Material Selection. The selected bituminous material shall be compatible with the aggregate to be used. It's the contractors responsibility to ensure compatibility between the bituminous material and aggregate. The selection of bituminous material shall also be subject to the approval of the Engineer. Under the work the Contractor shall select, furnish and apply one of the following bituminous materials to a prepared surface.

1. Bituminous Surface Treatment - Pavement

Materials

Designation	Grade	Description
702-3101	RS-2	Rapid Setting Asphalt Emulsion
702-3102	HFRS-2	High Float Rapid Setting Asphalt Emulsion
702-4101	CRS-2	Cationic Rapid Setting Asphalt Emulsion

When the two-way AADT is greater than 500, the selected bituminous material shall be polymer modified to increase the desired aggregate retention. When the two-way AADT is less than 500, the Contractor may or may not choose to blend the emulsion with a polymer modifier.

2. Bituminous Surface Treatment - Shoulders

Materials

Designation	Grade	Description
702-3101	RS-2	Rapid Setting Asphalt Emulsion
702-3102	HFRS-2	High Float Rapid Setting Asphalt Emulsion
702-3301	HFMS-2	High Float Medium Setting Asphalt Emulsion
702-4101	CRS-2	Cationic Rapid Setting Asphalt Emulsion

410-2.02 Aggregates. The aggregates for bituminous surface treatments shall conform to the requirements of Subsection 703-02, "Coarse Aggregate" and be from an approved source. Where aggregates for pavement surface treatment are from more than one source or of more than one type of material, they shall be proportioned and blended to provide a uniform mixture. The procedure used for proportioning shall be approved by the Regional Director or the authorized representative.

A. Bituminous Surface Treatment - Pavement. The aggregate size shall be No. 1ST and meet one of the following:

1. Limestone having an acid insoluble content of not less than 20%, excluding particles of chert and similar siliceous rocks. Blends of siliceous and non-siliceous and non-siliceous limestone will not be permitted.
2. Dolomite
3. Sandstone, granite, chert, trap rock, ore tailings or other similar non-carbonate materials.
4. Gravel, or a natural or manufactured blend of two or more of the following types of material; limestone, dolomite, gravel, sandstone, granite, chert, trap rock, ore tailings, slag or other similar materials meeting the following requirements:
 - Non-carbonate plus 1/8 inch particles must comprise a minimum of 10.0% of the total aggregate (by weight with adjustments to equivalent volumes for materials of different specific gravities).
 - A minimum of 20.0% of plus 3/16 inch particles must be non-carbonate.

B. Bituminous Surface Treatment - Shoulders. The required aggregate size shall meet the following gradation requirements:

Screen Sizes	Percent Passing
1/2 in	100
1/4 in	85-100
1/8 in	0-15

410-2.03 Polymer Modifier. The minimum amount and type of polymer modifier shall be based on the bitumen content and shall be determined by the laboratory performing the mix design. The minimum polymer modifier content shall be 3% polymer solids, based on bitumen weight. The polymer materials shall be milled or blended into the asphalt or blended into the emulsifier solution prior to the emulsification process.

410-3 CONSTRUCTION DETAILS

410-3.01 Bituminous Surface Treatment - Pavements

A. Weather and Seasonal Limitations. Bituminous material shall not be applied to a pavement surface when the:

1. Surface is wet
2. Ambient temperature is less than 50°F in the shade
3. Ambient temperature is greater than 95°F
4. Weather conditions would prevent proper construction of the surface treatment

The surface on which the bituminous material is applied shall have a temperature of 68°F or higher.

Surface treatments shall be placed during the period of May 1st up to the last Saturday in August (inclusive).

B. Equipment. The following equipment shall be required:

1. Self-propelled Rotary Power Broom. A self-propelled rotary power broom shall so be designed, equipped, maintained and operated so that the pavement surface can be swept clean. The broom shall have an adjustment to control the downward pressure. The power broom shall meet the approval of the Engineer.

2. Bituminous Material Distributor. The liquid bituminous material distributor shall have been calibrated within the previous 12 months for transverse and longitudinal application rates according to ASTM D2995, Practice for Determining Application Rate of Bituminous Distributors. The bituminous material distributor shall be equipped, maintained, and operated so that the bituminous material can be applied at controlled temperature rates from 0.05 to 2.0 gal/sy. The distributor shall be capable of applying bituminous material on variable widths up to 15 feet. The distributor shall uniformly apply the bituminous material to the specified rate with a maximum allowed variation of 0.02 gal/sy. Distributor equipment shall include tachometer, accurate volume measuring devices or a calibrated tank, and a thermometer for measuring temperatures of tank contents. Distributors shall be equipped with a separate power unit for the pump, and full circulation spray bars adjustable laterally and vertically.

The distributor and/or transport shall be equipped with a sampling valve so designed and installed as to be non-clogging and safe. The type of valve and its general location shall be according to Department written instructions. When samples are taken through such valves in accordance with Department instructions, they shall be considered representative of all material in the tank.

3. Self-propelled aggregate spreader. The aggregate spreader shall be a self-propelled unit capable of uniformly spreading the aggregate at the required rate on a minimum width of 6 inches wider than the width of the lane to be treated. The spreader shall meet the approval of the

Engineer and be calibrated similar to the test method used in ASTM D2995, within the previous 12 months, for transverse and longitudinal application using a portable scale and several sheets of canvas, 1 x 3 feet in size..

4. Pneumatic tire roller A minimum of two pneumatic tire rollers will be required for each project. The Engineer will require a sufficient number of pneumatic tire rollers to permit initial rolling of the aggregate to occur within 5 minutes of the application of the bituminous material and the final of the three coverages to be completed within 30 minutes of the application of the bituminous material. The pneumatic tire rollers shall be self-propelled and have oscillating wheels with smooth tread tires and will have a minimum ballasted weight of 10 tons. The tire pressure for all wheels shall be uniform within ± 5 psi. The rollers shall be operated at a maximum speed of 5 mph. To prevent pick-up of the aggregate to the tires, the tires shall be kept properly moistened with water mixed with small quantities of detergent or other material approved by the Engineer. In no case shall a solvent having affect upon the surface treatment be used.

C. Determination of the Quantities of Materials to be Applied. The Contractor shall place a minimum of three test patches at locations determined by the Engineer. The site or sites selected to apply the test patches should be representative of the various road surfaces on which the surface treatment is to be applied. The detailed instructions for test patch installations are as follows:

1. Test Patch Section. The test patch section shall consist of a minimum of three test patches at varying application rates. Recommended variation of 0.05 gal/sy both sides of the selected target as suggested in 2.a.. (below). Each test patch shall be a minimum of 3 x 9 feet or big enough to cover sufficient lane width so traffic will drive over it.

2. Suggested Application for Emulsion and Aggregates

a. Emulsion

i. High Volume Traffic, Tight Surfaces. Emulsion application shall be 0.35 gal/sy

ii. Low Volume, Porous Surfaces. Emulsion application shall be 0.45 gal/sy

b. Aggregate - 1ST(20-24 lbs/sy). The actual amount of aggregate should be determined by weighing the amount of aggregate required to completely cover a one square yard area, one aggregate layer thick.

3. Determination of Application Quantities

a. Emulsion Quantity. Pounds of Emulsion Per Patch = Application Rate (gal/sy) X Size of Test Patch (sy) X Unit Weight of Emulsion (8.34 lb/gal).

b. Aggregate Quantity. Pounds of Aggregate Per Patch = Application Rate (lb/sy) X Size of Patch (sy).

4. Layout Procedure

- a. Clean patch area.
- b. Mark out patch with chalk and straight edge.
- c. In a pre-tared container weigh out determined amount of aggregate for patch.
- d. In a pre-tared container, weigh out determined amount of emulsion for patch. The emulsion should be at the application temperature and work should proceed rapidly to maintain temperature.

- e. Immediately pour the emulsion on the marked patch area, spread with a squeegee until emulsion is evenly spread at uniform thickness throughout the patch area. Squeegeeing should be kept to a minimum to minimize breaking of the emulsion. This whole operation should be done quickly to insure the emulsion doesn't set before cover aggregate is applied.
- f. Spread preweighed cover aggregate, by hand, over patch area.
- g. With pneumatic tire roller, roll the patch area a minimum of three complete passes.

5. Evaluation of Test Patches. After a minimum of 14 days of traffic over the test patches, the Engineer will evaluate the test patches for aggregate retention, flushing or bleeding, aggregate embedment and bonding to the existing pavement.

The selected patch should retain a minimum of 95% of the cover aggregate, show no signs of flushing or bleeding, have 70% embedment of aggregate into the emulsion residue and be securely bonded to the existing pavement.

D. Preparation of Surface. A self-propelled power broom shall be used to clear any loose material from the pavement surface immediately prior to the application of bituminous material. Potholes shall be patched with an appropriate asphalt concrete truing and leveling course approved by the Engineer. These patched areas shall be fog sealed with the same bituminous material selected for the project at a rate of 0.30 gal/sy.

Manhole covers, drop inlets, catch basins, curb any other structure within the roadway area shall be protected against the application of surface treatment material.

E. Application of Bituminous Material. Bituminous material shall be applied by means of a pressure distributor in a uniform, continuous spread over the section to be treated and within the temperature range specified. The quantity of bituminous material to be used shall be that established by the test patch unless modified by the Engineer. The allowable variation from this quantity shall not exceed 0.02 gal/sy. A strip of building paper, at least 3 feet in width and with a length equal to that of the spray bar of the distributor plus 1 foot, shall be used at the beginning of each spread. If the cut-off is not positive, the use of paper may be required at the end of each spread. The paper shall be removed and disposed of in a satisfactory manner. The distributor shall be moving forward at the proper application speed at the time the spray bar is opened. If any skipped areas or deficiencies occur, the operation shall be immediately stopped. Junctions of spreads shall be carefully made to assure a smooth riding surface and the deficient areas corrected in a manner approved by the Engineer.

The bituminous material shall not be applied more than 200 feet in advance of the self-propelled stone spreader.

Under no circumstances shall operations proceed in such a manner that bituminous material will be allowed to chill, set up, dry, or otherwise impair retention of the cover aggregate. Traffic will not be allowed to run on uncovered bituminous material.

The distributor, when not spreading, shall be parked so that the spray bar or mechanism will not drip bituminous material on the surface of the traveled way.

F. Application of the Cover Aggregate. Immediately following the application of bituminous material, cover aggregate shall be spread at the rate established for the test patch unless modified by the Engineer. The allowable variation from this rate shall not exceed 3 lb/sy. All aggregate used for bituminous surface treatment shall be clean as determined by the Engineer at the time of placement.

Spreading shall be accomplished in such a manner that the tires of the aggregate spreader at no time contact the uncovered and newly applied bituminous material.

Immediately after the cover aggregate is spread, any deficient areas shall be covered by additional material. Pneumatic tire rolling shall begin immediately. The initial pass shall be completed within 5 minutes of the application of the bituminous material and shall be continued until three complete coverages are obtained within 30 minutes of the application of the bituminous material. Pneumatic tire rollers shall come to a complete stop prior to reversing direction.

§410

Any free bituminous material on the surface caused by a deficient amount of cover aggregate shall be covered by broadcasting additional aggregate over the deficient area. Any excess aggregate material shall be swept from the surface in a manner acceptable to the Engineer.

G. Opening to Traffic. “Loose Stone” signs meeting requirements of MUTCD shall be posted at 1 mile intervals throughout the length of the project. These signs shall be erected before surface treatment starts and removed after contract is accepted.

Unless otherwise specified, the highway shall be kept open to traffic at all times. Traffic shall be discontinued on the lane being surface treated; and as soon as the final layer is applied and rolled, controlled traffic may be permitted thereon. Traffic shall be maintained at a speed not to exceed 15 mph for a period of four hours after placement of the surface treatment by the use of two-way radio equipped patrol vehicles in accordance with the maintenance and protection of traffic details shown on the plans. All patrol vehicles shall be equipped with signs meeting the requirements of Section 6F.54 of the MUTCD. The required number of two-way radio-equipped patrol vehicles shall be as follows:

Lane Miles Length of Surfacing for past 4 hours

Lane Miles Length of Surfacing for past 4 hours	Number of Patrol Vehicles
1	1
2	3
3 or more	4

Immediately after completion of surface treatment, the section shall be posted for speed limit of 30 mph for a period of three days. The signs should be posted at 1/2 mile intervals and signs showing other speed limitations should be covered for this period. All construction signs shall meet the requirements of the MUTCD.

410-3.02 Bituminous Surface Treatment - Shoulders. The requirements of §410-3.01 shall apply except that the sections labeled “A. Weather and Seasonal Limitations,” “C. Determinations of the Quantities of Material to be Applied” and “G. Opening to Traffic” do not apply. The following modifications to A. Weather and Seasonal Limitations and C. Determination of the Quantities of Materials to be applied do apply in their place.

A. Weather and Seasonal Limitations. Bituminous material shall not be applied on a wet surface, when the ambient temperature is less than 50°F and rising, or when weather conditions would prevent proper construction of the surface treatment. The surface on which the bituminous material is applied shall be placed only during the period of May 1st up to and including the last Saturday of September.

C. Determination of the Quantities of Materials to be Applied. The quantity of bituminous material to be used shall be in the range of 0.35 – 0.50 gal/sy unless otherwise directed by the Engineer. The cover aggregate shall be spread in a single stone thickness in the range of 15 to 25 lb/sy for the indicated aggregate unless otherwise directed by the Engineer. The actual quantity of bituminous material shall be such that a minimum of 70% of the aggregate particle is embedded in the bituminous material. The actual quantities used will be determined visually by the Engineer at the time of placement.

410-4 METHOD OF MEASUREMENT. Bituminous surface treatments for pavement and shoulders will be measured by the number of square yards of compacted material in place making no deductions for minor untreated areas such as catch basins and manholes.

The bituminous material will be measured by the number of gallons used.

410-5 BASIS OF PAYMENT

410-5.01 Bituminous Surface Treatment - Pavement and Shoulders. The unit price bid per square yard shall include the cost of all labor, materials, and equipment necessary to perform the work except:

- Bituminous material used for treatment will be paid under separate item.
- Patching material will be paid for under the item for Truing and Leveling.
- Construction signs will be paid for under appropriate items.

The cost of installing test patches and furnishing patrol vehicles when surface treating pavements shall be included in the unit bid price for the surface treatment.

410-5.02 Bituminous Material - Pavement and Shoulders. The unit price bid per gallon shall include all the cost of labor, materials, and equipment necessary to perform the work.

Payment will be made under:

Item No.	Item	Pay Unit
410.04	Bituminous Surface Treatment (Pavement)	Square Yard
410.05	Bituminous Surface Treatment (Shoulders)	Square Yard
410.07	Bituminous Material (Pavement and Shoulders)	Gallon

SECTION 411 - STABILIZED GRAVEL SURFACE COURSE

411-1 DESCRIPTION. The work shall consist of placing a stabilized gravel surface course with additive, if specified, on a prepared base in accordance with these specifications and in conformance with the lines and grades shown on the plans or as directed by the Engineer.

411-2 MATERIALS

411-2.01 Gravel. The gravel shall conform to the following gradation requirements:

Sieve Size	Percent Passing by Weight
2 in	100
1/4 in	30 - 65
No. 200	10 - 20

Particles passing the No. 40 sieve size shall have a maximum liquid limit of 30 and a plasticity index ranging from 3 to 8. The maximum loss in 4 cycles of the Magnesium Sulfate Soundness Test shall be 30. If the gravel as obtained from the bank is deficient in any of the requirements specified, such deficiency shall be corrected by screening, processing and/or blending with other acceptable materials before stockpiling. The requirements of §304-2.03, Stockpiling shall apply to all gravel furnished for this work.

411-2.02 Chemical Additives. Chemical additives, if required, shall meet the applicable requirements of the following subsections:

Calcium Chloride	712-02
Sodium Chloride	712-03

411-3 CONSTRUCTION DETAILS

411-3.01 Placement. After the base has been brought to grade and cross section, as shown on the plans, thoroughly compacted, and approved by the Engineer, the Contractor shall place the stabilized gravel surface course.

When calcium or sodium chloride additives are specified, they shall be added by an approved mechanical distributor after the gravel has been spread and prior to the addition of water. Calcium

chloride shall be added in the amount of 1/2 pound per square yard per inch of compacted thickness of the course. Sodium chloride shall be added at a rate of 2 pounds per square yard per inch of compacted thickness of the course which is equivalent to approximately 2% of sodium chloride based on dry weight of aggregate. Water shall then be added to the material in amounts as directed by the Engineer.

If the Contractor so elects, only the calcium chloride may be added to the gravel material as a water solution. In such cases the Contractor shall submit to the Engineer a detailed description in writing of the proposed procedure of operations. Construction shall not be started until the Engineer's approval is obtained in writing.

411-3.02 Mixing

A. Gravel Without Additive. Water shall be thoroughly dispersed by any appropriate methods which will insure a uniform consistency and moisture content within the limits for proper compaction.

B. Gravel With Additive. The water and the chemical additive shall be thoroughly and uniformly incorporated with the gravel for the full depth of the course, by mixing with an approved power-driven rotary type mixing machine. Mixing shall continue until the material is of uniform composition. The Contractor may elect to mix the materials in an approved plant of the pugmill type. Mixing by blading, shoveling and/or scooping will not be permitted.

411-3.03 Compaction. When the in-place material is of uniform consistency and has a moisture content within the limits for proper compaction, as determined by the Engineer, it shall be thoroughly compacted by the use of self-propelled pneumatic tired or vibratory compactor in accordance with the requirements of Section 203, [Compaction](#) §203-3.12. During the compaction operation, light grading shall be done as required to maintain the surface of the course true to grade and cross-section. In confined areas, inaccessible to rollers, mechanical rammers shall be used to obtain the compaction required in §203-3.12. The finished surface of the stabilized gravel course shall be rolled in a float of free water with a smooth steel wheeled roller weighing not less than 10 tons. In all cases, the material must be so thoroughly compacted that it will not displace under the roller.

Comment [c37]:
EI09024

This course shall not be placed in excess of 500 linear feet without being shaped, compacted and finish rolled.

When posts for guide railing are to be installed adjacent to a stabilized gravel surface course, extreme care shall be taken during installation of the posts so that the stabilized gravel surface course is not disturbed.

411-3.04 Surface Preparation for Treatment

A. Calcium Chloride Stabilized Gravel Surface Course. After the calcium chloride stabilized gravel surface course has been completed, water shall be applied to the surface in amounts as directed by the Engineer. Immediately following the application of water, calcium chloride shall be applied on the surface with an approved mechanical spreader at the rate of 1/2 pound per square yard.

B. Sodium Chloride Stabilized Gravel Surface Course. After the sodium chloride stabilized gravel surface course has been brought to final grade and cross section and rolling has been completed, the course shall be permitted to cure for a minimum of 10 days at a minimum temperature of 60°F before any additional pavement courses are applied. The cured completed surface course shall be broomed to remove dust, before application of the overlying course.

C. Gravel Without Additive. No surface preparation required for treatment.

411-4 METHOD OF MEASUREMENT. The quantity for payment, in cubic yards of material, shall be computed within the payment lines shown on the plans or otherwise ordered in writing by the Engineer, and in accordance with the plans and specifications.

411-5 BASIS OF PAYMENT. The unit bid price per cubic yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except that the water, the calcium chloride, and the sodium chloride shall be paid for under their appropriate items. No direct payment will be made for any losses of material which may result from shrinkage, compaction, foundation settlement, waste, overflow, erosion, leakage, or any other causes; the cost of such losses shall be included in the price bid for this work.

Payment will be made under:

Item No.	Item	Pay Unit
411.01	Stabilized Gravel Surface Course	Cubic Yard
411.02	Calcium Chloride Stabilized Gravel Surface Course	Cubic Yard
411.03	Sodium Chloride Stabilized Gravel Surface Course	Cubic Yard

SECTION 412 - CRACK SEALING ASPHALT PAVEMENTS

412-1 DESCRIPTION. The work in this section shall include work required for crack sealing asphalt pavements.

412-2 MATERIALS. Materials shall be as specified in the special specifications.

412-3 CONSTRUCTION DETAILS. The extent of work and construction requirements will be covered by special specifications in the contract documents.

412-4 METHOD OF MEASUREMENT. As specified in the special specifications.

412-5 BASIS OF PAYMENT. As specified in the special specifications.

SECTIONS 413 THRU 489 (VACANT) ~~SECTIONS 412 THRU 489 (VACANT)~~

Comment [c38]:
EI09-014

SECTION 490 - COLD MILLING

490-1 DESCRIPTION. This work shall consist of the milling, shaping and removal of portions of existing surfaces by a cold milling process, and subsequent cleaning, utilizing equipment and procedures meeting the requirements in this specification.

The work shall consist of Miscellaneous Cold Milling or Production Cold Milling of bituminous or portland cement concrete as indicated in the contract documents and as shown on the plans.

490-2 MATERIALS

490-2.01 Equipment. Milling machines shall be power operated, self-propelled machines capable of removing the desired thickness of existing surfaces. The machines shall have sufficient power, traction and stability to accurately maintain depth of cut and slope. They shall be capable of producing a finished profile and cross slope to within 1/4 inch of that required and shall produce a uniform surface texture free from gouges and ridges greater than 3/8 inch in depth.

The machines shall be equipped with a means to control dust and other particulate matter created by the cutting action.

The machines shall have an integral loading system or sufficient equipment shall be provided to accomplish complete removal of milled material at a rate equivalent to the milling rate.

Vacuum trucks, street sweepers or power brooms shall be used to clean the milled surfaces. The Engineer may disallow the use of power brooms in urban, residential or other sensitive areas if the dust raised by the broom is deemed by the Engineer to be objectionable.

490-2.02 Disposal of Material. Material removed during the milling process, including foreign debris within or on the pavement, shall become the property of the Contractor and shall be disposed of at a site obtained by the Contractor.

490-3 CONSTRUCTION DETAILS

490-3.01 General. Milling shall be performed at the locations and in accordance with the details indicated on the plans.

When indicated on the plans, profile and cross slope shall be controlled by a taut reference string line. The reference elevation and string line shall be established by the Contractor and subject to the approval of the Engineer.

Areas not accessible to the milling machine, such as around and/or adjacent to inlets, manholes, curbs and transverse joints on structures, may be removed by a small milling machine, handwork or other methods approved by the Engineer.

All milled material, including that removed by other means, shall be immediately removed from the milled surfaces and adjacent surfaces. Surfaces shall be cleaned of all fines and dust prior to opening to traffic. The Contractor shall conduct operations in such a manner that dust is controlled and is not objectionable. Milled and adjacent surfaces shall be cleaned again, as directed by the Engineer, prior to the placement of tack coats, or pavement courses if traffic has been allowed on the milled surface and/or if more than 48 hours have elapsed since the initial cleaning.

The Contractor shall maintain drainage at catch basins, according to the details shown on the plans, or in a manner approved by the Engineer.

When working adjacent to traffic, the Contractor shall immediately remove material that is spilled on the traveled way.

Milled surfaces to be overlaid with asphalt concrete shall be covered with at least a single course of asphalt concrete before the end of the paving season. Portland cement concrete overlays shall be completed over milled surfaces before the end of the paving season. Damage to milled surfaces resulting from traffic or other causes such as, but not limited to, raveling, fuel spillage or any contaminants which would inhibit bond, shall be repaired or remilled by the Contractor in a manner approved by the Engineer.

490-3.02 Production Cold Milling. Production cold milling of bituminous or portland cement surfaces shall be performed in accordance with the details and at the locations indicated on the plans.

490-3.03 Miscellaneous Cold Milling. Miscellaneous cold milling of bituminous or portland cement surfaces shall be performed in accordance with the details and at the locations indicated on the plans.

490-3.04 Production Cold-Mill Surface Planing. Production cold-mill surface planing of bituminous concrete surfaces shall be performed in accordance with the details and at the locations indicated on the plans. When specified, the milling machine shall control the profile and cross slope with a moving reference at least 30 feet in length. The moving reference may be a floating beam, ski, or other suitable type such that the resulting milled surface is sufficiently even.

In areas accessible to the milling machine, construct a milled surface to a maximum 1/2 inch tolerance. If the pavement surface is not being constructed or has not been constructed to this tolerance based upon visual observation or upon riding quality, the Engineer may test the surface with a 15 foot straight edge or string line placed parallel to the centerline of the pavement and with a 10 foot straight edge or string line placed transversely to the centerline of the pavement on any portion of the pavement. Variations exceeding 1/2 inch will be satisfactorily corrected at no additional cost to the State.

490-4 METHOD OF MEASUREMENT. The quantity shall be measured as the number of square yards of pavement surface milled in accordance with the plans and this specification.

In no case will a deduction in area be made for minor unmilled areas due to catch basins, manholes, transverse joints, or minor low areas in pavements from the measured surface area that has been milled. Minor unmilled or low areas are those areas of 10 square yards or less.

490-5 BASIS OF PAYMENT. The unit price bid per square yard shall include the cost of furnishing all labor and equipment necessary to complete the milling, including the removal of pavement by other means, the removal and disposal of milled material, the removal and hauling of milled material to a designated storage area when indicated in the contract documents and cleaning the resultant surface after milling. No payment will be made for additional cleaning that may be necessary just prior to placement of any overlying pavement courses or tack coats. The cost of maintaining drainage shall be included in the price bid for work zone traffic control. The cost of providing tack coats, overlay courses, and temporary pavement wedges around drainage structures, manholes, valve boxes, bridge abutments and beginning and ends of milled pavement shall be paid for separately.

Payment will be made under:

Item No.	Item	Pay Unit
490.10	Production Cold Milling of Bituminous Concrete	Square Yard
490.15	Production Cold-Mill Surface Planing of Bituminous Concrete	Square Yard
490.20	Production Cold Milling of Portland Cement Concrete	Square Yard
490.30	Miscellaneous Cold Milling of Bituminous Concrete	Square Yard
490.40	Miscellaneous Cold Milling of Portland Cement Concrete	Square Yard

Section 500

PORTLAND CEMENT CONCRETE

SECTION 501 - PORTLAND CEMENT CONCRETE - GENERAL

501-1 DESCRIPTION. These general requirements apply to concrete furnished for pavement, structures and incidental construction. Additional requirements may be specified in the contract item. All testing will be done in accordance with Department procedures.

501-2 MATERIALS

~~**501-2.01 Composition of Mixtures.** The Contractor shall inform the Regional Director, in writing, of the materials sources prior to mixing concrete. Proportion and mix portland cement, fine aggregate, coarse aggregate, water, admixtures, pozzolan and /or microsilica to create a homogeneous portland cement concrete mixture.~~

~~— Produce the class of concrete indicated in the contract documents. However, substitutions may be made according to Table 501-1, Concrete Class Options.~~

TABLE 501-1 CONCRETE CLASS OPTIONS

A. Cementitious Materials. Use only cementitious materials meeting §701-01 whose brand name and type appears on the Department’s Approved List. Cementitious materials stored over the winter at concrete producing facilities will be retested for specification compliance. All contaminated, or hardened cementitious material will be rejected and not used in Department work.

The Department will consider requests to evaluate alternate cements, pozzolan or microsilica. The use of alternatives is subject to approval by the Director, Materials Bureau.

1. Portland Cement. Use Type I, Type II or Type I/II cement, except as indicated below or in the contract documents.

Type I cement is restricted to fresh water and low sulfate soil areas. Use Type II or Type I/II cement in high sulfate, and salt water areas. Salt water areas are defined as; The Hudson River south of the Newburg-Beacon Bridge, and all other tidal / sea water spray areas of New York State. Type I/II cement is defined as a cement that meets the requirements of both Type I and Type II cements. High alkali cement is defined as any portland cement having an alkali content in excess of 0.70% as denoted on the Approved List. High alkali cement use is restricted, unless otherwise approved by the Regional Director, to mixtures that do not contain reactive aggregates (as denoted in the Department’s List of Approved Sources of Aggregates).

2. Blended Portland Cement. Blended cements meeting the requirements of 701-03, may be used as follows:

a. Type IP or SM. Blended Portland Cement (Type IP or Type SM), may be used in all classes of concrete listed in Table 501-03, Concrete Mixtures, except Class F. Type IP or SM blended cement replaces the portland cement/pozzolan portion of the designed mix in Class DP, G, GG, or HP concrete. When using Type IP or SM blended cement in Class DP and HP concrete, an addition of Microsilica §711-11 is required.

b. Type SF. Blended Portland Cement (Type SF), may be used in Class DP or HP concrete. Type SF blended cement replaces the portland cement/microsilica portion of the designed mix in Class DP or HP concrete. When using Type SF blended cement in Class DP or HP concrete, an addition of Fly Ash, §711-10, or Ground Granulated Blast Furnace Slag (GGBFS), §711-12, is required.

c. Ternary Blend. Blended Portland Cement (Ternary Blend), may be used in Class DP or HP concrete. Ternary blend cement in Class DP or HP concrete replaces the entire portland cement/pozzolan/microsilica portion of the designed mix. No subsequent addition of cementitious material is required or allowed.

3. Pozzolan. Pozzolan is defined as Fly Ash, §711-10, or Ground Granulated Blast-Furnace Slag (GGBFS), §711-12. All classes of concrete, except Class F, allow or require a pozzolan as a partial replacement for portland cement. Classes DP, G, GG, and HP concrete require the use of a pozzolan.

4. Microsilica. Class DP and HP concrete require Microsilica, §711-11, as a partial replacement for portland cement. Microsilica, a pozzolanic material, is not included in the definition of a pozzolan in these specifications.

5. High Reactivity Pozzolan. High Reactivity Pozzolans which meet the requirements of §711-14 may be considered as supplementary cementitious materials in concrete mixtures where enhanced physical properties are desired. With prior approval from the Regional Materials Engineer, these materials may be allowed in lieu of microsilica in specialized and high performance concrete mixtures.

Comment [cjt40]:
EI08027

B. Aggregates. Use aggregate from a source on the Approved List of Sources of Fine and Coarse Aggregates that also meets the following requirements for gradation and friction.

1. Gradation. Samples will be taken from stockpiles, barges, conveyor belts, or bins and tested for gradation at the plant site in accordance with NYSDOT Materials Method 9.1. Rejected aggregates may be reprocessed or reworked to meet the gradation requirements.

a. Concrete Sand. Use only sand meeting the requirements of §703-07, Concrete Sand.

b. Coarse Aggregate. Use only crushed stone, crushed gravel, or crushed slag meeting the requirements of §703-02, Coarse Aggregates in either one or a combination of size designations specified in Table 703-4, Sizes of Stone, Gravel, and Slag and graded according to Table 501-2, Coarse Aggregate Gradations.

Aggregates that are uniform in size, but do not meet the requirements in Table 703-4, may be approved by the Regional Director. When these sizes are combined to meet the mixture gradation requirements of Table 501-2, the gradation requirements of §703-02 shall not apply. Blending of aggregates during the batching process may be approved by the Regional Director. When blending aggregates prior to batching, the blending method requires approval by the Regional Director.

TABLE 501-2 COARSE AGGREGATE GRADATIONS		
Sieve Sizes	Type CA 1 General Limits	Type CA 2 General Limits

	% Passing	% Passing
1 1/2 inches	-	100
1 inch	100	93-100
1/2 inch	90-100	27-58
1/4 inch	0-15	0-8

NOTES:

ASTM C33 Size Number 7 is an acceptable equivalent to the Type CA 1 gradation.

ASTM C33 Size Number 57 is an acceptable equivalent to the Type CA 2 gradation.

Material passing the No. 200 sieve (wet) is limited to a maximum 1.0 % by weight for ASTM sizes 7 and 57.

2. Friction. Sample and test aggregate for friction characteristics according to the procedures of Materials Method 28 “Friction Aggregate Control and Test Procedures.” The Engineer will identify pavement areas, if any, represented by failing samples according to the procedures of Materials Method 28 “Friction Aggregate Control and Test Procedures.”

a. Concrete Sand. For use in concrete pavements, bridge decks, precast pavers, or any other item used in concrete highway wearing surfaces, sand (natural or manufactured) must contain at least 25.0% acid-insoluble residue in the plus No. 30 size fraction and in the minus No. 30 size fraction. Sands may be blended to meet this requirement.

b. Type 1 Coarse Aggregate. Use coarse aggregate meeting one of the of the following requirements:

- Limestone, dolomite, or a blend of the two, having an acid-insoluble residue content not less than 20.0%.
- Sandstone, granite, chert, traprock, ore tailings, slag, or other similar noncarbonate materials.
- For concrete mixtures containing CA1 coarse aggregate: gravel or a blend of rock types containing no less than 95.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 inch, plus 1/4 inch primary size fraction.
- For concrete mixtures containing CA2 coarse aggregate: gravel or a blend of rock types containing no less than 95.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 1/2 inch, plus 1/2 inch and the minus 1/2 inch, plus 1/4 inch primary size fractions.

c. Type 2 Coarse Aggregate. Use coarse aggregate meeting one of the following requirements:

- Limestone, dolomite, or a blend of the two, having an acid-insoluble residue content not less than 20.0%.
- Sandstone, granite, chert, traprock, ore tailings, slag, or other similar noncarbonate materials.
- For concrete mixtures containing CA1 coarse aggregate: gravel or a blend of rock types containing no less than 20.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 inch, plus 1/4 inch primary size fraction.
- For concrete mixtures containing CA2 coarse aggregate: gravel or a blend of rock types containing no less than 20.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 1/2 inch, plus 1/2 inch and the minus 1/2 inch, plus 1/4 inch primary size fractions.

d. Type 3 Coarse Aggregate. Use coarse aggregate meeting one of the following requirements:

- Limestone or a blend of limestone and dolomite having an acid-insoluble residue content not less than 20.0%.

- Dolomite.
- Sandstone, granite, chert, traprock, ore tailings, slag or other similar noncarbonate materials.
- For concrete mixtures containing CA1 coarse aggregate: gravel or a blend of rock types containing no less than 20.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 inch, plus 1/4 inch primary size fraction.
- For concrete mixtures containing CA2 coarse aggregate: gravel or a blend of rock types containing no less than 20.0% noncarbonate particles (by weight with adjustments to equivalent volumes for materials of different specific gravities) in the minus 1 1/2 inch, plus 1/2 inch and the minus 1/2 inch, plus 1/4 inch primary size fractions.

e. Type 9 Coarse Aggregate. Use coarse aggregate meeting the requirements of §501-2.02 B.1.b. Coarse Aggregate.

~~**C. Admixtures.** Use only admixtures meeting §711-08 that appear on the Department's Approved List. Admixtures not conforming to §711-08 are subject to approval by the Director, Materials Bureau.~~

C. Admixtures. Use only admixtures which meet the requirements of §711-08, or §711-13, and which appear on the Department's Approved List of Materials. Admixtures which do not conform to these requirements are subject to evaluation by the Materials Bureau.

Comment [cjt41]:
EI08027

501-2.03 Concrete Batching Facility Requirements. Batching facilities must be of sufficient design and capacity to produce the quantity of concrete specified. Batching facilities that differ from conventional designs will be considered for use by the Director, Materials Bureau.

A. Acceptance. Each facility requires initial and annual approval by the Director, Materials Bureau. The Regional Director may disapprove use of a previously approved facility at any time for non-conformance with the specifications. Once disapproved, production for Department work will not be allowed until corrective measures are implemented under the approval of the Regional Director.

~~**B. Bins.** Each facility requires:~~

- ~~• Sufficient size and number of storage bins to produce the quantity of concrete specified.~~
- ~~• Positive separations between fine aggregate and various sizes of coarse aggregates.~~
- ~~• Separate cement, pozzolan, and microsilica bins, except Type I and Type II cement may be combined in common storage unless the cement is intended for use in high sulfate or salt water areas as described in §501-2.02 A. Cementitious Materials.~~
- ~~• Cement, pozzolan, and microsilica bins with protection from rain and moisture.~~
- ~~• A means of safely obtaining uncontaminated samples from all microsilica bins.~~
- ~~• A means of safely obtaining uncontaminated samples from any cement or pozzolan bin that has been determined by the Regional Materials Engineer as either unsafe to sample, or difficult to verify the acceptability of its contents.~~

~~Sampling will be conducted, or witnessed by the Regional Materials Engineer's representative.~~

B. Bins. Each facility requires:

- Sufficient size and number of storage bins to produce the quantity of concrete specified.
- Positive separations between fine aggregate and various sizes of coarse aggregates.
- Separate cement, pozzolan, High Reactivity Pozzolan, and microsilica bins, except Type I and Type II cement may be combined in common storage unless the cement is intended for use in high sulfate or salt water areas as described in §501-2.02 A. Cementitious Materials.
- Cement, pozzolan, High Reactivity Pozzolan and microsilica bins with protection from rain and moisture.
- A means of safely obtaining uncontaminated samples from all microsilica bins.

- A means of safely obtaining uncontaminated samples from any cement, pozzolan or High Reactivity Pozzolan bin that has been determined by the Regional Materials Engineer as either unsafe to sample, or difficult to verify the acceptability of its contents.

Sampling will be conducted, or witnessed by the Regional Materials Engineer's representative.

Comment [cjt42]:
EI08027

C. Weigh Hoppers and Discharge Chutes. Each facility requires:

- Separate weigh hoppers for aggregate and cementitious materials.
- Enclosed cement weigh hopper to protect against moisture and reduce escaping dust.
- Chutes arranged so that materials will not lodge or be lost on discharge.
- No chutes suspended from any part of the weighing system.
- Vibrators arranged so that no significant vibrations are transmitted to the scales or other plant control equipment during the weighing process.

D. Scales. Each facility requires:

- Load cell type scales which indicate the load at all stages of the weighing operation, from zero to full capacity, when installed for weighing materials after January 2, 2003.
- Scales that meet the requirements of the National Institute of Standards and Technology, Handbook 44, with no less than 500 nor more than 2000 scale divisions.
- Digital displays that match the primary scale within 1 division.
- Minimum resolution of digital displays equivalent to the minimum resolution on the primary scale.
- Digital displays located in direct sight of the operator's normal work station.
- Face of digital displays protected from manipulation.

Test all plant scales for accuracy, at no additional cost, by a qualified technician as follows:

- Annually, prior to use for Department work.
- At intervals of not more than 90 calendar days.
- Whenever a plant changes location.
- At any time ordered by the Regional Director.

~~— Provide a cradle or test platform, approved by the Regional Director, for each scale, and at least 20 standard 50 lb test weights. The use of a set of test weights for two or more facilities will be permitted when they can be available within 1 hour. If directed by the Regional Director, make provisions for locking scales against tampering.~~

Provide a cradle or test platform approved by the Regional Materials Engineer, for each scale. Provide at least 20 certified 50 lb. test weights for performing scale accuracy tests. The certification of compliance for the test weights must be made available upon request at the time of the scale accuracy test. The use of a set of test weights for multiple facilities may be permitted, providing that the test weights are available for use within one hour after request. When directed by the Regional Director, protect the scales, and displays from manipulation by locking or sealing. Any evidence of tampering will be cause for rejection.

Comment [cjt43]:
EI08027

E. Proportioning Control Equipment. Proportion the materials by automatic proportioning devices approved by the Director, Materials Bureau. The Regional Director may require the locking or sealing of proportioning equipment that is subject to manipulation. Install automatic proportioning equipment in a dust and weather protected area of at least 36 square feet, with no internal dimension less than 6 feet.

Include equipment to:

- Produce all batches in fully automatic mode using preprogrammed US Customary mix designs. The only manual operation allowed is a switch or button to start the batching sequence and/or discharge the completed batch.

- Accurately proportion the various components of the mixture by weight, or by volume for admixtures and water, in the proper order so that aggregates and cementitious materials are displayed cumulatively (when appropriate).
- Deliver each constituent within the tolerances indicated in Table 501-4, Batching Tolerances.
- Control the cycle sequence.
- Interrupt and stop the automatic batching operations via auxiliary interlock cutoff circuits, whenever an error exceeding the acceptable tolerance occurs in proportioning, for all materials except water.
- Time the mixing operations for central mix plants, and provide a clear indication on the recordation whenever the mix time has been interrupted.

Interlock the system so that during the batching of cementitious materials, aggregates and admixtures:

- No inlet gate can open while the weigh hopper discharge gate is open.
- No inlet gate can open while another material is being weighed in a shared weigh hopper.
- No weigh hopper discharge gate can open while the hopper is being filled nor until the full batch weight is within delivery tolerance.
- No new batch can be weighed until the hopper is entirely empty of the previous batch and the scale has returned to within the allowable zero tolerance.

F. Admixture Dispensing Systems. Equip plants with calibrated systems that meet the following:

- A sufficient number of dispensing systems to supply the concrete mixture specified.
- The ability to dispense each admixture through its own measuring system.
- Accurate measurement within the tolerance limits specified in Table 501-4, Batching Tolerances.
- A bypass valve to obtain a calibrated sample of admixture from each measuring device.
- Uniform distribution of admixture throughout the mix within the specified mixing period.
- When multiple admixtures are added, no direct contact with each other prior to mixing.
- An approved automatic admixture dispensing system in plants equipped with automated proportioning systems.
- Volumetric measuring devices interlocked with the automated proportioning equipment that insure the preset quantity has been actually measured and completely discharged.
- A readable indication at the operator's normal work station of the actual quantity batched.

Interlock the admixture system with the automated proportioning system so that aggregate and/or cement weigh hopper discharge gates cannot be opened until the preset quantity of admixture has been batched or discharged.

Recordation of the presence of admixture is dependent on completion of admixture discharge.

G. Recordation Equipment. Equip all plants with digital recording instruments approved by the Director, Materials Bureau, that meet the following requirements:

- Is readily accessible and readable at the operator's normal work station.
- Provides separate quantity recordation of each aggregate component, cement, pozzolan, High Reactivity Pozzolan, microsilica, admixture, fine aggregate moisture content, and water (at central mix plants) for each batch of concrete. Water at central mix plants may be recorded by weight or volume.
- Records the batch number, concrete class, date (day, month, year), and time of day to the nearest minute on each batch record.
- Provides cumulative recordation (when batching cumulatively) of weight and/or volume as indicated on the batching scale or meter within an accuracy of 1 scale or meter graduation.
- Has a minimum recorder resolution equivalent to or less than the minimum graduation on the scale or meter, unless otherwise approved by the Director, Materials Bureau.

Comment [cjt44]:
E108027

§501

- Provides a clear and legible copy of all batch records, containing permanent identification of the time and all quantities in each batch, to the Department.
- Automatically stamps the date and time of batch completion on each batch and /or delivery ticket.
- Provides clear identification on batch recordation when:
 - ◆ Initiating a batch without all conditions satisfied for full automated production.
 - ◆ An out of tolerance condition is accepted during batching.
 - ◆ A system is taken out of the full automated mode during the batching sequence.
 - ◆ A system produces a “demonstration” or “simulated” batch.
 - ◆ A system reprints a batch ticket.
 - ◆ The timing of a central mixer has been interrupted.

When the automation system can produce other than standard size batches (full, half or quarter cubic yard increments), recordation will be subject to approval of the Director, Materials Bureau.

H. Inspection Facility. Provide a weatherproof building or trailer, for use as an inspector's testing laboratory and office that meets the following criteria:

- Meets all applicable uniform fire prevention and building code requirements.
- Office area partitioned from the testing laboratory.
- Minimum gross area of 160 square feet, a minimum internal width of 7 feet and a ceiling height of not less than 7 1/2 feet.
- Protected from a noise level greater than an 8 hour, time weighted average of 85 dBa.
- Laboratory area with tables, work benches, shelving, and other equipment for testing portland cement concrete mixes.
- Increase the area proportionally to house and operate any additional testing equipment, and when there are multiple plants at one site, size the increase of the laboratory and office space to be adequate for performing inspection duties during all production circumstances.

Use the inspection facility only for its intended purpose, and when the inspection facility is used by more than one inspection authority, the Department will have priority. The facility and its location are subject to approval by the Regional Materials Engineer. Maintain the inspection facility, office, and testing equipment in good operating and clean condition. The Producer will be responsible for routine cleaning.

Equip the inspection facility with the following:

1. Office Equipment. A Standard size (approx. surface dimensions: 30 x 60 inches) office desk with drawers and a chair, and a fireproof file cabinet with at least two locking drawers and two keys.

2. First Aid Equipment. An adequately stocked first aid kit at the plant site including:

- An emergency eye wash station in the laboratory area.
- Safety equipment including gloves, dust mask, etc..

3. Sanitary Facilities. A flush type toilet at the plant site, enclosed in a properly vented, separate room and complying with applicable sanitary codes. A portable toilet may be substituted when a facility is set up on a temporary basis for a specific project.

4. Lighting. Electric, non glare, providing a minimum illumination level of 1000 lux at desk and work bench level.

5. Laboratory Sink / Potable Water. A Sink and faucet with an adequate supply of clean water for testing, and if necessary, a water cooler for potable drinking water.

6. Heating and Cooling. Adequate heating and air conditioning equipment to maintain an ambient temperature of $70\pm 5^{\circ}\text{F}$.

7. Ventilation. Minimum 3.5 cfs exhaust hood, vented to the atmosphere, located over the sample drying area.

8. Communication Equipment. A telephone with a dedicated line in the laboratory office and a fax machine at the inspection facility or plant site for the inspector's use.

9. Fire Extinguisher. A 10 pound capacity multi-class ABC fire extinguisher, maintained and located in the laboratory area.

10. Coarse Aggregate Sieve Shaker. Power driven, with a minimum clear sieve area of 324 square inches.

- Anchored to a firm base.
- Imparts a vertical, or lateral and vertical motion.
- Equipped with an automatic timing shut-off device and dust cover.
- Fully enclosed and weatherproof when located outside the inspection facility.

11. Fine Aggregate Sieve Shaker.

- Power driven, independent of the coarse aggregate shaker.
- For 8 inch minimum diameter sieves.
- Imparts a vertical, or lateral and vertical motion.
- Equipped with an automatic timing shut-off device.
- Fully enclosed and weatherproof when located outside the inspection facility.

12. Sample Splitter. Able to split samples with a particle size of 1/2 – 2 inches.

13. Large Scale. Minimum capacity of 14 kg, with a maximum gradation of 0.005 kg meeting AASHTO M-231 Class G20. Scales provided as new or replacement after September 1, 2004, must be digital.”

14. Small Scale. Minimum capacity of 1500 g, with a maximum gradation of 0.1 g meeting AASHTO M-231 Class G2. Scales provided as new or replacement after September 1, 2004, must be digital.

15. Sample Drying Appliance. Stove or hot plates sized to rapidly dry aggregate samples with a minimum total of four burners.

16. Miscellaneous Testing Equipment. Miscellaneous equipment as per Department written directives or as requested by the Regional Director.

17. pH Test Kit. pH test kit meeting the requirements of Materials Procedure NY 90-1 for all plants supplying concrete containing microsilica (711-11).

501-2.04 Concrete Mixer and Delivery Unit Requirements. Each mixer requires a Manufacturer's plate, which contains the mixing capacity of the mixer, in a convenient visible location. Repair or replace blades inside the drum that have become heavily encrusted with mortar, or are loose, broken, bent, scalloped or worn 20% in any dimension or otherwise damaged.

A. Central Mixers. Central mixers meeting the following may be used unless otherwise specified:

- Equipped with an acceptable timing device that prohibits a batch of concrete from being discharged before the specified mixing time has elapsed (as per §501-3.03 C) without a clear indication on the recordation equipment.

- Able to discharge the entire batch in an unrestricted manner into a hopper or delivery unit.

B. Delivery Units. Delivery units are subject to inspection as per NYSDOT Materials Method 9.1 and approval by the Regional Director. If found unfit, it will be disapproved until properly repaired. Completely clean and empty the agitating and non-agitating units of concrete and wash water before loading again.

1. Truck Mixer Requirements. Use an inclined axis rotating drum type with a water tank system able to measure water (gallons) going into the drum within a 2% accuracy, and equipped with a hatch in the drum periphery to permit access to inspect the inside.

Each truck mixer unit will be inspected and approved annually by the Regional Materials Engineer for use in Department work, and additional inspections will be made during use to determine its operating condition. Truck mixers will not be permitted to mix batches greater than the maximum capacity indicated on the Manufacturer's rating plate.

a. Transit Mixed Concrete. Equip each truck mixer used for transit mixed concrete with an electrical revolution-counting device, appearing on the Approved List, mounted in a clearly visible position as follows:

- Separate counters showing: The number of drum revolutions at speeds within the mixing range and the total number of drum revolutions.
- Both counters legible to one revolution and designed to accept a non-standard electric plug for resetting each counter to read zero when loading at the batch plant.
- Tamper-proof such that if tampering occurs, the counters will become inoperative or the device will otherwise indicate tampering, including the interruption of electric power.
- Installed to count the number of revolutions of the drum only in the direction of mixing.
- Adjusted so that it counts the number of revolutions specified for the mixing and agitating drum speed within the tolerances indicated on the Manufacturer's rating plate, but not to exceed the following Department's requirements for truck mixers:
 - ◆ Mixing - 6 RPM minimum to 18 RPM maximum
 - ◆ Agitating - 2 RPM minimum to 6 RPM maximum
 - ◆ The mixing and agitating revolution limits may be adjusted for individual mixing units upon approval of the Director, Materials Bureau.

b. Central Mixed or Truck Mixed Concrete. Equip each truck mixer used for central or truck mixed concrete, either as described in §501-2.04 B.1.a., for Transit Mixed Concrete, or as follows:

- Mixing speed capability - 6 RPM minimum to 18 RPM maximum.
- Agitating speed capability - 2 RPM minimum to 6 RPM maximum.
- Approved counter- located in a position readily visible to the Engineer that accurately counts the number of revolutions in the direction of mixing.

2. Non- Agitating/Open Haul Units for Central Mixed Concrete. Each truck shall be:

- Sound and watertight enough to prevent loss of material during delivery.
- Free of contamination.
- Covered to protect the concrete from adverse drying or precipitation, when ordered by the Engineer.

C. Mobile Concrete Mixing Units. A mobile concrete mixing unit, with the Engineer's approval, may be used for miscellaneous work such as curb, gutter, headwalls, catch basins, manholes, drop inlets, field inlets, sign foundations, lighting structure foundations, anchor units, pullboxes, leveling footings and similar placements.

Equip the mobile mixing unit with proportioning devices that deliver the materials within the following tolerances by weight:

Cement	0 to +4%	Admixtures	±1%
Fine Aggregate	±2%	Water	±3%
Coarse Aggregate	±2%		

Use a self contained, continuous mixing type, that meets the following:

- Carries unmixed dry bulk cementitious materials, fine and coarse aggregate, water and admixtures sufficient for at least 6 cubic yards per batch, unless otherwise approved by the Regional Materials Engineer.
- Measures the amount of cement being introduced into the mix by a clearly visible meter which is kept clean at all times.
- Records the quantity of cement by a ticket printer that, as a minimum, records the number of revolution counts of the cement feeder.

1. Water system

- Provides positive control of the water flow into the mixing chamber.
- Water flow indicated by a readily adjustable flow-meter to provide for minor variations in aggregate moisture.
- Equipped with a bypass valve or hose suitable to determine batching accuracy.

2. Admixture System

- Equipped with at least one admixture delivery system.
- Provides positive control of the admixture flow into the unit's mix water system.
- Flow-meters to control the amount of admixture added to the mix.
- Dispenses admixtures in a manner that provides uniform distribution throughout the concrete.
- Adds admixture in the amount necessary to achieve the required air content.
- Equipped with a bypass valve to obtain a calibrated sample to determine batching accuracy.

3. Mobile Mixing Unit:

- Capable of combining aggregates, cement, water and admixture into a thoroughly mixed and uniform weight, and discharging the mixture without segregation.
- Set the mixing time to achieve proper and uniform mix, as determined by the Engineer.
- Stockpile all mix materials at the project site, unless otherwise approved by the Engineer
- Provide the necessary scales, containers and personnel, approved by the Engineer, to calibrate the unit.
- Calibrate the unit and provide a record of the calibration to the Engineer for the mix design to be used. The Regional Materials Engineer will furnish the mix design information and the calibration procedure. The Department reserves the right to witness calibration of the unit.
- Prior to actual use, demonstrate to the Engineer that the concrete meets the specification requirements for slump, air content and proportioning. Proportioning may be verified in accordance with NYSDOT Materials Method 9.4.

Correct any improper mixer conditions as approved by the Engineer. Improper conditions include, but are not limited to, blades that have become heavily encrusted with mortar, or are loose, broken, bent, scalloped, or worn 20% in any dimension or otherwise damaged. The Engineer will discontinue use of a unit that performs unsatisfactorily.

D. Small Mixing Units. The Engineer may allow a small construction mixer to mix small quantities of concrete. Mix for at least 90 seconds after all materials are in the mixer, and the Engineer will test the concrete for the specified slump and air content.

501-3 CONSTRUCTION DETAILS

501-3.01 Proportioning. Proportion all ingredients, except for admixtures, according to Table 501-3, Concrete Mixtures and as determined by the Department unless otherwise indicated in the contract documents. Any concrete mix design not meeting the requirements of Table 501-3 will be subject to approval by the Director, Materials Bureau.

A. Aggregates and Cementitious Materials. Aggregate and cementitious material proportions are indicated in Table 501-3, Concrete Mixtures, for standard classes of concrete. Mixes containing aggregate other than those permitted by §501-2.02B, Aggregates, are subject to approval by the Director, Materials Bureau.

Certain aggregates appear in the Approved List of Sources of Fine & Coarse Aggregates that have use limitations if combined with a high-alkali portland cement. The Regional Materials Engineer may allow the use of these aggregates in combination with high-alkali cements provided that pozzolans are substituted for cement in the following way:

TABLE 501-3A POZZOLAN SUBSTITUTIONS		
Concrete Class Specified	Substitute Cement by Mass With	Class Substitution Allowed
A, C, E, H	15-20% Class F Fly Ash (711-10)	HP ¹
I, J	15-20% Class F Fly Ash (711-10)	-
D	15-20% Class F Fly Ash (711-10)	DP ¹
G ² and GG ²	20% Class F Fly Ash (711-10)	-
F	No Substitution Allowed	-

NOTES:

1. Class HP and DP concrete may be substituted to mitigate ASR as listed above. Classes HP and DP require the replacement of portland cement with 20% pozzolan and 6% microsilica. The pozzolan may be either Class C or F Fly Ash (§711-10) or Ground Granulated Blast Furnace Slag (§711-12).
2. Classes G and GG require the replacement of portland cement with 20% pozzolan. The mitigation of ASR in Classes G and GG must be accomplished using Class F Fly Ash (§711-10).

Notify the Regional Materials Engineer prior to using pozzolan substitutions to mitigate ASR when using reactive aggregates in combination with a high alkali cement.

Approval may be withdrawn when unsatisfactory results occur.

B. Admixtures. ~~Admixtures are used to achieve the desired set retardation, water reduction, slump, and/or the required air content, and are not considered part of the solid volume.~~ Admixtures are used to achieve the desired set retardation, water reduction, slump, air content, and to protect reinforcing steel from corrosion. Admixtures are not considered part of the solid volume in the concrete mixture. The admixture manufacturer’s recommended maximum dosage rate should not be exceeded to obtain the desired results as specified in Table 501-3.

Comment [cjt45]:
E108027

1. Air Entrainment. Air entraining agent is required for all mixes to produce concrete with an air content in the range specified in Table 501-3, Concrete Mixtures unless otherwise indicated in the contract documents. The Engineer will test the concrete for plastic air content, and reject concrete with air contents outside the specified limits.

2. Retardation. The setting time of concrete may be retarded when necessary for proper placement. A water-reducing and retarding admixture (§711-08, ASTM Type D), is required in Class DP for Structural Slab Overlays (Section 584), Class HP for Superstructure Slabs and Structural Approach Slabs (Section 557), Class G and Class GG concrete. It may be used with, or in place of, a water-reducing admixture (§711-08, ASTM Type A) in other applications that allow Class DP or Class HP. Limit the use of the water-reducing and retarding admixture to the minimum amount required to achieve retardation during placing conditions. Unless otherwise specified, the use of water-reducing and retarding admixtures are subject to approval of the Regional Director.

3. Water Reduction. Unless otherwise specified, a water-reducing admixture (§711-08, ASTM Type A), is required in Classes DP, HP, I and J concrete. For all other classes, except G and GG, a water-reducing admixture may be used, subject to advance notification and approval of the Regional Materials Engineer.

High Range Water-Reducing Admixtures (§711-08, ASTM Type F), may not be used unless allowed by specification, plans, or the Director, Materials Bureau.

4. Corrosion Inhibitors. Corrosion Inhibitors, meeting the requirements of §711-13, may be used in special applications where specified in the plans, contract documents, or as directed by the Director, Materials Bureau.

Comment [cjt46]:
EI08027

C. Water. Add water to obtain the slump desired by the Engineer, within the Design Mix Guidelines of Table 501-3, Concrete Mixtures. The Engineer will test the concrete for slump, and reject concrete with a slump greater than the guidelines for use in Department work.

Concrete with insufficient slump may be adjusted to within the guidelines of §501-3.03 by adding water and remixing, when permitted by the specifications or the Engineer.

D. Pozzolan. Up to 20% of the cement content for Classes A, C, D, E, H, I, and J may be substituted with a pozzolan (Fly Ash or GGBFS), except where prohibited by the Regional Director. No additional pozzolan is permitted in Classes DP, G, GG, or HP. No pozzolan is permitted in Class F.

E. Microsilica. Microsilica meeting the requirements of §711-11 may be added as part of a Blended Cement (§701-03, Type SF or Ternary Blend) or batched independently as a powder.

F. High Reactivity Pozzolan (HRP). When permitted by Regional Materials Engineer, HRP meeting the requirements of §711-14 may be batched independently as a partial replacement for Portland cement in specialized or high performance mixes.

Comment [cjt47]:
EI08027

TABLE 501-3 CONCRETE MIXTURES							
Design Mix Guidelines (where sand fineness modulus = 2.80) ¹							
Concrete Class	T.C.M. ⁵ Content (lb/cy)	Sand % Total Agg. (solid volume)	Water/cementitious mat'ls (by weight)	Air Content % desired (Range)	Slump Range (in)	Type of Coarse Aggregate Gradation	Primary Use
A	606	36.2	0.46	6.5 (5.0 - 8.0)	2 1/2 - 3 1/2	CA 2	general purpose structural
C ⁶	605	35.8	0.44	6.5 (5.0 - 8.0)	1 - 3	CA 2	Pavement: slipform paving, form paving
D	725	45.8	0.44	7.5 (6.0 - 9.0)	2 1/2 - 3 1/2	CA 1	thin structural applications
DP ²	725	45.8	0.40	7.5 (6.0 - 9.0)	3 - 5	CA 1	thin structural applications, overlays
E	648	35.8	0.44	6.5 (5.0 - 8.0)	3 - 4	CA 2	structural slabs and structural approach slabs

F	716	34.6	0.38	6.5 (5.0 - 8.0)	2 - 3	CA 2	high early strength for pavement or structural applications
G ³	727	45.0	0.45	6.0 (4.0 - 8.0)	6 - 7	CA 2	underwater
GG ³	800	45.0	0.45	6.0 (4.0 - 8.0)	6 - 7	CA 1	underwater (special)
H	675	40.0	0.44	6.5 (5.0 - 8.0)	3 - 4	CA 2	pumping applications
HP ²	675	40.0	0.40	6.5 (5.0 - 8.0)	3 - 5	CA 2	pumping, structural slabs, approach slabs, substructures exposed to chlorides
I ⁴	640	41.0	0.44	6.0 (4.0 - 8.0)	1/2 - 1 1/2	CA 2	slip forming highway median barriers
J ⁴	680	45.8	0.44	6.0 (4.0 - 8.0)	1/2 - 1 1/2	CA 1	slip forming structural median barriers, parapet walls and curbs

NOTES :

1. Mixture proportions will be computed by the Regional Materials Engineer using the fineness modulus and bulk specific gravities (saturated surface dry) of the aggregates proposed for use.
2. Class DP and HP require the replacement of portland cement with 20% pozzolan and 6% microsilica and the addition of a water reducing admixture and / or water- reducing and retarding admixture. Refer to §501-3.01 B, Admixtures.
3. Class G and GG require the replacement of portland cement with 20% pozzolan, and the addition of a water- reducing and retarding admixture. Refer to §501-3.01 B, Admixtures.
4. These mixes require the use of a water reducing admixture. Refer to §501-3.01 B, Admixtures.
5. T.C.M. = Total Cementitious Material.
6. Slump range for slipform paving is 1 – 2 1/2 inches and for fixed form paving is 1 1/2 – 3 inches.

501-3.02 Handling, Measuring and Batching Materials. Arrange the batching facility and equipment to assure a continuous supply of material to the work.

~~When written approval is granted by the Regional Director, bagged cement, pozzolan or microsilica may be incorporated into the mix. Adjust the batch size to use whole bags of cementitious materials and batch the aggregates at the plant site according to these specifications.~~

When written approval is granted by the Director, Materials Bureau, bagged material may be incorporated into the mix. Adjust the batch size to use whole bags of bagged material. The handling, measuring and batching of bagged material must be verified and documented by a Department representative.

Comment [cjt48]:
EI08027

A. Stockpiles. Build good draining bases for stockpiles, at the batching facility, on prepared aggregate, concrete, metal or wood surfaces, or barge floors, subject to approval by the Regional Director. Build the stockpiles by methods which do not cause particle segregation. Stockpile all aggregates separately, by source and size so that no cross contamination occurs. Label all Department approved stockpiles by source number.

Handle aggregates throughout the batching process such as to maintain uniform grading of the material. In case the aggregates contain a high or non-uniform moisture content, stockpile the aggregates for a sufficient length of time to stabilize the moisture content.

Equip each plant with a moisture sensing device that indicates, on a readily visible scale or chart, the fine aggregate moisture content as it is batched. Indicate the free moisture content on the batch recordation during batching. The free moisture content during batching is limited to a maximum of 8% of the fine aggregate’s saturated-surface dry weight.

The Regional Materials Engineer will determine the acceptability and accuracy of the moisture sensing device. If the device is considered accurate, the free moisture content of the fine aggregate may be allowed to be adjusted between batches based on the most recent moisture reading. No adjustment for free moisture will be allowed for an individual batch after batching starts.

B. Heating Materials for Cold Weather Concreting. Use equipment that uniformly heats the materials. To obtain the specified temperature of the plastic concrete when the air temperature is below 32°F, heat the aggregates by steam or dry heat and heat the mix water. When the air temperature is 32°F or more, and the aggregates are free of ice, the specified temperature may be obtained by heating only the mix water. The equipment and operations for heating the materials must be approved by the Regional Director prior to use on Department projects.

Specified Temperature Range	Minimum	Maximum
Mix Water	70°F	180°F
Aggregate	40°F	100°F
Plastic Concrete in place	50°F	70°F

To avoid the possibility of flash set when water is heated over 100°F, combine the water and aggregate in the mixer so that the water temperature is reduced before cement is added.

C. Batching.

~~1. **Aggregates.** When sizes are weighed cumulatively, allow a $\pm 2\%$ tolerance for each draw weight, based on the combined aggregate batch weight. If sizes are weighed separately, apply the tolerance to each scale weight.~~

~~2. **Cement and Pozzolan**~~

~~a. *Batching without microsilica powder added independently on a common scale.* Weigh the cement, blended cement, or pozzolan cumulatively with a $\pm 1\%$ tolerance for each draw weight, based upon the combined weight of cementitious materials. Weigh the pozzolan last in the weighing sequence.~~

~~b. *Batching with microsilica powder added independently on a common scale.* Weigh the cement, Type IP or SM blended cement, or pozzolan cumulatively with a $\pm 0.5\%$ tolerance for each draw weight, based upon the combined weight of cementitious materials. Double the minimum allowable batch weight. Weigh the microsilica last in the weighing sequence.~~

~~3. **Microsilica**~~

~~a. *Batching with cement, Type IP or SM blended cement, or pozzolan on a common scale.* Weigh the microsilica powder cumulatively with a $\pm 0.5\%$ tolerance for each draw weight, based upon the combined weight of cementitious materials. Double the minimum allowable batch weight. Weigh the microsilica last in the weighing sequence.~~

~~b. *Batching microsilica powder on a separate scale.* Allow a $\pm 1.0\%$ tolerance for the total draw weight of microsilica.~~

C. Batching.

1. Aggregates. When sizes are weighed cumulatively, allow a $\pm 2\%$ tolerance for each draw weight, based on the combined aggregate batch weight. If sizes are weighed separately, apply the tolerance to each scale weight.

2. Cement and Pozzolan.

a. *Batching without microsilica or HRP added independently on a common scale.* Weigh the cement, blended cement, or pozzolan cumulatively with a ± 1% tolerance for each draw weight (based on the combined weight of all cementitious materials). Weigh the pozzolan last in the weighing sequence.”

b. *Batching with microsilica or HRP added independently on a common scale.* Weigh all cementitious materials cumulatively with a ± 0.5% tolerance for each draw weight (based on the combined weight of all cementitious materials). Double the minimum allowable batch weight. Weigh the microsilica or HRP last in the weighing sequence.

3. Microsilica and High Reactivity Pozzolan (HRP).

a. *Batching with cement, Type IP or SM blended cement, or pozzolan on a common scale.* Weigh the microsilica or HRP cumulatively with a ± 0.5% tolerance for each draw weight (based on the combined weight of all cementitious materials). Double the minimum allowable batch weight. Weigh the microsilica or HRP last in the weighing sequence.

b. *Batching microsilica or HRP on a separate scale.* Weigh the microsilica or HRP with a ± 1% tolerance (based on the total weight of microsilica or HRP).

Comment [cjt49]:
EI08027

D. Delivery Tickets. Each delivery ticket must contain the following:

- SiteManager Mix ID
 - Delivery Ticket Number
 - Plant Identification, with plant name and location and/ or facility number
 - Contract Number
 - Concrete Class or Item Number
 - Quantity (Nominal Batch Size)
 - Truck Number
 - Batch Number
 - An Automatically Applied Time- Date Stamp (immediately upon completion of batching) which may consist of one of the following :
 - ◆ Time - Date stamp by separate printing device on a regular ticket
 - ◆ Time - Date printed by a batch weight recorder on a printed ticket.
 - ◆ Time - Date printed by a batch weight recorder on a printed tape. Affix a copy of the tape to the regular delivery ticket.

Comment [cjt50]:
EI08023

E. Failure of Automatic Batching, Admixture Dispensing and Recording Equipment.

If automatic proportioning, admixture dispensing or recording instruments fail, the plant may be allowed, subject to approval of the Regional Director or his representative, to continue producing concrete for the Department for up to 48 hours from the time of breakdown. Written permission of the Regional Director will be required to operate without these instruments for periods longer than 48 hours.

During this period, batch all materials within the automatic proportioning system tolerances.

TABLE 601-4 BATCHING TOLERANCES	
Cement, Pozzolan, or Blended Cement	± 1% (by weight) of total cementitious materials, if no microsilica is weighed cumulatively on common scale. ± 0.5% (by weight) of total cementitious materials, if microsilica powder is weighed cumulatively on a common scale.
Microsilica Powder	± 0.5% (by weight) of total cementitious materials, if weighed cumulatively with cement, Type IP or SM blend, or pozzolan. ± 1% (by weight) if weighed on a separate scale.
Aggregate	± 2% (by weight)
Water (See Note 1)	± 1% (by weight or volume)

Admixtures 711-08	$\pm 3\%$ (by weight or volume) or ± 1 meter pulse (see Note 3), whichever is greater.
Admixture (other)	contact Director, Materials Bureau
Zero—Aggregate (See Note 2)	$\pm 2\%$
Zero—Cementitious Mat'ls. (See Note 2)	$\pm 1\%$
Zero—Water (See Note 1, 2)	$\pm 1\%$

NOTES: 1: Tolerance applies to water added at central mix plants only.
 2: Zero Tolerance is based on the minimum allowable batch size.
 3: Based on the preprogrammed target quantity.

Cement, Pozzolan, or Blended Cement	$\pm 1\%$ (by weight) of total cementitious materials, if no microsilica or HRP is weighed cumulatively on a common scale.
	$\pm 0.5\%$ (by weight) of total cementitious materials, if microsilica or HRP is weighed cumulatively on a common scale.
Microsilica or HRP	$\pm 0.5\%$ (by weight) of total cementitious materials, if weighed cumulatively with any other cementitious material.
	$\pm 1\%$ (by weight) if weighed on a separate scale.
Aggregates	$\pm 2\%$ (by weight)
Water ¹	$\pm 1\%$
Admixtures (711-08, or 711-13)	$\pm 3\%$ by volume, or ± 1 meter pulse, whichever is greater.
Admixtures (others)	Contact Director, Materials Bureau
Zero - Aggregate ²	$\pm 2\%$
Zero - Cementitious Materials ²	$\pm 1\%$
Zero-Water (weighed) ^{1,2}	$\pm 1\%$

NOTES: 1: Tolerance applies to water batched at central mix plants only.
 2: Zero tolerance applies to empty scales, based on the minimum allowable batch size.
 3. All tolerances are based on the pre-programmed target quantity.

Comment [cjt51]:
EI08027

501-3.03 Concrete Mixing, Transporting and Discharging.

A. General. Mix the concrete at a central mix plant, in truck mixers in transit or at the site. When mixed at a central mix plant, transport the concrete in vehicles acceptable to the Regional Director. Place the fresh concrete directly into the forms or into conveyance equipment approved by the Regional Director before evidence of initial set. No water addition will be permitted after the mix has reached the mid-point of the slump range, as indicated in Table 501-3, Concrete Mixtures, for the class used. Concrete with a discharge temperature exceeding 90°F will be subject to rejection.

Notify the Regional Materials Engineer's office by 3:00 PM on the day before any production for the Department. Supply fresh concrete at a rate consistent with placement operations as determined by the Engineer. The Regional Director may disapprove the use of any type of concrete mixing or transporting units when unsatisfactory results occur.

Load the mixer, regardless of type, in a manner approved by the Regional Director and mix batches of concrete no larger than the rated capacity shown on the Manufacturer's plate.

A summary of time limitations for various types of concrete mixing equipment, from the beginning of batching to the completion of discharge, is given in Table 501-7, Summary of Concrete Batching, Mixing, Hauling and Discharging.

B. Concrete Uniformity. Use a mixer that combines aggregates, cementitious materials, water and admixtures into a uniform weight within the specified time. The mixer is required to discharge the mixture without segregation, and meet the uniformity requirements in Table 501-5, Concrete Uniformity. The Department will perform tests when required by the specifications or requested by the Regional Director.

It will only be necessary to verify that mixing equipment meets uniformity requirements if evidence of non-uniform concrete is found or a reduced mixing time for central mixers is requested. A reduction in the batch size below the rated mixer capacity or reduced mixing speed tolerance limits may be required to obtain uniformity.

TABLE 501-5 CONCRETE UNIFORMITY		
Test	Permissible Variation (Concrete samples taken at two locations in the batch)	
Weight per cubic foot calculated to an air-free basis	2.0 lb/cf	
Air Content, % by volume of concrete	1.0%	
Slump:	Average slump 4 in or less	1 in
	Average slump greater than 4 in	1 1/2 in
Coarse aggregate content, portion by weight of each sample retained on a No. 4 sieve	6.0%	
Unit weight of air-free mortars based on average for all comparative samples tested	1.6 %	

NOTE: The Department will take samples at the mixer discharge point and test in accordance with Materials Method 9.2.

C. Central Mixed Concrete. Central mixed concrete is concrete mixed in a stationary mixer and transported in approved agitating or non-agitating delivery units to the deposition point. Use a minimum 90 second mixing time after all materials are in the drum, unless tests show that the requirements of Table 501-5, Concrete Uniformity, can be consistently obtained at a lesser time as approved by the Director, Materials Bureau.

Use delivery units that transport thoroughly mixed concrete without loss of uniformity meeting the requirements of §501-2.04B.1.b. or §501-2.04B.2., pertaining to Central Mixed Concrete.

Travel on a haul road free from holes, washboarding or other features that cause segregation in plastic concrete.

Do not exceed the time limit between completion of mixing at a central mix plant and completion of discharge as noted in Table 501-6, Time Limits for Delivery of Central Mixed Concrete.

When transporting central mixed concrete in units approved for truck mixing, add a minimum of 90% of the design water to the mix with the batch plant water system.

Two additions of water will be allowed at the discharge point to obtain initial slump. After each addition, mix the concrete at least 30 mixing-speed revolutions before discharging. The initial loads may, with prior written approval by the Regional Materials Engineer, also be adjusted by using a water-reducing admixture (711-08, ASTM Type A). This adjustment will be limited to the first trucks arriving for a particular placement before any adjustments have been made at the batching facility. Observe the maximum number of mixing revolution or water addition requirements. Make all subsequent admixture additions or adjustments during production at the batching facility. No additions or adjustments are allowed when non-agitating / open haul units are used.

TABLE 501-6 TIME LIMITS FOR DELIVERY AND DISCHARGE OF CENTRAL MIXED CONCRETE	
Delivery Unit	Maximum Time (Minutes)

Non-Agitating / Open haul	30
Agitating - rotating drum	90 *

* The Engineer will reject the concrete if there is evidence of initial set, and may reduce the time limit in hot weather or under unusual conditions if unsatisfactory results occur. For concrete that does not contain a water-reducing and retarding admixture, the time to initial strike-off or placement of subsequent lifts is included in the delivery and discharge time limit.

D. Transit Mixed Concrete. Transit mixed concrete is concrete batched at the production facility and mixed completely in a truck mixer at the following locations or combinations thereof: the plant, while in transit, or the discharge point. Transit mix may be used for all concrete items unless otherwise specified. Use a truck mixer meeting the requirements of §501-2.04B.1.a., pertaining to Transit Mixed Concrete.

Load the mixer as follows:

1. Totally drain the drum of wash water before loading.
2. Revolve the drum while loading the mix ingredients and add approximately 90% of the design water.
3. Begin mixing within 5 minutes of cement to aggregate contact .

TABLE 501-7 SUMMARY OF CONCRETE BATCHING, MIXING, HAULING AND DISCHARGING			
Central Mixed Concrete	Transit Mixed Concrete		Truck Mixed Concrete
Begin Batching	Begin Batching		Begin Batching
Load mixer	Hatch load, or ribbon load materials through barrel hopper.		REGULAR MIX Load aggregates. Drum may be rocked or revolved
End of Batching and Begin Mixing	Add approx. 90% of design water		LAYERED MIX Load fine agg. , then SSD coarse agg. through hatch Drum may be rocked.
90 Second minimum after all materials are in the mixer.	▲	Cement In Contact With Aggregates 5 Minutes max.	Load Cement (See Note 3)
End of Mixing		Begin Mixing at plant or in transit	Cement In Contact With Aggregates 30 Minutes max.
Open Haul Units		Class HP or Class DP 100 rev. minimum 200 rev. maximum	Load Cement (See Note 3)
Rotating Drum Agitate 2-6 rpm		Begin Mixing at project, after adding water	Cement In Contact With Aggregates 90 Minutes max.
30 Minutes maximum		Class HP or Class DP 100 rev. minimum 200 rev. maximum	
90 Minutes maximum (See Note 2)		Mix: 6-18 rpm	
Completion of Discharge		All Other Classes 100 rev. minimum 160 rev. maximum	
(When concrete is transported in units approved for mixing, see Note 1)	90 Minutes max. (Note 2)	Mix: 6-18 rpm	
		End of Mixing Agitate 2-6 rpm	
		Begin Discharge 50 Minutes maximum	
	▼	Completion of Discharge	End of Mixing Agitate 2-6 rpm
			Begin Discharge 30 Minutes maximum
			Completion of Discharge

NOTES:

1. The remainder of the design water may be added at the work site to attain initial slump. When approved by the Regional Materials Engineer, only the first trucks may be adjusted to obtain initial slump using a water-reducing admixture (711-08, ASTM Type A). Exceeding the maximum mixing revolutions or water addition requirements will not be permitted.
2. For mixtures that do not contain a water-reducing and retarding admixture (711-08, ASTM Type D), the 90 minute maximum time includes the time to initial strike- off, or placement of subsequent lifts.
3. Add cement through hatch. Do not move drum while cement is being added.

Mix for a minimum of 100 mixing- speed revolutions and then check for consistency. If the truck is en route to the project, change the speed from mixing to agitating after 100 mixing revolutions. Unless restricted by local traffic laws, do not stop the rotation of the drum during transit.

Two additions of water will be allowed to obtain initial slump at the discharge location . After each addition, mix at least 30 mixing speed revolutions. For Class DP or HP concrete, mix a total of 100 to 200 mixing speed revolutions. For all other classes of concrete, mix a total of 100 to 160 mixing speed revolutions.

The initial loads may, with prior written approval by the Regional Materials Engineer, also be adjusted by using a water- reducing admixture (§711-08, ASTM Type A). This adjustment will be limited to the first trucks arriving for a particular placement before any adjustments have been made at the batching facility. Observe the maximum number of mixing revolution or water addition requirements. Make all subsequent admixture additions or adjustments during production at the batching facility.

After mixing, either discharge the load immediately or revolve the drum at agitating speed. Once begun, discharge the entire load within 50 minutes.

For mixes containing a water- reducing and retarding admixture, the total time interval from the moment the cement makes contact with the aggregates to the completion of discharge shall not exceed 90 minutes.

For mixes that do not contain a water- reducing and retarding admixture, the total time interval from the moment the cement makes contact with the aggregates to the completion of initial strike off or placement of subsequent lifts shall not exceed 90 minutes.

The Regional Director may reduce the total time limit in hot weather or under unusual conditions, if unsatisfactory results are obtained.

E. Truck Mixed Concrete. Truck mixed concrete is concrete completely mixed in a truck mixer meeting the requirements of §501-2.04B.1.b. Truck Mixers, after adding water at the discharge location. Apply §501-3.03D. Transit Mixed Concrete, except as follows:

1. Loading of Mixer:

a. Regular Truck Mix (cement in contact with moist aggregates). The drum may be rocked or revolved while loading coarse and/or fine aggregates with admixtures. Load the cement last, while keeping the drum stationary. Begin mixing within 30 minutes of cement to aggregate contact.

b. Layered Truck Mix (cement in contact with Saturated Surface Dry(SSD) or drier coarse aggregate). Batch the fine aggregate with admixtures, coarse aggregate and cement all separately. Load these materials through a hatch in the side of the drum in the following sequence: fine aggregate with admixtures, coarse aggregate, and cement last. The drum may be rocked after adding each aggregate size, but kept stationary while loading the cement. Begin mixing within 90 minutes of cement to coarse aggregate contact.

2. Mixing: Begin mixing at the discharge location. Add water to the drum either from the head section or by dual injection from both the head and discharge end. Mix for a minimum 100 revolutions or until uniform concrete of the specified consistency is produced, whichever is longer. Do not exceed a 15 minute mixing period.

3. Discharge: Discharge the entire load within 30 minutes after mixing.

501-4 METHOD OF MEASUREMENT. The Engineer will compute the volume of concrete as the number of cubic yards within the payment lines indicated on the plans or as specified by the Engineer. No deductions will be made for the volume of embedded reinforcement, structural shapes or joint materials. Also, no deductions will be made in concrete pavement for catch basins, manholes, etc. unless otherwise indicated in the contract documents.

501-5 BASIS OF PAYMENT. Include the cost of furnishing all materials, equipment and labor necessary to complete the work in the unit price bid for the appropriate items.

SECTION 502 - PORTLAND CEMENT CONCRETE PAVEMENT

502-1 DESCRIPTION. Construct a portland cement concrete (PCC) pavement and shoulders, if required, as detailed in the contract documents.

502-2 MATERIALS AND EQUIPMENT

Portland Cement Concrete	501
Anchoring Materials - Chemically Curing	701-07
Highway Joint Sealants (ASTM D6690, Type IV)	705-02

§502

Silicone Joint Sealants	705-05
Premoulded Resilient Joint Filler	705-07
Preformed Elastic Longitudinal Joint Seal	705-10
Preformed Elastic Transverse Contraction and Expansion Joint Seal	705-12
Lubricant for Preformed Elastic Joint Sealer	705-13
Longitudinal Joint Ties	705-14
Transverse Joint Supports	705-15
Wire Fabric for Concrete Reinforcement	709-02
Epoxy Coated Bar Reinforcement, Grade 60	709-04
Quilted Covers (for curing)	711-02
Plastic Coated Fiber Blankets (for curing)	711-03
Polyethylene Curing Covers (white opaque)	711-04
Membrane Curing Compound	711-05
Form Insulating Materials for Winter Concreting	711-07
Water	712-01
Backer Rods	ASTM D5249

In addition to meeting the requirements of ASTM D5249 (Type 1 or 3), backer rods must be closed cell polyethylene foam with a diameter at least 25% wider than the second-stage saw cut.

In addition to meeting the requirements of §701-07, Anchoring Materials - Chemically Curing, the material used to anchor longitudinal joint ties, dowels, or other miscellaneous items into hardened concrete must be a pourable, two-component, 100% solids structural epoxy dispensed:

- From side-by-side cartridges by manual or pneumatically powered injection guns.
- Through a static mixing nozzle that homogeneously mixes the material without any hand mixing.
- The Department may perform supplementary sampling and testing of the silicone and highway joint sealants. Deliver sealant in the manufacturer's original sealed container legibly marked with the:
 - Manufacturer's name.
 - Trade name of the sealant.
 - Manufacturer's lot or batch number.
 - Pouring temperature (Highway Joint Sealant only).
 - Safe heating temperature (Highway Joint Sealant only).

502-2.01 Concrete. Use Class C concrete furnished in accordance with Section 501, Portland Cement Concrete – General, when specified. High-Early-Strength (HES) concrete, meeting the requirements of §502-2.02, may be substituted for closure or short placements, subject to the Engineer's approval.

502-2.02 High-Early-Strength (HES) Concrete. Use HES concrete where required in the contract documents or where the Contractor's request to use HES concrete is approved by the Department.

Whether required or requested, design the HES mix to satisfy the opening to traffic time requirements of the project and Table 502-1, High-Early-Strength Concrete Mix Requirements. Submit the HES concrete mix design to the Engineer. Include admixture brands and dosages as well as mixing, transporting, placing, paving, curing, and anticipated strength gain details.

Produce and place a 4.0 cy (minimum) trial batch at an off-contract location selected by the Contractor and agreed upon by the Engineer. Produce the trial batch using the same materials and processes as those to be used to produce concrete for the contract. Provide the Engineer a 7-day minimum advance notification of trial batch production. Produce and place the trial batch in the presence of the Engineer, the Regional Materials Engineer, and Materials Bureau personnel.

Provide an American Concrete Institute (ACI) Certified Concrete Field Testing Technician, Grade I, or higher, to:

- Measure slump, air content, and unit weight of the trial batch.
- Cast cylinders from the trial batch for compressive strength and freeze-thaw resistance testing.

Determine the compressive strength of the trial batch concrete at the desired time as discussed in §502-3.18C, Project Strength Determination.

The Materials Bureau will render a decision on mix acceptability, curing, and opening to traffic requirements within 45 calendar days of trial batch production. Changes other than minor fluctuations in admixture dosage rates require a new mix design and trial batch. The Engineer will reject the concrete if the specified slump or plastic air content are not achieved. The Engineer may halt paving and order additional trial batches whenever the specified compressive strength requirements are not achieved.

TABLE 502-1 HIGH-EARLY-STRENGTH CONCRETE MIX REQUIREMENTS			
Property	Minimum	Desired	Maximum
28 Day Compressive Strength	4000 psi	-	-
Opening Compressive Strength	2500 psi	-	-
Freeze-Thaw Loss (Test 502-3P, 3% NaCl)	-	0.0 %	3.0 %
Plastic Air Content	5.0 %	6.5 %	8.0 %
Hardened Air Content	5.0%	6.5 %	8.0 %
Water – Cement Ratio (w/c)	-	-	0.44
Slump ²	1 in	-	6 in

NOTES:

1. See §502-3.18, Opening to Traffic.
2. Minimum slump provided the mix consolidates and finishes properly. Maximum slump provided the mix is nonsegregating.

502-2.03 Portland Cement Treated Permeable Base (PCTPB). Use (1) coarse aggregate meeting §501-2.02B2, Coarse Aggregate, with Type CA2 gradation, (2) portland cement, Type I, II, or I/II meeting §701-01, Portland Cement, and (3) water in the following proportions:

Cement	10 pcf (240 lb/cy)
Aggregate	100 pcf (2700 lb/cy)
W/C	0.37 max

Aggregate weight is based on a bulk density of 100 pcf (2700 lb/cy) and a saturated, surface-dry condition determined in accordance with AASHTO T 19M, Bulk Density (“Unit Weight”) and Voids in Aggregate. Adjust the aggregate weight accordingly if the contract aggregate has a different bulk density.

Use saturated, surface-dry coarse aggregate if PCTPB is brought to the site in open haul units. Coarse aggregate for PCTPB do not have to meet friction requirements.

502-2.04 Equipment. Provide the Engineer with an equipment list and specifications a minimum of 14 days prior to the planned start of PCC paving. Bring all equipment needed to place, consolidate, finish, texture, cure, saw cut, seal, and test the PCC pavement and permeable base to the job site a minimum of 1 full work day before its use to allow examination by the Engineer. Repair or replace any equipment found to be defective before or during its use. Discontinue any operation if unsatisfactory results are being obtained. Use of equipment other than described below is subject to the approval of the Director, Materials Bureau.

- A. Slipform Paving.** Use a self-propelled slipform paver equipped with:
- Rigid side forms that laterally support the concrete and minimize edge slumping.
 - A full-width finishing pan.
 - Attached internal vibrators capable of consolidating the entire concrete placement.

Slipform paving consists of a single paver, or a placer/spreader followed by a separate paver, capable of placing, spreading, consolidating, screeding, and finishing the concrete such that hand finishing is kept to a minimum. Use equipment guided by a reference system that ensures the pavement is placed to the specified line, grade, and cross section.

B. Fixed Form Paving

1. Forms. Use straight forms without horizontal joints meeting Table 502-2, Form Requirements, and equipped with:

- At least 3 stake pockets spaced 3 feet apart (maximum), each having a positive, nondetachable wedge.
- Positive, interlocking devices capable of holding abutting sections together to form neat, tight joints.

Flexible, curved, or wooden forms may be used in irregular areas or curved sections having horizontal radii of 100 feet or less.

2. Paving Equipment. Use a self-propelled paver equipped with a full-width finishing pan and attached internal vibrators capable of consolidating the entire concrete placement. Three (3) full-width transverse finishing screeds may be used in lieu of the full-width finishing pan. When 2 pavers are used to employ 3 transverse screeds, vibrate with the first paver only.

Finishing machines with double cylinders and augers capable of rotating in opposite directions, attached internal vibrators, and at least 1 pan float may also be used. However, if the pavement is specified as nonprofilographed, §502-3.16, Profilograph, and §502-3.17, Diamond Grinding, will apply. §502-3.15, Hardened Surface Test, will not apply.

Fixed form paving consists of 1 or 2 pavers, or a placer/spreader followed by the paver(s), capable of placing, spreading, consolidating, screeding, and finishing the concrete to the specified line, grade, and cross section such that hand finishing is kept to a minimum.

TABLE 502-2 FORM REQUIREMENTS	
Characteristic	Requirement
Material	Steel, 1/4 inch thick, minimum.
Length	10 feet, minimum.
Depth	Equal to the sum of the edge thicknesses of all pavement layers placed within the form.
Base Width	Equal to the depth, minimum.
Horizontal Top Face	2 inch wide, minimum, and lying in a plane with a maximum variation of 1/8 inch in 10 feet.
Vertical Face	Maximum variation of 1/4 inch in 10 feet and rounded on the upper corner with a 3/4 inch radius, maximum.
Flange Bracing	Extends outward on the base 2/3 of the form depth, minimum.

3. Paving Irregular Areas. Pave with the following equipment, in order of preference, if slipform or fixed form paving equipment cannot be used in an irregular area:

- a. Triple tube roller pavers.
- b. Concrete finishing machines equipped with internal vibrators and double cylinders and augers capable of rotating in opposite directions and at least 1 pan float.
- c. Roller pavers.
- d. Manual, vibrator equipped power screeds appearing on the Department's Approved List.
- e. By hand.

C. Vibrators. Use paver-mounted internal vibrators capable of consolidating the entire concrete placement that are:

- Capable of being shut off without shutting off the paver.
- Equipped with frequency controls readily accessible to the paver operator.
- Capable of simultaneously operating at the same frequency as the other paver-mounted vibrators.

- Capable of operating through a frequency range of 6,000 - 10,000 vibrations per minute.

Check vibrator operating frequencies daily when paving begins. Check frequencies under load with the Engineer present. If the paver is not equipped with direct-read frequency gauges for each vibrator, supply the Engineer with a calibrated, hand-held tachometer, including instructions, to monitor vibrator frequencies. The tachometer will remain the Contractor's property after paving is complete.

Use hand-held vibrators capable of operating through a frequency range of 6,000 - 10,000 vibrations per minute in irregular areas or at any location that is not consolidated by internal vibrators attached to the paving equipment.

D. Permeable Base Paving Equipment. Use pavers meeting §502-2.04A, Slipform Paving, with vibrators disengaged or §402-3.02, HMA Pavers, with an attached vibrating screed. Permeable base may be placed by hand and compacted with plate or small drum vibrators in fixed form operations with permeable base placed within the forms or in areas not accessible to pavers.

E. Saw Cutting Equipment. Use diamond blade saws capable of making straight cuts to the dimensions depicted in the Standard Sheets that are equipped with cutting guides, blade guards, water cooling systems, dust controls, and cut depth control. Where beveled saw cuts are required, use a cutting or grinding device attached to the saw blade, or a separate device following the saw.

Maintain equipment and supplies to ensure uninterrupted saw cutting. Early entry saws require approval from the Director, Materials Bureau. Submit requests to use early entry saws at least 7 calendar days before paving.

F. Curing Compound Applicators. Use atomizing mechanical sprayers capable of exerting consistent pressure without hand pumping that are equipped with tank agitators to continuously mix the curing compound. Use nozzles with spray shields to prevent drift. Flush nozzles daily before use.

Maintain equipment and supplies, including extra nozzles, to ensure uninterrupted curing compound application. In a slipform paving operation, use self-propelled applicators guided by the same reference system as the slipform paver. In a fixed form operation, applicators need not be self-propelled.

G. Profilograph. For projects with profilograph smoothness requirements, use an automated California-type profilograph capable of producing and analyzing a profile trace in accordance with Materials Method 24, Portland Cement Concrete Pavements Profilograph Operations. Use automation capable of reporting profile indices in inches/mile using a 0.2 inch blanking band and in inches/mile using a zero blanking band.

H. Diamond Grinding. Use equipment having gang-mounted diamond saw blades on a multiblade arbor specifically designed for pavement bump cutting or production grinding. When production grinding, use equipment capable of producing a 4 foot (minimum) grinding pass width that is equipped with a vacuum system capable of removing slurry from the pavement surface. Use blade spacers having a minimum thickness of 0.105 inches. Inform the Engineer of the spacer thickness selected.

I. Drills. Use gang drills with a minimum of 2 independently powered and driven drills. Use tungsten carbide drill bits. Rest and reference the drill rig frame on and to the pavement surface such that the drilled holes are cylindrical, perpendicular to the surface being drilled, and repeatable in terms of position and alignment. Hand-held drills, or gang drills resting on the permeable base or subbase, are permitted for drilling holes in longitudinal joints if there is not enough room to use gang drills resting on the pavement surface. This typically occurs when traffic is being maintained on a previous placement.

J. Joint Sealing - Silicone Joint Sealant. Use equipment that pumps the silicone directly from plastic pails or drums by compressed air powered extrusion pumps designed for moisture curing silicone sealants. Use teflon seals and packing and teflon lined hoses to prevent moisture permeation. Use nozzles that apply the silicone within the joint confines for the full width of the joint, and to the level below the pavement surface depicted in the Standard Sheets.

K. Joint Sealing - Highway Joint Sealant. Heat the sealant in a melter constructed either:

- As a double boiler with the space between inner and outer shells filled with oil or other heat-transfer medium.
- With internal tubes or coils carrying the sealant through a heated oil bath and into a heated double-wall hopper.

Do not use direct heating. Use a melter capable of maintaining the sealant's pouring temperature and providing homogeneous sealant equipped with:

- Positive temperature control.
- Continuous full sweep mechanical agitation.
- Separate thermometers indicating the temperatures of the heat transfer medium and the sealant in the hopper. Do not place any sealant if the thermometers are defective or missing.

Provide 2 thermometers having stems 18 inches long and temperature ranges sufficient to meet the requirements of this specification. Use a discharge hose equipped with a controlled heating apparatus or sufficiently insulated to maintain the proper sealant pouring temperature. Use nozzles that apply the joint sealant within the joint confines for the full width of the joint, 1/4 to 3/8 inches below the pavement surface.

L. Air Blasting Equipment. Use equipment with traps or other installed devices that prevent moisture and oil from contaminating the concrete surface. Use a compressor that delivers air at a minimum of 120 cfm and develops a minimum nozzle pressure of 90 psi. Check the compressed air stream purity daily with a clean white cloth.

502-3 CONSTRUCTION DETAILS. Convene a prepping meeting 7 to 14 days before the planned start of PCTPB paving with the Engineer and any PCC paving and saw cutting subcontractors to coordinate all aspects of paving and inspection, including equipment review, construction methods, and time and personnel requirements.

Construct a smooth, well consolidated, properly finished, textured, and cured pavement to the line and grade depicted in the contract documents, 1/4 inch vertically at any location.

502-3.01 Weather Limitations

A. Rain. Do not pave in the rain. Supply sufficient quilted covers, plastic coated fiber blankets, or polyethylene curing covers near the paving operation when rain may be expected. Securely cover any concrete exposed to rain that has not reached initial set or will be visibly affected by the rain.

B. Cold Weather. Place concrete when the air temperature is 40°F and rising, or warmer, and when the surface temperature of the area to be paved is 40°F, or warmer. Stop paving when the air temperature falls below 40°F. Measure temperatures in the shade to an accuracy of 1°F. Refer to §502-3.11C, Cold Weather Curing.

502-3.02 Subbase Course. Furnish in accordance with Section 304, Subbase Course, before placing any PCTPB or PCC. If the subsequent PCC placement is a profilographed traveled way and the area is available, widen the prepared subbase course at the same line, grade, and cross slope such that it is at least:

- 3 feet beyond the longitudinal edges of a slipform pavement.
- 1 foot beyond the outside longitudinal edges of the fixed forms.

Additional subbase course that is not included in the finished work will be paid for under Section 304 items included in the contract.

502-3.03 Portland Cement Treated Permeable Base. Apply §502-3.01, Weather Limitations. Place and consolidate permeable base within 2 hours of water addition to the mix. Allow to air cure for a minimum period of time such that concrete placement results in no damage to the permeable base. Place permeable base on a prepared subbase course to the dimensions depicted in the contract documents such that the final surface elevation does not vary more than 1/4 inch above or 1 inch below the design grade elevation at any location. In a slipform paving operation, test the surface both perpendicular to the pavement centerline and diagonally across the pavement using a stringline placed across the referencing system. Test the surface (1) at the beginning of each day's placement, (2) every 50 feet thereafter, (3) at the end of each day's placement, and (4) wherever required to ensure reasonably close conformance to the contract documents. In a fixed form paving operation, use a scratch board placed transversely across the forms to continuously test the surface elevation and verify the appropriate concrete thickness will be placed. Trim excess permeable base from high areas exceeding 1/4 inch in 10 feet before it hardens. Build up low areas deeper than 1 inch in 10 feet with CA 1 or CA 2 coarse aggregate.

In a slipform paving operation, place the permeable base slightly wider than the pavement width being placed. Remove and replace permeable base placed wider than the pavement if it is damaged or contaminated.

In a fixed form paving operation, place permeable base either within the forms or beneath the forms. When placing within forms, place a bead of commercial masonry caulk along the top surface of the permeable base at the form interface before placing concrete to prevent paste infiltration down the vertical face of the form. The masonry caulk bead is not required at placement edges outside of the underdrains.

Construction traffic may be maintained on permeable base in areas of limited access. Remove and replace damaged or contaminated permeable base before placing PCC.

502-3.04 Slipform Paving. Establish a reference system to achieve the specified smoothness level. If string lines are used, set them by survey and use dual lines for the initial placement if it is a profilographed traveled way and the area is available. Maintain uniform concrete quality and head in front of the paver. Coordinate concrete delivery to maintain continuous forward movement of the paver and avoid excessive delivery truck queues. Keep paver tracks clear of concrete and debris before and during paving.

If concrete is placed directly on subbase, i.e., there is no permeable base, wet the entire subbase surface without forming puddles or mud immediately before placing concrete.

Whenever possible, unload concrete into a mechanical spreader that deposits it near the final position before paving. If a spreader is not used, uniformly distribute the concrete in front of the paver by maneuvering the delivery truck chute.

Consolidate the entire concrete placement using internal vibrators attached to the machine. Combine paver forward speed, vibrator frequency, and vibrator depth to consolidate the concrete without segregation, vibrator trails, or contacting the joint assemblies. Discontinue vibration and tamping if the paver stops.

Determine edge slump by extending a 2 foot (minimum) long straightedge over the longitudinal pavement edges. Immediately correct edge slumps greater than 1/4 inch that are between concrete placements and greater than 3/8 inch at free edges and HMA shoulders.

502-3.05 Fixed Form Paving.

A. Setting Forms. Compact the supporting layer at the form line such that the forms are supported for their full length. Set forms to string lines placed at the pavement elevation, line, and grade and to achieve the specified smoothness. If a form sits above the string line, remove the form and trim the form line to the proper grade. If a form sits below string line, remove the form and fill and compact the low area with granular material at least 6 inches on both sides of the form. Frequently check form grade and alignment while paving. Reset forms as necessary.

Set forms to accommodate a full days paving before placing concrete. Extend forms beyond construction bulkheads to provide a working platform at the end of a placement. Secure each form with a minimum of 3 pins each of sufficient length to hold the forms in place without movement during any operation. Lock the forms together such that the form ends are aligned and the joints are tight and smooth. Run the paving equipment atop the forms before placing any concrete and recheck form alignment. Reset forms as necessary.

Align keyway strips in a smooth, horizontal plane, parallel to the top of the form. Match keyway strips on abutting forms such that a nearly seamless keyway results.

B. Paving. Apply oil to forms before placing concrete. Immediately before placing concrete, wet the entire subbase or permeable base surface without forming puddles or mud. Whenever possible, unload concrete into a mechanical spreader that deposits it near the final position before paving. If a spreader is not used, uniformly distribute the concrete in front of the paver by maneuvering the delivery truck chute.

Maintain uniform concrete quality and head in front of the paving machine and without running over the screeds. Coordinate concrete delivery to maintain continuous forward movement of the paver and avoid excessive delivery truck queues. Keep form tops clean before and during paving. Consolidate the entire concrete placement using internal vibrators attached to the paver. Combine paver forward speed, vibrator frequency, and vibrator depth to consolidate the concrete without segregation, vibrator trails, or contacting the joint assemblies. Discontinue vibration and tamping if the paver stops.

Mark the midpoint (3/8 inch) of each transverse contraction joint with a shim placed into the plastic concrete immediately adjacent to each form. Use shims equal in width and depth to the contraction joint first-stage saw cuts depicted in the Standard Sheets. Set the shims perpendicular to the forms and the pavement surface. Make first-stage saw cuts from shim to shim as discussed in §502-3.06A1, Transverse Contraction Joints. Use shims of sufficient lengths to allow complete first-stage saw cutting to each shim without striking the form.

C. Paving Irregular Areas. Uniformly spread concrete. If concrete is spread by hand, use come-alongs or shovels. Do not use rakes or hand-held vibrators to spread concrete. Use hand-held vibrators ahead of the paving equipment to consolidate all concrete not vibrated by equipment-mounted internal vibrators. Keep hand-held vibrators perpendicular to the pavement surface. Vibrate between 2 and 4 seconds in each location, overlapping adjacent locations. Do not drag hand-held vibrators through the concrete. Do not walk through consolidated concrete.

D. Form Removal. Remove forms after the concrete has developed sufficient strength to allow removal without damaging the pavement. Repair pavement damaged during form removal. Remove forms before making second-stage saw cuts.

502-3.06 Joint Construction. Provide the Engineer approved Materials Details for longitudinal joint ties and transverse joint supports before placing any joint hardware. Construct joints in accordance with the Standard Sheets and approved Materials Details. Do not stand on joint hardware.

Base final joint layout on construction staging and the actual location of utilities, drainage structures, intersections, tapers, and other irregular areas. Submit a proposed joint layout to the Engineer at least 10 calendar days prior to PCC paving. Obtain the Engineer's joint layout approval before paving.

Make second-stage saw cuts and bevels, clean, and seal joints in accordance with §502-3.12, Sealing Joints.

A. Transverse Joints. Transverse joints include contraction, expansion, hinge, and construction joints. Secure joint supports to the permeable base or subbase as depicted in the Materials Details. Maintain joint supports in their proper position and alignment during paving.

Construct transverse joints perpendicular to both the pavement surface and longitudinal joints in the area being paved. Use a 16 foot typical transverse joint spacing for pavements having standard slab widths of 12 and 14 feet. For pavements having other slab widths, determine typical maximum and minimum transverse joint spacings in accordance with the following:

- L_{\max} = maximum transverse joint spacing (slab length), feet = $W_{\min} \times 1.33$
 L_{\min} = minimum transverse joint spacing (slab length), feet = $W_{\max} \div 1.33$
 W_{\max} = maximum slab width across the pavement (load carrying slabs only), feet ≤ 16 feet
 W_{\min} = minimum slab width across the pavement (load carrying slabs only), feet

The range of slab lengths may be extended to 10 to 16.5 feet (from L_{\min} - L_{\max} above) in accordance with the contract documents to accommodate utilities, drainage structures, and irregular areas.

1. Transverse Contraction Joints. All transverse joints are contraction joints unless otherwise shown in the contract documents. Typically, contraction joints are constructed in a straight line across the full width of the PCC pavement and shoulders. Contraction joints may be slightly angled (rather than straight across a pavement) at tied longitudinal joints between lanes placed separately if the placements do not have the same centerline, e.g., where a ramp centerline diverges from parallel to the pavement centerline. Contraction joints may terminate at, or be misaligned at, untied longitudinal joints as discussed in §502-3.06B3, Untied Longitudinal Joints with Keyway.

Store transverse contraction joint support assemblies in inverted stacks at the project site. Handle joint supports such that no twisting or bending occurs during storage and positioning. Supports with bent, twisted, or deformed wires will be rejected.

Before placing concrete, position transverse joint supports such that the:

- Entire longitudinal axis of each dowel is located at the middepth of the pavement slab (1/4 inch).
- Longitudinal axes of the dowels are aligned parallel with the pavement centerline and pavement surface such that the maximum misalignment of one dowel end relative to the other is 1/8 inch.
- Midpoint of the longitudinal axis of each dowel is at the center of the joint (1 inch).
- Longitudinal axes of the two end dowels are 4 to 8 inches from the longitudinal joints.
- Longitudinal axes of the dowels are spaced 4 to 12 inches apart.

Mark the location of each contraction joint before placing concrete. In a slipform paving operation, mark the joint support midpoint on the subbase or permeable base immediately adjacent to the pavement. In a fixed form paving operation, mark the joint support midpoint with shims as discussed in §502-3.05B, Paving. Immediately before concrete placement, cut the tie wires (parallel to the dowels) holding the 2 upper transverse support members in position.

Make first-stage saw cuts as soon as the concrete has hardened sufficiently to permit sawing without causing raveling wider than 1/8 inch. Replace blades if raveling persists. Center first-stage saw cuts within 1 inch of the longitudinal midpoints of the dowels.

Complete first-stage saw cuts before any uncontrolled cracking occurs. Be prepared to make first-stage saw cuts 24 hours a day to prevent uncontrolled cracking. Provide lighting required to make first-stage saw cuts at night at no additional cost to the State.

Sweep or wash first-stage saw cut debris from the pavement before profilographing, before it rains, or before opening the pavement to any traffic, such that debris does not enter the joint.

2. Transverse Expansion Joints. Construct transverse expansion joints as part of the utility and drainage structure isolation systems depicted in the Standard Sheets or where indicated in the contract documents. Handle and position expansion joint supports in accordance with §502-3.06A1, Transverse Contraction Joints.

Construct expansion joints using 3/8 to 5/8 inches thick premoulded resilient joint filler placed in 1 piece between longitudinal joints. Tightly place and support abutting sections of joint filler such that no concrete infiltrates the joint. Place expansion caps on the dowels as depicted in the Materials Details. Do not tap or hammer the caps onto the dowels.

No saw cuts are required in expansion joint construction. Remove the finishing cap, if supplied, after the concrete has developed sufficient strength to prevent damage.

3. Transverse Construction Joints. Construct transverse construction joints wherever there is an interruption of more than 30 minutes in concrete paving operations. Construct these joints as wide as the concrete placement, typically 1 or 2 lanes, but not necessarily the full pavement width. Align construction joints with transverse contraction or construction joints in adjacent lanes.

At unplanned stops, remove plastic concrete to the midpoint of the preceding transverse joint support. Place an Engineer-approved bulkhead over the exposed support assembly such that half of the dowel lengths are embedded within newly placed concrete. Immediately remove all plastic concrete in front of the bulkhead and from the exposed joint support.

At planned stops, use either the bulkhead system described above or transverse joint supports fabricated with hollow plastic cylinders, closed on one or both ends, instead of dowels. Use hollow cylinders with an inner diameter 0 to 1/32 inch greater than the required dowel diameter and an outer diameter 1/4 inch, maximum, larger than the required dowel diameter. Position cylinders as required in §502-3.06A1, Transverse Contraction Joints, with closed ends on the side of the support opposite to the paving direction.

Pave beyond the joint support containing the hollow cylinders. After the concrete has gained sufficient strength to prevent damage, saw cut the newly placed concrete full depth through the midpoint of the longitudinal axis of each cylinder (1 inch). Do not saw cut into previously placed PCC. Instead, stop saw cutting at the longitudinal joint between placements and chip out any uncut concrete such that a vertical joint face results.

Remove concrete and the joint assembly ahead of the saw cut. Repair damaged permeable base and/or subbase with coarse aggregate having a CA 1 or CA 2 gradation. Insert dowels into the exposed hollow cylinder to the required alignment in §502-3.06A1, Transverse Contraction Joints, and resume paving.

First-stage saw cuts are not required at construction joints.

4. Transverse Hinge Joints. Do not place hinge joints without the Engineer's approval. Construct transverse hinge joints when a slab length exceeds the geometric requirements of §502-3.06, Transverse Joints. (This situation typically occurs near structures that are skewed from perpendicular to the pavement centerline.)

Locate hinge joints such that they are equally spaced between other types of transverse joints. Construct hinge joints in accordance with 502-3.06A1, Transverse Contraction Joints, except the positioning requirements do not apply. Instead, position transverse hinge joint supports such that the:

- Entire longitudinal axis of each deformed bar is located at the middepth of the pavement slab (1/4 inch).
- Longitudinal axes of the bars are aligned parallel with the pavement centerline and pavement surface such that the maximum misalignment of one bar end relative to the other is 1 inch.
- Midpoint of the longitudinal axis of each bar is at the center of the joint (1 inch).
- Longitudinal axes of the two end bars are 4 to 10 inches from the longitudinal joints.
- Longitudinal axes of adjacent bars are spaced 4 to 18 inches apart.

B. Longitudinal Joints. Select tie type, size, spacing, and positioning in accordance with the contract documents. Provide a minimum clearance of 3 inches between the end ties in a slab and any part of the transverse joint support. Keep ties free of materials that inhibit bonding to concrete or anchoring material. Maintain ties in their proper position during paving.

Eliminating a longitudinal joint (and subsequent sawing and sealing) between a shoulder and adjacent lane is optional provided (1) the lane and shoulder are paved simultaneously and (2) the resulting slabs meet the geometric requirements detailed in §502-3.06A, Transverse Joints.

It is highly desirable to align longitudinal joints with the permanent pavement markings. Tied longitudinal joints located in the wheelpaths of the completed pavement will require additional ties.

1. Longitudinal Joints Between Lanes Paved Simultaneously. Use one-piece ties fabricated into assemblies capable of securely holding 2 or more ties. Secure the assemblies to the permeable base or subbase prior to paving in accordance with the Materials Details.

Make first-stage saw cuts parallel to the pavement centerline and perpendicular to the pavement surface within 24 hours of concrete placement and after first-stage transverse saw cuts are complete. Replace saw blades if raveling wider than 1/8 inch occurs. Center first-stage saw cuts within 1 inch of the longitudinal midpoint of the ties.

Sweep or wash first-stage saw cut debris from the pavement before profilographing, before it rains, or before opening the pavement to any traffic, such that debris does not enter the joint.

2. Tied Longitudinal Joints Between Lanes Paved Separately. In a slipform operation, construct a butt joint and drill and anchor one-piece ties into the hardened concrete. Do not drill holes until the concrete has developed sufficient strength to withstand drilling without damage. Damage from drilling will be treated in accordance with §502-3.14, Damaged or Defective Concrete.

Use # 6 ties, 28 inches long between travel lanes and 18 inches long between a travel lane and a PCC shoulder. Anchor ties between travel lanes 12 inches into the previously placed concrete, leaving 16 inches projecting from the joint face. Anchor ties between a travel lane and a PCC shoulder 8 inches into the previously placed concrete, leaving 10 inches projecting from the joint face.

Place end ties in a slab 12 to 14 inches from the transverse joint. Typically, space ties between the end ties 24 inches apart, maximum. Pavements having 4 or more tied lanes, or 3 lane pavements 12 inches (or more) thick, may require a decreased spacing in accordance with the contract documents.

Drill such that the hole diameters are in accordance with the anchoring material manufacturer's written recommendations. Give those recommendations to the Engineer before drilling any holes. Replace worn bits when necessary to ensure the proper hole diameter is drilled.

Follow the anchoring material manufacturer's written recommendations for cleaning the holes. Give those recommendations to the Engineer. As a minimum, air blast the drilled holes. Insert the air blasting equipment nozzle to the back of the hole to force out all dust and debris.

When using new cartridges of anchoring material, ensure the initial material exiting the nozzle appears uniformly mixed. If it is not uniformly mixed, waste the material until uniformly mixed material extrudes.

Place the anchoring material in the back of the hole using a nozzle or wand of sufficient length. Push the tie into the hole while twisting such that the air pocket within the hole is heard to burst and the anchoring material is evenly distributed around the bar. Use sufficient amounts of anchoring material such that it slightly extrudes out the hole as the bar is inserted.

In a fixed form operation, construct either a butt or a keyed joint. If a butt joint is constructed, drill and anchor longitudinal joint ties as described above. If a keyed joint is constructed, use multiple-piece ties. Apply a corrosion inhibiting coating to the threads of all components before assembly. Bolt the female portion of the tie to the form prior to paving as depicted in the Standard Sheets. Insert and tighten the male ends before paving the adjacent lane. Ensure all threaded connections are tight.

First-stage saw cuts are not required between lanes paved separately.

3. Untied Longitudinal Joints with Keyway. Construct untied longitudinal joints with keyways at utilities and/or drainage structures, at intersections, between adjacent lanes having non-parallel center lines (such as ramps), or where indicated in the contract documents. Form as depicted in the Standard Sheets. Transverse joint type, location, and alignment may be changed when a transverse joint intersects an untied longitudinal joint.

Patch honeycombing along the untied longitudinal joint face to achieve a smooth surface prior to applying the bond breaker and placing the adjacent concrete.

First-stage saw cuts are not required.

C. Utility and Drainage Structure Isolation Joint Systems and Telescoping Manholes.

Isolate utilities and drainage structures from the pavement using the isolation joint systems or telescoping manhole castings depicted in the Standard Sheets. Remove temporary support bolts from the telescoping manhole casting as soon as the concrete hardens. If telescoping manhole castings are not used, form the required isolation joint system.

Construct transverse portions of the isolation joint systems in accordance with §502-3.06A2, Transverse Expansion Joints, or §502-3.06A3, Transverse Construction Joints, in accordance with the contract documents. Construct other isolation joints in accordance with the contract documents.

502-3.07 Paving Adjacent To Existing Concrete. Wherever paving equipment operates on existing PCC pavement that is to remain, install bolt-on track covers or rubber tired, flangeless wheels. Remove all debris on the existing PCC pavement in the equipment track. Immediately remove any concrete that spills onto the existing concrete.

When paving from (or to) a transverse construction joint or intersecting pavement, use hand-held vibrators to thoroughly consolidate any concrete inaccessible to the paving equipment vibrators. Hand finish these areas with the minimum effort required to produce an acceptable surface. Do not dump the grout box head into the pavement concrete when approaching a construction joint.

502-3.08 Plastic Thickness Determination. In a slipform paving operation, anchor flat, thin (1/16 - 1/8 inch), 6 x 6 inches rigid steel or plastic plates to the permeable base (or subbase) surface 24 inches from both placement edges at 150 foot intervals. Clearly mark the plate locations on the subbase, permeable base, or previously placed concrete immediately adjacent to the placement. Provide the Engineer with a round, rigid, nonaluminum probe, having a 1/8 inch \pm 0 diameter. The Engineer will determine the plastic concrete thickness by inserting the probe to the plate and measuring the insertion depth. The plate thickness will be added to the insertion depth to determine concrete thickness.

In a slipform paving operation, the minimum measured plastic thickness must be within 3/8 inch of the thickness required in the contract documents. Areas not meeting minimum thickness will be treated in accordance with §502-3.14, Damaged or Defective Concrete. If 2 consecutive measurements do not meet minimum thickness, stop paving and reestablish the paving operation to achieve acceptable thickness.

502-3.09 Finishing. Mechanically finish the pavement after consolidation and strike off. Use machine mounted finishers such as full-width finishing pans, transverse oscillating screeds, longitudinal floats, pan floats or separate pieces of equipment such as tube floats or Lewis floats.

After mechanical finishing, hand finish the pavement to correct and seal minor imperfections. Provide an ACI certified concrete flatwork finisher to supervise all hand finishing. Provide proof of ACI flatwork certification to the Engineer. Keep hand finishing to a minimum. Do not use excess mortar or discarded concrete to fill low areas. Use work bridges to hand finish concrete inaccessible from the pavement edge. Do not add water to the concrete surface to close imperfections. Stop paving or reformulate the concrete mix if surface imperfections that require additional water to close routinely occur.

502-3.10 Texturing. Immediately after finishing and prior to applying the curing compound, texture the concrete surface using one of the following procedures in accordance with the contract documents. Apply longitudinal tining if no texturing method is designated in the contract documents. Additional requirements, such as Mean Texture Depth measured by a sand patch test or a profiler may be included in the contract documents. If the contract has a closed drainage system, provide a 8 - 12 inch blank in the texture along the pavement edges to enhance drainage to catch basins.

A. Longitudinal Tining. Texture the concrete parallel to the pavement centerline with a set of evenly spaced spring steel tines. Use rectangular tines 1/8 inch wide, 1/32 inch thick, and approximately 5 inches long at a center-to-center spacing of 3/4 inches.

Operate the tine head manually or mechanically. In either case, hold the tines as near an angle of 45° to the concrete surface as possible to minimize mortar dragging. Produce tine texture 1/16 - 1/8 inch deep with minimal dislodging of aggregate. Do not make multiple tine passes in the same area. Keep tines 2 - 4 inches from the placement edges. Keep the tines free of hardened concrete.

B. Artificial Turf Drag. Use a seamless strip of artificial turf drag appearing on the Department's Approved List entitled "Turf Drag" under "Equipment, Concrete Related." Produce a consistent texture, free of ridges or gouges, parallel to the pavement centerline either by hand or by attaching a weighted strip to the paver, texture/cure machine, or work bridge. Periodically replace or clean the drag to remove hardened concrete paste that compromises texture.

C. Transverse Tining. Texture the concrete perpendicular to the pavement centerline with a set of variably spaced spring steel tines. Use rectangular tines 1/8 inch wide, 1/32 inch thick, and approximately 5 inches long at the following center-to-center spacing in millimeters:

16/25/22/16/32/19/25/25/25/19/22/25/22/10/25/25/25/32/38/22/25/22/25.

Operate the tine head manually or mechanically. In either case, hold the tines as near an angle of 45° to the concrete surface as possible to minimize mortar dragging. Produce tine texture 1/16 - 1/8 inch deep with minimal dislodging of aggregate. Do not make multiple tine passes in the same area. Keep the tines free of hardened concrete. If the tine texture is placed manually, or if the mechanical equipment does not operate from the same referencing system as the paver, provide a 3 - 4 inch blank at each transverse joint saw cut location.

502-3.11 Curing. Keep the curing operation close to the texturing operation such that concrete is cured immediately after it is textured. The Engineer may stop paving if curing lags. Cure Class C concrete placed between June 1 and September 15 for 4 days, minimum. Cure Class C concrete placed between September 16 and May 31 for 6 days, minimum. Cure HES concrete in accordance with Materials Bureau requirements based on the Contractor-submitted mix design and the trial batch evaluation.

A. White Pigmented Membrane Curing Compound. Typically, cure concrete with white pigmented membrane curing compound. Mix the curing compound before each use and continuously agitate during use. Thoroughly and uniformly coat all exposed surfaces (including slipformed edges and formed edges immediately after form removal) at a minimum rate of 150 sf/gal. Check the application rate after every paving day, including exposed vertical slab faces in the calculations. Apply the curing compound in 2 opposite direction passes with no longer than 15 minutes between passes.

Immediately reapply curing compound to any damaged coating areas during the curing period. During curing equipment breakdown, cure the pavement in accordance with §502-3.11B, Curing Covers. Do not apply curing compound in the rain. If rain damages the curing compound before it sets, reapply curing compound after the pavement surface dries.

B. Curing Covers. Use of curing covers is subject to the approval of the Engineer. Use quilted covers, plastic coated fiber blankets, or polyethylene curing covers. Do not use covers with tears or holes. Cover all exposed surfaces and extend the covers a minimum of 12 inches beyond the pavement edges or beyond the forms, when used. Overlap successive covers 12 inches, minimum. Secure the covers to keep them in contact with the entire surface and maintain the overlap. Wet the entire surface of quilted covers and maintain them in a wetted condition throughout the curing period.

C. Cold Weather Curing. Supply form insulating materials for winter concreting when the air temperature is expected to fall below 40°F at any time during the curing period. Use material capable of maintaining a surface temperature of 55°F and being easily removed and replaced to accommodate first-stage saw cuts. Apply the insulating material to prevent newly placed concrete from being exposed to air temperatures below 35°F for the curing period. Secure the insulation tight to the concrete surface to prevent air intrusion beneath the insulation. Extend the insulation 12 inches beyond the newly placed concrete. Insulate the pavement vertical edge and/or forms as well.

Place recording surface thermometers between the pavement surface and insulating material 12 inches from one of the placement edges wherever insulation is used. Use 4 equally spaced

thermometers for each day's paving. Do not subject the concrete to a temperature drop in excess of 50°F during the first 24 hours after removing the insulation.

502-3.12 Sealing Joints. Seal joints as depicted in the Standard Sheets. Refer to Table 502-3, Joint Sealing Alternatives.

First-stage sawcuts may be temporarily left unfilled if a placement is only subjected to occasional construction traffic, such as pickup trucks or cars. In this case, sweep the pavement to ensure debris does not enter the joints.

Temporarily fill unsealed first-stage cuts with jute or backer rod if a placement is:

- Subjected to consistent construction traffic.
- Used as a haul road for subsequent concrete placements.
- Temporarily opened to general traffic while final sealing has been delayed for convenience, such as to maximize sealing production.

Before cleaning, remove any temporary fillers and repair damaged joints in accordance with §502-3.14, Defective or Damaged Concrete, including chipped joints resulting from debris accumulation in an unfilled or unsealed joint. Do not reuse backer rod used as temporary fillers in the final joint sealing.

A. Sealing Transverse Contraction Joints - Highway Joint Sealant. Widen joints to 1/4 - 3/8 inch for a depth of 1 inch if the first-stage saw cuts are less than 1/4 inch wide to allow full-depth sealing. Immediately wash the widening cut slurry from the pavement such that it does not reenter the joint. Do not seal transverse construction joints or longitudinal joints when highway joint sealants are specified for transverse contraction joints.

Joint cleaning and sealing may be delayed for convenience. Clean the joints by abrasive blasting immediately before sealing. Keep the nozzle within 2 inches of the joint surfaces. The Engineer may allow pressure washing in lieu of abrasive blast cleaning if it is not allowed in the contract. When pressure washing, use (1) a 900 psi minimum pressure and (2) a maximum pressure such that no damage occurs to the concrete. Manually dislodge debris remaining in the joint after cleaning, and reclean the joint. Immediately after pressure washing, air blast the joint to remove any debris from the cut and dry the exposed faces.

Do not allow any traffic on the pavement between cleaning and sealing. Reclean the joint if it rains between cleaning and sealing or if any traffic is on the placement between cleaning and sealing. Provide the Engineer a copy of the sealant Manufacturer's written recommendations for heating and application at least 1 work day before sealing. Follow those recommendations. Unless stated otherwise, the recommended pouring temperature is 40°F below the manufacturer's designated safe heating temperature, with an allowable variation of 40°F.

Prior to sealing, discharge sealant from the applicator wand into a vessel and measure the sealant temperature. The temperature must be equal to or above the Manufacturer's recommended minimum pouring temperature and equal to or below the Manufacturer's recommended safe heating temperature.

Do not use sealant heated above the safe heating temperature. Sealant may be reheated or heated in excess of 6 hours if allowed by the Manufacturer's heating and application recommendations. In these cases, recharge the melter with fresh sealant amounting to at least 20% of the sealant volume remaining in the melter.

Seal joints immediately after cleaning. Seal the joint from the bottom of the cut to within 1/4 - 3/8 inch of the pavement surface. Seal when the:

- Air and surface temperatures are 40°F or warmer.
- Air temperature is above the dew point.
- Pavement surface and all joint surfaces are dry.

Open to traffic after the sealant has cured to prevent tracking. Do not blot with fine aggregate.

B. Sealing Joints - Silicone Sealant. Make second-stage saw cuts and/or bevels in accordance with the Standard Sheets and (1) no sooner than 72 hours after concrete placement and (2) after the curing period has ended if curing covers are used. Wash the resulting slurry from the pavement and joint immediately after making second-stage saw cuts and/or bevels.

Second-stage saw cuts may be delayed for convenience, but do not leave second-stage saw cuts unsealed or unfilled while open to any traffic. Temporarily fill second-stage saw cuts with jute or backer rod if (1) they are exposed to any traffic before cleaning and sealing or (2) weather conditions are not favorable for timely (within 2 calendar days) cleaning and sealing, whether or not they are exposed to any traffic. Do not reuse backer rod used as temporary filler in the final joint sealing.

Install the sealant in accordance with the Manufacturer's written instructions. Give those instructions to the Engineer before any second-stage saw cutting begins. Consult the Manufacturer for primer requirements associated with the coarse aggregate used in the concrete.

Abrasive blast both vertical joint faces immediately before sealing. Tilt the nozzle to abrasive blast one vertical face at a time at each joint until uniformly abraded surfaces result. Air blast after abrasive blasting to remove all abrasives. Reclean the joint if it rains between cleaning and sealing. Do not allow any traffic on the pavement between cleaning and sealing. Immediately after blasting, install backer rod to the required depth without ripping, tearing, or puncturing the rod. Roll the insertion wheel over the backer rod twice, once in each direction.

Seal when the:

- Air and surface temperatures are 40°F or warmer.
- Air temperature is above the dew point.
- Pavement and all joint surfaces are dry.

Where possible, first widen and seal the longitudinal joints (if required), then widen and seal the transverse joints such that the entire transverse joint contains a continuous sealant bead. If this is not possible, install the silicone in full placement widths.

Traffic may traverse silicone sealed joints after the sealant has skinned over, provided traffic opening and sealer manufacturer requirements have been met.

C. Sealing Joints - Preformed Joint Sealers. Make second-stage saw cuts and/or bevels in accordance with the Standard Sheets and (1) no sooner than 72 hours after concrete placement and (2) after the curing period has ended if curing covers are used. Extend the second-stage saw cut vertically down the free concrete edges. Wash the resulting slurry from the pavement and joint immediately after making second-stage saw cuts and/or bevels.

Second-stage saw cuts may be delayed for convenience, but do not leave second-stage saw cuts unsealed or unfilled while open to any traffic. Temporarily fill second-stage saw cuts with jute or backer rod if (1) they are exposed to any traffic before cleaning and sealing or (2) weather conditions are not favorable for timely (within 2 calendar days) cleaning and sealing, whether or not they are exposed to any traffic.

Clean the joints by pressure washing before sealing. Use (1) a 900 psi minimum pressure and (2) a maximum pressure such that no damage occurs to the concrete. Manually dislodge debris remaining in the joint after cleaning, and reclean the joint. Within 24 hours of pressure washing, air blast the joint to remove any debris from the cut and dry the exposed faces. Reclean the joint if it rains between cleaning and sealing. Do not allow any traffic on the pavement between cleaning and sealing.

Install the sealant in accordance with the Manufacturer's written instructions. Give those instructions to the Engineer before any second-stage saw cutting begins. Lubricate the concrete, the sealer, or both before installation such that the lubricant fully covers the sealer/concrete interface, but not the top of the sealer.

Install one piece of transverse joint sealer in a compressed condition across the full pavement width, including concrete shoulders, and down the vertical saw cut at the free edge. Cut the longitudinal sealer where it crosses a transverse joint. Do not splice the longitudinal sealer between transverse joints. Seal the intersection between longitudinal and transverse sealers with lubricant.

Install the sealer such that it is not stretched more than 5% , nor compressed more than 2%, of the minimum theoretical length. Check the installation for stretch and compression by installing

sealers in 5 transverse joints and removing the sealer immediately after installation and checking the length. An alternate method for checking stretch and compression, where applicable, may be performed by premarking or precutting the sealer to length prior to installation. If the measurement of any of these 5 sealers exhibits stretching in excess of 5% or compression in excess of 2%, modify the installation method to meet the requirements or discontinue installation.

Once sealing operations begin, remove 1 joint per 100 in the presence of the Engineer to check stretch and compression. If the sealer is found to be stretched in excess of 5% or compressed in excess of 2%, remove the sealer material from successive joints in both directions until sealers are found that meet the stretch and compression requirements. Replace all joints sealers found with excess stretch or compression. Replace joint sealers removed and found to meet the stretch and compression requirements.

Joint Type	Sealing Alternative	First-Stage Saw Cut Required	Second-Stage Saw Cut and Bevel Required
Transverse Contraction	Silicone or Preformed	Yes	Both
	Highway Joint Sealant	Yes	Neither
Transverse Expansion and Isolation	Silicone or Preformed	No	Bevel Only
Transverse Construction	Silicone or Preformed	No	Both
	Do Nothing ¹	No	Neither
Longitudinal - Between Lanes Placed Simultaneously	Silicone or Preformed	Yes	Second-Stage Only
	Do Nothing ¹	Yes	Neither
Longitudinal - Between Lanes Placed Separately and Untied Joints With Keyway	Silicone or Preformed	No	Second-Stage Only
	Do Nothing ¹	No	Neither

NOTE:

1. Do nothing if highway joint sealants are specified for transverse contraction joints.

502-3.13 Pavement Protection. Protect the pavement and appurtenances from traffic and construction operations. Protect the work and provide for traffic as indicated in the contract documents.

502-3.14 Damaged or Defective Concrete. Repair or replace all damaged or defective concrete which occurs prior to final acceptance. Perform these repairs as described in the contract documents at no cost to the State. Damage and defects include, but are not limited to, cracking, spalling, honeycombing, or imperfections caused by inadequate pavement protection, traffic, and/or construction practices. Slipformed concrete with inadequate plastic thickness as described in §502-3.08, Plastic Thickness Determination, will be rejected in 150 foot segment lengths.

502-3.15 Hardened Surface Test (Nonprofilographed Concrete). After the concrete has hardened sufficiently, test the entire longitudinal center of each travel lane, including ramps, with a 10 foot, minimum, long straight edge laid longitudinally. The Engineer will mark high and low deviations in the pavement surface exceeding 1/8 inch in 10 feet. Diamond grind these deviations such that they do not exceed 1/8 inch in 10 feet when retested with the straight edge.

502-3.16 Profilograph. This section applies to profilographed concrete (and nonprofilographed concrete when a full-width finishing pan or triple transverse screed paving operation is not employed). The Engineer will divide each travel lane into reporting segments that are 0.1 mile long. The Engineer will group segments shorter than 0.1 mile with previous or subsequent segments. Provide survey

stationing and develop a reference system that allows the Engineer to readily associate profilograph data to the corresponding reporting segment.

Develop a profile trace for each wheelpath in each reporting segment in accordance with Materials Method 24, PCC Pavement Profilograph Operations. Determine an initial profile index (PI) for each reporting segment by averaging the PIs of the wheelpaths. Provide the traces and initial PIs to the Engineer. The Engineer will identify bumps exceeding 3/8 inch in 25 feet on each profile trace. Locate and diamond grind these bumps, if any, to 3/8 inch or less in 25 feet. If no grinding is required for a given reporting segment, the initial PI may be used to determine the payable Quality Units of Smoothness Quality Adjustment per reporting segment.

Production diamond grinding equipment can be used to increase the amount of Quality Units payable as discussed in §502-3.17, Diamond Grinding. Whether diamond grinding was required through profile trace analysis, or performed as a Contractor option, reprofilograph each reporting segment that was diamond ground and determine a final PI. Give the Engineer the final profile traces and final PI determined by using both the 0.2 inch and zero blanking bands.

502-3.17 Diamond Grinding. Diamond grind the pavement longitudinally, beginning and ending at lines normal to the pavement centerline, and in full travel lane width increments. Provide surface drainage by maintaining the proper cross slope on the finished surface and by blending adjacent passes. Continuously vacuum the slurry from the pavement when production grinding. If roadside slurry discharge is not allowed by the contract documents, transfer the slurry into equipment capable of transporting it from the contract site without spills. Dispose of slurry in conformance with all Federal, State, and local regulations.

In any case, do not allow slurry to enter:

- Occupied travel lanes.
- Drainage structures.
- Wetlands, streams, estuaries, or sensitive environmental resources.
- Areas where it will become a public nuisance.

Use of bump grinding equipment is restricted to grinding bumps that exceed 3/8 inch in 25 feet in profilographed concrete and bump grinding non-profilographed concrete. Production grinding equipment can be used to grind bumps or increase the amount of Quality Units payable subject to the following:

- For pavements textured with longitudinal tining or artificial turf drag, any amount of a reporting segment surface area may be diamond ground to increase the amount of Quality Units payable.
- For transverse tined pavements, Quality Units are payable if less than 20% or more than 95% of the reporting segment surface area is ground. If more than 20% of the reporting segment area is ground for any reason, diamond grind 95%, minimum, of the entire reporting segment.

502-3.18 Opening to Traffic

A. Construction Traffic. Class C concrete may be opened to construction traffic and paving equipment 7 days after placement. With the Engineer's approval, this time frame may be shortened to 3 days if cylinders achieve a compressive strength of 2500 psi in accordance with §502-3.18C, Project Strength Determination. Any pavement damaged from opening to construction traffic in a reduced time frame will be treated in accordance with §502-3.14, Damaged or Defective Concrete.

B. General Traffic. Class C concrete placed between June 1 and September 15 may be opened to general traffic 10 days after placement. Class C concrete placed outside this interval may be opened to general traffic 15 days after placement. With the Engineer's approval, these time frames may be shortened to 4 days if cylinders achieve a compressive strength of 3000 psi in accordance with §502-3.18C, Project Strength Determination, and the joints are addressed in accordance with §502-3.12, Sealing Joints.

If Project Strength Determination testing for construction traffic opening indicates the concrete has achieved a compressive strength in excess of 3000 psi, the concrete may be opened to general

§502

traffic after 4 days. Any pavement damaged from opening to general traffic in a reduced time frame will be treated in accordance with §502-3.14, Damaged or Defective Concrete.

C. Project Strength Determination. Provide an ACI Certified Concrete Field Testing Technician, Grade I, or higher, to cast all cylinders. Unless otherwise noted in the contract documents, use an agency accredited by the AASHTO Accreditation Program (AAP) in the field of construction materials testing of portland cement concrete to perform compressive strength testing.

Cast and test in the presence of the Engineer, or the Engineer's representative. Provide acceptable proof of ACI Certification and AASHTO Accreditation to the Engineer before placing any concrete.

The Engineer, or the Engineer's representative, will complete the Concrete Cylinder Report as cylinders are cast and tested.

Cast a minimum of 3 cylinder pairs (6 total) from each 1000 feet of paving length, or fraction thereof, in accordance with Materials Method 9.2, Field Inspection of Portland Cement Concrete. Cast each pair from different delivery trucks. Develop an Engineer-approved marking system that allows a cylinder to be readily associated with the corresponding placement location and placement time. Mark the cylinders and place them adjacent to the pavement under similar curing conditions. Determine the concrete compressive strength at the desired time in accordance with ASTM C39, Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens. The pavement may be opened to construction (or general) traffic if all the following apply:

- Average compressive strength of all cylinder pairs exceed 2500 psi (or 3000 psi).
- Average compressive strength of each cylinder pair exceeds 2000 psi (or 2500 psi).
- Appropriate time frame has elapsed for the entire area to be opened.

If these conditions are not met, test 3 additional cylinder pairs at a later time, provided the appropriate numbers of additional cylinders were cast. If the above conditions are not met after additional testing, or, if the required number of additional cylinders were not cast, open the pavement in accordance with the nonreduced time frames of §502-3.18A, Construction Traffic, and §502-3.18B, General Traffic.

D. HES Concrete. HES concrete may be opened to construction traffic when it has achieved a compressive strength of 2500 psi and to general traffic when it has achieved compressive strength of 3000 psi, in accordance with §502-3.18C, Project Strength Determination, and the joints are addressed in accordance with §502-3.12, Sealing Joints.

502-4 METHOD OF MEASUREMENT. The Engineer will measure the following quantities for items incorporated into the finished pavement:

502-4.01 Portland Cement Treated Permeable Base. The work will be measured for payment as the number of cubic yards of portland cement treated permeable base satisfactorily placed based on the payment lines shown in the contract documents. No deductions will be made for catch basins, manholes, or other similar pavement obstructions.

502-4.02 PCC Pavement, Unreinforced. The work will be measured for payment as the number of cubic yards of unreinforced PCC pavement satisfactorily placed based on the payment lines shown in the contract documents. Deductions in 150 feet segment lengths will be made for areas that do not meet minimum plastic thickness requirements. Deductions (and separate payment) will be made for catch basins, manholes, or other similar pavement obstructions requiring either mesh reinforced or heavily reinforced placements.

502-4.03 PCC Pavement, Mesh or Heavily Reinforced. The work will be measured for payment as the number of cubic yards of reinforced concrete satisfactorily placed. No deductions will be made for drainage and utility structures or other similar pavement obstructions being isolated from the surrounding pavement.

502-4.04 Smoothness Quality Adjustment (Profilographed Items Only). The work will be measured for payment as the number of Quality Units of Smoothness Quality Adjustment, if any, payable for each reporting segment determined by the following:

Quality Units (Per Segment) = (SAF - 1.00) x PCC Cubic Yards (Per Segment)

The Smoothness Adjustment Factor (SAF) from Table 502-4, Smoothness Adjustment Factors, is based on the final PI obtained for each reporting segment using a 0.2 inch blanking band. No Quality Units are computed for pavements specified as nonprofilographed.

TABLE 502-4 SMOOTHNESS ADJUSTMENT FACTORS		
Final Profile Index (in/mile.)	Level 1 SAF	Level 2 SAF
0 - 1	1.05	1.05
1 - 2	1.04	1.04
2 - 3	1.03	1.03
3 - 4	1.02	1.02
4 - 5	1.01	1.01
5	1.00	1.00
5 +	Grind	1.00
12 +	Not Applicable	Grind

502-4.05 Constructing Transverse Joints. The work will be measured for payment as the number of feet of transverse joints satisfactorily constructed.

502-4.06 Constructing Longitudinal Joints. The work will be measured for payment as the number of feet of longitudinal joints satisfactorily constructed.

502-4.07 Sealing Transverse Joints. The work will be measured for payment as the number of feet of transverse joints satisfactorily sealed, excluding preformed sealers turned down at the pavement edges.

502-4.08 Sealing Longitudinal Joints. The work will be measured for payment as the number of feet of longitudinal joints satisfactorily sealed.

502-5 BASIS OF PAYMENT

502-5.01 Portland Cement Treated Permeable Base. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Portland Cement Treated Permeable Base.

502-5.02 PCC Pavement, Unreinforced, Nonprofilographed. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for PCC Pavement, Unreinforced, Nonprofilographed. No payment will be made for areas that do not meet minimum plastic thickness requirements. No additional payment will be made for Contractor-requested HES concrete mixes.

Also include the cost of all labor, material, and equipment necessary to profilograph and diamond grind the pavement to meet the Level 2 smoothness requirements of Table 502-4, Smoothness Adjustment Factors, if paving equipment other than a paver equipped with a full-width finishing pan or triple transverse screeds is used. In this case, no payment will be made for SAF Quality Units.

PCC Pavement, Unreinforced, Nonprofilographed will be eligible for progress payments in accordance with the following:

- 80% upon satisfactory completion of all work up to, and including, first-stage saw cutting.
- An additional 10% upon satisfactory completion of diamond grinding, if any.

§502

- The remaining 10% upon satisfactory completion of the work.

502-5.03 PCC Pavement, Unreinforced, Profilographed. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for PCC Pavement, Unreinforced, Profilographed. No payment will be made for areas that do not meet minimum plastic thickness requirements. No additional payment will be made for Contractor-requested HES concrete mixes.

PCC Pavement, Unreinforced, Profilographed will be eligible for progress payments in accordance with the following:

- 80% upon satisfactory completion of all work up to, and including, first-stage saw cutting.
- An additional 10% upon satisfactory completion of diamond grinding, if any.
- The remaining 10% upon satisfactory completion of the work.

502-5.04 Smoothness Quality Adjustment. Quality Units of Smoothness Quality Adjustment are a fixed price in the bid documents and cannot be changed by the Contractor.

502-5.05 PCC Pavement, Mesh or Heavily Reinforced. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for PCC Pavement, Mesh or Heavily Reinforced. No additional payment will be made for Contractor-requested HES concrete mixes.

502-5.06 Constructing Transverse Joints. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Constructing Transverse Joints.

502-5.07 Constructing Longitudinal Joints. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Constructing Longitudinal Joints. Placing the inside shoulder and inside lane simultaneously, at the Contractor's option, will not generate a Significant Change in the Character of Work. No additional payment will be provided for the additional number of longitudinal joint ties associated with:

- Constructing butt joints between lanes placed separately in a slipform paving operation.
- Constructing longitudinal joints in wheelpaths.

502-5.08 Sealing Transverse Joints. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Sealing Transverse Joints.

502-5.09 Sealing Longitudinal Joints. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Sealing Longitudinal Joints. Placing the inside shoulder and inside lane simultaneously, at the Contractor's option, will not generate a Significant Change in the Character of Work.

Payment will be made under:

SECTION 503 - PORTLAND CEMENT CONCRETE FOUNDATION FOR PAVEMENT

503-1 DESCRIPTION. Construct a portland cement concrete (PCC) foundation for pavements and shoulders, if required, as detailed in the contract documents.

503-2 MATERIALS.

Portland Cement Concrete	501
Anchoring Materials - Chemically Curing	701-07
Premoulded Resilient Joint Filler	705-07
Longitudinal Joint Ties	705-14
Transverse Joint Supports	705-15
Epoxy Coated Bar Reinforcement, Grade 60	709-04
Quilted Covers (for curing)	711-02
Plastic Coated Fiber Blankets (for curing)	711-03
Polyethylene Curing Covers (white opaque)	711-04
Form Insulating Materials for Winter Concreting	711-07
Water	712-01

In addition to meeting the requirements of §701-07, Anchoring Materials - Chemically Curing, the material used to anchor longitudinal joint ties, dowels, or other miscellaneous items into hardened concrete must be a pourable, two-component, 100% solids structural epoxy dispensed:

- From side-by-side cartridges by manual or pneumatically powered injection guns.
- Through a static mixing nozzle that homogeneously mixes the material without any hand mixing.

Apply the requirements of the following in accordance with the contract documents:

- §502-2.01, Concrete.
- §502-2.02, High-Early-Strength (HES) Concrete.
- §502-2.03, Portland Cement Treated Permeable Base.
- §502-2.04, Equipment.
- §502-2.04A, Slipform Paving.
- §502-2.04B, Fixed Form Paving.
- §502-2.04C, Vibrators.
- §502-2.04D, Permeable Base Paving Equipment.
- §502-2.04E, Saw Cutting Equipment.
- §502-2.04I, Drills.
- §502-2.04L, Air Blasting Equipment.

503-3 CONSTRUCTION REQUIREMENTS. Apply the requirements of §502-3, Portland Cement Concrete Pavement, except as modified herein.

503-3.01 Placement of Reinforcement. Place bar reinforcement around utilities, drainage structures, and other projections into the pavement as depicted in the Standard Sheets for PCC Pavements. Use telescoping manholes when required by the contract documents in accordance with §502-3.06C, Utility and Drainage Structure Isolation Joint Systems and Telescoping Manholes.

503-3.02 Joints. Transverse joint supports are not required for contraction joints. Saw cut skewed contraction joints at a “6 on 1” skew across the pavement (approximately 10° from perpendicular to the

§503

centerline) before uncontrolled cracking occurs. Saw cut in accordance with the first-stage saw cut details in the Standard Sheets.

Use a maximum joint spacing of 20 feet and a minimum spacing that satisfies the geometric requirements of §502-3.06A, Transverse Joints. Center utilities and drainage structures between saw cuts. Skewed joints may be cut at the same angle across the pavement or chevron-shaped with the vertex at a longitudinal joint between separate placements. Maintain the same technique once selected. Construct transverse construction joints perpendicular to the centerline in accordance with §502-3.06A3, Transverse Construction Joints.

Construct longitudinal joints in accordance with §502-3.06B, Longitudinal Joints.

503-3.03 Finishing. Hand finish the pavement to correct surface irregularities.

503-3.04 Testing the Surface. Immediately after placement, test the entire longitudinal center of each travel lane with a 10 feet, minimum, long straight edge laid longitudinally. Immediately correct any surface irregularity exceeding 3/8 inches in 10 feet.

503-3.05 Texturing. Immediately after testing the surface, apply an aggressive transverse broom finish.

503-3.06 Curing. Cure in accordance with §502-3.11, except the impervious membrane method, i.e., curing compound, is not be permitted.

503-3.07 Surface Test. No surface test on the hardened concrete will be required.

503-3.08 Sealing Joints. Typically, no joint sealing is required in the PCC foundation course. Seal skewed contraction joints in accordance with §502-3.12A, Sealing Transverse Contraction Joints – Highway Joint Sealant, if a construction delay occurs that prevents the placement of the final pavement course until the subsequent construction season.

503-4 METHOD OF MEASUREMENT.

503-4.01 Portland Cement Concrete Foundation for Pavement. The work will be measured for payment as the number of cubic yards of Portland Cement Concrete Foundation for Pavement based on the payment lines shown in the contract documents. No deductions will be made for catch basins, manholes, or other similar pavement obstructions.

503-4.02 Constructing Longitudinal Joints. The work will be measured for payment as the number of feet of longitudinal joints satisfactorily constructed.

503-5 BASIS OF PAYMENT.

503-5.01 Portland Cement Concrete Foundation for Pavement. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Portland Cement Concrete Foundation for Pavement. No payment will be made for areas that do not meet minimum plastic thickness requirements as described in §502-3.08, Plastic Thickness Determination. No additional payment will be made for Contractor-requested HES concrete mixes.

503-5.02 Constructing Longitudinal Joints. Include the cost of all labor, material, and equipment necessary to satisfactorily perform the work in the unit price bid for Constructing Longitudinal Joints.

Payment will be made under:

Item No.	Item	Pay Unit
503.1010	PCC Foundation for Pavement, Class C	Cubic Yard
503.1011	PCC Foundation for Pavement, Class F	Cubic Yard
503.1012	PCC Foundation for Pavement, HES Concrete	Cubic Yard

INTENTIONALLY LEFT BLANK**

Section 550

STRUCTURES

SECTION 551 - PILES AND PILE DRIVING EQUIPMENT

551-1 DESCRIPTION

551-1.01 Piles. Under this work, the Contractor shall furnish and place piles of the type and size and at the locations indicated on the Plans, or where ordered by the Engineer. The Contractor shall furnish equipment and personnel for dynamic pile tests as required. Timber piles are not covered under this specification.

551-1.02 Splices for Steel Bearing Piles. This is a contingent item and shall apply only when the Engineer directs the Contractor to drive a pile more than 5 feet beyond the estimated length provided in the Contract Plans. Pile splices shall be constructed as shown on the Plans, or as approved by the DCES.

551-1.03 Furnishing Equipment for Driving Piles. Under this work, the Contractor shall furnish equipment at the site for driving piles. The Contractor shall submit to the DCES, Form BD 138, "Pile Driving Equipment Data," for approval. The DCES shall be allowed 15 working days upon receipt for review. Each separate combination of pile and pile driving equipment proposed by the Contractor shall require the submission of a corresponding Form BD 138.

551-2 MATERIALS. Materials for piling shall conform to the requirements of the following Subsections:

Bar Reinforcement, Grade 60	709-01
Casings for Cast-In-Place Concrete Piles	720-03
Steel Bearing Piles	720-04
Pile Shoes	720-05

In addition to the requirements specified in the preceding Subsections, the following shall apply:

551-2.01 Cast-In-Place Concrete Piles

A. Concrete for Cast-In-Place Piles. Concrete placed in the Cast-In-Place Piles shall comply with requirements specified for Class A Concrete in Section 501, Portland Cement Concrete.

B. Paint for Exposed Piles and Pile Casings. The paint shall be in accordance with the Contract Documents. The color shall be as specified on the Plans and Proposal, or as required by the Engineer.

C. Cast-In-Place Concrete Pile Dimensions. Pile dimensions, including the rate of taper for tapered piles, shall be as shown on the Plans, or as approved by the DCES. In no case, however, shall the outside diameter at the toe be less than 8 inches nor shall the outside diameter at the section to be cut off be less than 12 inches.

The Contractor shall furnish the particular type of pile casing shown on the Contract Plans. No used pipe or shell will be permitted.

Pile casings which do not hold their original form during driving, which fracture, or fail during driving, due to manufacturer defect, fabrication, or Contractor's operations, unless otherwise directed, shall be withdrawn and removed from the site at the Contractor's expense. If, at any time during the driving or placing of the pile casings, the DCES determines from the results of the driving that the pile casings of the type or thickness being used cannot be satisfactorily placed, the Contractor shall

remove same from the site and furnish casings of a different type or greater thickness at the expense of the State.

551-3 CONSTRUCTION DETAILS

551-3.01 General

A. Storage, Handling and Inspection. The method of storing and handling of piles shall be such as to avoid damage to the piles.

B. Site Preparation. Piles shall not be driven until after the excavation is completed to the elevation required for the bottom of the footing or bottom of tremie. Unless otherwise shown on the Plans, any material forced up or depressions made by the driving shall be removed or filled and the correct elevation of foundation established before any concrete is placed.

C. Preparation Of Piles

1. Shoes

a. Steel Bearing Piles. Steel Bearing Piles shall be furnished with a shoe. These shall be fabricated as detailed on the Plans, or as approved by the DCES. Substitution of commercial shoes for those detailed on the Plans may be permitted subject to the approval of the DCES. Unless shown on the Plans, the shoes shall be attached by a NYSDOT Certified Welder with a 5/16 inch thick minimum fillet weld along the entire outside edge of the flanges.

b. Cast-In-Place Concrete Piles. The ends of all pile casings shall be perpendicular to the longitudinal axis of the casings. All pile casings for "Cast-In-Place Concrete Piles" shall be equipped with a round plate with a diameter of not more than 1/2 inch larger than the diameter of the pile, and a minimum thickness of 3/4 inch, unless otherwise indicated on the Plans.

2. Splices

a. General. Full length piles shall always be used where practicable. Where splices are unavoidable, their number, locations, and details shall be subject to the approval of the DCES.

Splices to steel piles, and steel pile casings shall be welded in conformance with the provisions of the S.C.M. These requirements include, but are not limited to, a NYS certified welder and a DCES approved welding procedure.

b. Cast-In-Place Concrete Piles. Where design considerations and soil characteristics permit, the DCES may approve the use of mechanical splices in lieu of the welded splice herein specified under §551-3.01.C.2.a. The mechanical couplings used for such splices shall be subject to the provisions of §715-01, Structural Steel. A seal weld shall be provided completely around the pile casing.

D. Equipment for Driving Piles

1. General. Piles shall be driven only with equipment which has the prior approval of the DCES in accordance with §551-1.03. All malfunctioning equipment, as determined by the Engineer, shall be removed from the site and be replaced with equipment which is satisfactory to the DCES. The minimum rated striking energy of the hammer to be used in driving Steel Bearing Piles and Cast-In-Place Concrete Piles shall be 13,000 ft-lbs per blow.

Hammers having greater striking energy may be used upon approval by the DCES. These hammers shall produce a minimum of 20 blows/foot and a maximum of 120 blows/foot at the

Ultimate Pile Resistance shown on the Contract Plans. However, if, in the opinion of the DCES, satisfactory results are not obtained with the hammer furnished by the Contractor, a hammer meeting the approval of the DCES shall be furnished and used.

2. Air/Steam Hammers. Sufficient boiler or compressor capacity shall be provided at all times to maintain the rated speed of air/steam hammers during the full time of pile driving. The valve mechanism and other parts of a single or double-acting hammer shall be maintained such that the number of blows per minute for which the hammer is designated, is satisfied.

3. Diesel Hammers. The valves, pumps, ports, rings, and other hammer parts shall be maintained such that the following condition for which the hammer is designated is satisfied:

Hammer Type	Designated Condition
Single Acting	Length Of Stroke Or Blows Per Minute
Double Acting	Bounce Chamber Pressure

All Diesel Hammers shall be provided with an acceptable means of measuring hammer energy. When pressure gages are included as normal equipment, they shall be furnished and maintained in operable condition. Manufacturer's Charts and Graphs, required to calibrate hammer energy, shall be furnished to the Engineer by the Contractor. The Contractor shall also arrange easy access to the pressure gages so that readings may be conveniently taken by the Engineer.

A double acting hammer not operating at the required bounce chamber pressure shall be removed promptly from the work site. It shall be replaced by a hammer acceptable to the Engineer at no cost to the State.

4. An approved hammer cushion block shall be used to transfer pile hammer energy to the pile. Each hammer shall be equipped with a helmet/drive head to fit the type of pile to be driven.

5. Pile driver leads shall be constructed in such a manner as to afford freedom of movement of the hammer. The use of either swinging or hanging leads will be permitted provided the pile or leads are properly supported during driving and the required final position and batter of pile is achieved. In the event the Engineer determines that the use of swinging or hanging leads is producing unsatisfactory results, the Engineer may require the Contractor to hold the leads in position with guys or braces to give the required support. The Contractor may, as an alternative, replace the unsatisfactory equipment with equipment having fixed leads.

Pile driving leads shall be of sufficient length so that the use of a follower will not be necessary. The driving of piles with followers will generally not be permitted and shall be done only with written permission and direction of the DCES.

When directed by the Engineer, either approved steel or wooden spuds shall be used to penetrate consolidated material or obstructions in the upper 10 feet in order to assist in driving the piles to the required depth and resistance. Augers may be used for this purpose when written permission is obtained from the DCES.

6. Water jets and vibratory hammers shall not be used in driving any pile, unless written approval is given by the DCES. Piles installed with a water jet or vibratory hammer shall be impact driven to secure the final penetration.

E. Methods of Driving. The driving of piles shall be done with an air/steam, diesel, or hydraulic hammer. Piles shall be driven starting from the center of the foundation and proceeding outward from this point, or starting at the outside row and driving progressively across the foundation.

F. Length of Piles. The length of piles will be determined in the field by driving to the driving criteria determined by the DCES. Piles may be completely driven in one operation or, if directed by

the DCES, be partially driven and allowed to set from 2 to 24 hours (or as indicated on the Plans) before driving is resumed.

G. Allowable Variation in Pile Alignment. Piles shall be truly vertical or accurately battered as indicated on the Contract Plans. The top of any pile driven its full length into the ground shall not vary from the plan location by more than 4 inches, unless otherwise shown on the Plans. The top of any pile partially exposed or included in an integral abutment shall not vary from the plan location by more than 1 inch, unless otherwise shown on the Plans. In addition, piles may have a variation at their tip of not more than 1/4 inch per foot from the vertical or from the batter shown on the Plans or permitted by the DCES.

H. Defective Piles. All piles forced up by any cause shall be driven again, as directed by the Engineer.

The following shall be causes for rejection of a pile:

- Pile location or batter is incorrect.
- Pile damaged from any cause whatsoever.
- Pile fails to attain the driving resistance determined by the DCES, or the driving resistance set forth in the Contract Documents.
- Pile tip elevation is not within the limits called for on the Plans, or specified by the Engineer.
- Pile is determined by the Engineer to be unserviceable for other reasons related to the furnishing and installing of the pile.
- Cast-In-Place Concrete Pile Casing not free from water.

No footing concrete shall be placed until all piles within the footing are inspected by the Engineer. The Contractor shall remove such rejected piles, or, at the option of the Engineer, a second pile may be driven adjacent thereto, if this can be done without impairing the structure.

I. Cutting Off Piles and Pile Casings. The tops of all piles and pile casings shall be cut off at the elevation indicated on the Plans, or as established by the Engineer. The cut shall be clean and to a true plane, in accordance with the detail shown on the Plans.

J. Included Work

1. Voids. All cavities, left by the pile driving operation, shall be backfilled, as specified by the Engineer.

2. Concrete. Cast-In-Place Concrete Pile casings shall be inspected immediately prior to placing concrete in the casing. The Engineer may require that all casings in the footing be satisfactorily placed and dry before concrete is placed. Each casing shall be filled with a continuous pour of concrete, mixed and placed in accordance with the Specifications for Concrete for Structures Class A, Section 555, except that the slump of the concrete shall not exceed 5 inches.

Special care shall be exercised in filling the piles to prevent honeycomb and air pockets from forming in the concrete. Internal vibrators and other means shall be used to the maximum depth practicable, as determined by the Engineer, to consolidate the concrete.

3. Reinforcement. Cast-In-Place Concrete Piles shall be reinforced as shown on the Plans and the reinforcement secured in such a manner as to insure its proper location in the finished piles.

K. Painting of Exposed Piles and Pile Casings. All exposed pile or pile casing surfaces not embedded in concrete shall be painted as described in the Contract Documents.

L. Furnishing Equipment And Personnel - Dynamic Testing Of Piles. The Contractor shall furnish pile driving equipment, a source of electrical power, and a suitable test enclosure to

perform field testing of piles and evaluate pile hammer efficiency. All incidental labor and material necessary to make the work area accessible shall also be supplied by the Contractor.

The actual tests shall be conducted by the Engineer under the direction of the DCES. The Contractor's responsibility is limited to the supplying of support services for the individual tests. Tests shall be performed at the locations indicated on the Contract Plans and where ordered by the Engineer.

A Dynamic Testing Procedure, known as the "Impact Driving Method", will be used. This Procedure entails the following steps:

1. Prior to being struck with the pile driving hammer, each pile to be tested will be instrumented with strain and acceleration transducers by State personnel, aided by the Contractor's forces.
2. Dynamic measurements resulting from the pile hammer blows will be automatically recorded on a pile driving analyzer supplied by the State. State personnel will operate the pile driving analyzer.
3. Upon determination by the Engineer that valid data has been recorded, State personnel, assisted by the Contractor's forces, will remove the instrumentation.

The Contractor will schedule equipment movements to ensure that testing is done as part of the normal driving schedule, insofar as it is possible.

551-4 METHOD OF MEASUREMENT

551-4.01 Piles. The quantity of piles to be paid for under the work specified for Steel Bearing Piles or Cast-in-Place Concrete Piles, will be the number of feet of driven, acceptable piles, measured below cut off elevation, remaining in the finished structure in accordance with the Plans, Specifications, and orders of the Engineer.

The length of piles will be determined in the field by driving to the resistance required by the Plans, Specifications, or DCES at the time of driving. The pile lengths indicated on the Plans are for estimating purposes only.

551-4.02 Splices for Steel Bearing Piles. The quantity of splices paid for will be the number of piles that exceed the estimated length by more than 5 feet. A second splice may be utilized at 25 feet beyond the estimated length subject to DCES approval.

551-4.03 Dynamic Pile Tests. The quantity of Dynamic Pile Tests will be made for the number of piles tested. If the pile requires re-driving within 28 hours after the initial test, this shall be considered as one Dynamic Pile Test. If re-driving is more than 28 hours, this shall be considered as an additional test.

551-5 BASIS OF PAYMENT.

551-5.01 Furnishing Equipment for Driving Piles. The lump sum price bid shall include the cost of furnishing all labor, materials, and equipment necessary for transporting, erecting, maintaining, making any ordered equipment replacement, dismantling and removing the pile driving equipment.

The furnishing of equipment for driving sheet piling is not included in this work.

Payment will be made at the lump sum price bid for this item, as follows: 75% of the amount bid will be paid when the equipment for driving piles is furnished and driving of satisfactory piles has commenced. The remainder will be paid when the work of driving piles is completed.

551-5.02 Piles. The unit price bid per foot for each of the respective Pile Items shall include the cost of furnishing all labor, (including the manipulation of pile driving equipment and materials), materials and equipment (excluding pile driving equipment) necessary to complete the work as prescribed in the Specifications, including the following additions:

A. Structure Excavation. Payment for removal of any material forced up above the foundation by the driving of piles shall be included in the cost of the pile.

B. Defective Piles. No payment will be made for piles rejected in accordance with requirements under §551-3.01H, Defective Piles.

C. Backfilling. Payment for backfilling of all cavities left by the extraction of damaged piles or from auger holes or soil deformations necessary to place piles shall be included in the work for the respective Pile Item.

D. Redriving Piles. The cost of driving piles that are forced up by any cause shall be included in the Unit Price Bid for the respective Pile Item.

E. Pile Shoes, Etc. The cost of furnishing and using pile shoes, followers, augers, or spuds shall be included in the unit price bid.

F. Reinforcement and Splices for Cast-In-Place Concrete Piles. Reinforcement and splices for C.I.P. Concrete Piles shall be included in the Unit Price Bid for Cast-in-Place Concrete Piles.

G. Progress Payments for Steel Piles. Progress payments will be made when the piles are properly installed in accordance with the Plans, Specifications, and orders of the Engineer. Payment will be made at the Unit Price Bid for 80% of the quantity properly installed, exclusive of cutting off piles, placing concrete in Cast-In-Place Piles and pile casings, and painting of exposed piles and pile casings. The balance of the quantity will be paid for upon completion of the work, including the cutting off, placing concrete in the pile, and painting of the pile and pile casings.

551-5.03 Splices. The Unit Price Bid shall include the cost of furnishing all labor, materials, and equipment necessary to complete each splice to the satisfaction of the Engineer.

551-5.04 Dynamic Pile Test. The cost of furnishing equipment and personnel to perform Dynamic Tests shall be included in the Unit Price Bid.

Payment will be made under:

Item No.	Item	Pay Unit
551.10XX	Steel Bearing Piles	Foot
551.11	Cast-In-Place Concrete Piles	Foot
551.12XX	Splices for Steel Bearing Piles	Each
551.13	Furnishing Equipment for Driving Piles	Lump Sum
551.14	Dynamic Pile Testing	Each

Refer to the Standard Contract Pay Item Catalog for full Item Number and full Description.

SECTION 552 - SUPPORT AND PROTECTION SYSTEMS

552-1 DESCRIPTION

552-1.01 Permanent Sheeting. Under this work, the Contractor shall furnish and place permanent sheeting of the type, at the locations and to the elevation(s) shown on the plans.

All the sheeting and supports will be left in place as a finished structure unless removal of waling and bracing is called for on the plans.

552-1.02 Temporary Sheeting. This work shall include the requirements specified in §552-1.01 Permanent Sheeting with the following addition:

The Contractor shall be required to maintain the sheeting while in place, and remove it from the job site after its function has been accomplished or when ordered by the Engineer. It may be left in place only with the written permission of the Engineer.

552-1.03 Interim Sheeting. Under this work, the Contractor shall furnish and place sheeting of the type, at the locations and to the elevation(s) shown on the plans.

The Contractor shall be required to maintain the sheeting while it is serving its function.

The interim sheeting shall be cut off and removed only to the elevation shown on the plans. The remaining material shall be left in place.

552-1.04 Excavation Protection System. Under this work, the Contractor shall design, furnish, place, maintain and remove an excavation protection system (EPS) at locations shown on the plans or as ordered by the Engineer. Details of the EPS must conform with the requirements of 29CFR1926 and installation shall be in accordance with the State and Federal Safety Codes. A sloping (layback) option will not be allowed.

Sheeting, shoring, a shield system, i.e. trench box or trench shield or other pre-engineered protective system may be used to prevent cave-ins. The requirements of any protective system shall be as contained in 29CFR1926. It may be left in place only with the written permission of the Engineer.

552-1.05 Alternate Design. The Contractor may submit to the Department a construction alternate other than that presented in the contract documents as a Value Engineering Change Proposal. Slope lay back will not be allowed. Any geotechnical analysis for a flexible support system shall be done in accordance with the procedures contained in the appropriate Departmental publication, which is available upon request, from the Regional Director or the Director, Geotechnical Engineering Bureau.

552-2 MATERIALS

552-2.01 Permanent Sheeting

A. Permanent Timber Sheeting. Timber sheeting shall be new and unused and consist of any acceptable species which can be placed satisfactorily. The sheeting shall have a preservative treatment conforming to the American Wood-Preservers Association (AWPA) Standard C-2, Soil Contact. The timbers shall not be less in actual cross section or stress grade than that shown on the plans. Stress grading and acceptance shall be in accordance with the requirements and provisions of §712-14, Stress Graded Timber and Lumber. The timbers shall be sound and free from any defects which might impair its strength or tightness. The materials shall include all necessary waling and bracing required.

B. Permanent Steel Sheeting. Steel sheeting shall be new and unused conforming to the requirements of ASTM A328M unless otherwise indicated on the plans. Waling and bracing shall be new and unused conforming to the requirements of ASTM A36 unless otherwise indicated on the plans. The sheeting shall not have a section modulus less than that shown on the plans. Stock steel may be used. The Contractor shall furnish to the Engineer, certified copies of physical and chemical test results which shall include a sworn statement by a qualified mill representative to the effect that the subject material conforms to the requirements of the steel specified.

552-2.02 Temporary Sheeting

A. Temporary Timber Sheeting. The provisions of §552-2.01A Permanent Timber Sheeting shall apply with the following modifications:

The timber sheeting may consist of new or used, treated or untreated material but must be in satisfactory condition and suitable for the intended use. The Engineer may disapprove and reject used materials regarded to be unsatisfactory.

B. Temporary Steel Sheeting. The steel sheeting, waling and bracing may consist of new or used material but must be in satisfactory condition and suitable for the intended use. The section modulus of the sheeting shall not be less than that shown on the plans. The materials shall include all necessary waling and bracing required. The Engineer may, disapprove and reject used materials regarded to be unsatisfactory.

552-2.03 Interim Sheeting

A. Interim Timber Sheeting. The provisions of §552-2.02A Temporary Timber Sheeting shall apply.

B. Interim Steel Sheeting. The provisions of §552-2.02 B Temporary Steel Sheeting shall apply.

552-2.04 Excavation Protection System. The selection of EPS materials shall be the Contractor's option. The Engineer may disapprove and reject materials regarded to be unsatisfactory.

552-3 CONSTRUCTION DETAILS

552-3.01 General. Any material which stops the driving of sheeting within a depth of 10 feet from the ground surface at the time of driving, shall be removed by the Contractor. Payment for removal of such material will be made under the appropriate excavation item. If very compact material or boulders prevent the progression of the sheeting to the design tip elevation at a greater depth, the Contractor shall notify the Engineer.

552-3.02 Temporary Sheeting. The requirements of §552-3.01 General shall apply with the following addition:

Upon completion of the structure, the Contractor will remove the sheeting placed under this work, or with the written permission of the Engineer, leave it in place after cutting off the tops at an agreed elevation.

552-3.03 Interim Sheeting. The provisions of §552-3.01 General shall apply with the following modification:

The interim sheeting shall be cut off and removed only to the elevation shown on the plans. The remaining material shall be left in place.

552-3.04 Excavation Protection System. The EPS installed under this item shall be of sufficient size and strength to meet the requirements of Title 29, Code of Federal Regulations, Part 1926, Safety and Health Regulations for Construction, and the Live Load requirement as contained in the Standard Specifications for Highway Bridges adopted by AASHTO. Prior to use, the Contractor shall supply the Engineer with documentation of compliance.

All damage to the adjacent pavement or ground caused by the use of the chosen EPS (e.g. Voids beneath the pavement or shoulder, pavement or shoulder cracking or subsidence, ground settlement) shall be repaired to the satisfaction of the Engineer at no additional cost to the State. Severe damage which directly affects the safety of the public shall be immediately repaired to the satisfaction of the Engineer. The operation shall be halted until a satisfactory prevention method is instituted.

552-4 METHOD OF MEASUREMENT

552-4.01 Permanent Sheeting. The quantity of sheeting to be paid for shall be the number of square feet obtained by multiplying the vertical length of sheeting measured between the payment lines herein described, by the horizontal length of sheeting shown on the plans or approved by the Engineer. The vertical length of sheeting is that length measured between the upper and lower payment lines. The upper payment line, unless otherwise specified on the plans or approved by the Engineer, shall be the original ground at the time of commencing work. The lower payment line shall be the elevation shown on the Plans as the minimum embedment depth unless otherwise authorized in writing by the Engineer.

The horizontal length shall be measured along a projection of the sheeting on a plane parallel to and midway between the front and rear face of the sheeting wall.

552-4.02 Temporary Sheeting. The provisions of §552-4.01 Permanent Sheeting shall apply.

552-4.03 Interim Sheeting. The provisions of §552-4.01 Permanent Sheeting shall apply.

552-4.04 Excavation Protection System. The quantity of protection system to be paid for shall be the number of square feet obtained by multiplying the vertical length measured between the payment lines herein described, by the horizontal length of EPS shown on the plans or approved by the Engineer. The vertical length is that length measured between the upper and lower payment line. Unless otherwise specified on the plans, the upper payment line shall be the ground surface existing at the site prior to the beginning of the work, or as ordered, in writing, by the Engineer. Unless otherwise indicated on the plans or in the proposal, the lower payment line shall be the bottom of the excavation shown on the plans immediately adjacent to the protection system. The horizontal length shall be the actual length of protection system installed measured along the payment lines as shown on the contract plans. Both sides of the excavation shall be measured and computed for payment.

552-4.05 Stage Construction. When the support system is used in stage construction, the quantity of support system to be paid shall be the maximum number of square feet satisfactorily installed between the payment lines shown in the Contract Documents measured on either, but not both sides, of adjacent construction stages.

552-5 BASIS OF PAYMENT

552-5.01 Permanent Sheeting. The unit price bid per square foot for this work shall include the cost of furnishing all labor, materials and equipment necessary to complete this work, including driving equipment, waling, bracing and design services when employed. The cost of maintaining the excavated area free from earth, water, ice, and snow will be included in the price bid for the appropriate excavation item.

552-5.02 Temporary Sheeting. The provisions of §552-5.01 Permanent Sheeting shall apply except that estimate payments in the amount of 75% of the bid amount shall be made upon installation of the sheeting with the remainder paid upon its satisfactory removal. If the Contractor leaves all or part of the sheeting in place, it will be at their own expense and the remaining 25% of the bid amount shall be paid after its function is no longer required.

552-5.03 Interim Sheeting. The provisions of §552-5.01 Permanent Sheeting shall apply except that estimate payments in the amount of 75% of the bid amount shall be made upon installation of the sheeting with the remainder paid upon satisfactory removal of that portion specified in the contract documents. If the support system is to be left in place in its entirety, the remainder shall be paid after its function is no longer required. The cost of any work necessary to cut off and remove the specified portion shall be included in the unit price bid.

552-5.04 Excavation Protection System. The unit price bid per square foot for this work shall include the cost of furnishing all labor materials and equipment necessary to complete this work, including driving equipment, waling, bracing, and design services when employed.

If the Engineer directs, in writing, that the EPS be left in place, this will be classified as extra work.

Payment will be made under:

Item No.	Item	Pay Unit
552.10	Permanent Timber Sheeting	Square Foot
552.11	Permanent Steel Sheeting	Square Foot
552.12	Temporary Timber Sheeting	Square Foot
552.13	Temporary Steel Sheeting	Square Foot
552.14	Interim Timber Sheeting	Square Foot
552.15	Interim Steel Sheeting	Square Foot
552.16	Excavation Protection System	Square Foot

SECTION 553 - COFFERDAMS AND WATERWAY DIVERSION STRUCTURES

553-1 DESCRIPTION

553-1.01 General. All work done under this Section shall conform to all Federal, State, County and Local Regulations and permit conditions.

553-1.02 Cofferdam. Under this work, the Contractor shall design, furnish, place, maintain, and remove cofferdams together with all necessary waling and bracing, and dewatering equipment within the limits shown on the plans. The Contractor shall also construct, maintain, stabilize, backfill and restore adequate sediment removal area(s) for water discharge control at location(s) shown on the plans or where allowed by the Engineer in accordance with all applicable permits.

If a waterway diversion structure is proposed as a substitution, approval of the Engineer must be obtained. A review by the appropriate permitting agency(ies) will be required. Any delay due to this review and approval process will not be a basis for an extension of time.

553-1.03 Temporary Waterway Diversion Structure. Under this work, the Contractor shall design, furnish, install, maintain, and remove a temporary water diversion structure at the location(s) shown on the plans or as ordered by the Engineer.

553-1.04 Submittals

A. Cofferdams Cofferdams shall be designed by a Professional Engineer licensed and registered to practice in New York State. All systems submitted shall be designed for the static water pressure plus stream pressure and ice pressures as appropriate. Stresses shall not exceed the allowable given in AASHTO Standard Specifications for Highway Bridges. The Contractor shall indicate the water elevation above which the system should be flooded to avoid overloading. The Contractor's Engineer shall design the cofferdam to conform to all Federal, State, County and Local Regulations and Permits.

1. Cofferdams (Type 1). The Contractor shall submit the design, including computations and method of installation, to the Engineer for review by the Deputy Chief Engineer Structures (DCES). The DCES shall be allowed 20 working days for review. Permission to proceed must be received, prior to beginning construction of any cofferdam. The furnishing of such information and receipt of permission to proceed shall not serve to relieve the Contractor of its responsibility for the safety of the workers, the need to meet permit conditions, and the successful completion of the work.

2. Cofferdams (Type 2). Prior to beginning construction of any cofferdam, the Contractor shall submit the methods to be employed to the Engineer for review and approval. Ten working days shall be allowed for review. Construction shall not be started prior to receipt of approval.

B. Temporary Waterway Diversion Structure. Prior to beginning construction/installation of any temporary waterway diversion structure, the Contractor shall submit the methods to be employed to the Engineer for review and approval. Ten working days shall be allowed for review. Construction shall not be started prior to receipt of approval.

553-2 MATERIALS. The materials shall be timber or steel sheeting of a quality equivalent to that specified in §552-2.02 Temporary Sheeting of Support and Protection Systems, tightly sealed impermeable earth filled bags, precast concrete, a commercially designed system manufactured specifically for the control of water, or other material as indicated in the cofferdam design submitted for review.

553-3 CONSTRUCTION DETAILS

553-3.01 Cofferdams. Cofferdams shall be constructed so as to keep the excavations free from earth, water, ice, or snow, and to permit excavations to be carried to the depths indicated on the plans. Cofferdams, when used in conjunction with a tremie pour, shall be designed and constructed to automatically flood by non-mechanical means such as over topping or flooding ports. The automatic flooding elevation shall be as indicated by note in the plans.

In the event that permanent or temporary sheeting is required by the plans at the location of the cofferdam, the Contractor may elect to incorporate this material into the cofferdam system. Additional bracing may be required to satisfactorily perform excavation, dewatering, and other required construction operations. The permanent sheeting system shall be returned to its intended condition after all cofferdam equipment and material, including any additional bracing, has been removed. All damage done to the temporary system, if still required, or permanent sheeting, shall be repaired at the Contractor's expense, to the satisfaction of the Engineer.

Unless otherwise indicated on the plans, cofferdams shall be maintained in a dewatered condition during foundation construction. The placement of foundation concrete shall not be impeded by water standing or flowing within the cofferdam.

If a waterway diversion structure is approved as a substitution, all of the requirements of §553-3.02 Temporary Waterway Diversion Structure shall apply.

Dewatering equipment and any additional bracing shall be of adequate quality and capacity and shall be so arranged as to permit their proper functioning in connection with the cofferdam. Dewatering equipment and bracing shall be so located to permit construction of the structure in accordance with the plans.

All damage caused by the failure of a cofferdam to perform its proper functions shall be the responsibility of the Contractor. It shall also be the Contractor's responsibility to protect all stream banks from erosion by reason of restriction of the channel caused by the erection of the cofferdam to limits greater than that shown on the plans for the Contractor's own convenience. In that situation, all material which erodes from the banks during that time the cofferdam is in place shall be replaced by the Contractor at the Contractor's own expense. The Engineer, in consultation with the regulatory permit agency(ies) representative(s), will be the sole determiner of the nature and extent of all damages and mitigation requirements. The Engineer shall approve all repair methods proposed by the Contractor prior to the Contractor beginning any remedial activities for which they are liable.

It shall be the Contractor's responsibility to place the cofferdam so that it will not interfere with any batter piles.

The Contractor shall establish and maintain a sediment removal area(s) to retain the discharge for a sufficient period of time using equivalent best management practices as approved by the Engineer, in order that the discharge entering the stream will be as clear as the flowing stream.

553-3.02 Temporary Waterway Diversion Structure. Waterway diversion structures shall be constructed at the locations(s) as shown on the plans so as to divert the flow of water. The structure shall be continuous and constructed in accordance with any regulatory agency permit conditions.

If a system commercially designed and manufactured specifically for the control of water is used, it shall be installed and maintained in accordance with the manufacturer's recommendations.

All damage caused by the failure of the temporary water diversion structure to perform its proper function shall be repaired by the Contractor at no cost to the State.

553-3.03 Removal. The Contractor shall remove the temporary portion of the cofferdam installation or the waterway diversion structure, including anchor spuds if used, after such time that it is determined by the Engineer to be no longer necessary. The removal shall be sequenced to minimize turbidity and the discharge of materials into the waterway. Additional temporary erosion control measures, as determined by the Engineer, may need to be employed to facilitate removal.

553-4 METHOD OF MEASUREMENT

553-4.01 Cofferdams. Measurement will be for each cofferdam actually established where indicated on the plans.

§553

In those cases where approval is given to construct a waterway diversion structure in lieu of a cofferdam, the cost of the diversion will be paid at the unit price bid for the cofferdam work.

553-4.02 Temporary Waterway Diversion Structure. Measurement will be for each temporary waterway diversion structure actually constructed in accordance with the requirements of the contract documents and to the satisfaction of the Engineer.

553-5 BASIS OF PAYMENT

553-5.01 Cofferdams. The unit price bid for each cofferdam shall include the cost of furnishing all labor, materials, and equipment necessary to complete the work, including pile driving equipment, waling, and bracing, anchor spudding, maintaining in a dewatered condition, and final removal. No separate payment will be made for any additional temporary erosion control measures required to facilitate removal. In addition, all costs associated with the removal of any sediment deposited in the waterway due to the Contractor's operations shall be included. When a cofferdam is installed incorporating permanent or temporary sheeting required by the plans, payment will be made for each cofferdam established, including any miscellaneous sheeting, additional bracing, anchor spudding, or other material necessary to complete the work. The permanent or temporary sheeting, if used as part of the cofferdam, will be paid for under a separate item. The cost of establishing, maintaining, stabilizing, backfilling and restoring the sediment removal area(s) shall also be included in the price bid. No separate payment will be made for any repairs of damage required due to the failure of a cofferdam to perform its proper function.

Progress payments will be made. Seventy-five percent of the bid price will be paid after cofferdam installation, construction of the sediment removal area(s) and initial dewatering. The remaining percentage will be paid upon satisfactory removal of the cofferdam and restoration of the sediment removal area(s).

553-5.02 Temporary Waterway Diversion Structures. The unit price bid for each diversion structure shall include the cost of furnishing all labor, equipment, and materials necessary to satisfactorily install, maintain, and remove the diversion structure and any additional temporary erosion control measures required to facilitate removal.

No separate payment will be made for any repairs of damage required due to the failure of a waterway diversion structure to perform its proper function.

In the event that the Contractor is required to extend the temporary waterway diversion structure beyond the limits shown in the contract documents, changes to the diversion structure will be considered extra work.

When the waterway diversion structure is satisfactorily installed, 75 percent of the bid price will be paid. The remaining percentage will be paid when all temporary equipment and material have been removed and the waterway satisfactorily restored to its permanent location.

Payment will be made under:

Item No.	Item	Pay Unit
553.01nnnn	Cofferdams (Type 1)	Each
553.02nnnn	Cofferdams (Type 2)	Each
553.03nnnn	Temporary Waterway Diversion Structure	Each

Note: nnnn denotes serialized pay item.

SECTION 554 – INTERNALLY STABILIZED FILL STRUCTURES

554-1 DESCRIPTION. This work shall consist of furnishing and installing an internally stabilized fill structure at the location(s) and to the elevation(s) shown in the contract documents. Internally stabilized fill structures rely on the internal reinforcing elements to provide tensile forces to resist instability and are categorized in the retaining wall subsections of this specification.

554-1.01 Mechanically Stabilized Earth System. A Mechanically Stabilized Earth System (MSES) is comprised of an unreinforced concrete leveling pad, precast concrete facing units, earth backfill, and reinforcing elements used to stabilize the backfill.

Obtain all necessary materials, except backfill and leveling pad material, from the approved wall system designer-supplier. Approved designers-suppliers, wall systems, and the components of each wall system appear on the Approved List, available on the Department's web site. Designer-suppliers wishing to have their wall systems reviewed for placement on the Approved List shall follow the procedural directives of the Geotechnical Engineering Bureau as contained in Highway Design Manual Appendix 9A.

A. MSES Definitions.

- 1. Wall System.** A combination of a specific facing unit, a design-specific backfill reinforcing element and the backfill.
- 2. Leveling Pad.** An unreinforced concrete footing which serves as a flat, level surface for placing the initial course of facing units.
- 3. Facing Unit.** A precast concrete panel incorporating a means for attaching the backfill reinforcing element, forming part of the face area of the MSES. A corner unit is a facing unit having two faces.
- 4. Reinforcing Element.** A metal strip, wire mesh, geogrid or other similar material connected to the facing unit and extending into the backfill for the purpose of backfill stabilization.
- 5. Attaching Devices.** Components cast into the facing unit to provide a means for attaching reinforcing elements.
- 6. Fastener.** Hardware used to connect the reinforcing element to the attaching device.
- 7. Joint Filler.** Material used to fill the joints between units.
- 8. Slip Joint.** A vertical joint specific to the wall system used as a stress relief at wall step locations.
- 9. Identification Markers.** Signs or marking tape buried near the finished grade to identify and prohibit excavation of the reinforced backfill.
- 10. Backfill.** Material placed and compacted in conjunction with the reinforcing elements and facing units.

554-1.02 Mechanically Stabilized Segmental Block Retaining Wall System. A Mechanically Stabilized Segmental Block Retaining Wall (MSSBRWS) is comprised of an unreinforced concrete or compacted granular fill leveling pad, facing and cap units, earth backfill, backfill drainage materials, and reinforcing elements used to stabilize the backfill. Only MSSBRWS designer-suppliers (designer-supplier) with facing and cap units appearing on the Approved List for Precast Concrete Retaining Wall Block will be acceptable for use.

Obtain all necessary materials (except backfill, unit infill, leveling pad material, backfill drainage materials, and cast-in-place concrete) from the chosen designer-supplier. Approved facing and cap units from designers-suppliers appear on the Department's Approved List available on the Department's web site. Designer-suppliers wishing to have their facing and cap units reviewed for placement on the Approved List shall follow the procedural directives of the Geotechnical Engineering Bureau as contained in Highway Design Manual Appendix 9A.

A. MSSBRWS Definitions.

- 1. Wall System.** A combination of a specific facing unit, backfill reinforcing elements and the backfill.
- 2. Leveling Pad.** An unreinforced concrete or compacted granular fill footing or pad which serves as a flat, level surface for placing the initial course of facing units.
- 3. Facing Unit.** A segmental precast concrete block unit, with less than 6 ft² wall face area, that incorporates an alignment and connection device and also forms part of the MSSBRWS face area. A corner unit is a facing unit having two faces.
- 4. Alignment and Connection Device.** Any device that is either built into or specially manufactured for the facing units, such as shear keys, leading/trailing lips, or pins. The device is

used to provide alignment and maintain positive location for a facing unit and also provide a means for connecting the reinforcing elements.

5. Reinforcing Element. High density polyethylene, polypropylene or high tenacity polyester geogrid mats for the purpose of backfill stabilization.

6. Unit Infill. Well-graded aggregate fill placed within and/or contiguous to the back of the facing unit.

7. Cap Unit. A segmental precast concrete unit placed on and attached to the top of the finished MSSBRWS.

8. Backfill. Material placed and compacted in conjunction with the reinforcing elements and facing units.

9. Underdrain. A system for removing water from behind the MSSBRWS.

10. Geotextile. A permeable textile material used to separate dissimilar granular materials.

554-1.03 Geosynthetic Reinforced Earth System. A Geosynthetic Reinforced Earth System (GRES) slope is comprised of earth backfill, geosynthetic reinforcing elements used for internal stabilization and surface protection to resist erosion. For wall applications, the surface protection is replaced by a geotextile face wrap, welded wire forms or permanent facing elements.

A. GRES Definitions.

1. Geosynthetic Reinforcing Element. A geogrid or geotextile used for the purpose of backfill stabilization meeting the requirements of §737-07 *Geogrids*.

a. Primary Reinforcing Element. A geogrid or geotextile with sufficient strength and soil compatible modulus, placed horizontally within the slope or wall, to provide tensile forces to resist instability.

b. Secondary Reinforcing Element. A geogrid or geotextile used in a non-wrapped GRES installation typically employed in over steepened slopes, to aid in stability of the slope face between primary reinforcing element layers.

2. Geotextile Face Wrap. A layer of geotextile used to prevent loss of backfill, typically employed in a wall application which incorporates a welded wire facing system. In applications where a geotextile is used as the primary reinforcing element, it may be designed to also function as the face wrap.

3. Facing System. A series of structural elements incorporating a means for attaching the reinforcing elements, which serves to support the front edge of the backfill.

4. Welded Wire Forms. A non-structural facing system used in temporary walls to aid in compaction near the face of the wall.

5. Backfill. Material placed and compacted in conjunction with the reinforcing elements and facing system.

554-2 MATERIALS.

554-2.01. Mechanically Stabilized Earth System. Ensure that the proper materials are supplied for the chosen system design. Not all materials listed are required for each Mechanically Stabilized Earth System. Provide materials meeting the following requirements:

A. MSES Facing Units. Fabricate in accordance with the requirements of §704-14 *Precast Concrete Panel Units*.

Fabricate Precast concrete coping and other incidental precast units in accordance with the requirements of §704-14 *Precast Concrete Panel Units*. Architectural treatment of the Precast Concrete Panels may be required by special notes shown in the contract documents.

B. MSES Metal Reinforcing Strips. Manufacture the reinforcing strips from recognized ASTM Designated metal grades and galvanize in accordance with the requirements of §719-01 *Galvanized Coatings and Repair Methods, Type I*. The reinforcing strips associated with each approved wall system appear on the Department's approved list under wall system components.

C. MSES Metal Reinforcing Mesh. Shop fabricate the reinforcing mesh from cold drawn steel wire conforming to the requirements of §709-09 *Cold Drawn Wire for Concrete Reinforcement*, and weld into the finished mesh fabric in accordance with the requirements of §709-02 *Wire Fabric for Concrete Reinforcement*. Galvanize in accordance with §719-01 *Galvanized Coatings and Repair Methods, Type I*. The reinforcing mesh associated with each approved wall system appears on the Department's approved list under wall system components.

D. MSES Geogrid Reinforcing Element. Provide geogrid reinforcing elements meeting the requirements of §737-07 *Geogrids*. The grid(s) associated with each approved wall system appear on the Approved List under wall system components.

E. MSES Fasteners and Attaching Devices. The fasteners and attaching devices are specific to each wall system and provided by the wall system supplier. The fasteners and attaching devices associated with each approved wall system appear on the Approved List under wall system components.

F. MSES Joint Fillers. Fill joints with material approved by D.C.E.S. and supplied by the approved wall system supplier.

G. MSES Slip Joints. The type of slip joints are specific to each wall system and are designed and supplied by the wall system supplier.

H. MSES Leveling Pad. Provide leveling pad material meeting the requirements of Section 501 *Portland Cement Concrete - General*, Class A concrete.

I. MSES Backfill. Provide backfill material meeting the requirements of §733-02 *Mechanically Stabilized Earth System Backfill Material*.

J. MSES Identification Markers

1. Signs. These will be 7 in. x 10 in. (minimum) fiberglass. Include warning information as follows:

WARNING

Internally Stabilized Fill Structure

DO NOT EXCAVATE

Call Regional Office of NYS DOT

2. Marking Tape. This will be polyethylene material 3 in. wide, 4 mil thick. Include warning markings.

554-2.02. Mechanically Stabilized Segmental Block Retaining Wall System. Not all materials listed are required for each MSSBRWS. Ensure that the proper materials are supplied for the chosen system design. Provide materials meeting the following requirements:

A. MSSBRWS Leveling Pad. MSSBRWS height is measured from the top of the leveling pad to the top of the cap unit.

1. Wall Heights Taller Than or Equal to 15 ft. For MSSBRWS taller than or equal to 15 ft. in total height, supply a leveling pad of unreinforced Class A concrete - Section 501 *Portland Cement Concrete - General*.

2. Wall Heights Shorter Than 15 ft. For MSSBRWS shorter than 15 ft. in total height, supply a leveling pad conforming to one of the following:

- a. Unreinforced Class A concrete - Section 501 *Portland Cement Concrete - General*, or
- b. Select Granular Fill - Section 203, *Select Granular Fill* ~~§203-2.02-C Select Granular Fill and Select Structure Fill~~, or
- c. Crushed Stone - §501-2.02, B.1.b. Coarse Aggregate Type CA-2 in Table 501-2 Coarse Aggregate Gradations.

Comment [c52]:
EI09024

B. MSSBRWS Facing and Cap Units. Supply units fabricated and conforming to §704-07 *Segmental Retaining Wall Blocks*.

C. MSSBRWS Alignment and Connection Devices. Supply devices conforming to the designer-supplier's Installation Manual.

D. MSSBRWS Reinforcing Element. Provide geogrid or geotextile reinforcing elements meeting the requirements of §737-07 *Geogrids*.

E. MSSBRWS Unit Infill. Supply unit infill conforming to material and gradation requirements for §501-2.02B.1.b. Coarse Aggregate Type CA-2 in Table 501-2 Coarse Aggregate Gradations.

F. MSSBRWS Cast-In-Place Concrete. Supply concrete conforming to Section 501 *Portland Cement Concrete – General*, Class A concrete.

G. MSSBRWS Backfill. Provide backfill material meeting the requirements of §733-02 *Mechanically Stabilized Earth System Backfill Material*.

H. MSSBRWS Separation Geotextile. Supply a geotextile for the separation of dissimilar materials, conforming to the requirements of §737-01 *Geotextiles*, Geotextile Separation, Strength Class 2.

I. MSSBRWS Drainage System. Supply underdrain and geotextile material for a backfill drainage system as shown in the contract documents or conforming to the designer-supplier's Installation Manual:

1. **Underdrain Pipe.** Supply optional underdrain pipe conforming to Section 605 *Underdrains*.
2. **Geotextile Drainage.** Supply geotextile conforming to the requirements of §737-01 *Geotextiles*, Geotextile Drainage, Strength Class 2, Drainage Class B.

J. MSSBRWS Identification Markers. Supply identification markers conforming to §554-2.01 J. *MSES Identification Markers*.

554-2.03. Geosynthetic Reinforced Earth System. Ensure that the proper materials are supplied for the chosen system design. Not all materials listed are required for each GRES. Provide materials meeting the following requirements:

A. GRES Geosynthetic Reinforcing Element. Provide a geogrid or geotextile primary and secondary reinforcing elements meeting the requirements of §737-07 *Geogrids*.

B. GRES Backfill. Provide backfill material conforming to the following:

1. **Walls.** Provide backfill material meeting the requirements of Section 203, *Select Structural Fill* ~~§203-2.02 C-Select Granular Fill and Select Structural Fill~~.
2. **Slopes.** Provide backfill material meeting the requirements of §703-12 *Geosynthetic Reinforced Earth System Slope Backfill Material*.

Comment [c53]:
EI09024

C. GRES Geotextile Face Wrap. Provide geotextile face wrap material meeting the requirements of §737-01 *Geotextiles* and as shown in the contract documents.

D. GRES Facing System. Provide a facing system shown in the contract documents and in accordance with the requirements below.

1. **Welded Wire Forms.** Provide welded wire forms and wire struts as shown in the contract documents, conforming to the material requirements of §709-02 *Wire Fabric for Concrete Reinforcement*. Proposed alternate, non-structural facing systems used to aid in compaction near the face of the wall shall be included in the submittal outlined in §554-3.03 A. *GRES Submittal*.

2. Geocells. Provide geocells and anchoring devices and staples as shown in the contract documents, conforming to the material requirements of §737-08 *Geocells*.

Provide infill material conforming to Section 203, *Select Structural Fill* ~~§203-2.02 C, *Select Granular Fill and Select Structural Fill*~~, with the added stipulation that the maximum particle size is 2 in. Where a vegetated face is called for, the outermost cells are to be filled with topsoil meeting the material requirements of §713-01 *Topsoil*.

3. Timbers. Provide timbers as shown in the contract documents, graded for an extreme fiber stress of at least 1000 psi conforming to the material requirements of §712-14 *Stress Graded Timber and Lumber*. Treat timbers in accordance with §708-31 *Wood Preservative - Waterborne* and applied in conformance with American Wood Preservers Association (AWPA) Use Category Designation UC4B.

4. Gabions. Provide gabions, tie wire or lacing wire, and gabion backfill as shown in the contract documents, conforming to the material requirements of §712-15 *Gabions*.

5. As Shown in the Contract Documents. Provide materials in accordance with the contract documents.

E. GRES Surface Protection. Provide erosion resistant covering of the finished GRES slope surface meeting the requirements of §713-07 *Rolled Erosion Control Products and Soil Stabilizers* Class III Type C and as shown in the contract documents.

F. GRES Identification Markers. Supply identification markers conforming to §554-2.01 J. *MSES Identification Markers*.

Comment [c54]:
EI09024

554-3 CONSTRUCTION DETAILS

554-3.01. Mechanically Stabilized Earth System.

A. MSES Submittal. Obtain from the designer-supplier a Mechanically Stabilized Earth System design stamped by a Professional Engineer. Submit the MSES design package, including working drawings of the wall design, design calculations, and the designer-supplier's Installation Manual to the Deputy Chief Engineer Structures (DCES) at least 30 work days before starting work. The MSES design package must also include working drawings for all job-specific facing panels not previously approved by the Materials Bureau.

A Pre-Operation Meeting will be held between the Engineer, Contractor, Regional Geotechnical Engineer, Geotechnical Engineering Bureau and other appropriate Department representatives to discuss the Contractor's proposed construction methods. Begin work only after receiving the DCES written approval and holding the Pre-Operation Meeting.

Supply on-site technical assistance from a representative of the designated designer-supplier during the beginning of the installation until such time as outside consultation is no longer required.

B. MSES Excavation and Disposal and MSES Area Preparation. Excavate and dispose of all excavated material in accordance with the requirements of Section 203 *Excavation and Embankment*, except as modified herein.

1. Placement Area. Grade the area under the Mechanically Stabilized Earth System, level for a width equal to, or in excess of, the reinforcing element length. Prior to wall system construction, compact this area to a minimum of 90% of Standard Proctor Maximum Density. Treat all soils found to be unsuitable, or incapable of being satisfactorily compacted because of moisture content, in a manner directed by the Engineer, in conjunction with the recommendations of the Regional Geotechnical Engineer.

2. Rock. Remove rock to the limits indicated in the contract documents.

3. Depth of Excavation. The depth of excavation for the leveling pad is indicated in the contract documents. Include the cost of this excavation in a separate excavation item.

C. MSES Facing Unit Inspection, Storage, and Repair

1. **Precast Concrete Facing Units.** An inspection will be made prior to installation to determine if any damage has occurred to the unit(s). Handle and store the units with extreme care to prevent damage.
2. **Damaged Units.** Repair damaged units in a manner approved by the Engineer. Replace units that are not repairable at no additional cost to the State.

D. MSES Erection

1. **Methods and Equipment.** Install units in accordance with the designer-supplier's working drawings and Installation Manual, unless otherwise modified by the contract documents. Prior to installation of the units, furnish the Engineer with detailed information concerning the proposed construction method, as well as the equipment planned for use.
2. **Unreinforced Concrete Leveling Pad.** Provide an unreinforced concrete leveling pad as required by the contract documents. Place the concrete in accordance with the requirements Section 555 *Structural Concrete*.

3. Unit Installation

- a. Place units such that, after completion of compaction, the requirements of Table 554-1 *MSES Facing Unit Alignment and Joint Offset Tolerances* are not exceeded. After placement, maintain each unit in position. If wedges are used, do not allow them to remain in place below three panel unit heights during installation, and compaction. Remove all wedges remaining in the top three panel unit heights upon completion of the MSES. External braces may be required for initial placements. Install joint fillers in the manner indicated by the Installation Manual.
- b. Correct all misalignments of installed units in excess of the tolerances allowed by Table 554-1 *MSES Facing Unit Alignment and Joint Offset Tolerances*, at no additional cost to the State.
- c. Govern the operations and procedures to prevent misalignment of the installed panel units. Precautionary measures include, but are not limited to, keeping vehicular equipment a minimum of 3 ft. from the panel units. Within 3 ft. of the panel units use compaction equipment meeting the requirements of Section 203, *Compaction Equipment for Confined Areas*.

~~§203-3.12-B-6. Compaction Equipment for Confined Areas.~~

Comment [c55]:
EI09024

TABLE 554-1 MSES FACING UNIT ALIGNMENT AND JOINT OFFSET TOLERANCES	
Horizontal Alignment	± 3/4 in./ 10 ft.
Joint Offset per Unit	± 1/2 in.
Overall Vertical Plumbness (Top to Bottom of Wall System)	± 1/2 in./ 10 ft.

4. Backfill

- a. Backfill types shall not be mixed behind any wall without the written permission of the Director, Geotechnical Engineering Bureau.
- b. Place backfill materials, other than Type B and Type D, at a moisture content less than or equal to the Optimum Moisture Content. Rework or replace all backfill material which is at a moisture content in excess of the Optimum Moisture content. Determine the Optimum Moisture Content in accordance with the latest Geotechnical Test Methods for compaction that incorporate moisture content determination. Rework or replace backfill material at no additional cost to the State.
- c. Place granular backfill material in uniform layers not exceeding 12 in. loose lift thickness per layer. Compact each layer to a minimum of 95% of Standard Proctor Maximum Density.
- d. Place Type B and Type D backfill in uniform layers not exceeding 16 in. loose lift thickness. Compact in accordance with requirements determined by the Engineer.

- e. Prior to placement of the reinforcing element, backfill the area within 3 ft. of the panel units horizontally to within 1 in. or less, below the required reinforcing element elevation. Roughly grade the backfill beyond the 3 ft. line to the reinforcing element elevation.
- f. *Surface Drainage Control.* Provide positive control and discharge of all surface drainage that will affect the installation of the MSES throughout the construction of the wall. Maintain all vertical drains, weeps, ditches, pipes, or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost.
- g. *QA Program.* The Department will sample and test backfill from the grade in accordance with the Quality Assurance Program outlined in §703-11 *Mechanically Stabilized Earth System Backfill Material*. If the material is determined to not meet the specification requirements, the material will be rejected. The Contractor shall remove rejected material and replace it with acceptable material at no additional cost to the State.

5. Reinforcing Elements

- a. Place reinforcing elements in accordance with the designer-supplier's recommendations or as described in the designer-supplier's Installation Manual.
- b. Before attaching the reinforcing elements to the panel units, repair all damage to the zinc coating in accordance with the requirements of §719-01 *Galvanized Coatings and Repair Methods, Type I*.
- c. Prior to the attachment of the reinforcing elements, as required, fill all openings, or attachment locations, with grease, or other protective material. Obtain the grease or other protective materials from the chosen designer-supplier.
- d. Place reinforcing elements normal to the panel units unless indicated otherwise by the contract documents. Take care to avoid breaking, distorting, or disturbing the reinforcing elements. Replace reinforcing elements which are broken, or distorted, as determined by the Engineer.
- e. Connect reinforcing elements to the facing before placement of subsequent facing units, or as directed by the approved construction drawings.
- f. Operate rubber tired equipment on top of reinforcing elements only at low speeds (less than 5 mph) and without making sharp turns or braking sharply. Do not operate tracked equipment directly on reinforcing elements. Cover reinforcing elements with a minimum 6 in. thick soil layer prior to operating tracked equipment over reinforced areas.
- g. Repair or replace damaged reinforcing elements in strict accordance with the designer-supplier's written instructions.

6. Identification

- a. Install MSES identification markers.

554-3.02. Mechanically Stabilized Segmental Block Retaining Wall System.

A. MSSBRWS Submittal. Obtain from the designer-supplier a Mechanically Stabilized Segmental Block Retaining Wall System design stamped by a Professional Engineer. All MSSBRWS designs shall conform to the requirements of Section 5.8 of the AASHTO Standard Specifications. Submit the MSSBRWS design package, including working drawings of the wall design, design calculations, and the designer-supplier's Installation Manual to the Deputy Chief Engineer Technical Services (DCETS) at least 30 work days before starting work. Begin work only after receiving the DCETS written approval.

Supply on-site technical assistance from a representative of the designated designer-supplier during the beginning of the installation until such time as outside consultation is no longer required.

B. MSSBRWS Excavation and Disposal and MSSBRWS Area Preparation. Excavate, dispose and prepare the area on which the MSSBRWS will rest in conformance with the requirements of §554-3.01 B. *MSES Excavation and Disposal and MSES Area Preparation*.

C. MSSBRWS Facing and Cap Unit Inspection, Storage, Repair and Rejection. Handle and store facing and cap units with extreme care to prevent damage. Facing and cap units will be inspected prior to their installation. Facing and cap units will be considered damaged if they contain any cracks or spalls and/or honeycombed areas with any dimensions greater than 1 in. Replace rejected units at no additional cost to the State.

D. MSSBRWS Facing Unit Erection

1. Unreinforced Concrete or Compacted Granular Fill Leveling Pad. Provide an unreinforced concrete or compacted granular fill leveling pad as shown in the contract documents.

Place concrete in conformance with Section 555 *Structural Concrete*, or
Place and compact granular fill in conformance with Section 203 *Excavation and Embankment*.

2. Unit Installation. Install by placing, positioning, and aligning facing units in conformance with the designer-supplier’s Installation Manual and within the tolerances in Table 554-2 *MSSBRWS Facing Unit Alignment Tolerances*.

3. Corrective Measures. Correct all misalignments of installed facing units that exceed the tolerances allowed in Table 554-2 *MSSBRWS Facing Unit Alignment Tolerances*.

TABLE 554-2 MSSBRWS FACING UNIT ALIGNMENT TOLERANCES	
Vertical Control	± ¼ in. over a distance of 10 ft.
Horizontal Control	± ½ in. over a distance of 10 ft.
Rotation from established plan wall batter	± ½ in. over a distance of 10 ft.

4. Control. Control all operations and procedures to prevent misalignment of the facing units. Precautionary measures include (but are not limited to) keeping vehicular equipment at least 3 ft. behind the back of the facing units. Compaction equipment used within 3 ft. of the back of the facing units must conform to Section 203, *Compaction Equipment for Confined Areas*.
~~B.6. Compaction Equipment for Confined Areas.~~

Comment [c56]:
EI09024

E. MSSBRWS Unit Infill

1. Placement. Place unit infill to the limits indicated in the contract documents. Before installing the next course of facing units, compact the unit infill and brush the tops of the facing units clean to ensure an even placement area.

2. Protection. Protect unit infill from contamination during construction.

F. MSSBRWS Backfill

1. Moisture Content. Place backfill materials (other than Types B and D) at a moisture content less than or equal to the Optimum Moisture Content. Rework or replace all material which is at a moisture content exceeding the Optimum Moisture Content. Determine Optimum Moisture Content in conformance with Geotechnical Test Methods (excluding GTM-6) for compaction that incorporates moisture content determination. Rework or replace backfill material at no additional cost to the State.

2. Backfill Placement. Prior to placement of the reinforcing element, backfill the area within 3 ft. of the facing units horizontally to within 1 in. or less below the required reinforcing element elevation. Roughly grade the backfill beyond the 3 ft. line to the reinforcing element elevation.

3. Separation Geotextile. Place the geotextile separation, if required, loosely but in intimate contact with the soil so that placement of the overlying material will not stretch or tear the geotextile.

4. Granular Backfill Layers. Place granular backfill material in uniform layers so that the compacted thickness of each layer does not exceed 10 in. or one block height, whichever is less. Compact each layer to a minimum of 95% of Standard Proctor Maximum Density.

5. Types B and D Backfill Layers. Place Types B and D backfill in uniform layers so that the compacted thickness of each layer does not exceed 10 in. or one block height, whichever is less. Compact each layer in conformance with Section 203, ~~Compaction~~ §203-3.12 ~~Compaction~~.

6. Drainage System. Lay underdrain pipe at the location shown in the contract documents, at a grade to positively outlet, and having a full, firm and even bearing along the entire length of pipe. Place the geotextile drainage, if required, loosely to the shape of the excavated backslope.

7. Surface Drainage Control. Provide positive control and discharge of all surface drainage that will affect the installation of the MSSBRWS throughout the construction of the wall.

Maintain all vertical drains, weeps, ditches, pipes, or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost.

8. QA Program. The Department will sample and test backfill from the grade in accordance with the Quality Assurance Program outlined in §703-11 *Mechanically Stabilized Earth System Backfill Material*. If the material is determined to not meet the specification requirements, the material will be rejected. The Contractor shall remove rejected material and replace it with acceptable material at no additional cost to the State.

Comment [c57]:
EI09024

G. MSSBRWS Reinforcing Element

1. Reinforcing Element Placement. Place the reinforcing element normal to facing units unless otherwise indicated in the contract documents. Replace all broken, damaged or distorted reinforcing elements at no additional cost to the State.

2. Reinforcing Element Connection. Install the reinforcing element within/between courses of facing units conforming to the designer-supplier's Installation Manual. Pull taut and secure the reinforcing element before placing the backfill.

H. MSSBRWS Identification

1. Identification Markers. Install MSSBRWS identification markers.

554-3.03. Geosynthetic Reinforced Earth System.

A. GRES Submittal. Submit the geogrid or geotextile reinforcing element certifications, verifying that the material meets the requirements of §737-07 *Geogrids* for the specified long term design tensile strength shown in the contract documents, to the Engineer prior to start of work. Begin work only after receiving the Engineer's approval.

Supply on-site technical assistance from a representative of the geosynthetic reinforcing element supplier until such time as outside consultation is no longer required.

B. GRES Storage of Geosynthetic. Store and protect geosynthetic materials in accordance with the manufacturer's recommendations prior to installation.

C. GRES Placement of Materials.

1. Geosynthetic Reinforcing Element. Place and secure the primary and secondary reinforcing element in accordance with the manufacturer's recommendations, in continuous strips without joints, seams or connections throughout the embedment length, to the line, grade and orientation shown in the contract documents. Place reinforcing elements to lay flat with no creases and pull taut to remove any slack prior to placement of backfill.

2. Welded Wire Forms. Place welded wire forms where required, as shown in the contract documents. Position and connect the welded wire forms to overlap 2 in. with adjacent forms and connect with wire ties. Install wire struts as shown in the contract documents and as required to stiffen the welded wire forms.

3. Geotextile Face Wrap. Place geotextile face wrap as shown in the contract documents. If used in conjunction with welded wire forms, place the geotextile face wrap so as to conform closely to the welded wire forms.

4. Backfill. Replace any damaged geosynthetic prior to placement of any overlying material at no cost to the State. Place the backfill onto the geosynthetic reinforcing elements in such a manner that no damage occurs. Progress placement of backfill materials so as to minimize the

development of slack in the reinforcing element. The thickness of a compacted lift of backfill is not to exceed 12 in. or the measured vertical distance between geosynthetic layers, whichever is less. Compact the backfill to a minimum of 95% of Standard Proctor Maximum Density in accordance with the requirements contained in Section 203, ~~Compaction~~ §203-3.12 ~~Compaction~~. Only hand operated equipment is allowed within 3 ft. of the face. Lift thickness may have to be reduced to achieve required compaction.

Comment [c58]:
EI09024

5. Surface Protection. Place and secure erosion control material in accordance with Section 209 *Soil Erosion and Sediment Control* and as shown in the contract documents.

6. Permanent Facing. Place and connect permanent facing as shown in the contract documents.

7. Surface Drainage Control. Provide positive control and discharge of all surface drainage that will affect the installation of the GRES throughout the construction of the wall. Maintain all vertical drains, weeps, ditches, pipes, or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost.

D. GRES Construction Monitoring. Monitor the system face during fill placement and compaction. If verticality or the required batter of a system is not being maintained, stop work until compaction equipment and/or operational procedures are modified.

E. GRES Identification

1. Identification Markers. Install GRES identification markers for GRES installations other than welded wire form facing.

554-4 METHOD OF MEASUREMENT.

554-4.01. Mechanically Stabilized Earth System. A MSES will be measured in square feet of face area, measured to the nearest square foot from the payment lines shown in the contract documents.

554-4.02. Mechanically Stabilized Segmental Block Retaining Wall System. A MSSBRWS will be measured in square feet of face area, measured to the nearest square foot from the payment lines shown in the contract documents.

554-4.03. Geosynthetic Reinforced Earth System. A GRES will be measured in square feet of vertical face area, measured to the nearest square foot from the payment lines shown in the contract documents.

554-5 BASIS OF PAYMENT

554-5.01 Mechanically Stabilized Earth System. Include in the unit price bid the cost of all labor, materials, and equipment, including backfill, reinforcing elements, leveling pad, joint fillers, coping, and the cost of adding water for backfill compaction, unless items for Furnishing Water Equipment and Applying Water are included in the Contract, necessary to satisfactorily complete the work.

554-5.02 Mechanically Stabilized Segmental Block Retaining Wall System. Include in the unit price bid the cost of all labor, material, and equipment, including leveling pad, facing and cap units, backfill, underdrains, geotextiles, and the cost of adding water for backfill compaction, unless items for Furnishing Water Equipment and Applying Water are included in the Contract, necessary to satisfactorily complete the work.

554-5.03 Geosynthetic Reinforced Earth System. Include in the unit price bid the cost of all labor, materials, and equipment, including backfill, geosynthetic reinforcing elements, geotextile face wrap, welded wire forms and struts necessary to satisfactorily complete the work

Payment will be made under:

SECTION 554 – MECHANICALLY STABILIZED EARTH SYSTEM

Comment [c59]:
E108-037

554-1 DESCRIPTION. Construct a Mechanically Stabilized Earth System (MSES) at the locations indicated on the plans. A Mechanically Stabilized Earth System is comprised of an unreinforced concrete leveling pad, facing units, earth backfill, and a reinforcing material used to stabilize the backfill.

— Obtain all necessary materials, except backfill and leveling pad material, from the approved wall system designer supplier. Approved designers suppliers, wall systems, and the components of each wall system appear on the Department's approved list located in the office of the Director, Materials Bureau. Obtain from the designer supplier a Mechanically Stabilized Earth System design stamped by a Professional Engineer licensed and registered to practice in New York State. Submit the MSES design package, including working drawings of the wall design, design calculations, working drawings for all job specific facing panels not previously approved by the DCES, and the designer supplier's Installation Manual to the DCES at least 30 working days before starting work. After receipt of all pertinent information, the DCES requires 20 working days to review the submission and reply to the Engineer. Begin work only after receiving DCES written approval.

— Supply on site technical assistance from a representative of the designated designer supplier during the beginning of the installation until such time as the Engineer determines that outside consultation is no longer required.

554-1.01 Definitions. The following definitions apply:

A. Wall System. A marriage of a specific facing unit, a specific reinforcing and the backfill described in §554-2.09 of this specification.

B. Facing Unit. A precast concrete panel incorporating a means for attaching the reinforcing, forming part of the face area of the mechanically stabilized earth system. A corner unit is a facing unit having two faces.

C. Reinforcing. A metal strip, wire mesh, geogrid or other similar material connected to the facing unit for the purpose of fill stabilization.

D. Attaching Devices. Anything cast into the facing unit to provide a means for attaching reinforcing.

E. Fastener. Anything used to connect the reinforcing to the attaching device.

F. Joint Filler. Material used to fill the joints between units.

~~G. Slip Joint.~~—A vertical joint specific to the wall system used as a stress relief at wall step locations.

~~H. Identification Markers.~~—Signs or marking tape buried near the finished grade to identify and prohibit excavation of the reinforced backfill.

~~554-2 MATERIALS.~~—Not all materials listed are required for each Mechanically Stabilized Earth System. Ensure that the proper materials are supplied for the chosen system design. Provide materials meeting the following requirements:

~~554-2.01 Facing Units.~~—Fabricate in accordance with the requirements of §704-14 Precast Concrete Panel Units.

—Fabricate Precast concrete coping and other incidental precast units in accordance with the requirements of §704-14 Precast Concrete Panel Units. Architectural treatment of the Precast Concrete Panels may be required by special notes shown on the plans.

~~554-2.02 Reinforcing Strips.~~—Manufacture the reinforcing strips from recognized ASTM Designated metal grades and galvanize in accordance with the requirements of §719-01, Type I. The reinforcing strips associated with each approved wall system appear on the Department's approved list under wall system components.

~~554-2.03 Reinforcing Mesh.~~—Shop fabricate the reinforcing mesh from cold drawn steel wire conforming to the requirements of §709-09 and weld into the finished mesh fabric in accordance with the requirements of §709-02. Galvanize in accordance with §719-01, Type I. The reinforcing mesh associated with each approved wall system appear on the Department's approved list under wall system components.

~~554-2.04 Geogrid Reinforcing.~~—Provide geogrid reinforcing tested and certified to meet the minimum requirements for geosynthetic products in accordance with AASHTO Specifications for Highway Bridges, Section 5.8.6.1.2, Geosynthetic Reinforcement. Submit the geogrid manufacturer's certification with the material. Include in the certification: the geogrid manufacturer's name, the geogrid name, the test lot number, the minimum average roll value for Ultimate Tensile Strength, the long term design tensile strength, and the reduction factors used to calculate the long term design tensile strength. The grid(s) associated with each approved wall system appear on the Department's approved list under wall system components.

~~554-2.05 Fasteners and Attaching Devices.~~—The fasteners and attaching devices are specific to each wall system and provided by the wall system supplier. The fasteners and attaching devices associated with each approved wall system appear on the Department's approved list under wall system components.

~~554-2.06 Joint Fillers.~~—Fill joints with material approved by DCES and supplied by the approved wall system supplier.

~~554-2.07 Slip Joints.~~—The type of slip joints are specific to each wall system and are designed and supplied by the wall system supplier.

~~554-2.08 Leveling Pad.~~—Provide leveling pad material meeting the requirements of Section 501, Class A concrete.

~~554-2.09 Backfill.~~—Provide backfill material for any Mechanically Stabilized Earth System from a single source unless prior approval for use of designated multiple sources is obtained from the Director, Geotechnical Engineering Bureau. Any mineral (inorganic) soil, blasted or broken rock, or similar materials of natural origin, including mixtures thereof, may be suitable materials subject to the following:

A. Tests, Control and Acceptance Methods. Perform material tests and control methods pertaining to the backfill requirements in conformance with the procedures contained in the appropriate Departmental publications in effect on the date of the advertisement for bids. These publications are available upon request to the Regional Director, or the Director, Geotechnical Engineering Bureau.

—Acceptance of the backfill will be made in accordance with the procedural directives of the Geotechnical Engineering Bureau.

B. Backfill Material. Stockpile the backfill material in accordance with the latest “Geotechnical Control Procedures for the Control of Granular Materials”, and grade in accordance with TABLE 554-1.

Sieve Size Designation	Percentage Passing by Weight
4 inch	100
1/4 inch	30-100
No. 40	0-60
No. 200	0-15

C. Plasticity Index. If the State elects to test for plasticity, the Plasticity Index shall not exceed 5

D. Durability. If the State elects to test for durability, material having a Magnesium Sulfate Soundness loss in excess of 30 percent will be rejected and shall not be placed in the work.

E. Corrosion Potential (Metal Reinforcing and/or Connectors Only). The State will test for the corrosion potential of any system with exposed metal in the backfill. All stockpiled backfill materials will be tested for resistivity and pH, and may be tested for sulfides at the Department's discretion. Material failing to meet the following requirements of Table 554-2, for those tests that are performed, will be rejected except as specified below:

—Material failing to meet the resistivity criterion may be tested for sulfate and chlorides. Material meeting the criteria for both sulfates and chlorides and having a resistivity greater than 10 ohm-m will be acceptable.

Resistivity $\rho \geq 3000$ ohm-cm	Sulfates ≤ 200 ppm
$5 \leq \text{pH} \leq 10$	Chlorides ≤ 100 ppm
Sulfides ≤ 300 ppm	

554-2.10 Identification Markers

A. Signs. These will be 7 x 10 inches (minimum) fiberglass.

B. Marking Tape. This will be polyethylene material 3 inches wide, 4 mils thick.

—Signs and marking tape are provided by the chosen designer-supplier.

554-2.11 Basis of Acceptance

~~**A. Facing Units.**—Accepted in accordance with the requirements of §704-14, Precast Concrete Panel Units.~~

~~**B. Cast-in-Place Concrete.**—The requirements of Section 501, Class A concrete, apply.~~

~~**C. Other Materials.**—These will be accepted by certification. The State, however, reserves the right to sample, test and reject certified material in accordance with Departmental written instructions.~~

554-3 CONSTRUCTION DETAILS

~~**554-3.01 Excavation and Disposal.**—Excavate and dispose of all excavated material in accordance with the requirements of Section 203, except as modified herein.~~

~~**A. Placement Area.**—Grade the area under the Mechanically Stabilized Earth System, level for a width equal to, or in excess of, the reinforcing length. Prior to wall system construction, thoroughly compact this area to the satisfaction of the Engineer. Treat all soils found to be unsuitable, or incapable of being satisfactorily compacted because of moisture content, in a manner directed by the Engineer, in conjunction with the recommendations of the Regional Geotechnical Engineer.~~

~~**B. Rock.**—Remove rock to the limits indicated on the plans.~~

~~**C. Depth of Excavation.**—The depth of excavation for the leveling footing is indicated on the plans. Include the cost of this excavation in a separate excavation item.~~

554-3.02 Facing Unit Inspection, Storage, Repair and Rejection

~~**A. Precast Concrete Facing Units.**—Precast concrete facing units will be inspected upon arrival at the work site to determine if damage occurred during shipment. An additional inspection will be made prior to installation to determine any damage which may have occurred during storage. Handle and store the units with extreme care to prevent damage.~~

~~**B. Tolerances.**—Units not meeting dimensional tolerances, as determined by the Engineer, will be rejected. Replace rejected units with units acceptable to the Engineer.~~

~~**C. Damaged Units.**—Repair damaged units in a manner approved by the Engineer. Units that the Engineer determines are not repairable will be rejected. Replace rejected units with units acceptable to the Engineer.~~

~~**D. Rejection Responsibility.**—Responsibility for the rejection of units delivered to the job site rests solely with the Engineer.~~

554-3.03 Structure Erection

~~**A. Methods and Equipment.**—Install units in accordance with the designer-supplier's working drawings and Installation Manual, unless otherwise modified by the Contract Documents, or the Engineer. Prior to installation of the units, furnish the Engineer with detailed information concerning the proposed construction method, as well as the specific construction equipment planned for use. Begin work only after receiving the Engineer's written approval of the proposed construction methods.~~

~~**B. Unreinforced Concrete Leveling Pad.**—Provide an unreinforced concrete leveling pad as required by the plans. Place the concrete in accordance with the requirements §555-3. The Engineer may waive any part of §555-3, that the Engineer determines is impractical.~~

~~**C. Unit Installation**~~

- ~~1. Place units such that, after completion of compaction, the requirements of TABLE 554-3 are not exceeded. After placement, maintain each unit in position by a method acceptable to the Engineer. If wedges are used, do not allow them to remain in place below three panel unit heights during installation, and compaction. Remove all wedges remaining in the top three panel unit heights upon completion of the Mechanically Stabilized Earth System. External braces may be required for initial placements. Install joint fillers in the manner indicated by the Installation Manual.~~
- ~~2. Correct all misalignments of installed units in excess of the tolerances allowed by Table 554-3, in a manner satisfactory to the Engineer at no additional cost.~~
- ~~3. Govern the operations and procedures to prevent misalignment of the installed panel units. Precautionary measures include, but are not limited to, keeping vehicular equipment a minimum of 3 feet from the panel units. Within 3 feet of the panel units use compaction equipment meeting the requirements of §203-3.12B6.~~

TABLE 554-3 FACING UNIT ALIGNMENT AND JOINT OFFSET TOLERANCES	
Horizontal Alignment	±3/4 inch/10 feet
Joint Offset per Unit	±1/2 inch
Overall Vertical Plumbness (Top to Bottom of Wall System)	±1/2 inch/10 feet

D. Backfill

- ~~1. Place backfill materials, other than rock, at a moisture content less than, or equal to, the Optimum Moisture Content. Rework or replace, as determined by the Engineer, all backfill material placed at a moisture content in excess of the Optimum Moisture content. Determine the Optimum Moisture Content in accordance with the latest Geotechnical Test Methods for compaction that incorporate moisture content determination. Rework or replace backfill material at no additional cost to the State.~~
- ~~2. Place granular backfill material in uniform layers not exceeding 12 inches loose lift thickness per layer. Compact each layer to a minimum of 95 percent of Standard Proctor Maximum Density in accordance with §203-3.12.~~
- ~~3. Place rock backfill in uniform layers not exceeding 16 inches loose lift thickness. Compact in accordance with requirements determined by the Engineer.~~

E. Reinforcing

- ~~1. Place reinforcing in accordance with the designer-supplier's recommendations or as described in the designer-supplier's Installation Manual.~~
- ~~2. Prior to placement of the steel reinforcing, backfill the area within 3 feet of the panel units horizontally to within 1 inch or less, below the required reinforcing elevation. Roughly grade the backfill beyond the 3-foot line to the reinforcing elevation. Roughly grade the backfill for the geogrid reinforcing to the reinforcing elevation.~~
- ~~3. Before attaching the reinforcing to the panel units, repair all damage to the zinc coating in accordance with the requirements of §719-01.~~

~~4. Prior to the attachment of the reinforcing, as required, fill all openings, or attachment locations, with grease, or other protective material. Obtain the grease, or other protective materials from the chosen designer supplier.~~

~~5. Place reinforcing normal to the panel units unless indicated otherwise by the plans. Take care to avoid breaking, distorting, or disturbing the reinforcing. Replace reinforcing which is broken, or distorted, as determined by the Engineer.~~

~~6. Connect geogrid reinforcing to the facing before placement of subsequent facing units, or as directed by the approved construction drawings.~~

~~7. Operate rubber tired equipment on top of geogrid reinforcing only at low speeds (less than 5mph) and without making sharp turns or braking sharply. Do not operate tracked equipment directly on geogrid reinforcing. Cover geogrid with a minimum 6 inches thick soil layer prior to operating tracked equipment over reinforced areas.~~

~~8. Repair or replace damaged geogrid in strict accordance with the designer supplier's written instructions.~~

~~**554-4 METHOD OF MEASUREMENT.** Determine the quantity as the total number of square feet of face area computed from the plans using the following limits:~~

~~**A. Vertical**~~

~~1. Topmost surface of the leveling footing.~~

~~2. Topmost surface of the facing units.~~

~~**B. Horizontal.** Limits indicated on the plans.~~

~~—When computing quantity, take into consideration the possible variation in the elevations of the footing and top of facing units. No field measurements will be made unless the Engineer specifies in writing a change to the limits indicated on the plans.~~

~~**554-5 BASIS OF PAYMENT**~~

~~**554-5.01 Mechanically Stabilized Earth System.** Include in the unit price bid the cost of all labor, equipment, technical representation from the designer supplier, and materials, including backfill, reinforcing, leveling footing, joint fillers, and coping, unless otherwise modified by the Contract Documents.~~

~~**554-5.02 Excavation and Disposal.** Excavation and disposal of excavated material will be paid for under a separate item.~~

~~**554-5.03 Damaged Units.** No payment will be made for damaged units, nor for units that do not meet dimensional tolerances. Repair, or replace such units as determined by the Engineer, at no additional cost to the State.~~

~~**554-5.04 Reinforcing.** No payment will be made for reinforcing that the Engineer orders replaced. Replace such reinforcing at no additional cost.~~

~~**554-5.05 Water.** Include the cost of adding water for backfill compaction in the unit price bid for the Mechanically Stabilized Earth System, unless items for Furnishing Water Equipment and Applying Water are included in the Contract. If these items are included, include the cost of adding water in their bid prices.~~

Payment will be made under:

Item No.	Item	Pay Unit
554.01XX	Mechanically Stabilized Earth System, No Color	Square Foot
554.02XX	Mechanically Stabilized Earth System, Integral Color	Square Foot

XX	Surface
01	Plain Concrete Surface
02	Textured Surface (hand tooled, raked, etc.)
03	Exposed Aggregate Surface
04	Architectural Pattern (form liner or stamped)
05	As Shown on Plans

SECTION 555 - STRUCTURAL CONCRETE

555-1 DESCRIPTION. This work shall consist of furnishing and placing portland cement concrete for structures as indicated in the contract documents and as directed by the Engineer.

555-2 MATERIALS

555-2.01 General. The materials used for structural concrete shall comply with the material requirements of Section 501, Portland Cement Concrete, General.

Additional materials, listed below, required specifically for use in conjunction with structural concrete items shall meet the requirements of the following subsections:

Concrete Grout Material	701-05
Vertical and Overhead Patching Material	701-08
Rapid Hardening Concrete Repair Material	701-09
Preformed Cork Joint Filler	705-01
Preformed Rubber Joint Filler	705-03
Caulking Compound for Structures	705-06
Preformed Elastic Bridge Joint Sealer	705-09
Polyvinyl Chloride Extruded Shapes and Sheet Material	705-11
Lubricant for Preformed Elastic Joint Sealer	705-13
Bar Reinforcement, Grade 60	709-01
Wire Fabric for Concrete Reinforcement	709-02
Quilted Covers (for curing)	711-02
Plastic Coated Fiber Blankets (for curing)	711-03
Polyethylene Curing Cover (White Opaque)	711-04
Membrane Curing Compound	711-05
Burlap	711-06
Form Insulating Materials for Winter Concreting	711-07
Admixtures	711-08
Water	712-01
Asphalt Roofing Felt	712-12
Epoxy Resin System	721-01
Epoxy Polysulfide Grout	721-03
Copper Flashing	725-01
Sheet Gasket (treated both sides)	728-06
Concrete Cylinder Curing Box	735-01

555-2.02 Concrete for Structures. The class of concrete required for the various structural concrete items will be indicated in the contract documents. The same source of aggregates shall be used for all faces and surfaces of concrete exposed to view.

555-3 CONSTRUCTION DETAILS

555-3.01 Concrete Manufacturing and Transportation. Unless otherwise specified in the contract documents, the construction details for manufacturing and transporting concrete shall comply with §501-3, Portland Cement Concrete - Construction Details.

555-3.02 Falsework. Falsework plans shall be submitted by the Contractor and approved by the Engineer before falsework construction is started. Falsework or centering shall be designed for the dead load of the concrete forms, the dead load of the plastic concrete (based on 150 pcf) and a live load resulting from a weight of 50 psf applied to all horizontal surfaces.

Falsework which cannot be founded upon a solid footing, shall be supported by falsework piling.

Screw jacks or hardwood wedges may be required for falsework centering or to take up any slight settlement in the form work, either before or during the placing of concrete.

Falsework shall be set to give the finished structure the specified camber, plus allowance for shrinkage and settlement.

555-3.03 Forms.

A. General. All forms shall be well constructed, carefully aligned, substantial, and firm, securely braced, and fastened together in their final position. They shall be strong enough to prevent the fresh concrete from bulging the forms between supports and to withstand the action of mechanical vibrators. If required by the Engineer, form work plans shall be submitted by the Contractor and approved by the Engineer before forms can be used on the work.

Forms shall be designed to resist a dead load resulting from a weight of 150 pcf for the plastic concrete and a live load resulting from a weight of 50 psf on horizontal surfaces. The form and falsework design shall provide for the loads resulting from any conveyance system in addition to the live load.

When concrete is transported by buggies, conveyor belt, or other approved methods of conveyance, the forms shall be capable of supporting the distribution equipment and any concentrations of concrete which may occur during transportation and distribution. Buggy runways and other supporting platforms shall be supported directly by the forms.

Forms shall be adequately braced to resist concrete design loads. If the forms are inadequately braced concrete placement shall stop until adequate bracing has been provided.

All forms shall be set and maintained true to the line designated until the concrete is sufficiently hardened. Forms shall be maintained to eliminate the formation of joints due to shrinkage of the lumber. Forms shall be sufficiently tight to prevent leakage of mortar.

Forms may be constructed of wood, metal, or other approved materials, except when a particular material is specified in the contract documents. The use of fiber forms will be permitted for round columns only if the interior surface of the forms have been treated in such a manner as to prevent helical corrugation marks on the finished concrete surfaces. Forms shall be filleted 1 inch with forming material at all exposed corners to create a chamfer in the finished concrete unless otherwise shown in the contract documents.

When curved, patterned, or other special forms are required, the Contractor shall submit details of the form construction to the Engineer for approval prior to constructing the forms. Forms shall be so constructed that those surfaces on which finishing may be required may be stripped without disturbing the remaining forms. Premanufactured formliner panels, if used, shall be capable of imprinting the surface of the concrete with a uniform and aligned pattern and texture. The panels shall be composed of elastomeric urethane, polyvinyl chloride (PVC), ABS plastic, or other suitable material for their intended shape and number of reuses to achieve the desired effects. Formliners shall leave crisp, sharp definition of the architectural surface. Sufficient liners shall be used to minimize pattern repeat. Formliners shall not compress more than 1/4 inch when concrete is poured at a rate of 10 vertical feet per hour.

Any metal ties or anchorages within the forms shall be so constructed that the embedded portion of the ties can be removed to a depth of at least 2 inches from the surface of the concrete without damage to such surface. Wire ties shall not be used without written approval of the Engineer. In

case wire ties are approved, all wires, upon removal of the forms, shall be cut back at least 1/4 inch from the face of the concrete with sharp chisels or nippers (nippers are necessary for green concrete). All cavities produced by the removal of metal ties shall be filled in conformance with requirements of §555-3.11, Corrective Finishing.

For walls where access to the bottom of the forms is not practicable, the lower form boards or panels shall be left loose so that the inside of the forms can be readily cleaned of all chips, dirt, sawdust, or other extraneous material, immediately prior to the placing of concrete.

Forms to be reused shall be maintained in good condition as to accuracy of shape, strength, rigidity, watertightness, and smoothness of surface. Any warped or bulged forms must be carefully resized before being re-used. Forms that are unsatisfactory in any respect shall not be used. All form surfaces that will be in contact with the concrete shall be thoroughly treated with an approved form coating in the manner, and at the rate specified by the manufacturer. Only those coatings listed on the Approved List published by the Materials Bureau are acceptable. Forms so treated shall be protected against damage or dirt prior to placing concrete.

If metal forms are used, the material shall be of such thickness that the forms will remain true to shape. All bolt and rivet heads shall be countersunk. Clamps, pins, or other connecting devices shall be designed to hold the forms rigidly together and to allow removal without damage to the concrete. Metal forms, which do not present a smooth surface or line up properly, shall not be used. Special care shall be exercised to keep metal forms free from rust, grease, or other foreign matter that would tend to discolor the concrete.

B. Foundation Concrete. The footings of structures shown in the contract documents shall be considered as approximate only, and when ordered in writing by the Deputy Chief Engineer (Structures), shall be changed to such dimensions as will give a satisfactory foundation. Concrete shall not be placed in any foundation form without the Engineer's approval.

555-3.04 Handling and Placing Concrete.

A. Placement Limitations. No concrete shall be placed when the ambient air temperature is below 45°F, unless the Engineer grants approval to a written proposal from the Contractor. No concrete shall be placed during rain.

When concrete is to be placed in contact with steel members, reinforcing steel, or previously placed concrete, the temperature of the steel and concrete shall be raised to approximately 45°F. The use of enclosures and heating equipment, including but not limited to the use of forced hot air, hot water boilers, and hoses, or other methods suitable to the Engineer, may be required before concreting begins.

When concrete is to be placed in contact with earth or rock, within piles, or for tremie placements, the temperature of the earth or rock shall be 35°F or higher. The earth or rock shall not have any snow, ice, frost, or standing water on its surface. The use of insulating materials and heating equipment may be required before concreting begins.

B. Conveyance. Concrete shall be placed so as to avoid segregation of materials and displacement of reinforcement. All equipment used for conveying the concrete mix, from the point of delivery and material acceptance to the discharge point, shall be capable of meeting the permissible variations given in Table 555-1, Concrete Conveyance Uniformity. Prior to the actual placement of concrete, the Contractor shall demonstrate the capability of the equipment to convey the concrete mixture. Tests according to Department written instructions will be performed by, and at the discretion of the Engineer. No further verification of the equipment capability will be required unless evidence of nonuniform concrete is observed during placement.

When concrete pumps are used, the lines shall have a minimum diameter of 5 inches. The pumping operation shall be performed in such a manner as to discharge concrete horizontally a minimum distance of 3 feet. Where horizontal discharge is not possible, the use of double 90-degree bends at the end of the pump hose, reducer hoses, or other equipment capable of maintaining a head of concrete in the pump line may be allowed, subject to the approval of the Director, Materials Bureau.

All chutes, troughs, and pipes shall be kept clean and free from coatings of hardened concrete by thoroughly flushing with water after each use. Water used for flushing shall be discharged clear of the concrete already in place.

Concrete shall not come in contact with any aluminum during conveying and placing operations.

TABLE 555-1 CONCRETE CONVEYANCE UNIFORMITY		
Test	Permissible Variation (Concrete samples taken at two locations in the handling process)	
Air Content, % by volume of Concrete	1.5%	
Slump	Average slump 4 inches or less	1 inch
	Average slump greater than 4 inches	1 1/2 inches

C. Acceptance/Testing. The concrete mixture, prior to placement into the conveying equipment, shall meet the specified requirements for air content and slump given for the various classes and types of placement under Table 501-3, Concrete Mixtures.

D. Placement. All foreign matter of every kind shall be removed from the interior of the forms before placing concrete. Temporary studs or braces within the forms shall be removed when the concrete has reached an elevation rendering their further use unnecessary. Dropping concrete a distance of more than 5 feet or depositing a large quantity at any point and running or working it along the forms shall not be permitted. Dropchutes shall be used between vertical forms unless conveyance equipment can be inserted between forms.

Special care shall be taken to fill each part of the form by depositing concrete directly into the form as near to its final position as possible, to work the coarser aggregates back from the face of the concrete and to force the concrete under and around the reinforcement without displacing the reinforcement. After the concrete has taken its initial set, care shall be exercised to avoid jarring the forms or placing any strain on the ends of the projecting reinforcement.

Concrete shall be placed in horizontal layers not more than 1 foot thick except as hereinafter provided. When less than a complete layer is placed in one operation, it shall be terminated in a vertical bulkhead. Each layer shall be placed and consolidated before the preceding layer has taken its initial set to prevent damage to the green concrete and avoid cold joints between batches. Each layer shall be consolidated using appropriate vibrating practices so as to avoid the formation of a joint with a preceding layer which has not taken initial set.

When concrete placement is temporarily discontinued, the concrete, after becoming firm enough to retain its form, shall be cleaned of laitance and other objectionable material to a depth sufficient to expose sound concrete. To avoid visible joints as far as possible upon exposed faces, the top surface of the concrete adjacent to the forms shall be smooth and level whenever concreting is discontinued. Where a “feather edge” would be produced at a construction joint, as in the sloped top surface of a wing wall, an inset form work shall be used to produce a blocked out portion in the preceding layer which shall produce an edge thickness of not less than 6 inches in the succeeding layer. Work shall be continuous from the bottom to the top of any face.

When embedding structural shapes in concrete, the placement of concrete shall be progressed on one side of the shape only until it flushes up over the bottom flange of the shape on the opposite side, after which concrete shall be placed on both sides to completion.

E. Vibration. During and immediately after deposition, concrete shall be thoroughly consolidated by vibrating the concrete internally with mechanical vibrating equipment. The use of external vibrators will be permitted when satisfactory surfaces cannot be obtained by internal vibration alone or when it is impossible to use internal vibrators. The use of external vibrators shall be subject to the approval of the Engineer. External vibrators shall be attached to or held on the forms in such a manner as to effectively vibrate the concrete in a horizontal plane.

Internal mechanical vibrators shall be adequately powered, capable of transmitting vibration to the concrete in frequencies of not less than 5,000 vibrations per minute while inserted in concrete and

shall produce a vibration of sufficient intensity to consolidate the concrete into place without separation of the ingredients. If any of the reinforcing steel has epoxy coating, an internal mechanical vibrator shall have a rubberized or elastomeric cover to prevent damage to the epoxy coating on the reinforcing bars. The vibrators and covers shall be inspected for defects prior to use.

A sufficient number of vibrators shall be employed, so that at the required rate of placement, thorough consolidation occurs throughout the entire volume of each layer of concrete. Extra vibrators shall be on hand for emergency use and when other vibrators are being serviced.

The vibrating element shall be vertically inserted in the concrete mass at a depth sufficient to vibrate the bottom of each layer effectively inserting the vibrator into the underlying lift. It shall be withdrawn completely from the concrete before being advanced to the next point of application.

Internal vibrators shall not be placed directly on the forms or the reinforcing steel. The vibratory element shall be inserted vertically into the concrete at the point of deposit and in areas of plastic concrete at evenly spaced intervals not farther apart than the radius over which the vibration is visibly effective and at a distance close enough to the forms to effectively vibrate the surface concrete. The time of vibration shall be of sufficient duration to accomplish thorough consolidation, complete embedment of the reinforcement, produce dense, smooth surfaces free from aggregate pockets, honeycombing, and air bubbles and to work the concrete into all angles and corners of the forms however, over-vibration shall be avoided. Vibration shall be continued in one place until the concrete has become uniformly plastic, but not to the extent that pools of grout are formed.

Vibration shall be supplemented by working or spading by hand in the corners and angles of forms and along form surfaces while the concrete is plastic. Vibrators shall not be used to push or distribute the concrete laterally.

555-3.05 Depositing Structural Concrete Under Water.

A. General. Use a tremie tube, pipeline, or similar method to place concrete under 32 - 90°F water in one continuous operation. Since the tremie tube and the pipeline are both tubes, the word "tube" in this specification refers to either type, except where specific reference is made to either the tremie tube or the pipeline.

Unless noted differently on the plans, use Class G concrete as described in Table 501-3, Concrete Mixtures. Substitute Class GG Concrete when clear openings between closely spaced objects such as reinforcement bars are less than 3 inches. Pozzolan replacement may be omitted for small placements in a fresh water environment when approved by the DCES.

In addition to §555-3.03 Forms, place concrete on prepared areas cleaned of all debris, mud, or other unsuitable material.

Submit a list of equipment, including back-up, and a schedule for transporting and placing concrete, to the Engineer for review at least 20 working days prior to concrete placement. The Contractor shall be responsible to design a tremie placement, with appropriate forming, that maintains a minimum vertical rise of 1 foot per hour for the overall area and a minimum placement rate of 40 cubic yards per hour, unless fluid concrete pressure requires a reduced placement rate.

Place fresh concrete before stiffening and initial set of the adjacent concrete to ensure a good bond and avoid cold joints. If a delay occurs, determine stiffening and initial set by probes or other methods approved by the Engineer. Stop the operation if the placement cannot be continued before initial set of the adjacent concrete. The Engineer will then immediately contact the DCES.

B. Methods of Placement. The tremie tube and pump and pipeline are the most common methods. Obtain approval of the DCES for any other method.

1. Tremie Tube Method (Open System). This method uses a vertical tube open at the top, where concrete is delivered to the top and falls down the tube.

a. Tremie tube size shall be based on the delivery system used by the Contractor.

Delivery System	Inside Diameter
Large volume, such as crane and bucket	10 inches minimum

Small volume, such as pump line or conveyor 5 inches minimum

b. Use a sturdy hopper or funnel with a bottom opening smaller than the tremie tube diameter to transfer concrete into the tremie tube. The capacity and shape of the hopper or funnel depends on the volume and type of concrete delivery system. A device with the same size bottom opening may be used if a 1 1/2 to 2 inch diameter breather tube is installed to reach 1 foot or more down into the tremie tube.

c. Install a safe work platform at the top of the tremie tube.

2. Pump and Pipeline Method (Closed System) This method uses a vertical tube, attached to a closed tube system, where concrete is pumped to the top and falls down the tube.

a. Use pipe with a minimum inside diameter of 5 inches.

b. Install a minimum 2 inch diameter air vent or valve connection, or leave the pipe joint loose without a gasket, near the high point of the downgrade, 1 to 4 feet below the point where concrete starts falling down the pipe, to allow air displaced by concrete to escape, and admit air to prevent a siphoning effect.

c. Class G concrete, the mix noted on the plans, or a “cement-water” grout may be used for pipeline lubrication and placed in the forms. Waste any other concrete mix used to lubricate pipeline.

C. Placement Tubes for Tremie Tube or Pump and Pipeline Method. Clearly mark each tube in at least 1 foot increments (numbered every 5 feet) to show depth to the outlet. Use watertight joints. Place tubes no more than 15 feet from the forms and no more than 30 feet on center.

1. Open end tubes Install a separate tube at each placement point, as loss of seal occurs when the embedded end of this tube type is removed from fresh concrete under water. Once started, do not relocate or remove open end tubes until completion of the concrete placement at that location. If loss of seal occurs, remove and seal the tube with a watertight plate or plug for restarting. Restart tremie placement only if a seal can be reestablished using a dewatered tube where the outlet can be surrounded by fresh concrete.

2. End-valve sealed tubes Install the number of tubes based on the minimum placement rate defined in A. General, as the seal is maintained when the embedded end of this type is removed from fresh concrete under water. Raise the end of the tube to about 3 feet below the fresh concrete surface. Then, close the valve with the tube 1/2 full of concrete (1/2 the water depth), and slowly remove the tube. Reverse this procedure upon relocation in fresh concrete.

D. Dewatering. When necessary, proceed with dewatering at least 4 days after completion of concrete placement, unless noted differently on the Contract Plans or as ordered by the Engineer. After dewatering, continue curing and excavate one or more sumps to provide for pumping of accumulated water. Excavate sumps outside of areas which will receive new concrete, or as approved by the Engineer.

E. Concrete Evaluation.

1. Nondestructive Testing. Use as directed by the Contract, or as approved by the DCES.

2. Cores. Obtain cores in the presence of the Engineer at locations and to depths shown on the contract plans. Take NX size (2 1/8 inch) cores, no earlier than 7 days after concrete placement, according to §648-3.04, Rock Core Samples, B. Sampling, the 1st sentence. Use drill bits meeting the requirements of Subsection 732-06, Coring Bits.

Obtain 100% recovery from each core hole, as less is presumed to indicate defective concrete. Use a 5 foot nominal length of core drill run. Record core boring log data in accordance with §648-3.01B, Driller’s Logs.

Label and pack all cores according to §648-3.04 C, Marking, Packaging and Transporting Samples. Deliver and store the core boxes at a site approved by the Engineer, where they become the property of the Department. Provide assistance in moving and arranging core boxes at the site to facilitate evaluation by the Department.

F. Defects. Obtain additional cores for further investigation from areas which contain voids, honeycombing, seams, or other defects. The DCES will determine the number and location of additional core holes. Repair defects with grout when approved by the DCES. Placements with defects determined to be unreparable by grouting will be rejected. Alternate repair techniques require DCES approval.

G. Grout Repairs and Grout Placements. This section only applies for underwater grout placements limited to quickly filled areas, such as core drill holes, small piles up to 1 foot in diameter, and other small voids. Use materials meeting §701-05, Concrete Grout Material, for the grout proportioned as specified or as approved by the DCES.

When the DCES grants approval for repairs, the proposed grouting method shall be performed by cleaning out and filling all defects and core drill holes with grout. Position a grout tube (2 inches or less in diameter) about 1 inch off the bottom of the prepared hole until the grouting operation is complete. Start pumping (closed system) or filling a tremie tube (open system) faster than the grout can fall through water. Continue placing grout until the grout coming back out the hole is the same consistency as that going in. Then withdraw the tube.

Additional cores may be required to verify acceptable repairs.

H. Tremie Construction Joints. Prepare the top area of the placement receiving new concrete to within 3 inches of the elevation shown on the plans. When joining fresh concrete to concrete that has already set, the concrete in place shall have its surface scoured or abraded with a suitable tool to remove all loose and foreign materials. After the surface preparation, the concrete surface, and all porous surfaces to be in contact with new concrete shall be thoroughly wet using potable water for 12 hours with soaker hoses or the use of burlap/burlene/etc. to maintain moisture. The Contractor shall remove any puddles of free-standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated, surface-dry condition until placement of the new concrete.

Fill any low areas with a leveling course of Class A concrete (or Class D for 1 1/2 to 5 inches thick placements).

Fill sumps with concrete or stone, as ordered by the Engineer.

555-3.06 Concrete Joints.

A. Construction Joints. Construction joints for the purpose of these specifications are joints used to provide for interruptions in the placement of concrete. Construction joints shall be placed only where shown in the contract documents or where approved by the Deputy Chief Engineer (Structures). Bulkheads required during placement shall be constructed at the direction of the EIC.

Unless otherwise shown in the contract documents, a shear key shall be provided at each construction joint by embedding water-saturated wooden blocks in the plastic concrete. The shear key thus provided shall be approximately 1/3 of the width of the parts joined. The key depth shall equal the thickness of standard form lumber, approximately 1/2 the key width. Shear keys need not exceed 5 1/2 inches in depth regardless of the key width.

On steel truss or open-spandrel, concrete arch spans, unless otherwise noted in the contract documents, the concrete in the floor system shall be placed about the center line of the span, beginning at the center and working simultaneously toward each end; or beginning at the ends, and working simultaneously toward the center. Care shall be taken to prevent the displacement of reinforcement during the placing of concrete. If, for any reason, it becomes necessary to introduce a construction joint, this shall be formed by means of a vertical bulkhead so constructed as to produce a key joint, placed as shown in the contract documents or as permitted by the Deputy Chief Engineer (Structures).

When joining fresh concrete to concrete that has already set, the concrete in place shall have its surface scoured or abraded with a suitable tool to remove all loose and foreign materials. After the surface preparation, the concrete surface and all porous surfaces to be in contact with new concrete shall be thoroughly wetted, to achieve a saturated surface dry condition, using potable water for 12 hours with soaker hoses or the use of burlap/burlene/etc., to maintain moisture. If conditions or the situation prohibits this, then the surfaces should be wetted for as long as possible. The Contractor shall remove any puddles of free-standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated surface-dry condition until placement of the new concrete. Immediately before placing the new concrete, the forms shall be drawn tightly against the concrete already in place.

Forms for female shear keys shall be beveled on four sides to facilitate their removal and shall be securely fastened to the forms to prevent displacement before the concrete has set. Key forms shall be removed in such a manner as to avoid damage to the concrete.

B. Contraction Joints. Contraction joints shall be placed at locations shown in the contract documents and unless otherwise specified, shall be formed the same as construction joints, except that reinforcement shall not extend through the joint.

C. Expansion Joints. Expansion joints shall be placed as shown in the contract documents. Expansion joints shall provide for expansion, contraction, and the transfer of shear at the joint, unless otherwise specified. When expansion joints are formed by the insertion and subsequent removal of joint templates, this work shall be done in such a manner that joint edges are not chipped or broken down in the process.

When concrete is to be placed against a joint filler, holes or joints in the filler shall be suitably filled with mastic to prevent mortar or concrete from entering the joint and restricting its movement. The face edges of all joints shall be carefully finished or formed true to line and elevation for a minimum distance of 2 inches back from all exposed surfaces.

When caulking compound is used to seal a joint containing premolded bituminous joint filler, a layer of an approved type of pressure-sensitive release tape shall be placed between these materials due to their incompatibility.

D. Waterstops. Waterstops shall be installed in joints to provide for expansion and contraction movements at joints. Place waterstop at all joints exposed to view, as shown in the contract documents, or as ordered by the Engineer. Waterstop shall be a polyvinyl chloride or other approved flexible material, copper strip, zinc strip or lead sheet. The waterstop shall extend at least 3 inches into the concrete on each side of the joint, shall be joined to be continuous and watertight, and shall be carefully protected from damage until covered by concrete or backfill.

555-3.07 Finishing.

A. General. All exposed unformed surfaces, whether permanent or at construction joints, shall be finished by placing an excess of material in the forms and striking off the excess with a suitable float, forcing the coarse aggregate below the level of the finished surface, and troweled to a suitable finish. The use of mortar topping for surfaces shall not be permitted.

Following the discontinuance of placing concrete, all accumulation of mortar splashed upon the reinforcing steel and the surfaces of forms shall be removed. Dried mortar chips and dust shall not be puddled into the plastic concrete.

B. Bearing Surfaces. The entire surface area of bridge seats or pedestals shall be floated and troweled to true grade or, at the option of the Contractor, left approximately 1/4 inch high and bush hammered or otherwise finished to the exact elevations indicated in the contract documents.

555-3.08 Curing.

A. General. All structural concrete shall be cured for a minimum of seven curing days unless otherwise stated. The curing period shall begin only after all curing procedures and practices for a given placement are established. A curing day is defined as any day during which the ambient air temperature at the concrete surface is 45°F or higher for the entire day.

Conditions may occur which prevent an entire day from qualifying as a curing day, but do not prevent portions of that day from reaching temperatures that qualify as curing temperatures. If these conditions occur and with the Engineer's approval, the Contractor may aggregate curing hours. A curing hour is defined as any hour during which the curing temperature remains at, or above 45°F. An aggregation of 24 curing hours will be credited as one curing day. Aggregations of less than 24 curing hours will not be credited.

Curing hours will be determined with continuous recording thermometers. The number and placement of the thermometers will be determined by the Engineer. Thermometers used to monitor curing temperatures shall consist of the following types:

1. Continuously Recording Thermometer. The thermometer shall be capable of continuously recording temperatures within a range of 0°F to 120°F for a minimum of 24 hours.

2. Maximum - Minimum Recording Thermometer. For all placements, the thermometer shall be capable of recording maximum and minimum temperatures within a range of 0°F to 120°F.

Provide all equipment, supplies, and labor necessary for calibration.

The curing temperature of concrete is the air temperature at the concrete surface, or the air temperature between the concrete surface and its protective covering. Temperatures at these locations are critical for proper concrete curing. For the purposes of this section the temperatures at the foregoing locations shall be maintained between 45°F and 85°F inclusive.

All structural concrete surfaces must be cured by any one, or a combination of, the following methods unless otherwise noted:

- Polyethylene curing covers - white opaque.
- Plastic coated fiber blankets.
- Clear (fugitive dye) membrane curing compound.
- Continuous burlap wetting.
- Wet burlap and curing covers.
- Forms left in place

Curing shall commence on all exposed surfaces no later than 30 minutes after completion of finishing. Finishing and curing operations shall progress with concrete placement. Curing covers shall be placed as soon after concrete finishing as the Engineer determines will not cause damage to the concrete surface. However, under no circumstances shall the curing be delayed beyond 30 minutes of the completion of finishing. Care shall be taken so as not to damage the finished surface or texturing. Curing covers shall be lapped a minimum of 1 foot. All lapped edges shall be sealed with pressure sensitive tape. Covers shall be protected from displacement.

Clear (fugitive dye) membrane curing compound shall be sprayed on the concrete surface immediately following the finishing operation, or form removal, whichever is applicable. The compound shall be applied by means of a pressure spraying system, or by distributing equipment, at a minimum rate of 150 sf per gallon of surface. The equipment for applying the compound shall be such that the compound is applied as a fine spray with no surface damage to the concrete. The equipment shall also provide for adequate agitation of the compound during application, and shall be approved by the Engineer before work is started. Should the application method produce a nonuniform film, or should the spraying equipment fail and back-up equipment is not immediately available, the application shall cease. Curing shall then be continued by another acceptable method. The Contractor shall provide sufficient approved covers for protection of the concrete surface in the event of rain or equipment breakdown.

If forms are removed during the curing period (refer to §555-3.09), the concrete curing shall be continued using a clear (fugitive dye) membrane curing compound applied immediately after form removal.

B. Provisions for Curing in Hot Weather. When forms are left in place in extremely hot weather the forms shall require wetting to reduce surface heat.

If the ambient air temperature exceeds 85°F, continuous, uniform wetting for curing shall be required until the seven (7) day curing period is complete and forms are removed. Use of plastic sheeting over the established curing is not allowed in hot weather conditions.

C. Provisions for Curing in Cold Weather. If the ambient air temperature falls, or is expected to fall, below 45°F, the requirements of Table 555-2 shall apply.

TABLE 555-2 COLD WEATHER CURING REQUIREMENTS	
Ambient Temperature (AT) at time of concrete placement and as anticipated during curing duration	Curing requirements
32°F < AT < 45°F for less than 24 consecutive hours	Contractor proposed/Engineer approved method for maintaining temperatures used
32°F < AT < 45°F for more than 24 consecutive hours	Heated enclosure required
AT < 32°F	Heated enclosure required

Prior to use, all proposed methods must meet the approval of the Engineer. If the curing temperature falls below 32°F at any time during the curing period, the concrete will be rejected.

To provide assurance of the curing temperatures, the Contractor shall supply maximum-minimum thermometers. Temperature measurements will be taken by the Engineer and a record will be maintained for the curing period. As a minimum, thermometers shall be placed adjacent to forms at the bottom, middle, and top of a placement. Additional thermometers may be placed in areas where extreme cold or heat, from external sources, can be expected.

If the existing method employed by the Contractor to maintain the curing temperature fails, the Contractor shall modify the existing method immediately to reestablish an acceptable curing temperature.

The length of the curing period will be extended until the required number of curing days are accumulated.

1. General. When approval is granted in writing by the Engineer for cold-weather concreting, the curing temperature shall be maintained between 45°F and 85°F for the curing durations stated by provision of external heat or utilization of heat of hydration retained by insulated forms.

2. Provision of External Heat. If the Contractor is required, or elects, to maintain curing temperatures by this method, the Contractor shall furnish sufficient canvas and framework, or other type of housing, to enclose and protect the structure in such a way that the air surrounding the fresh concrete on all sides be kept at a temperature between 45°F and 85°F for the specified curing period. At the end of the curing period, the heat shall be gradually reduced at a rate not to exceed 1 degree F per hour until the temperature within the enclosure equals the temperature outside the enclosure. Materials and equipment necessary to erect the enclosure and provide external heat shall be present on the job site and approved by the Engineer before any concrete is placed.

External heat shall be provided by means of stoves, salamanders, heated hoses, steam equipment, warmed curing water, or other equipment supplied by, operated by the Contractor. Heating appliances shall not be placed in such a manner as to endanger formwork, centering, or expose any area of concrete to drying out or damage due to excessive temperatures. Sufficient equipment shall be supplied to continuously maintain the specified temperature with a reasonable

degree of uniformity in all parts of the enclosure. The enclosures shall be properly vented to prevent surface disintegration of fresh concrete due to an accumulation of carbon dioxide gas. All exposed concrete surfaces within the heated area shall be protected from drying by one of the following methods:

- Use of live steam.
- Continuous wet burlap or wet burlap used with curing covers.
- Curing compounds used with curing covers.

TABLE 555-3 INSULATION REQUIREMENTS FOR CONCRETE WALLS, PIERS AND ABUTMENTS ABOVE GROUND				
Minimum air temperature allowable - Concrete Placed at 50°F				
Wall Thickness feet	Thicknesses of Commercial blanket or bat insulation - Deg. F.			
	1/2 inch	1 inch	1 1/2 inch	2 inch
Portland Cement Content - 500 lb/cy				
1/2	45	35	22	14
1	35	15	-5	-26
1 1/2	27	-3	-33	-65
2	23	-10	-50	
3	18	-20		
4	17	-23		
5	16	-25		
Portland Cement Content - 600 lb/cy				
1/2	44	32	16	6
1	32	8	-16	-41
1 1/2	21	-14	-50	-89
2	18	-22		
3	12	-34		
4	11	-38		
5	10	-40		
Portland Cement Content - 700 lb/cy				
1/2	43	29	10	0
1	29	1	-27	-56
1 1/2	15	-25	-69	
2	13	-33		
3	7	-48		
4	5			
5	4			

NOTES:

1. This table is based upon the stated thickness of blanket, or bat-type insulation, having a thermal conductivity (K value) of 0.25 BTU per hour per sf per thermal gradient of 1°F per inch.
2. When using concrete containing pozzolans, do not consider the pozzolans as part of the cement content. Use the values given for a portland cement content that are equal to or less than the actual cement content of the mix, due to a lower heat of hydration when using pozzolans.

3. Heat Retention by Insulated Forms. Insulated forms may be used to maintain acceptable curing temperatures in accordance with the provisions of Table 555-2, when ambient temperatures will not drop below 32°F. If the Contractor elects to maintain curing temperatures by this method, sufficient insulation shall be furnished to protect and maintain the temperature between the insulation and formwork within the range of 45°F to 85°F for the specified curing period. Discontinuance of protection shall be accomplished in such a manner that the drop in temperature of any portion of the concrete shall be gradual. The surface temperature of concrete sections more than 2 feet in thickness shall not drop faster than 18°F in a 24-hour period. The

surface temperature of concrete sections less than 2 feet in thickness shall not drop faster than 36°F in a 24 hour period.

Forms may be removed without restriction, providing the temperature difference between the air and the surface of the concrete is not more than 27°F. If possible, forms shall be removed about the middle of the day to take advantage of the generally higher afternoon temperatures.

Form insulating material shall be installed on the forms in such a manner so as to achieve the full benefit of its insulating properties and at the same time provide against the infiltration of wind and water. All portions of steel forms shall be covered by insulating material so that no steel is exposed to the air. Any tears or damaged areas in the insulating material shall be repaired. Special attention shall be given to ensure that all corners and angles are properly insulated and protected against wind damage.

Where tie rods extend through the form insulating material, a plywood washer (3/4 x 6 x 6 inches approx.) shall be placed over the tie rod and secured against the insulating material.

After placement of the concrete, the exposed concrete surfaces shall be covered with insulating blankets, except for areas where protruding reinforcing bars make the use of blankets impracticable. These areas may be covered with hay or other approved insulating material. Tarpaulins shall be used to protect the insulating material.

The insulating material shall be insulating blankets, bat insulation, solid foam, or sprayed foam meeting the requirements of §711-07, Form Insulating Materials for Winter Concreting. The thickness of standard blankets, or bat insulation, required for varying air temperatures, concrete thicknesses, and cement contents of the mix are listed in Table 555-3. The thickness of the insulating material used shall be determined by multiplying the equivalency factor for the insulating material by the thickness shown on Table 555-3. The equivalency factors for all approved insulating materials are given in the Department's Approved List, Insulating Materials for Winter Concrete (§711-07).

SUBSTRUCTURE PIECE	STRIPPING ⁽²⁾	FORMING NEXT PLACEMENT	LOADING
All Footings	2 days	2 days	4 days before next placement
Abutment stems, backwalls	2 days if less than 10 feet (avg.). Add 1 day for each additional 5 feet to 5 days, maximum.	2 days	5 days before placing backwall on stem. 7 days before backfilling, 14 days before placing superstructure loads. ⁽³⁾
Pier Columns, Pier Plinths	2 days if less than 10 feet high (avg.). Add 1 day for each additional 5 feet.	4 days - columns 2 days if forming pedestal	Columns - 7 days before placing cap beam. Plinth- 2 days before pedestal placement. 21 days before placing superstructure loads. ⁽³⁾
Pier cap beams	8 days (bottom) 3 days (sides)	2 days	5 days before pedestal placement. 21 days before placing superstructure loads. ⁽³⁾
All pedestals	2 days	—	7 days (class A) 3 days (class F) ⁽⁴⁾
Wingwalls or Retaining walls	Same as abutment stems.	—	14 days before backfilling ⁽³⁾
Arch centers Centering under beams	8 days	—	14 day ⁽³⁾

NOTES:

1 The minimum times for loading in this table are NOT applicable when using concrete that contains fly ash or ground, granulated blast furnace slag that is placed and/or cured when ambient temperatures are 60°F or less. The provisions in Note 3 are required for casting, curing, and testing of compressive strength cylinders for concrete that contains fly ash or ground, granulated blast furnace slag that is placed and/or cured when the ambient temperature is 60°F or less. The compressive strength results will be the basis of determining when loading can occur.

2 All concrete shall be cured for a minimum of seven curing days. A "Day" is a curing day as defined in Subsection 555-3.08A. Concrete surfaces being cured using forms, covers, or blankets from which the covers are removed for any purpose prior to the full cure period shall be sprayed with an approved clear (fugitive dye) curing compound within ten minutes of cover removal.

3 When early loading is requested, the minimum time requirements for loading may be reduced (or extended) based on test cylinder compressive strength results. The DCES will establish requirements for early loading upon request. The Contractor shall notify the Engineer, in writing, at least 10 days prior to placement, that early loading is being requested, so that arrangements for test cylinders can be made. Test cylinders shall be prepared in accordance with Materials Method 9.2 - Field Inspection of Portland Cement Concrete. Two test cylinders shall be prepared for each anticipated testing period. These cylinders shall be cured in the same manner as the substructure element which they represent. After the first compression test, the Engineer shall determine subsequent testing periods based on the results of the first test. No more than three tests for each substructure element shall be allowed.

4 Minimum time for loading pedestals shall not compromise minimum loading times specified for other placements.

555-3.09 Form Removal. Forms shall be removed in such a way as to permit the concrete to take the stresses uniformly and gradually. Any method of form removal likely to cause overstressing of the concrete shall not be used.

The forms for any portion of a structure shall not be removed until the concrete is strong enough to resist damage. The earliest time of form removal shall be as specified in Table 555-4, Minimum Time for Form Removal - Substructures. If the form removal causes damage, the operation must stop immediately until such time that sufficient concrete strength is achieved. All damage shall be repaired in conformance with §555-3.13, Damaged or Defective Concrete.

555-3.10 Loading Limitations. Forms used for substructure concrete placements shall be removed in accordance with the requirements of Table 555-4, Minimum Time for Form Removal - Substructures. The minimum times for loading in this table are NOT applicable when using concrete that contains fly ash or ground, granulated blast furnace slag that is placed and/or cured when ambient temperatures are 60°F or less. The provisions in Note 3 are required for casting, curing, and testing of compressive strength cylinders for concrete that contains fly ash or ground granulated blast furnace slag that is placed and/or cured when the ambient temperature is 60°F or less. The compressive strength results will be the basis of determining when loading can occur.

555-3.11 Corrective Finishing. Immediately after forms have been removed, surfaces exposed to view shall have all projections and irregularities carefully removed and all cavities greater than 1 inch in diameter and/or 1/4 inch in depth neatly filled with mortar of the proportion used in the concrete. The same brand of cement and the same kind of aggregate shall be used for filling cavities as was used in the original concrete mix. Plastering of surfaces shall not be allowed. The surface film (drying cement paste) of all such repaired surfaces shall be carefully removed before setting occurs.

All rust and other stains shall be removed from concrete exposed to view. Removal shall be accomplished using methods and materials approved by the Engineer. Materials used for rust stain removal shall be as listed on the Approved List published by the Department's Materials Bureau.

555-3.12 Weep Holes. The Contractor shall construct weep holes in all retaining walls and abutments as indicated in the contract documents.

555-3.13 Damaged or Defective Concrete. All defects or damage to concrete which occurs prior to the final acceptance of the work shall be repaired or replaced at no additional expense to the State. The defects shall include but are not limited to spalling and irregular cracking at joints, edge spalls, honeycombing, and damage or other imperfections caused by traffic and/or construction operations. Any concrete requiring complete replacement shall be replaced in kind as concrete originally called for in the contract documents. Any repairs shall be performed to the methods described in these specifications

§555

unless otherwise approved by the Engineer. When a repair is made, the defective or damaged concrete shall be removed by saw cutting the perimeter to a depth of 1 1/2 inches, chipping the unsuitable material to sound concrete with light, hand held, pneumatic tools at a 45 degree angle into the patch area, and cleaning all exposed reinforcing and concrete surfaces. All surfaces to be repaired shall be thoroughly blast cleaned. Prior to placing repair concrete, all surfaces shall be wetted to a saturated surface dry condition.

Small spalls of 0.1 cy or less, and areas of 10 sf or less where concrete removal is required may be repaired using approved Concrete repair materials. Vertical or overhead surfaces may be patched with Vertical and Overhead Patching Material. Surface preparation for small repairs shall be according to the material manufacturer's recommendations. After repair is complete, and curing time has elapsed, the Engineer will hammer sound all repair areas to assure proper bond has been achieved.

Concrete with surfaces misshapen by bulges or deformations caused by inadequate forms, or resulting in insufficient cover of reinforcing, shall be removed or corrected.

555-4 METHOD OF MEASUREMENT

555-4.01 Concrete for Structures. The work will be measured for payment as the number of cubic yards of concrete for structures satisfactorily placed, measured to the nearest 0.1 cubic yard within the lines of the structure as shown in the contract documents. No deductions shall be made for the volume of joint material, embedded metal reinforcement, structural shapes, chamfers, tops of piles, or pipe with an end area of less than 1 sf.

555-5 BASIS OF PAYMENT

555-5.01 General. When the Contractor elects to substitute an optional concrete class as permitted by Table 501-1, Concrete Class Options, payment will be made for the originally specified class of concrete using the originally specified method of measurement.

555-5.02 Concrete for Structures. The unit price bid per cubic yard shall include the cost of furnishing all labor, materials and equipment necessary to complete the work, except reinforcement will be paid for separately under its appropriate item. Unless otherwise provided, the unit price bid shall include the cost of furnishing and placing flashing or other metal strips, flexible water stops, sheet packing, pipe drains, bituminous material, water for wetting, joint materials, felt, tar paper, joint sealing compounds, joint fillers, and concrete curing materials.

No extra compensation for falsework or falsework piling will be paid. This work is included as part of the formwork.

No extra compensation for corrective finishing or repairs to damaged or defective concrete will be paid.

Bridge bearings, expansion joints, and anchor bolts will be paid for under their appropriate items.

Progress payments will be made, after the concrete and curing applications have been properly placed, to the extent that payment will be made at 90% of the computed quantity of each concrete placement, with the balance to be paid after completion of all curing and corrective work thereon.

Payment will be made under:

Item No	Item	Pay Unit
555.0104	Footing Concrete, Class A (No Concrete Class Substitutions Permitted, Except Class H Where Footing is 3 feet Thick or Less)	Cubic Yard
555.0105	Concrete for Structures, Class A	Cubic Yard
555.05	Concrete for Structures, Class F	Cubic Yard
555.06	Concrete for Structures, Class G (Deposited Under Water)	Cubic Yard
555.07	Concrete for Structures, Class GG (Deposited Under Water)	Cubic Yard
555.08	Footing Concrete, Class HP	Cubic Yard
555.09	Concrete for Structures, Class HP	Cubic Yard
555.10	Concrete for Structures, Class D	Cubic Yard
555.11	Concrete for Structures, Class DP	Cubic Yard

SECTION 556 - REINFORCING STEEL FOR CONCRETE STRUCTURES

556-1 DESCRIPTION. The work will consist of furnishing and placing reinforcing steel for concrete structures, or stud shear connectors, in accordance with the contract documents, and in a manner satisfactory to the Engineer.

Reinforcing steel for concrete structures may be uncoated, epoxy-coated, galvanized, or stainless steel, as indicated in the contract documents.

Comment [c60]:
EI09032

~~**556-1 DESCRIPTION.** The work will consist of furnishing and placing reinforcing steel for concrete structures, or stud shear connectors, in accordance with the contract documents, and in a manner satisfactory to the Engineer.~~

~~—Reinforcing steel for concrete structures may be uncoated, epoxy-coated, galvanized, stainless steel clad, or stainless steel, as indicated in the contract documents.~~

556-2 MATERIALS. Materials for this work shall meet the requirements of the following subsections of Section 700-Materials and Manufacturing:

Uncoated Bar Reinforcement, Grade 60	709-01
Wire Fabric for Concrete Reinforcement	709-02
Epoxy-Coated Bar Reinforcement	709-04
Stud Shear Connectors	709-05
Epoxy-Coated Wire Fabric Reinforcement	709-08
Mechanical Connectors for Reinforcing Bar Splices	709-10
Galvanized Bar Reinforcement	709-11
Stainless Steel Clad Bar Reinforcement	709-12
Stainless Steel Bar Reinforcement	709-13
Uncoated Bar Reinforcement, Grade 75	709-14

556-2.01 Devices for Supporting and Tying Reinforcement. Chairs, tie wires, and other devices used to support, position, or fasten the reinforcement shall be made of or coated with, a dielectric (electrically insulating) material. Stainless steel chairs without polyethylene tips and meeting the requirements of ASTM A493, AISI Type 430, may also be used. The specific hardware that the Contractor proposes to use shall be approved by the Engineer.

When forms are to be removed in their entirety, uncoated steel chairs equipped with snug-fitting, high-density, polyethylene tips which provide 1/4" clearance between the metal and any exposed surface may be used, except that uncoated steel chairs shall not be used in contact with stainless steel.

Comment [c61]:
EI09032

~~—When forms are to be removed in their entirety, uncoated steel chairs equipped with snug fitting, high density, polyethylene tips which provide 1/4 inch clearance between the metal and any exposed surface may be used.~~

556-3 CONSTRUCTION DETAILS

556-3.01 General

A. Ordering. Prior to ordering reinforcing steel, the Contractor shall carefully check all bar lists, and assume full responsibility for their accuracy. No change in the bar list shall be made by the Contractor unless approved by the DCES. If no bar list is provided in the Plans, then §557-3.16 No Bar List Provided shall apply.

B. Handling and Storage

~~**B. Protecting Reinforcement Coatings**~~

1. Epoxy-Coated Reinforcing Steel. All epoxy-coated reinforcement shall be stored above ground on wood or padded supports.

Epoxy-coated reinforcement stored on-site shall be protected from sunlight and moisture using opaque waterproof covers. Covers shall be placed in a manner that will permit constant air circulation so as to minimize the formation of condensation on the epoxy-coated surface.

All equipment for handling epoxy-coated steel shall have padded contact areas. All bundling bands shall be padded and all bundles shall be lifted with a strong back, multiple supports, or a platform bridge so as to prevent steel-to-steel abrasion from sags in the bundle.

Steel shall not be dropped or dragged. Care shall be taken at all times to prevent damage to the epoxy coating.

Steel that is partially embedded in concrete shall have the exposed sections protected with opaque waterproof covers prior to any winter shutdown of a project.

2. Galvanized Bar Reinforcement. All galvanized bar reinforcement shall be stored above ground on wood or padded supports and arranged so that rainwater drains off the bars.

3. Stainless Steel Bar Reinforcement. Stainless Steel Bar Reinforcement shall be stored separately and shall be handled using tools that are not used on carbon steel.

Comment [c62]:
E109032

C. Placing and Fastening Reinforcing Steel. Prior to placing reinforcement, all grease, dirt, mortar, and any other foreign substances shall be removed.

Loose rust and loose millscale on uncoated reinforcement shall be removed by wire brushing. Steel reinforcement shall be placed in the position indicated in the contract documents and within the allowable tolerances specified. Before concrete is placed, all reinforcement shall be securely fastened and supported with approved chairs or other approved devices.

D. Inspection. Concrete shall not be placed until the reinforcing steel is inspected, placement of the steel meets applicable tolerances, and permission for placing concrete is granted by the Engineer. All concrete placed in violation of this provision will be rejected and removed.

556-3.02 Steel Fabric Reinforcement.

A. Field Repair of Coatings. Field repair will not be required on areas of minor damage. Minor damage is defined as any defect or break in the coating less than 1/4 x 1/4 inch. The maximum number of unrepaired minor damaged areas shall not exceed an average of six (6) per foot of wire.

Reinforcing fabric having coating damage exceeding the above criteria shall be rejected and immediately removed from the work site.

B. Placement. Steel fabric reinforcement shall be placed as shown in the contract documents. Unless otherwise noted in the contract documents, steel fabric reinforcement shall be overlapped a minimum of the distance between adjacent wires in the panel. Overlapping panels of steel fabric reinforcement shall be wired together to ensure that the location and overlap of the mesh panels is maintained during concrete placement.

556-3.03 Bar Reinforcement

A. Field-Bending. The bar reinforcement shall be bent to the shapes shown in the contract documents. Unless shown otherwise in the contract documents or below, the radii of bends, measured to the inside face of the bend, shall be greater than, or equal to, three times the diameter of the bar. Bends in stirrups shall be greater than, or equal to, the diameter of the bar.

1. Uncoated Bar Reinforcement. When bars are heated for field-bending they shall not be heated to a temperature higher than that producing a dark cherry-red color. Only competent personnel shall be employed and proper equipment provided for cutting and bending.

2. Epoxy - Coated Bar Reinforcement. The alternatives of shop bending or field-bending

of epoxy-coated bar reinforcement will be at the option of the Contractor. Field-bending shall be done by cold methods only.

Field-bending operations will be allowed only when ambient and bar temperatures are 40°F or greater. When lower temperatures prevail, the Contractor may supply, for field-bending operations, a fully enclosed space that is heated. Direct heating of the bars shall not be permitted.

Epoxy coatings damaged by field-bending work shall be evaluated and repaired or replaced, in accordance with the requirements of §556-3.03 B.1 Epoxy-Coated Bar Reinforcement.

3. Galvanized Bar Reinforcement. The galvanized bar reinforcement shall be shop bent before galvanizing. Up to 5% of the mass of bars may be field bent to replace missing, damaged, or incorrectly fabricated bars. Field-bending shall be done by cold methods only. When bending galvanized bar reinforcement size 7 and greater, the minimum bend radius measured to the inside face of the bend shall be increased to 4.5 times the bar diameter. For bars numbered 14 and 18, increase the bend radius to 5.5 times the bar diameter.

Field-bending operations will be allowed only when ambient and bar temperatures are 40°F or greater. When lower temperatures prevail the Contractor may supply, for field-bending operations, a fully enclosed space that is heated. Direct heating of the bars shall not be permitted.

The ends of bars cut after galvanizing shall be coated with zinc repair material following the procedures of §719-01, Galvanized Coatings and Repair Methods except that repair materials containing aluminum shall not be permitted.

Galvanizing damaged by field-bending work shall be evaluated and repaired, or replaced, in accordance with the requirements of §556-3.03 B.2 Galvanized Bar Reinforcement.

~~4. Stainless-Steel-Clad Bar Reinforcement. The stainless steel clad bar reinforcement shall be shop bent or field bent as shown in the contract documents. All ends of the bar reinforcement where the mild steel core is exposed shall be capped by one of the following:~~

- ~~a. Heat shrink cap applied in accordance with the cap manufacturer's instructions.~~
- ~~b. Neoprene cap adhered with silicone or epoxy sealant.~~
- ~~c. Stainless steel cap epoxied in place.~~
- ~~d. Stainless steel seal weld.~~

~~—The stainless steel clad bar reinforcement will be shop bent or field bent as shown in the contract documents. When shop bending is required, up to 5% of the mass of bars may be field bent to replace missing, damaged, or incorrectly fabricated bars. Field bending shall be done by cold methods only.~~

54. Stainless Steel Bar Reinforcement. The stainless steel bar reinforcement shall be shop bent or field bent as shown in the contract documents. When shop bending is required, up to 5% of the mass of bars may be field bent to replace missing, damaged, or incorrectly fabricated bars. Field-bending shall be done by cold methods only.

Comment [c63]:
E109032

B. Field Repair of Coatings

1. Epoxy-Coated Bar Reinforcement. The Contractor will be required to field repair damaged areas of the bar coating, and to replace bars exhibiting severely damaged coatings. The material used for field repair shall be that supplied by the coating applicator.

Field repair will be required on all areas of major damage. Major damage is defined as any defect or break in the epoxy coating 1/4 x 1/4 inch or greater. The total number of all major damaged areas which have been repaired with patching material shall not exceed five (5) in any 10 foot length of bar.

Field repair will not be required on areas of minor damage. Minor damage is defined as any defect or break in the coating less than 1/4 x 1/4 inch. The maximum number of unrepaired minor damaged areas shall not exceed an average of six (6) per foot on any individual bar.

A reinforcing bar having coating damage determined by the Engineer to exceed the above

criteria shall be rejected and immediately removed from the work site. All such bars shall be replaced, in kind, by the Contractor at no additional cost to the State.

2. Galvanized Bar Reinforcement. The Contractor shall field repair damaged areas of the bar coating, and replace bars exhibiting severely damaged coatings. Severe damage is defined as more than five (5) 1/4 x 1/4 inch or larger areas in a 10 foot length. The material and procedures used for field repair shall meet the requirements of §719-01, Galvanized Coatings and Repair Methods, except that repair materials containing aluminum shall not be permitted.

C. Splices. Splices will be permitted only where shown in the contract documents. Should the Contractor desire to splice bars at locations other than those shown in the contract documents, written permission to do so shall first be obtained from the DCES. Such permitted splices shall be well distributed or located at points of low tensile stress. Splices shall not be permitted unless a minimum of 2 inches can be provided between the splice and the nearest adjacent bar.

Splices for bar sizes No. 11 or smaller, shall be made by means of a mechanical connector or by placing the bars in contact and wiring them together for the full length of the splice. Splices for bars larger than No. 11 shall be made by use of a mechanical connector unless welding is specifically required by the contract documents. Mechanical connectors shall be installed in accordance with the manufacturer's written requirements. [Mechanical connectors for stainless steel shall be stainless. Welding stainless steel will not be permitted unless the proposed welding technique is submitted to and approved by the DCES.](#)

Arc-welded splices shall be made and will be inspected in accordance with the provisions of the SCM.

Prior to welding of epoxy-coated reinforcing bars, the epoxy coating shall be removed for the length to be welded plus 6 inches on each side of the weld. After welding, the spliced area shall be cleaned in accordance with SSPC - Surface Preparation Specification No. 6 (SSPC-SP6), Commercial Blast Cleaning. The surface shall be blast cleaned to SSPC-SP6 Commercial Blast Cleaning standard.

Photographs in SSPC-VIS 1, Guide And Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning, for B SP6, C SP6, D SP6, G1 SP6, G2 SP6, or G3 SP6, can be used as a guide to identify the desired cleaning, depending on the initial condition of the steel. However, the written standard for SP6 will be the primary means to determine conformance with blast-cleaning requirements. The photographs shall not be used as a substitute for the written standards. A compatible epoxy repair material supplied by the coating applicator shall be applied to the spliced area and overlap the original coating by 6 inches. The epoxy repair material shall be applied the same day as the cleaning.

Prior to welding galvanized bar reinforcement, the zinc coating shall be removed for the length of the weld plus 2 inches on each side of the weld. Cleaning shall be the same criteria as for epoxy-coated reinforcing. Coating repair shall be in accordance with the requirements of §556-3.03 B.2 Galvanized Bar Reinforcement.

D. Placement in Structural Slabs. Bar supports shall be spaced no farther apart than 4 feet center-to-center, nor shall any bar support be closer than 6 inches from the edge of any future concrete surface. Bridge slab bar reinforcement shall be placed in accordance with the following tolerances:

Vertical ± 1/4 inch
Horizontal ± 1/2 inch

The structural slab bar reinforcement mats (top and bottom) shall be securely connected together. This connection shall be accomplished by wiring or other means approved by the Engineer. Connections shall be placed no farther apart than 4 feet on center. The bar supports may be utilized for this purpose. Connecting devices shall neither deflect the bar reinforcement nor interfere with the smooth flow of concrete. [Stainless steel reinforcement shall not be in direct contact with uncoated steel reinforcement, nor with galvanized reinforcement. This does not apply to stainless steel wires and ties.](#)

Comment [c64]:
EI09032

Comment [c65]:
EI09032

Immediately prior to placement of concrete, the Engineer will verify that the reinforcing steel is positioned within the above-stated tolerances.

Subsequent to placement of concrete, the Engineer will verify, at random, that the vertical clear distance from the top of the structural slab to the top mat of main reinforcing, as shown in the contract documents, is correct within a tolerance of plus or minus 1/2 inch. If the allowable tolerance is exceeded, the Engineer will reject the work and so advise the Contractor and the DCES, in writing, stating the deficiencies upon which the rejection is based. The DCES will review the nature and extent of the deficiencies and shall designate one or more of the following alternatives:

1. The affected concrete placement shall be removed and replaced in whole or in part.
2. The Contractor shall provide special corrective measures as directed by the DCES.
3. The concrete placement shall be accepted without corrective action.

556-3.04 Stud Shear Connectors for Bridges. Stud shear connectors shall be shop or field welded to the structural steel members at the locations indicated in the contract documents. This work shall be done in accordance with the provisions of the SCM.

556-4 METHOD OF MEASUREMENT

556-4.01 Steel Fabric Reinforcement. The quantity of steel fabric reinforcement satisfactorily installed will be measured for payment as the number of square yards of overall surface area of the deck or structure shown on the contract documents, not including clear distance to the edges, measured to the nearest whole square yard. No subtractions will be made for holes smaller than one-half of a square yard, and no additional payment will be made for overlaps.

556-4.02 Bar Reinforcement. These will be measured as the number of pounds of steel bars placed. The weight of bar reinforcing will be computed by the Engineer utilizing the unit mass for each size bar as given in Table 556-1. No allowance will be made for the weight of any coating on the bars.

Bar Number	3	4	5	6	7	8	9	10	11	14	18
Weight (lb/ft)	0.376	0.668	1.043	1.502	2.044	2.670	3.400	4.303	5.313	7.650	13.60

NOTE. Bar Numbers are bar sizes in numbers of eighths of an inch.

556-4.03 Stud Shear Connectors for Bridges. Stud Shear Connectors will be measured as each connector placed.

556-5 BASIS OF PAYMENT

556-5.01 Steel Fabric Reinforcement. The unit price bid per square yard will include the cost of all labor, materials, and equipment necessary to complete the work. The removal of the concrete placement and its subsequent replacement, or other corrective work which the Contractor is directed to perform, shall be accomplished at no additional cost to the State. No additional payment will be made for the replacement of defective fabric or the replacement of fabric with defective coatings.

556-5.02 Bar Reinforcement. The unit price bid per pound shall include the cost of all labor, materials, and equipment necessary to complete the work. The unit price shall also include the cost of chairs, supports, fastenings, connections, and splices not specifically shown in the contract documents. If the Engineer permits the substitution of larger bars than those specified, or the DCES permits splices not shown in the contract documents, payment will be made only for the amount of steel which would have been required if the specified size and length had been used. No additional payment will be made for enclosures constructed for bending of bars or for replacement of defective bars or for replacement of bars with defective coatings.

556-5.03 Stud Shear Connectors for Bridges. The unit price bid per stud shall include the cost of all labor, materials, and equipment necessary to complete the work. If the use of any stud shear connector requires payment of a royalty to the manufacturer, the royalty shall be included in the unit price bid for this work.

Payment will be made under:

Item No.	Item	Pay Unit
556.0101	Uncoated Steel Fabric Reinforcement for Structures	Square Yard
556.0102	Epoxy-Coated Steel Fabric Reinforcement	Square Yard
556.0201	Uncoated Bar Reinforcement for Concrete Structures	Pound
556.0202	Epoxy-Coated Bar Reinforcement for Structures	Pound
556.0203	Galvanized Bar Reinforcement for Structures	Pound
556.0204	Stainless Steel Clad Bar Reinforcement for Structures	Pound
556.0205	Stainless Steel Bar Reinforcement for Structures	Pound
556.03	Stud Shear Connectors for Bridges	Each

Comment [c66]:
E109032

SECTION 557 - SUPERSTRUCTURE SLABS, SIDEWALKS ON BRIDGES, AND STRUCTURAL APPROACH SLABS

557-1 DESCRIPTION. The work shall consist of placing high performance (Class HP) concrete to construct superstructure slabs, sidewalks, safety walks, and structural approach slabs, as required by the contract documents.

557-2 MATERIALS

557-2.01 General. The materials used for superstructure slabs, sidewalks on bridges, and structural approach slabs shall meet the material requirements of the following subsections:

Structural concrete materials	555-2.01
Reinforcing steel	556-2
Prestressed concrete form units	718-05
Permanent Corrugated Metal Forms for Bridge Slabs	736-01

557-2.02 Concrete. This shall meet the material requirements for Class HP in accordance with §501. Unless otherwise directed by the Engineer, all concrete shall contain a water-reducing and retarding admixture, meeting the requirements of §711-08. The quantity of the admixture shall be sufficient to achieve the minimum retardation consistent with placing conditions to keep the entire placement plastic (either one continuous placement or all sections of a sequence placement). The dosage rate used shall be determined by the Contractor in accordance with the manufacturer’s recommendation and in concurrence with the Regional Materials Engineer. The dosage shall remain consistent for the duration of the concrete placement except for minor adjustments to meet changing environmental conditions.

557-3 CONSTRUCTION DETAILS

557-3.01 Concrete Manufacturing and Transportation. The requirements of §501-3 shall apply.

557-3.02 Falsework. The requirements of §555-3.02 shall apply.

557-3.03 Forms. Unless otherwise noted the contractor may use any of the following forming systems to form the underside of the superstructure slabs:

A. Removable Forms. The requirements of §555-3.03A shall apply.

B. Permanent Corrugated Metal Forms for Superstructure Slabs. Where permanent metal forms are employed, the following construction procedures shall apply.

Care and protection shall be given the metal form sheets, supports, and accessory items during handling, shipping, and storage. During loading, hoisting, and unloading operations, extra precaution and care shall be taken to prevent damage to ends, corners, and edges of the form sheets, supports, and accessory items. If the form units and accessories are to be stored prior to installation, they shall not be placed in contact with the ground and the material shall be adequately covered or protected to keep it dry.

Form supports shall be placed in direct contact with the flange of a stringer or floor beam. All attachments shall be made by permissible welds, bolts, clips, or other approved means. The welding of form supports to steel not considered weldable or to portions of flanges subject to tensile stresses shall not be permitted. Welding shall be in accordance with the provisions of the New York State Steel Construction Manual (SCM) except that 1/8 inch fillet welds will be permitted. All welding shall be performed by a welder certified under the SCM.

Form sheets shall not be permitted to rest directly on the flanges. They shall be securely fastened to form supports by self-tapping screws and shall have a minimum bearing length of 1 inch at each end. Transverse construction joints shall be located at the bottom of a flute and 1/4 inch weep holes shall be field drilled at not less than 1 foot on centers along the line of the joint.

Screed rail and pouring runway supports shall not be located directly on the form sheets, form supports, or reinforcing steel. No loose sheets or miscellaneous hardware shall be left on the structural slab at the end of the work day. Metal forms shall not be used where longitudinal slab construction joints are located between stringers, nor shall they be used on the fascia overhang.

The corrugated metal sheets shall be fabricated for the placement sequence used with the joints between sections of sheet overlapped or securely fastened to eliminate differential deflections between sections. Any exposed form metal where galvanizing has been damaged, shall be cleaned and repaired as provided for in §719-01, Galvanized Coatings and Repair Methods.

C. Prestressed Concrete Form Units. The applicable requirements of §555-3.03A and the Prestressed Concrete Construction Manual shall apply.

Form supports shall be placed in direct contact with the flange of the stringer. All attachments shall be made by permissible welds, bolts, or other means approved by the Engineer. The welding of form supports to steel not considered weldable, or to portions of flanges subject to tensile stresses will not be permitted. Welds and welding shall be in accordance with those portions of the SCM concerned with fillet weld design, fillet weld details, general workmanship and technique, except that 1/8 inch fillet welds will be permitted. All welding shall be performed by a welder certified under the SCM.

D. Restrictions. The following restrictions shall apply to all forms.

1. Fascia overhangs shall be formed with removable forms to provide a flat concrete surface.
2. A bay, constructed in stages such that a longitudinal joint is required, shall only be formed with removable forms.
3. A haunch which rests upon an end diaphragm shall only be formed with removable or permanent corrugated metal forms.
4. Prestressed concrete form units shall not be used where the design span is less than 5 feet nor greater than 11 feet. The design span is equal to the beam spacing minus one-half the top flange width.
5. Prestressed concrete form units may be restricted at the ends of some skewed spans. Refer to the contract documents for details.
6. Prestressed concrete form units shall not be used on prestressed concrete box beam superstructures unless specifically allowed by the contract documents.

557-3.04 Placing and Fastening Reinforcing Steel. Immediately prior to placement of concrete, the Engineer will verify that the reinforcing steel is positioned within required tolerances. If

§557

the allowable tolerances are exceeded, the Contractor shall correct the position of the reinforcing steel before placing concrete. All reinforcing steel and chairs shall be anchored to prevent uplift.

A. Permanent Corrugated Metal Forms or Removable Forms. Except for prestressed concrete form units the requirements of §556-3.01 and §556-3.03 shall apply.

B. Prestressed Concrete Form Units. The requirements of §556-3.01 and §556-3.03 shall apply. The top reinforcing steel mat shall be securely connected to the forms and the stud shear connectors. Connections shall be placed no farther apart than 4 feet on center. Connections to the forms may be made to the form-lifting devices, reinforcing steel projecting from the forms, or devices in the form supplied for this purpose. Hold-down devices shot into the form will not be permitted. Connections shall neither deflect the reinforcing steel nor interfere with the smooth flow of concrete.

557-3.05 Handling and Placing Concrete. The requirements of §555- 3.04 Handling and Placing Concrete shall apply. A Preplacement Meeting is required to be held at least one week prior to the start of any concrete placement for superstructure slabs. Meeting participants besides the Contractor and Engineer should include materials suppliers, subcontractors, Regional Materials Engineer, Regional Safety Officer, and others as deemed appropriate. Participants will review all aspects of the proposed placement including, but not limited to, the following:

Equipment proposed for use and for backup.

- Planned workforce, assigned tasks of each designated position, and experience and expertise.
- Proposed construction techniques and crew experience.
- Safety considerations.
- Concrete mix design.
- Admixtures and technical data; dosage rates will be approved by the Regional Materials Engineer.
- Proposed placement rate, curing and loading schedules.
- Curing practices to be employed as well as the workforce designated to the curing process.
- Delivery/conveyance equipment, including deck finishing machine setup and operation.
- Traffic control.

For placements proposed between October 1st and April 1st the Preplacement Meeting should additionally review cold weather concreting operations including, but not limited to, the following:

~~For placements between September 15th and April 1st:~~

- Expected environmental conditions at time of placement and during curing
- Proposed curing methods to maintain acceptable curing temperature
- ~~Engineers permission to progress cold weather concreting~~

Comment [c67]:
E109022

No concrete shall be placed until all aspects of the proposed placement are approved by the Engineer. A written report of the preplacement meeting will be established by the Engineer. Modifications shall be submitted in writing to the Engineer for approval. Further, for placements between ~~October 1st and September 15th~~ and April 1st, no concrete shall be placed until all aspects of the proposed placement are approved by the Regional Construction Engineer.

Before concrete slabs are placed on steel spans, all permanent field connections shall be completed unless otherwise noted on the contract plans, and all temporary supports and mechanisms used in steel erection shall be removed.

No concrete shall be placed until all the provisions of §555-3.04A. Placement Limitations are met, environmental conditions are deemed favorable, and satisfactory means to mitigate adverse environmental conditions exist. Favorable environmental conditions are defined as an expected weather forecast suitable for concrete placement during the entire placement duration, the evaporation rate not to exceed 0.25 lb/sf-hr, and acceptable curing temperatures expected for the duration of the curing period.

The Contractor shall provide any necessary means to mitigate adverse weather conditions and curing temperatures. Failure to maintain acceptable environmental conditions will result in the concrete placement being stopped and a bulkhead put in place.

The Contractor shall take the necessary measurements and calculate the theoretical evaporation rate. The measurements for air temperature, relative humidity, and wind speed shall be taken as near as possible to the final placement location of the concrete.

Concrete temperature will be taken from the same sample used for slump and air content tests. These measurements will be taken prior to commencement of concrete placement. If, in the Engineer's opinion, significant changes occur in atmospheric conditions, additional atmospheric measurements and calculations by the Contractor will be required. The Contractor shall supply all instruments necessary to make the required calculations. All instruments shall be approved by the Engineer, as being in good working order. The Contractor's measurements and calculations will be subject to the Engineer's approval. To determine the evaporation rate, apply the values taken for relative humidity, plastic concrete temperature, air temperature, and wind velocity to Figure 557-1 Structural Concrete Evaporation Rate.

The placing of concrete for any bridge slab shall be continuous between joints. Conveyance of concrete shall meet the requirements of §555-3.04B.

Vibrating of concrete shall be in accordance with §555-3.04E except the number of vibrators required shall be one for every 40 cy of concrete placed per hour, with a minimum of two vibrators in use at all times, and equally spaced across the placement front. One additional vibrator shall be available for use as a backup.

557-3.06 Cold Joints. "Cold Jointing," the bonding of fresh concrete to set concrete, shall be done where indicated in the contract documents, or where approved by the DCES.

A. Horizontal Joints. Within 24 hours of the start of the placement, the hardened concrete shall have laitance and dirt removed by a high-pressure water wash. The high-pressure water wash shall be sufficiently strong to remove any laitance and dirt, but not damage the reinforcement or reinforcement coating. The pressure wash equipment shall be capable of providing pressure of 3000 to 5000 psi.

After pressure washing, the concrete shall be continuously wetted for a minimum of 12 hours immediately prior to deck placement. Before placing fresh concrete, all standing water shall be removed with oil-free compressed air. The surface shall be protected from drying to maintain a clean, saturated surface dry condition when placing the new concrete.

If the tops of precast/prestressed elements have been sealed with a penetrating sealer, pressure wash the tops a maximum of 2 hours prior to concrete placement. The requirement for prewetting is waived.

B. Construction Joints. The requirements of § 555-3.06 A. shall apply. Construction joints shall be placed only where shown in the contract documents or where permitted by the DCES.

In the event an ongoing placement is delayed excessively, the establishment of a bulkhead shall be required.

557-3.07 Finishing Integral Wearing Surfaces on Superstructure Slabs. Machine finishing shall be used throughout all superstructure concrete placement operations with the exception of areas which are inaccessible to finishing machines.

Machine finishing shall be accomplished with an approved power-driven, one-operation (strike-off and finishing) machine. The finishing machine shall have a strike-off auger set 1/4 to 1/2 inch above the finished surface, a power-driven roller or oscillating type screed, and a pan float.

Finishing machines shall be equipped with adjustable strike-off and finishing screeds, the bottom surfaces of which shall be adjusted to produce the required contour of the finished surface. Machines shall be kept in true adjustment. Machines out of adjustment shall not be used until proper adjustments have been made and the adjustments have been approved by the Engineer.

The specific method and equipment that the Contractor proposes to use for finishing will be supplied during the Preplacement Meeting and will be subject to approval by the Engineer based on the above listed requirements.

Finishing machine rail supports shall be accurately set and of substantial construction so that the finished deck surface will conform to the profile and transverse sections shown in the contract

documents. Finishing machine rail supports shall be placed and adjusted to properly provide for the deflection of forms, falsework, and structural supporting members which will occur during the placement of the concrete. Finishing machine rail supports shall not be attached by welding to portions of flanges subject to tensile stresses. The finishing machine rail supports shall be spaced at a maximum of 2 feet on center. During stage construction, the support system shall be on the stage being placed.

Where the deck surface falls outside the fascia stringer flange, the finishing machine rail supports shall be placed on the forms. The forms shall be designed to take these loads through the use of outriggers or some other approved means.

Prior to commencing concreting operations, the finishing machine shall be given a test run over the full length of the superstructure segment to be paved, with the finishing machine adjusted to its finishing position. While operating the finishing machine during this test, the finishing machine rails shall be checked for deflection and proper adjustment, the cover on slab reinforcement measured, and the controlling dimensions of slab reinforcement and forms checked. All necessary corrections shall be made and verified by the Engineer before concreting is begun.

A sufficient amount of concrete equal to the finishing machine capacity shall be supplied at all times.

After the concrete has been placed, spread, and consolidated to provide a uniformly dense structural slab, the surface shall be struck off immediately by a single passage of the transverse finishing machine. The finishing machine shall carry sufficient concrete in front of the screed to fill low and porous places. This operation shall be done only once and shall produce a uniformly consolidated dense smooth surface of the required contour. The passage of the strike-off auger shall provide a concrete surface slightly above grade so that after settlement, if any, and the disappearance of excess water from the surface, the passage of the finishing screed will result in a uniform surface at the required grade and contour over its entire area, and provide the required cover over reinforcing.

In areas which are inaccessible to finishing machines, use of approved manual vibratory equipped power screeds may be used, with written approval of the DCES.

Hand finishing shall be allowed only in areas inaccessible to finishing machines or manually driven vibratory-equipped power screeds. Hand finishing shall be performed in the same sequence and manner as machine finishing, unless otherwise permitted by the Engineer. Hand finishing shall be performed in such a manner as to produce a concrete surface with quality and uniformity identical to that produced by the finishing machine. Hand screeds or bullfloats shall be magnesium and 10 inches, or more, in width. Care shall be taken not to overwork the concrete surface during any finishing operation.

In the event the placement is delayed as a result of equipment breakdowns or delivery problems, all concrete in place shall be protected from evaporation by covering the surface with wet burlap, curing blankets, or plastic sheets. Excessive delays shall require the establishment of a bulkhead and the ceasing of the placement.

Prior to texturing, the finished concrete surface shall be examined by the Contractor and the Engineer using a straightedge. The straight-edge shall not be less than 10 feet long. It shall be furnished by the Contractor and maintained in good, usable condition at the placement site at all times. While the concrete is still plastic, surface depressions shall be filled with concrete of the same class as the placement in progress. Surface irregularities greater than 1/4 inch in 10 feet in either the longitudinal or the transverse direction shall be corrected in a manner acceptable to the Engineer. Thin mortar or laitance, which may have accumulated ahead of the finishing machine screed, shall be removed from the work site. They shall not be used to fill depressions.

After finishing, the surface shall be given a suitable texture with an artificial turf drag made of molded polyethylene with approximately 53,500 synthetic turf blades per square yard, each approximately 1/2 inch long. The artificial turf drag shall be of a type and brand appearing on the Department's Approved List.

The Contractor may apply texture in a transverse direction, longitudinal direction, or parallel to the finishing machine. Once begun, the direction of texturing shall not change. All texturing shall be done from a work bridge immediately following the finishing operation. Texturing shall be done prior to the beginning of curing operations. Only one pass of the turf drag over the finished area will be permitted.

If texturing is done in a transverse or skewed direction, the Contractor shall texture by hand methods immediately after finishing machine passage.

If texturing is done in the longitudinal direction the turf drag shall be a seamless strip and shall be attached to the work bridge such that the surface of the concrete is textured immediately after finishing

machine passage. Small areas, otherwise inaccessible to the attached drag, may be textured by hand methods. Texture resulting from the drag shall stop within 1 foot of curbs.

The finishing movement and resulting progress of the turf drag shall be done in a manner so as to prevent ridges or gouges forming in the concrete surface. The drag shall be weighted and the contact area changed as required to produce an acceptable texture. The drag shall be cleaned periodically to remove all hardened concrete particles.

557-3.08 Finishing Integral Wearing Surfaces on Structural Approach Slabs. The requirements of §557-3.07 shall apply together with the following:

The Contractor may use an approved, manually driven, vibrator-equipped power screed in lieu of a power-driven transverse finishing machine. Only screed model types appearing on the Department's Approved List shall be employed for this work. The Engineer may require the use of a power-driven finishing machine if satisfactory results are not being attained.

557-3.09 Finishing Surfaces to be Overlaid with Portland Cement or Asphalt Concrete.

Machine finishing shall be used throughout all superstructure concrete placement operations, with the exception of areas which are inaccessible to finishing machines. In areas which are inaccessible to finishing machines, use of approved manual vibratory equipped power screeds may be used, with written approval of the D.C. E. S.

Surfaces shall be finished to a surface tolerance of 3/8 inch in 10 feet. The surface tolerance shall be verified by the Engineer with an approved straightedge not less than 10 feet long. The straightedge shall be furnished by the Contractor who shall maintain it in good condition at the paving site at all times.

Hand finishing shall be allowed only in areas inaccessible to finishing machines or manually driven vibratory-equipped power screeds. Hand finishing shall be performed in the same sequence and manner as machine finishing, unless otherwise permitted by the Engineer. Hand finishing shall be performed in such a manner as to produce a concrete surface with quality and uniformity identical to that produced by the finishing machine. Hand screeds or bullfloats shall be magnesium and 10 inches, or more, in width. Care shall be taken not to overwork the concrete surface during any finishing operation.

Upon completion of screeding, surfaces which will be overlaid with portland cement concrete shall be textured to conform to §557-3.07.

557-3.10 Sidewalk and Safety Walk Finish on Bridges. Sidewalks and safety walks shall be constructed by placing concrete continuously to an elevation slightly higher than shown in the contract documents. The concrete shall then be screeded to the correct elevations and worked with a magnesium float to give uniform surface. Floating shall be kept to a minimum, consistent with the desired finish, in order to avoid overworking the concrete. Follow floating with a broom finish. Surface scoring will not be permitted.

FIGURE 557-1 STRUCTURAL CONCRETE EVAPORATION RATE

To use this chart:

1. Enter with air temperature, move up to relative humidity.
2. Move right to plastic concrete temperature.
3. Move down to wind velocity.
4. Move left to read approximate rate of evaporation.

557-3.11 Curing. After finishing and plastic-concrete texturing operations are completed, the concrete surface shall be completely covered with clean, prewetted burlap. The allowable time period for wet burlap covering shall not exceed five minutes from the completion of texturing, and 30 minutes from the time of concrete placement. Care shall be taken so as not to damage the finished surface and texturing. The curing shall not be delayed beyond the specified period. Burlap shall be lapped a minimum of 1 foot. Lapped edges are not required to be sealed. Burlap shall be thoroughly saturated over its entire surface area and shall be drained of excess water prior to its application. Burlap shall be kept continuously wet, commencing 10 minutes from the time the wet burlap is placed, and protected from displacement. The Contractor may cover the wet burlap and soaker hoses only if it is necessary to maintain curing temperature.

The curing period shall begin only after all concrete for a given placement is complete. A curing day is defined as any day during which the ambient air temperature at the concrete surface is 45°F or higher for the entire day.

Conditions may occur which prevent an entire day from qualifying as a curing day, but do not prevent portions of that day from reaching temperatures that qualify as curing temperatures. If these

conditions occur and with the Engineer's approval, the Contractor may aggregate curing hours. A curing hour is defined as any hour during which the curing temperature remains at, or above 45°F.

An aggregation of 24 curing hours will be credited as one curing day. Aggregations of less than 24 curing hours will not be credited.

Curing hours will be determined with continuous recording thermometers. The number and placement of the thermometers will be determined by the Engineer. Thermometers used to monitor curing temperatures shall consist of the following types:

1. **Continuously Recording Thermometer.** The thermometer shall be capable of continuously recording temperatures within a range of 0°F to 120°F for a minimum of 24 hours.
2. **Maximum - Minimum Recording Thermometer.** For all placements the thermometer shall be capable of recording maximum and minimum temperatures in a range of 0°F to 120°F.

The curing temperature of concrete is the air temperature at the concrete surface, or the air temperature between the concrete surface and its protective covering. Temperatures at these locations are critical for proper concrete curing. For the purposes of this section the temperatures at the foregoing locations shall be maintained between 45°F and 85°F inclusive.

A. Superstructure Slabs. After the burlap placement has been fully completed, the concrete surface shall be cured for 14 curing days. The Contractor may use either option listed below. After seven curing days, the Contractor may be permitted to perform incidental work on the structure under the loading limitations of §557-3.14 Loading Limitations for Superstructure Slabs. The burlap may be displaced in limited areas, for short durations, to perform items such as sawcut grooving, placement of sidewalks, safety walks, curbing, bridge rail, and fencing. The amount of burlap displaced to perform these operations shall be limited to the immediate area affected by the Contractor's operations. All concrete surfaces exposed during these operations shall be kept in a saturated condition. Immediately after the work is completed in the affected area, all burlap shall be replaced for the duration of the curing period. Removable forms shall remain in place until the minimum curing period is complete.

1. Fourteen-Day Continuous Wetting. Leave all burlap in place for 14 curing days. Provide continuous, uniform wetting for the entire curing period.

2. Wet Burlap and Curing Covers. Provide continuous uniform wetting for seven curing days. After seven curing days, either of the following methods may be used:

- a. Remove all burlap after seven curing days. Apply curing covers immediately upon burlap removal. Plastic-coated fiber blankets are not required to be laid dry. Application and maintenance of covers shall be in accordance with §555-3.08A General. Concrete cured in this manner shall not be exposed to the atmosphere for more than 10 minutes between burlap removal and curing cover placement.
- b. Apply curing covers directly over the wet burlap. Plastic-coated fiber blankets are not required to be laid dry. Application and maintenance of covers shall be in accordance with §555-3.08A General. The concrete surface shall be inspected periodically to ensure that its condition remains saturated.

The Contractor shall inform the Engineer of the intended curing procedure at the Preplacement Meeting.

B. Structural Approach Slabs, Curbs, Sidewalks and Safety Walks on Bridges. After the burlap placement has been fully completed, leave all burlap in place for 7 curing days. Provide continuous, uniform wetting for the entire curing period. Forms for curbs, sidewalks, and safety walks shall remain in place until the minimum curing period is complete. Forms for structural approach slabs shall remain in place until sufficient strength is achieved to avoid damage to the

concrete. After removal of approach slab forms, the formed surfaces shall be cured as per the requirements of §555-3.08A.

557-3.12 Provisions for Concreting in Cold Weather. Cold-weather concreting provisions shall apply when the ambient air temperature below 45°F for 24 consecutive hours, or drops below 32°F at any time, during the curing or drying periods of the concrete.

When cold-weather concreting of superstructure slabs is progressed, curing shall be maintained in accordance with §555-3.08C *Provisions for Curing in Cold Weather*, except as modified here:

A. Superstructure Slabs.

The curing duration shall be 14 days (336 hours). Conditions may occur which prevent an entire 24 hour day from qualifying as a curing day, but do not prevent portions of that day from reaching temperatures that qualify as curing temperatures. If these conditions occur the Contractor may aggregate curing hours. An aggregation of 24 curing hours will be credited as one curing day based on the Engineer's acceptance of monitored temperature data. Any aggregations of less than 24 curing hours will not be credited as a curing day. A curing hour is defined as any hour during which the curing temperature remains at, or above 45°F. Curing temperature is defined as the temperature of the air measured at the surface of the curing concrete.

Curing temperatures shall be maintained in accordance with the requirements of Table 555-2, *Cold Weather Curing Requirements*. If ambient air temperatures are expected to fall below 45°F, materials and equipment necessary to maintain required curing temperatures shall be present on the site or readily available. The contractor shall provide protection in a timely manner to maintain acceptable curing.

External heat and enclosures to maintain curing temperatures may be required, as determined by the contractors proposed curing methods documented at the Preplacement Meeting. Enclosures are defined as those materials, combinations of materials, or systems that provide for uniform temperature and curing management of the concrete. If enclosures are required, they shall be constructed in such a way that all surfaces of the fresh concrete shall be maintained between 45°F and 80°F for the curing period. On structures where bottom formwork is not required, the existing superstructure materials may be considered for their insulating values provided all curing temperature requirements are maintained. If the Contractor expects to, or will, perform work when ambient temperatures are below 45°F, the enclosure shall be constructed in such a manner that work can be performed inside the enclosure without exposing any concrete to a temperature below 45°F. All concrete surfaces within heated areas shall be protected from drying by the use of live steam or use of continuously wetted burlap. All concrete surfaces within heated areas shall be protected from surface disintegration of fresh concrete due to an accumulation of carbon dioxide gas by properly venting the enclosure or use of non-combustion type heating systems.

Continuously recording thermometers shall be placed on both the top and underside of the deck to monitor areas where extreme cold or heat can be expected. Multiple thermometers may be required as directed by the Engineer. On structures where bottom formwork is not required and the existing superstructure materials are considered for their insulating value, temperatures shall be monitored at the interface between the existing superstructure materials and new concrete using continuously recording thermocouples and thermometers.

A maximum temperature differential of 30° F between any two locations within any form of enclosure, heated or otherwise, shall be maintained at all times.

When the ambient temperature is 45°F or greater, an enclosure may be removed for access to progress additional work providing there is a temperature difference of 30 Fahrenheit degrees or less between the air and the surface of the concrete. If the temperature difference between the air and the surface of the concrete is greater than 30 Fahrenheit degrees, temperatures shall be gradually reduced at a rate not to exceed 1°F /hr until the temperature difference is equal to or less than 30 Fahrenheit degrees. If an enclosure is removed, all heating in other areas shall cease until such time that the enclosure is replaced. Upon completion of the incidental work and replacement of the enclosure, the Contractor shall reestablish acceptable curing temperature differentials, with a maximum temperature differential not more than 30 Fahrenheit degrees between any two locations within the enclosure.

After seven (7) curing days, the Contractor may perform work on the structure to complete sidewalks, safety walks, curbs, and barriers. Work shall progress only when ambient temperatures are 45°F or greater or within an enclosure as described above. Incidental work shall not cause damage to the structure.

For all incidental work, the requirements of §557-3.14, *Loading Limitations for Superstructure Slabs*, shall apply.

B. Structural Approach Slabs, Curbs, Sidewalks and Safety Walks on Bridges.

The provisions of 557-3.12 A *Superstructure Slabs* shall apply except the curing duration shall be 7 days (168 hours). After three (3) curing days, the Contractor may perform work on approach slabs to complete sidewalks, safety walks, curbs, and barriers. Work shall progress only when ambient temperatures are 45°F or greater or within an enclosure as described above. Incidental work shall not cause damage to the structure.

For structural approach slabs, the requirements of §557-3.15 *Loading Limitations for Structural Approach Slabs, Sidewalks, and Safety Walks on Bridges*, shall apply.

C. Saw Cut Grooving.

When concrete is placed, cured, or dried under cold weather provisions, and a surface treatment option requiring saw cut grooving is used, saw cut grooving may be commenced after 7 curing days and shall be completed prior to commencing the drying period. Work shall progress only when ambient temperatures are 45°F or greater or within an enclosure as described in §557-3.12 A. Care shall be taken to prevent damage to the structure and no chipping or spalling of concrete shall occur at the sawcut edges.

D. Winter Surface Treatment - Superstructure Slabs and Structural Approach Slabs.

Upon completion of the curing period, the Contractor shall progress one of the following two options:

1. **Option 1.** The top surface and fascias of the superstructure slab shall be air dried for 10 days before being sealed with a penetrating sealer or exposed to freezing temperatures. Saw cut grooving shall be completed, as described above, prior to application of penetrating sealer. External heat and enclosures to maintain drying temperatures may be required. Drying shall be achieved by the following:
 - a. Providing free air flow and maintaining temperatures between 45°F and 80°F to the top surface and fascias (vertical faces) of the superstructure slab. Fascia forms shall be removed to allow for free air flow.
 - b. Drying of the underside of the structure, and of the fascias when a concrete barrier is to be placed on the superstructure slab, will not be required. However, ambient temperatures shall be maintained between 45°F and 80°F in these areas for the duration of the drying period.
 - c. The drying period shall be continuous except that aggregate drying hours may be allowed when a contractor ceases free air flow for any reason but protects the drying concrete from exposure to any additional water. Exposure to any additional water, beyond minor leakage thru an enclosure in limited areas, will require the drying period to re-commence for 10 days. Any 3 hour period of time, or fraction thereof, when the concrete is exposed to minor leakage shall not be counted as part of the drying period. Minor leakage shall be defined as water that dries or evaporates in 3 hours or less. Limited areas are defined as areas less than 100 ft². The total area of allowable minor leakage shall not exceed 5% of the concrete area under drying conditions. The same area of concrete shall not be exposed to minor leakage more than twice. Areas that exceed 100 ft² or are exposed to additional water that does not dry or evaporate in less than 3 hours, may be dried independently to accommodate removal of the

original enclosure. Any independent enclosures shall be maintained under the same temperature and air flow requirements as the original enclosure for 10 days.

d. Means of accelerating the drying process will be considered by the Director, Materials Bureau, to achieve an internal moisture content of 85% relative humidity or less, measured at a depth of 1 inch from any concrete surface.

Once the drying period is complete, temperatures shall be gradually reduced at a rate not to exceed 1°F/hr until the temperature within the enclosure equals the temperature outside the enclosure. Application of a penetrating sealer, in accordance with other items shall be completed before opening the superstructure slab to traffic.

2. Option 2. The top surface and fascias of the superstructure slab shall be air dried for 24 hours before being sealed with an interim application of penetrating sealer or being exposed to freezing temperatures. No saw cut grooving will be performed. External heat and enclosures to maintain drying temperatures may be required. Work shall be progressed by doing the following:

a. Providing free air flow and maintaining temperatures between 45°F and 80°F to the top surface and fascias of the superstructure slab. Fascia forms shall be removed to allow for free air flow.

b. Drying of the underside of the structure, and of the fascias when a concrete barrier is to be placed on the superstructure slab, will not be required. However, ambient temperatures shall be maintained between 45°F and 80°F in these areas for the duration of the 24 hour drying period. Application of interim penetrating sealer shall be completed before opening the superstructure slab to traffic.

c. After April 1st the contractor shall clean the deck of debris and provide necessary site access. The Department will inspect the superstructure slab for freeze / thaw or scaling damage. Damage shall be defined as:

(1) Delaminations

(2) Surface defects as follows:

- Total combined area greater than 50 ft² with a scaling rating of 3 or greater as defined by ASTM C-672.
- Total combined area greater than 10 ft² where the surface distress is greater than 3/16 inch deep.

(3) Pop-outs – surface imperfections greater than 3/4 inch in diameter

d. If the above described damage exists, the Contractor shall repair any damaged or defective concrete greater than 3/16 inch deep by saw cutting the perimeter of the area to a depth of 3/4 inch, chipping any unsuitable material to 1-1/2 inch or sound concrete (whichever is deeper) with light, hand held, pneumatic tools, at a 45 degree angle into the repair area. Clean all repair area surfaces thoroughly by blast cleaning. Repair small areas 3 ft² or less using approved concrete repair material that provides a permeability less than 1200 coulombs, Item 701-04, preparing the surface according to the material manufacturer's recommendations. Repair larger areas using Class DP concrete, preparing the surface according to §584-3.02 and 584-3.03. Cure Class DP concrete for 7 days.

e. After all necessary repairs are completed, the Contractor shall perform diamond grinding to the entire superstructure slab and approach slabs, to within 1 foot of any curb or barrier.

Diamond grinding shall be performed as follows:

(1) The depth of the grinding shall be approximately 3/16 inch to obtain a smooth texture.

(2) In all travel lanes, use equipment having gang-mounted diamond saw blades on a multi-blade arbor specifically designed for PCC pavement or superstructure production grinding. Using equipment capable of producing a 3 ft wide (minimum) grinding pass that

is equipped with a vacuum system capable of removing slurry from the bridge deck surface, such as the Target 3800, Boart-Longyear (Kushion Kut) PC5000 or PC600, or equal as approved by the Director, Materials Bureau. Smaller diamond grinding equipment shall be used as necessary to complete grinding adjacent to curbs or barriers. The Contractor shall submit requests to use other equipment at least 7 days prior to the start of grinding operations.

(3) Begin and end diamond grinding lines normal to the bridge deck centerline. Grind the bridge deck longitudinally such that at least 95% of the bridge deck surface is ground and the bridge deck is in the same plane across a joint or crack when measured with a 3 ft (minimum) straightedge. When steel joints are specified, joints shall be placed to allow for the required grinding of 3/16 inch. Feathering of the grinding operation at steel joints shall be kept to a minimum. Provide surface drainage by maintaining the proper cross-slope on the finished surface and by blending adjacent passes. Re grind the bridge deck if an acceptable surface is not being obtained.

(4) Continuously remove slurry from the bridge deck using the vacuum system on the grinding equipment. If required, provide equipment capable of transporting the slurry from the job site to an acceptable waste area or facility, without spilling.

(5) Traffic may be allowed on ground areas after slurry removal is complete or on decks where only partial diamond grinding is complete.

(6) After diamond grinding is complete, concrete shall be saw cut grooved according to contract documents and specifications for saw cut grooving, followed by penetrating sealer application placed in accordance with contract documents and specifications for penetrating sealers.

E. Winter Surface Treatment -Curbs, Sidewalks and Safety Walks on Bridges.

Upon completion of the curing period, concrete shall be air dried for 24 hours by providing free air flow and maintaining temperatures between 45°F and 80°F to all concrete surfaces. The drying period shall be continuous. Upon completion of drying, curbs, sidewalks and safety walks shall be sealed with a penetrating sealer in accordance with contract documents.

~~**557-3.12 Provisions for Concreting in Cold Weather.** When permission is granted in writing by the Regional Construction Engineer for cold weather concreting of superstructure slabs, between September 15th and April 1st, curing temperatures shall be maintained in accordance with §555-3.08C Provisions for Curing in Cold Weather, except as modified here:~~

~~— The curing duration shall be 14 days. Use of maturity methods approved by the Director, Materials Bureau, may be allowed to reduce the curing period. Conditions may occur which prevent an entire day from qualifying as a curing day, but do not prevent portions of that day from reaching temperatures that qualify as curing temperatures. If these conditions occur and with the Engineer's approval, the Contractor may aggregate curing hours. A curing hour is defined as any hour during which the curing temperature remains at, or above 45°F. An aggregation of 24 curing hours will be credited as one curing day. Aggregations of less than 24 curing hours will not be credited.~~

~~— If ambient air temperatures fall, or are expected to fall, below 45°F, as described in Table 555-2, Cold Weather Curing Requirements, the Contractor shall provide an enclosure to maintain an acceptable curing temperature. Materials and equipment necessary to erect an enclosure shall be present on the site or readily available. External heat to maintain curing temperatures may be required. Enclosures shall be constructed in such a way that all surfaces of the fresh concrete shall be maintained between 45°F and 85°F for the curing period. Enclosures may be removed to progress subsequent or incidental work during periods when the ambient temperature is above 45°F. If the Contractor expects to or will perform work when ambient temperatures are below 45°F, the enclosure shall be constructed in such a manner that work can be performed inside the enclosure without exposing any concrete to a temperature below 45°F. All concrete surfaces within heated areas shall be protected from drying by the use of live steam or use of continuously wetted burlap.~~

~~— Continuously recording thermometers shall be placed on both the top and underside of the deck to monitor areas where extreme cold or heat can be expected.~~

Comment [c68]:
EI09022

~~The temperature differential between any two locations within the heated enclosure shall not be more than 27°F.~~

~~—When ambient temperatures are 45°F or greater, an enclosure may be removed for access to progress additional work during the work day providing the temperature difference between the air and the surface of the concrete is not more than 27°F. If temperature difference between the air and the surface of the concrete is greater than 27°F, temperatures shall be gradually reduced at a rate not to exceed 1°F/hr until the temperature difference is equal to or less than 27°F. If an enclosure is removed, all heating in other areas shall cease until such time that the enclosure is replaced. Upon completion of the incidental work and replacement of the enclosure, the Contractor shall reestablish acceptable curing temperature differentials, with a maximum temperature differential not more than 27°F between any two locations within the enclosure.~~

~~—After seven (7) curing days, the Contractor may perform work on the structure to complete sidewalks, safety walks, curbs, and barriers. Work shall progress only when ambient temperatures are 45°F or greater or within the enclosure as described above.~~

~~—After fourteen (14) curing days, the Contractor may perform work on the structure to progress sawcut grooving and sealing, provided the sawcut grooving does not cause damage to the structure. If chipping or spalling of concrete at the sawcut edges occurs, the Contractor shall stop this work until the structure concrete is able to withstand damage from the sawcutting. This work shall progress when ambient temperatures are 45°F or greater or within the enclosure as described above. All concrete surfaces shall be kept reasonably dry during these operations, with use of any water kept to a minimum.~~

~~For all incidental work, the requirements of §557-3.14 Loading Limitations for Superstructure Slabs, shall apply.~~

~~—Upon completion of curing, concrete shall be air dried for 14 days before being exposed to freezing temperatures. Drying shall be achieved by providing free air flow and maintaining temperatures between 45°F and 85°F to all concrete surfaces. Fascia forms shall be removed to allow for free air flow. Drying of the underside of the structure will not be required. Means of accelerating the drying process will be considered by the Director, Materials Bureau, to achieve an internal moisture content of 85% relative humidity or less, measured at a depth of 1 inch from any concrete surface. Once the drying period is complete, temperatures shall be gradually reduced at a rate not to exceed 1°F/hr until the temperature within the enclosure equals the temperature outside the enclosure.~~

~~—Failure to complete acceptable curing and drying, as described above, will result in rejection of all concrete in the placement.~~

557-3.13 Removal of Forms. Removal of forms for superstructure slabs shall meet the requirements of §555-3.09 Form Removal and as modified herein. The minimum curing period prior to form removal is 10 curing days, except that for cold weather concreting a minimum of 14 curing days is required unless minimum compressive strengths are achieved as determined by the D.C. E. S. A curing day is defined in §555-3.08A. Permanent field connections, if required, shall be made on the same day prior to removal of forms and falsework.

The following inspection procedures will be used as a check to insure the soundness of the concrete structural slab adjacent to the steel forms. Not less than two days after completion of a concrete structural slab pour, but prior to the next slab pour, the Contractor shall remove a section of the steel form from the most recently completed pour of each span, at a location selected by the Engineer, in order to provide visual evidence that the concrete mix or the construction procedures are obtaining the desired results. If either the concrete mix or the construction procedures are varied significantly within a pour, such as a change in the extent of vibration or change in the workability of the mix, the Contractor shall remove another section of form to verify that the new procedures yielded desirable results.

After the concrete has been placed in a span for a minimum of ten days but prior to any further work performed on the superstructure in that span, the Engineer will spot-check the underside areas of the steel forms by sounding with a suitable-weight hammer at least 50% of the area of at least 25% of the individual form panels on a random basis to determine whether any honeycomb or void areas exist. If such areas are detected, the Contractor shall remove the forms from these areas for a visual inspection of the slab.

The amount of sounding and form removal may be reduced after a substantial amount of slab has been constructed and inspected, if the Contractor's methods of construction and the results of the inspections as outlined above indicate that sound concrete is present throughout the slabs.

If, after removing a section of form, the concrete is found to be defective, additional panels shall be removed. All defective concrete shall be repaired to match the adjacent concrete in section and color.

The form sections shall be removed by a metal saw or air-carbon-arc gouging with minimum damage to the concrete. Cuts shall only be sufficiently deep to sever the form. Any other method of removal shall be submitted to the Deputy Chief Engineer (Structures) for approval. Cuts that are parallel to the corrugations in the forms shall be located on the sloping surface midway between a crest and a valley. Cuts parallel to the supporting beams shall be made through the supporting angles taking care not to damage the structural steel beams. The Contractor will not be required to replace the removed forms.

The Contractor shall provide all the facilities required for safe, suitable and convenient means of access to the forms for the Engineer's inspection.

557-3.14 Loading Limitations for Superstructure Slabs. Superstructure slabs, during the curing period, may be subjected to a vehicle load not to exceed 10 tons, or a wheel load not to exceed 3 tons no sooner than seven curing days after placement. Full legal loading may commence using either of the following options:

A. Superstructure slabs may be subjected to full legal loads no sooner than 14 calendar days after completion of the curing period.

B. The Contractor may subject a superstructure slab to its full legal load upon completion of the curing period, or any day thereafter provided that the procedure below is followed:

1. The Contractor shall notify the Engineer at the Preplacement Meeting of the intention to subject the slab to full legal load prior to the 14th day after completion of curing.
2. During the slab concrete placement, the Engineer will cast two sets (pairs) of test cylinders in addition to each set cast for record and cure the cylinders on site in the same manner as the superstructure slab.
3. The Engineer will forward cylinders to the Materials Bureau or Regional Testing Facility. One set will be tested fourteen calendar days after placement and, if necessary, the second set will be tested twenty-one calendar days after concrete placement. Under no circumstances will cylinders be tested sooner than fourteen calendar days after the concrete placement they represent.
4. Concrete cylinder sets (pairs) designated for advance testing shall achieve an average compressive strength of 3000 psi, or greater, with individual cylinders having a compressive strength of 2800 psi, or greater.
5. Results of compression tests will be transmitted to the Engineer as soon as possible. The Engineer will inform the Contractor of the cylinder testing results and allow early loading if appropriate. If the required compressive strengths are not achieved, the requirements of §557-3.14A shall apply.

557-3.15 Loading Limitations for Structural Approach Slabs, Sidewalks, and Safety Walks on Bridges. During the curing period, approach slabs may be subjected to a vehicle load not to exceed 10 tons, or a wheel load not to exceed 3 tons. The Contractor may subject structural approach slabs, sidewalks, and safety walks to their full legal load upon completion of the 7-day curing period.

Comment [c69]:
E109022

557-3.16 Damaged or Defective Concrete. Damaged or defective concrete shall be defined by, and repaired in accordance with, the requirements of §555-3.13, Defective or Damaged Concrete.

Subsequent to placement of concrete, either before or after setting, the Engineer will verify at random that the vertical clear distance from the top of the structural slab to the top mat of main reinforcing, as shown on the contract plans, is correct within a tolerance of plus or minus 1/2 inch. If the allowable tolerance is exceeded, the Engineer shall reject the work so advise the Contractor and the Deputy Chief Engineer (Structures), in writing, stating the deficiencies upon which the rejection is based.

The Deputy Chief Engineer (Structures) shall review the nature and extent of the deficiencies and shall designate one or more of the following alternatives:

- The affected placement shall be removed and replaced in whole or in part.
- The Contractor shall provide special corrective measures as directed by the Deputy Chief Engineer

§557

(Structures).

- The concrete placement shall be accepted without corrective action.

After the concrete has hardened, the Engineer will examine it using the Contractor's straightedge. Surface irregularities greater than 1/4 inch in 10 feet shall be corrected. Unless otherwise directed by the Regional Materials Engineer, the concrete used for repairs shall be of the same materials as that used for the original placement.

557-3.17 No Bar list provided. When no bar lists are provided in the contract documents the following shall apply:

1. At least thirty (30) days prior to fabrication of the reinforcement the Contractor shall submit a minimum of two copies of the bar lists and placement drawings showing the bar locations to the Engineer. The details of the bar list and placement drawings shall meet the requirements of the current edition of the Concrete Reinforcing Steel Institute's publication Reinforcing Bar Detailing. Placement drawings shall be size "B". Drawings and bar lists shall be clear and legible.
2. Requests for information or changes along with reasons shall be documented in a separate list.
3. The Engineer will transmit the documents to the designer for review for conformance with the design requirements in accordance with the Shop Drawing Approval process. The designer will not be checking lengths, number of bars, weights or bar marks. Corrections will be returned to the Contractor. When the documents are satisfactory they will be returned to the Contractor stamped "Approved In Conformance With Design Requirements".
4. Partial submissions that require coordination with other drawings will not be accepted.

557-4 METHOD OF MEASUREMENT. The work will be measured for payment in square yards of superstructure slab, approach slab, or sidewalk and safety walks installed, measured to the nearest 0.1 square yards.

Winter surface treatment of superstructure and approach slabs will be measured for payment in square yards of superstructure and approach slab, measured to the nearest 0.1 square yard.

~~**557-4 METHOD OF MEASUREMENT.** The work will be measured for payment as the number of square yards of slab, sidewalk, or safety walk satisfactorily installed, measured to the nearest 0.1 square yards.~~

Comment [c70]:
EI09022

557-5 BASIS OF PAYMENT. The unit price bid shall include the cost of furnishing all labor, materials, and equipment necessary to complete the work. Unless otherwise provided, the unit price bid shall include the cost of furnishing and placing bar reinforcement, wire fabric for concrete reinforcement, copper flashing, flexible water stops, mechanical connectors where specified, sheet packing, water for wetting, joint sealing compounds, joint fillers, concrete curing materials, including any materials for temperature management during the curing period and the cost of screed rail supports and other brackets or braces necessary to support finishing machines.

If permanent metal forms are used, the cost of furnishing all facilities required for access, removing the permanent forms for inspection or repair purposes, painting the cut edges of the forms and repairing the concrete as required herein shall be included in the price bid for this work.

No extra compensation for corrective finishing or repairs to damaged or defective concrete will be paid.

Progress payments will be made on a per-span basis as follows:

Forty (40) percent of the area will be paid for after all reinforcing is properly placed. Forty (40) percent of the area will be paid for after the concrete has been properly placed and proper curing applications have been instituted. The remainder will be paid for after completion of all curing, and necessary corrective work.

The unit price bid for Surface Treatment of Superstructure and Approach Slabs shall include all labor, materials and equipment necessary to satisfactorily complete the work including work zone traffic control for work associated with deck cleaning, evaluation, and diamond grinding. The cost for interim penetrating sealer applied under §557-3.12C.2., prior to the concrete being exposed to freezing conditions, shall be included in this item. The cost for saw cut grooving and final application of penetrating sealer will be paid for under separate items and paid for only once.

Winter Surface treatment – Superstructure Slabs and Structural Approach Slabs shall only be paid when environmental conditions related to temperature and moisture protection during the drying period require use of enclosures

Comment [c71]:

SECTION 558 - LONGITUDINAL SAWCUT GROOVING OF STRUCTURAL SLAB SURFACE

558-1 DESCRIPTION. Sawcut grooves into the surface of a portland cement concrete structural slab at the locations indicated in the contract documents.

The Contractor is hereby notified that concrete curing requirements, combined with structural slab loading restrictions, may have a significant effect upon the specific time, relative to concrete placement, at which sawcut grooving may be performed. The Contractor shall be familiar with the limits imposed by these factors and conduct operations accordingly.

558-2 MATERIALS. Use multibladed wet saw cutting equipment using circular saw blades. The Engineer may allow the use of single blade, circular saw equipment, where it is determined such equipment is necessary to complete the work as required. The equipment the Contractor proposes to use will be subject to the approval of the Engineer, prior to use.

Use water which meets the requirements of §712-01.

558-3 CONSTRUCTION DETAILS. Sawcutting concrete produces silica dust. Include sawcutting of concrete in the Health and Safety Plan in accordance with the silica safety requirements of §107-05 L.4.

Start sawcutting only after the specified curing period has elapsed, unless otherwise allowed by the applicable specification.

Cut longitudinal grooves parallel to the centerline of roadway using a single pass. Space the center-to-center of grooves at 0.75 inch ± 10%. Cut all grooves rectangular in shape conforming to the following dimensions:

Width 0.1 inch (+ 20%, - 0) Depth 0.15 inch ± 50%

During the grooving operations, the Engineer will verify, at random, that the minimum groove depth is being achieved. Should the Engineer determine that minimum groove depth is not being achieved, the Contractor shall stop grooving operations and make all adjustments necessary to achieve the minimum depth.

Supply the Engineer with two (2) accurate, easily readable gauges with which to verify groove depth. Deliver the gauges and applicable manufacturer’s instructions for use, if necessary, no later than one week prior to the anticipated beginning of grooving operations.

Terminate grooves within the following limits unless otherwise indicated on the contract documents:

Location	Closest Allowable Distance	Farthest Allowable Distance
Drainage structure	4 inches	15 inches
Vertical face (curb or parapet), or face of railing (no curb)	4 inches	15 inches
Joint System (Dimension measured perpendicular to the centerline of the joint system)	4 inches	15 inches

Using a self-contained system, continuously collect any slurry or debris created by the grooving operation such that it does not accumulate on the surface.

558-4 METHOD OF MEASUREMENT. The quantity will be measured as the number of square yards of structural slab satisfactorily grooved, measured between the faces of barrier, curb, or rail, and between the ends of the slabs, computed to the nearest whole square yard. No deduction will be made for areas left ungrooved near curbs, barriers, rails, joints, drainage structures, or other objects embedded in the slab.

558-5 BASIS OF PAYMENT. The unit price bid per square yard shall include the cost of all labor, materials, and equipment necessary to complete the work.

Payment will be made under:

Item No.	Item	Pay Unit
558.02	Longitudinal Sawcut Grooving of Structural Slab Surface	Square Yard

SECTION 559 (VACANT)

SECTION 560 - MASONRY

560-1 DESCRIPTION. Under this work the Contractor shall furnish and place masonry, with or without coping, of the type, shape, size, color and location indicated in the plans, proposal or as directed by the Engineer.

560-2 MATERIALS. Materials shall meet the requirements specified in the following subsections of 700 - Materials:

Split Faced Concrete Brick	704-10
Precast Concrete Coping	704-11
Caulking Compound for Structures	705-06
Premolded Resilient Joint Filler	705-07
Masonry Mortar	705-21
Bar Reinforcement - Grade 60	709-01
Wire Fabric for Concrete Reinforcement	709-02
Admixtures	711-08

560-2.01 Dimension Stone Masonry. All stone shall be sound, durable, free from reeds, rifts, seams, laminations and minerals which would cause discoloration or deterioration from weathering. The stone shall be of size, quality and color acceptable to the Regional Director. Duplicate samples of stone showing the complete color range shall be submitted to the Regional Director for approval. Stone shall be quarried so the stratification will be radial or parallel to the bed when set in place except where split face or seam face finish is called for on the plans. All beds and joints shall have a "Fine Point or Sawn Finish" for at least 2 inches from the arris lines. The balance shall not fall off from a straight line for more than 1/6 of the stone's minimum dimension. When stones project beyond adjoining faces, the fine pointing shall be carried at least 2 inches in from the adjoining surfaces (arris lines of stone or face of concrete).

Soffits of ring stones shall be cut to the curve of the arch and shall have a "Fine Point or Sawn Finish" unless otherwise shown on the plans. All other showing surfaces shall be finished as indicated on the plans.

On square bridges and on bridges where the skew is 30 degrees or less, the ring stones shall be cut so the joint sides are parallel to the faces of the abutments. On bridges with a skew greater than 30 degrees the ring stones shall be cut so the joint sides of each stone will be at right angles with the face. Soffit joints shall lie in a horizontal plane.

"Fine Point or Sawn Finish" shall be as described in §560-2.07, Definition of Finishes.

560-2.02 Split Faced Concrete Masonry. Split faced concrete masonry units shall be new, sound, durable, true to size, free from laminations and cracks, and uniform quality which complies with the requirements of §704-10. All split face concrete masonry units delivered to the site shall be of the sizes necessary to produce the wall pattern as indicated on the plans.

An approved mechanical self-leveling splitting machine with two steel knives, one directly above the other will be used for all field splitting. Four samples of each thickness of each split faced concrete masonry unit shall be submitted to the Engineer for tentative approval. They shall be labeled with the contract title and number, the Contractor's name, and manufacturer's name. The split faced concrete masonry units used in the work shall be equal in all respects, color, quality, texture and surface to the approved samples.

Anchors shall be a metal slot formed from sheet zinc not less than 0.025 inches in thickness, bent to form a dovetail channel 5/8 inch wide at the front, 1 inch wide at the rear, 1 inch deep and with wings 1/8

§560

to 1/4 inch wide. The slots shall be provided with a felt insert to prevent the entrance of fresh concrete. These inserts shall be removed just prior to the insertion of the ties. Ties shall be formed of zinc not less than 0.078 inches thick, 1 inch wide with one end designed to fit snugly into the anchor slots and shall be crimped with corrugations 1/8 inch deep, but no less than 1/16 inch deep.

The ties shall be at least 4 inches long. The Contractor shall submit to the Engineer for tentative approval four samples of the material used to fabricate the ties, i.e. anchors, felt and ties.

560-2.03 Stone Masonry. All stone shall be sound, durable, properly quarried, free from reeds, rifts, seams, laminations and minerals which would cause discoloration from weathering. Samples of stone shall be submitted to and be approved by the Regional Director prior to the beginning of any work on this masonry. The size, color and quality of the stone delivered to the site shall be substantially in accordance with the approved samples.

The stones may have an average variation of 1/6 of the thickness shown on the plans, however, they shall have a minimum thickness of at least 2/3 that shown on the plans and a maximum thickness of 1/6 over the maximum thickness shown on the plans.

560-2.04 Rubble Stone Masonry. All stones shall be clean, free from structural defects and acceptable to the Engineer. Selected stones, roughly squared and pitched to line, shall be used at all angles and ends of walls.

560-2.05 Precast Concrete Coping. Precast concrete coping units shall be new, sound, durable, true to size, free from laminations and cracks and of uniform quality which complies with the requirements of §704-11.

560-2.06 Mortar. Use 705-21 Masonry Mortar.

560-2.07 Definition of Finishes. Finishes of stone or manufactured masonry units shall be defined as shown in Table 560-1.

560-3 CONSTRUCTION DETAILS

560-3.01 General. Masonry or precast concrete coping shall not be constructed when the ambient temperature is 40°F or below, or when the stone or masonry units contain frost, except by written permission of the Engineer and subject to any conditions the Engineer may require.

Stone, masonry units or coping units shall not be dropped upon or slid over existing masonry, nor shall hammering or turning of stones, masonry units or coping on the masonry be allowed. Stones, masonry unit or coping units shall be carefully set without jarring masonry already laid, and they shall be handled in a manner so as not to cause disfigurement.

TABLE 560-1 MASONRY UNITS, SURFACE FINISH	
Finish Name	Maximum Surface Projection Beyond Pitch Lines
Smooth Finish	1/16 inch
Fine Point or Sawn Finish	1/4 inch
Rough Finish	1/2 inch
Scabbed Finish	3/4 inch
Seam and Split Face	1 inch
Rock Face	1/10 the vertical height of the individual stone
Thermal Finish	1/4 inch

NOTE: All faces of Dimension Masonry shall extend to the pitch lines shown on the plans.

560-3.02 Dimension Stone Masonry. The provisions of §560-3.01 shall apply with the following additional requirements:

A. Preparation of Stone and Bed. Each stone shall be cleaned and thoroughly saturated with water before being set. The bed which is to receive the masonry shall also be cleaned and moistened.

B. Bedding of Stone. All stone shall be well bedded in mortar and settled in place with a suitable wooden maul before the setting of the mortar.

C. Spalls not Permitted in Mortar Beds. No pinning up of stones with spalls will be permitted, and no spalls will be permitted in beds.

D. Expansion Joints. All surfaces of stone in contact with expansion joint material shall be made smooth, unless otherwise shown on the plans. The joints shall be filled with premolded resilient joint filler and sealed with an approved joint sealer as shown on the plans, or as ordered by the Engineer.

All joints in concrete backing shall be protected against intrusion of water into or through the joint by the installation of an approved water stop. The water stop shall be embedded into the concrete at least 3 inches on each side of the joint and shall be installed as near to the inside face of the concrete backing as practicable. The water stop may be of ASTM B370, 20 ounce preformed copper strip, 0.025 inch minimum thickness, soldered to be water tight and continuous, or may be approved flexible water stop as shown on the plans. Water stops shall be manufactured and installed so as to provide for the expansion and contraction movements present at the joint.

In case any stone is moved or the joint broken, the stone shall be taken up, the mortar thoroughly cleaned from beds and joints, and the stone reset in fresh mortar.

Joints shall not be filled by pouring in a thin or liquid mortar.

E. Pointing (new construction) and Tuck Pointing (raking out and repointing).

1. Pointing. Tool the face joints with a pointing tool before the mortar sets, as approved by the Engineer. Avoid smearing the masonry surfaces with excess mortar forced out of the joints. For joints not pointed when the masonry is laid, prepare the joints for pointing by following the tuck pointing procedures. There will be no separate payment for this work.

2. Tuck Pointing (Repointing). Repoint the joints in masonry where indicated on the Contract plans or directed by the Engineer. Use an Item 705-21 Type M, S or N masonry or mortar cement, tuck pointing mortar (or a specially designed one) with the same or weaker strength than the original mortar, as approved by the Engineer.

Remove soft, loose, cracked and deteriorated mortar to a minimum depth (measured from the wall face) of twice the average joint width, and remove all deteriorated mortar beyond the minimum depth, as ordered by the Engineer. Do not damage the masonry during the removal process. Clean all contamination from the prepared joints.

Prior to repointing, flush with water and leave all surfaces to be re-mortared in a dampened, surface dry state. Pack the prepared joints in layers with mortar that closely matches the original color and texture, allowing each layer to become thumb-print hard before the next. Use at least two layers when the joint depth is twice the joint width. Apply a final layer thickness that does not exceed the joint width. When the final layer is thumb-print hard, finish with a pointing tool that recreates the original joint shape, or as approved by the Engineer.

Perform pointing when the ambient temperature is 40°F or above, and the masonry is frost free. Avoid recessed joints that hold water.

After the mortar sets, clean all mortar and cement stains from other surfaces. In direct sunlight, keep the newly pointed masonry moist for at least 3 days. In shade, moisten 2 to 3 times a day for at least 3 days.

F. Drawings. The contract plans show the general character of the masonry. Prior to the beginning of any work, the Contractor shall prepare and submit for the approval of the Regional Director, three sets of detail plans for all dimension masonry shown on the plans. The Contractor shall carefully check and assume full responsibility for the accuracy of this work. These detail plans will be examined and either approved or returned without approval to the Contractor, who shall check the

indicated corrections and resubmit two sets of prints of revised details. When the detail plans have been approved, the Contractor shall furnish the Regional Director with three sets, one of which shall be reproducible. The drawings shall conform to the size and type of requirements for Shop Drawings set forth in the New York State Steel Construction Manual.

560-3.03 Split Faced Concrete Masonry. The provisions of §560-3.01 shall apply with the following additional requirements:

A. Sample Wall. The Contractor shall construct a split faced concrete masonry wall 6 feet long and 4 feet high of approved units and matching mortar at a location designated. This procedure shall be repeated until a sample wall is approved by the Engineer. The approved sample wall shall be maintained intact until the Engineer directs its removal.

In lieu of the field sample wall, the Contractor may show, for approval, a building constructed with units of the same type, color, texture and surface finish required. The field sample wall shall be required if the building masonry is not approved.

Upon approval of the sample wall or building, the Contractor shall furnish and lay split masonry to conform with the approved sample wall.

B. Protection and Handling. Split faced concrete masonry units shall be protected by a wrapping of 4 mil polyethylene, and shall be handled on pallets by mechanical means, or by hand or tongs. Dumping of the masonry units from trucks, wheel barrows or other conveyances is prohibited. Particular care shall be taken to protect all edges and the face of the masonry units. Distorted, laminated, checked or cracked masonry units will be rejected and removed from the site of construction.

On delivery to the site, the masonry units shall be neatly piled off the ground, on pallets or other approved implements, and protected from moisture by wrapping them with 4 mil polyethylene.

Masonry units which become wet, shall not be laid in the wall until their conformance with the specifications for §704-10 is shown by tests. The cost of these tests shall be borne by the Contractor.

C. Laying. The split faced concrete masonry shall be laid up, in the pattern shown on the plans, by skilled masons and in a first-class manner. The masonry shall be laid true to line and grade in level horizontal beds and be properly anchored. Each masonry unit shall be laid in a full mortar bed and in a manner to form a full end joint in one operation. The space between the split face masonry and the supporting concrete shall be filled with mortar and rodded until the mortar rises to the top of the masonry unit as each unit is placed.

D. Bonding. The split faced concrete masonry shall be bonded to the supporting concrete. Dovetail anchors shall be continuous, set vertically and spaced on centers not exceeding 1 foot on the concrete walls. Ties shall be installed in the anchor slots at a maximum vertical height of 1 foot on centers.

E. Joints. Joints in the exposed face shall be struck with a concave jointing unless otherwise specified. The joints shall be 3/8 inch wide and the concave jointing shall be 1/8 inch deep at the center.

F. Protection Against Weather. The split faced concrete masonry shall be protected against the action of the weather. The tops and at least 2 feet down the sides of all walls not completed shall be constantly protected with suitable waterproof covering properly secured in place during periods of suspended work. The facing shall be so protected until it has been bonded to the concrete wall and completely sealed against moisture. During hot dry weather, the masonry shall be protected from the sun and kept moist for at least three days after completion.

G. Protection Against Damage. Projections and angles exposed to damage shall be boxed or otherwise protected to prevent damage. Any units damaged during the progress of the work shall be replaced with new units at the Contractor's expense.

H. Cleaning of Exposed Faces of Mortar and Drippings. Exposed faces of split faced concrete masonry units shall be cleaned free of excess mortar and mortar drippings, as the work progresses, to prevent excessive rubbing during final cleaning operations.

I. Expansion and Contraction Joints. Expansion and contraction joints shall be constructed as shown on the plans. The surfaces of the joints shall be plumb, true to line and smooth to the caulking compound.

J. Final Cleaning. After the completion of adjacent work likely to soil the masonry, the split faced concrete masonry shall be thoroughly cleaned, removing all dirt, dust, mortar, stains, etc. The concrete masonry shall be brushed, while dry, with stiff fiber brushes. If this brushing does not clean the masonry to the satisfaction of the Engineer, then the Contractor shall clean the facing with soap powder in clean water applied with stiff fiber scrub brushes. After scrubbing with soap and water the Contractor shall rinse the masonry with clean water. The Contractor may, with the Engineer's approval, substitute a cleaning solution that will not harm the concrete or mortar joints. The cleaning operation shall in all cases start at the top and proceed downward.

K. Caulking. When the split faced concrete masonry has received the final cleaning, all expansion and contraction joints shall be filled at least 1 inch deep with caulking compound.

All surfaces to receive the caulking compound shall be clean, free of loose materials, dirt, dust, frost, moisture, oils, laitance or curing compounds and shall be primed with clear lacquer, shellac or the manufacturer's recommended primer after the surfaces have been cleaned. A bond breaker shall be used as a release material back of the caulking compound. The bond breaker may be polyethylene, specially treated bond inhibiting pressure sensitive tape or any approved equal. The caulking compound shall be tooled with a concave joint finishing tool to provide a neat smoothly finished joint of uniform width. Where solvents are required on the jointing tool, they shall be as recommended by the manufacturer of the caulking compound.

560-3.04 Stone Masonry. The construction provisions of §560-3.02 shall apply. The individual stones shall be trimmed, recut and dressed, as may be necessary at the site, to obtain a pattern in the finished wall which will be in character with the requirements of drawings, specifications and the approved sample wall.

The following general requirements will apply to the placing of stone masonry:

A. Cross-Joints, Steps or Ladders. There shall be no cross-joints, steps or ladders.

B. Subdivision of Rectangles. There shall be no subdivision of rectangles.

C. Stone Shapes. There shall be no unusually shaped stone.

D. Clusters. There shall be no clusters of stone of the same length and height.

E. Horizontal Joint Length. There shall be no continuous horizontal joint greater in length than 10 feet.

F. Vertical Joints. There shall be no more than five stones abutting any one vertical joint.

G. Stone Proportions. There shall be no stone longer than six times its height nor shorter than one and one half times its height. The length of the average stone shall be three to five times its height.

H. Horizontal Joints. Horizontal joints shall not have a slope varying from the horizontal by more than one percent.

§560

I. Color. Where stone masonry and dimension masonry are specified, for the same structure or in close proximity to each other, there shall be no great contrast in size or color between the Stone Masonry and the Dimension Masonry.

Prior to beginning the work the Contractor shall lay up a sample wall conforming to the requirements of §560-3.03A except that the material details for the work shall conform to those for Stone Masonry.

560-3.05 Rubble Stone Masonry. The provision of §560-3.01 shall apply with the following additional requirements:

The stone shall be laid to form substantial masonry presenting a neat, finished appearance. The minimum size of stone to be used shall be 4 inches in depth or rise, 9 inches in width, and 12 inches long. Spalls and pinnars will not be allowed to show on the face of the work and shall be used otherwise only where necessary. All stones shall be soundly and completely bedded in the mortar. The length of stretchers shall not exceed three times their rise, and the width of stretchers shall in no case be less than one and one-half times their rise. At least one-fourth of the stones in the face shall be headers and shall be evenly distributed. The length of headers shall be not less than 32 inches nor more than the thickness of the wall, where the work is 4 feet or less in thickness. Where the work is more than 4 feet thick, the length of headers shall be not less than 32 inches. The width of headers shall be not less than their rise. All stones shall be laid to break joints 6 inches or more and to thoroughly bond the work. No joint in the face shall be over 1 inch in width. Backing shall be good-sized, well-shaped stones so laid as to break joints. Spaces between stones shall be filled with spalls set in mortar. The degree of roughness of exposed faces shall be measured with a 6 foot straight edge supported between adjacent projections on the stone face. Variations in the stone face, in excess of 4 inches, measured from the straight edge to the extreme depression in stone or mortar will not be permitted. Rear faces shall present approximately plane surfaces.

Pointing shall conform to the requirements of §560-3.02E.

560-3.06 Rubble Stone Masonry Laid Dry. The specifications of §560-3.05, Rubble Stone Masonry, shall apply except that no mortar shall be used and the requirements of §560-3.01 Construction Details (General), pertaining to frost shall not apply unless otherwise directed by the Engineer.

560-3.07 Precast Concrete Coping. The provisions of §560-3.02, Dimension Stone Masonry and §560-3.03, Split Faced Concrete Masonry, shall apply with exception of §560-3.02D, §560-3.03A, and §560-3.03D.

560-3.08 Tuck Pointing. Apply the provisions of §560-3.02E2 Tuck Pointing. For re-caulking work, rake out any old caulking to a minimum 1 inch depth and follow the provisions of §560-3.03K. Caulking. Do not damage masonry during the removal and cleaning process.

560-4 METHOD OF MEASUREMENT

560-4.01 Dimension Masonry. Dimension masonry will be measured as the number of square feet (including joints within the dimension masonry) measured on the plane of all the exposed surfaces of the dimension masonry incorporated in the work.

560-4.02 Split Faced Concrete Masonry. Split faced concrete masonry will be measured as the number of square feet (including joints within the masonry and between the split faced concrete masonry and the concrete wall, and the mortar bed for precast concrete coping), on the plane of all exposed surfaces of the masonry incorporated in the work. Split faced masonry below the finished surface of the ground or paving shall be considered as exposed in computing the area for payment. The approved, constructed, split faced concrete masonry sample wall will be paid for as split face concrete masonry.

560-4.03 Rubble Stone Masonry. Payment for rubble stone masonry will be made for the number of cubic feet within the payment lines shown on the plans and placed in accordance with the specifications. Concrete, mortar or any joint material within these payment lines will, for the purpose of payment, be classified as stone masonry and will not be paid for under any other item.

560-4.04 Stone Masonry. Payment for stone masonry will be made for the number of square feet (including joints within the stone masonry) measured on the plane of all the exposed surfaces of the stone masonry incorporated in the work. Mortar joints between concrete and stone masonry will be paid for as stone masonry.

Stone masonry shown on the plans below the finished grade or sidewalk (to prevent the possible exposure of unfaced concrete) shall be considered as exposed in computing the payment area for this item.

Thirty square feet will be used in payment for the complete accepted sample wall required in this specification.

560-4.05 (Vacant)

560-4.06 Precast Concrete Coping. The quantity to be paid for will be the number of feet of precast concrete coping (including the joints between the coping units) placed in accordance with the plans, specification and orders of the Engineer.

560-4.07 Tuck Pointing. The Engineer will measure this work in the field as the number of square or linear feet of masonry pointed and cleaned, as bid. Linear measurements will be made along the joint centerline.

560-5 BASIS OF PAYMENT

560-5.01 Dimension Stone Masonry. The unit price bid per square feet shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

Concrete, dimension masonry, mortar or any joint material within the nominal thickness of the dimension masonry will, for the purpose of payment, be classified as dimension masonry and will not be paid for under any other item. Projections, if any, into the concrete beyond the nominal thickness of dimension masonry will be paid for as the class of concrete displaced by the stone. No deduction will be made for railing post holes.

Mortar Joints between Dimension Masonry and Concrete will be paid for as Dimension Masonry.

Mortar Joints between Dimension Masonry and Stone Masonry will be paid for as Stone Masonry.

560-5.02 Split Faced Concrete Masonry. The unit price bid per square feet shall include the cost of furnishing all labor, materials (including anchors, ties, premolded bituminous joint material, and caulking compound) and equipment necessary to complete the work. The payment shall also include the labor, materials and equipment necessary to remove and dispose of all constructed sample masonry panels when directed by the Engineer.

No payment shall be made to the Contractor for the submitted alternate sample walls or for any unapproved sample walls.

The cost of furnishing and placing anchoring devices shall be included in the unit price bid for this work.

The cost of erecting and disposing the sample wall shall be included in the unit price bid for this item.

560-5.03 Stone Masonry. The unit price bid per square feet shall include the cost of furnishing all labor, materials and equipment necessary to complete the work.

Concrete, stone masonry, mortar or any joint material within the nominal thickness of the stone masonry will, for the purpose of payment, be classified as stone masonry and will not be paid for under any other item. Projections, if any, into the concrete beyond the nominal thickness of stone masonry will be paid for as the class of concrete displaced by the stone. No deduction will be made for railing post holes.

The cost of furnishing and placing anchoring devices shall be included in the unit price for this item.

560-5.05 Rubble Stone Masonry. The unit price bid per cubic feet for Rubble Stone Masonry with joints or laid dry, shall include the cost of furnishing all labor, materials and equipment necessary to complete the work except excavation will be paid for under the appropriate excavation item.

§560

560-5.06 Precast Concrete Coping. The unit price bid per feet shall include the cost of furnishing all labor, materials (including anchors, reinforcement, premolded resilient joint materials, and caulking compound) and equipment necessary to complete the work.

560-5.07 Tuck Pointing. Include all labor, material (including any re-caulking material), and equipment to complete the work in the unit bid price.

560-5.08 Progress Payments. Progress payments will be made, at the unit price bid, for 75% of the quantity properly placed. The balance of the quantity will be paid for upon proper cleaning and caulking of the joints.

Payment will be made under:

Item No.	Item	Pay Unit
560.01	Dimension Stone Masonry	Square Foot
560.02	Split Faced Concrete Masonry	Square Foot
560.0401	Stone Masonry	Square Foot
560.05	Rubble Stone Masonry	Cubic Foot
560.06	Rubble Stone Masonry Laid Dry	Cubic Foot
560.07	Precast Concrete Coping	Foot
560.08	Tuck Pointing	Foot
560.09	Tuck Pointing	Square Foot

SECTION 561 (VACANT)

SECTION 562 - REINFORCED CONCRETE THREE-SIDED STRUCTURES

562-1 DESCRIPTION. The work consists of designing and constructing reinforced concrete three-sided structure(s) at the location(s) indicated on the Plans.

A reinforced concrete three-sided structure is composed of some of the following discrete elements:

1. Span Unit
2. Span Unit Footing
3. Wing Wall with Footing
4. Headwall
5. Invert Slab with Cut-off Wall
6. Apron with Cut-off Wall

NOTE: Any of the above elements may be cast in place at no additional cost to the State.

562-2 MATERIALS. Materials for all precast concrete components shall meet the requirements of the PCCM. Materials for cast-in-place concrete shall be Class A concrete meeting the requirements of Section 555 and reinforcement meeting the requirements of Section 556.

562-3 CONSTRUCTION

562-3.01 Design. An appropriate structure design and all details necessary for construction meeting the Design parameters given in these specifications shall be developed and submitted to the DCES for approval. All design work, detail development, and proposed handling and installation procedure development, shall be done by a Professional Engineer. The design submittal shall conform to the requirements stated in the PCCM. The DCES reserves the right to reject a proposed design(s) if the structure type is determined to be unsuitable for the proposed application based on safety, durability, serviceability, or maintainability.

The Load Rating shall be determined in accordance with the AASHTO *"Manual for Condition Evaluation of Bridges, 1994 - Second Edition,"* with all interim provisions in effect. The contractor shall

show which method (working stress or load factor) was used in load rating computations. The load rating shall be shown on the Production Note Sheet of the shop drawings. The contractor shall include all load rating computations in the design calculation submittal.

562-3.02 Design Parameters. The design of the structure(s) described above shall meet the following:

1. Design Specification : New York State Standard Specifications for Highway Bridges.
2. Live Load : HS 25
3. Highway Profile Section : As shown in the contract documents.
4. Soil Parameters : As shown in the contract documents.
5. Layout, Span, Rise, and Length of the Bridge Structure : As shown in the contract documents.
6. Staged Construction : Construction staging shall be as shown in the contract documents.
7. Wing Walls : As shown in the contract documents.
8. Railing or Barrier : The railing anchorages or barrier anchorages on the structure shall be designed to develop adequate global and local capacities required to resist the loads in Section 2 of the New York State Standard Specifications for Highway Bridges.
9. Hydraulics : The proposed structure shall provide hydraulic area (effective flow area) below the design high water elevation shown in the contract documents.
10. Allowable concrete stress : As per the provisions of the Standard Specifications, except that maximum tensile stress in concrete for handling and erection loads when analyzed according to the proposed handling and installation procedures, shall not exceed $4.5 \sqrt{f'_{ci}}$, where f'_{ci} is the concrete compressive strength at the time being considered.
11. Joints : All joints between Span Units shall be designed to be leak proof. The determination of the acceptability of the proposed joint system by the DCES shall be final.

NOTE: The shape(s) of the Span Unit shown in the contract documents is for illustration purposes only. Other shapes meeting the design parameters are acceptable, unless otherwise noted in the contract documents.

562-3.03 Changes to Design Parameters. If the Contractor wants to propose a structure not in full compliance with the design parameters in the contract, a preliminary proposal, fully explaining the changed design parameters shall be submitted to the DCES for review and approval. The Contractor is not expected to develop a detailed design until the proposed design parameters have been approved by the DCES.

562-3.04 Design Computations, Shop Drawings/Detail Drawings. The preparation and submission for review and approval shall be according to the PCCM. Shop drawings shall show detailed handling procedure to be used during fabrication, storage, and transportation of the precast elements. All necessary supporting calculations shall be included in the design computation package.

Fabrication of all steel components shall meet the requirements of the SCM.

Shop drawings shall show the required tolerances for the geometry of all precast components, placement of reinforcement, location of all inserts, etc. Design shall consider the effects of these tolerances.

562-3.05 Fabrication. Fabrication of all precast elements shall be according to the PCCM.

562-3.06 Installation Drawings. Installation drawings shall meet the requirements of the PCCM and the following:

- A.** Details of all joints including all materials and a step-by-step procedure for installing them shall be shown on the installation drawings.

B. All welding operations during installation shall be shown on the installation drawings and shall meet the requirements of the SCM.

C. Details for all cast-in-place concrete not detailed in the contract documents.

562-3.07 Installation. Installation of all precast elements shall be according to the approved installation drawings. All elements after installation and prior to backfilling will be inspected for cracks or other visible defects. All defective elements shall either be replaced or be repaired using procedures approved by the DCES and at no additional cost to the state.

562-3.08 Erection Drawings. A separate set of erection drawings shall be prepared and submitted for review and approval of the Department as per the provisions of Section 2.6 ERECTION DRAWINGS of the PCCM.

562-3.09 Tolerances (After Erection)

A. Joint Width: $\pm 3/8$ inch

B. Vertical Difference Between Top of Adjacent Units: $\pm 1/2$ inch

C. Span - Variation From Post-Pour Measurement Recorded on the Shipping Paperwork: $\pm 3/8$ inch

562-3.10 Backfilling

A. Backfilling operations shall not begin until:

1. Span units to span unit footing key joints are grouted as shown on the approved installation drawings and have cured a minimum of 24 hours.
2. Transverse connections between unit segments are placed and secured (if required).
3. Joint seals are properly placed and approved by the Engineer.

B. Backfilling operations shall be conducted in accordance with Section 203 - Excavating and Embankment, with the following modifications:

1. Fills shall be placed and compacted in layers not exceeding 12 inches in depth.
2. Dumping for filling operations shall not be nearer than 3 feet to a plane passing vertically through the back face of any footing.
3. Backfill shall be placed as symmetrically as possible around the structure with differential depths of backfill on opposite sides of the structure span units not exceeding 18 inches.
4. Fill within 1 foot of any surface of the structure shall be compacted with hand compaction equipment.
5. Vibratory rollers shall not be used within 10 feet of any surface of the structure.
6. Construction equipment shall not travel or rest on an uncompleted structure unless the designer of the structure span unit has evaluated the loading conditions, submitted calculations to the DCES, and has received written approval of the proposed loading. Actual conditions at the time of loading, including both the weight of the fill and the equipment, shall be part of the analysis. The Contractor shall repair any damage resulting from equipment passage at no additional cost to the State.

562-4 METHOD OF MEASUREMENT. Measurement for payment for the Reinforced Concrete Span Units, Wing Walls, Apron, and Invert Slabs will be computed from the payment lines shown on the plans. No field measurements will be made.

562-5 BASIS OF PAYMENT. The Contractor shall include the cost of all engineering, labor, materials, and equipment necessary to complete the work in the unit price bid. The Contractor shall

include the costs of the footings, headwalls, and cut-off walls in the unit price bid of the element to which it is attached.

Payment will be made under:

Item No.	Item	Pay Unit
562.01nn	Reinforced Concrete Span Units	Square Yard
562.02	Invert Slab With Cut-Off Wall	Square Yard
562.03	Wing Wall with Footing	Square Yard
562.04	Concrete Apron With Cut-off Wall	Square Yard

NOTE: Serialization for the Span Units: nn represents the specific structure identifier.

SECTION 563 - PRESTRESSED CONCRETE UNITS (STRUCTURAL)

563-1 DESCRIPTION. This work shall consist of furnishing and placing prestressed concrete units for structures, as specified in the contract documents.

The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all prestressed concrete units (structural) and the fabricator of any steel diaphragms for the prestressed concrete units in accordance with §106-01 Sources of Supply.

563-2 MATERIALS

563-2.01 Prestressed Units. Prestressed concrete units shall meet the requirements of the P.C.C.M.

563-2.02 Transverse Tie Rods or Strands. Refer to P.C.C.M., Section 4.

563-2.03 Shear Key Material. Refer to P.C.C.M., Section 4.

563-2.04 Anchorage Block-Out Grout. Refer to P.C.C.M., Section 4.

563-2.05 Concrete. The concrete shall meet the requirements of §718-06, High Performance Concrete For Precast and Prestressed Bridge Beams.

563-2.06 Diaphragms. The requirements of §718-07 shall apply.

563-3 CONSTRUCTION DETAILS. The requirements of the P.C.C.M. shall apply.

563-4 METHOD OF MEASUREMENT

563-4.01 Prestressed Concrete I-Beam Units. The quantity to be paid for under this work shall be the number of feet (horizontal length center-to-center of bearings or anchor dowels, as shown on the plans) of each unit furnished and placed in accordance with the plans and specifications.

563-4.02 Prestressed Concrete Box-Beam Units and Hollow and Solid Slab Units. The quantity to be paid for under this work shall be the number of square feet of plan area of each prestressed unit installed. Plan area is defined as the area bounded by the centerline of bearings and the outer edges of each prestressed unit. No deductions will be made for chamfers, shear keys, or notch cuts. Space between the units shall not be included in any measurement.

563-5 BASIS OF PAYMENT. The unit price bid for these units shall include all labor, materials, diaphragms, and equipment necessary to complete the work except that bearings shall be paid for under their respective items.

Damaged units which cannot be satisfactorily repaired or which do not meet dimensional and camber tolerances shall be replaced by the Contractor at no cost to the State.

Progress payments will be made when each unit is furnished and placed in accordance with the plans and specifications exclusive of preparing and filling joints. Payment will be made at the unit price bid for

§563

90% of the quantity properly placed. The balance of the quantity will be paid for upon completion of the work. The completion of work will include the correct preparation and filling of the joints as well as the tightening of transverse ties.

Payment will be made under:

Item No.	Item	Pay Unit
563.010X	Prestressed Concrete I-Beam Units (Types 1-6)	Foot
563.02	Prestressed Concrete Box Beam Units	Square Foot
563.03	Prestressed Concrete Hollow Slab Units	Square Foot
563.04	Prestressed Concrete Solid Slab Units	Square Foot
563.05	Prestressed Concrete New England Bulb Tee Units	Foot

X = Type Designation (1 through 6)

SECTION 564 - STRUCTURAL STEEL

564-1 DESCRIPTION. Under this work, the Contractor shall fabricate, furnish and erect structural steel and other metal parts in accordance with the contract documents.

The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all structural steel in accordance with §106-01 Sources of Supply.

564-2 MATERIALS. Materials for this work shall meet the requirements of the New York State Steel Construction Manual and the following subsections of Section 700 - Materials:

Structural Steel	715-01
High Strength Bolts, Nuts and Washers	715-14
Pins and Rollers	715-15
Vertical Load Transmitting Devices	728

Certified copies of the results of tests conducted by the manufacturer shall be furnished to the Engineer in accordance with the requirements of §715-01, Structural Steel.

564-2.01 Structural Steel Replacement - Stock Steel Option. Stock steel may be furnished for this work. If furnished, the stock steel shall comply with the provisions of §715-01, Structural Steel. Positive heat identification will be required for all stock steel. Certified copies of the results of chemical analysis and physical tests shall be furnished to the Department. Shop inspection will be provided unless otherwise noted on the contract plans, or waived by the DCES. The provisions of this subsection shall apply only to pay items entitled "Structural Steel Replacement (lb.)" or "Structural Steel Replacement (Each)."

564-3 CONSTRUCTION DETAILS. All structural steel work, including, but not limited to fabrication inspection, transportation, and erection shall be done in accordance with the provisions of the SCM.

Shop drawings prepared for pay items titled Structural Steel Replacement (lb.) and Structural Steel Replacement (Each) shall be prepared, approved and distributed in accordance with the provisions of the SCM, except that the term "DCES" shall be interpreted as "the Engineer."

564-4 METHOD OF MEASUREMENT. Measurement will be made by one, or combinations of the following methods as indicated in the contract documents.

- Pound
- Each
- Lump Sum

564-4.01 Pound. Measurement will be made on a pound basis. The weight of each shipping unit shall be clearly shown on the approved shop drawings. For the purpose of measurement, such items as castings, anchor bolts, forgings, fasteners, cable and other metal parts used in the construction shall, unless otherwise provided, be considered to be structural steel even if made of other materials.

A. Payment Weight. Payment will be based on the computed weight of metal as shown on the approved shop drawings, and shall include permanent bolts and welds in the structure as erected. The weight of all erection materials including but not limited to bolts, pilot and driving nuts, temporary protective coatings, and all boxes, crates or other containers used for packing, together with sills, struts, and rods used for supporting members during transportation, shall be excluded.

The weight of all required bolt heads, nuts and washers will be estimated, making no allowance for waste, and included in the weight for which payment will be made.

The mass of all required welds will be estimated and included in the mass for which payment will be made.

B. Computed Weight. The density of steel shall be assumed as 490 pcf. The density of cast iron shall be assumed as 450 pcf.

The weights of rolled shapes and of plates of all dimensions shall be computed on the basis of their nominal weights as required by the dimensions shown on the approved shop drawings. If the Contractor, however, elects to use for his convenience, steel members with weights that are greater than the nominal weights specified on the approved drawings, the computations shall be based on the nominal weight values on the drawings. Deductions shall be made for copes, cuts and all holes except those holes required for high-strength bolts.

The weight of fillet welds shall be computed from the following:

TABLE 564-1 WEIGHT OF DEPOSITED METAL PER FOOT OF FILLET WELD							
Size of Fillet (inches)	3/16	1/4	5/16	3/8	1/2	5/8	3/4
Deposited Metal (lb/ft)	0.086	0.152	0.239	0.289	0.514	0.731	1.060

The weights of castings shall be computed from the dimensions shown on the approved shop drawings, with an addition of 10% for fillets and overrun.

The weight of high-strength bolts, nuts and washers, exclusive of grip, shall be computed from the following:

TABLE 564-2 WEIGHT OF HIGH-STRENGTH BOLTS								
Bolt Diameter (inch)	1/2	5/8	3/4	7/8	1	1 1/8	1 1/4	1 1/2
Wt of 100 Bolts w/ Nut & 2 Washers (lb) ¹	22	36	57	87	127	177	227	362

NOTE 1. Measured weight will be exclusive of grips.

564-4.02 Each Unit. Measurement will be made for each unit of structural steel as indicated on the contract plans. The provisions of §564-4.01, concerning castings, anchor bolts, forgings, fasteners, cable, and other metal parts, shall apply.

564.4.03 Lump Sum. No measurement will be taken. The provisions of §564-4.01 concerning castings, anchor bolts, forgings, fasteners, cable and other metal parts, shall apply.

564-5 BASIS OF PAYMENT

564-5.01 General. The price bid shall include the cost of furnishing all labor, materials and equipment necessary to complete the work. For the purpose of payment, castings, forgings, fasteners, anchor bolts for other than bridge bearing installation, cables and other metal parts used in the construction, will be considered to be structural steel, even if made of other materials.

564-5.02 Additional Work. Items that are included in the price bid and are the Contractor's responsibility are as follows:

A. Shop Drawings, including Paper Prints and Reproducible Prints. The cost of all shop drawings, prints, reproducible prints and microfilm required by the specifications or the Steel Construction Manual shall be included in the unit price bid for the payment item requiring the drawings.

Any prints and reproducible prints required beyond the number specified shall be furnished by the Contractor at cost.

B. Laminar Defects at the Boundary of Tension Groove Welds. The cost of all work and materials required for the correction or elimination of laminar defects at the boundary of tension groove welds shall be included in the price bid for structural steel.

The cost of all ultrasonic testing and repairs and the cost of replacement of defective portions of plates where partial replacement is approved shall be borne by the Contractor and included in the price bid for structural steel.

C. Inspection of Bolted Connections. All labor and equipment necessary for the performance of inspection of bolt tightness during structural steel fabrication and erection shall be provided by the Contractor and included in the price bid for structural steel. The State shall witness the bolt testing, but will not provide equipment or labor.

D. Qualification Test for Welders, Welding Procedures and Electrode and Flux Combinations. The cost of tests required to qualify welders, welding procedures and electrode and flux combinations shall be included in the unit price bid for the steel with the exception that the State will witness tests and perform Charpy V-Notch Impact Tests without cost to the Contractor.

E. Radiographic Inspection. The cost of radiographic inspection and of preparation for radiography, together with the cost of providing access and of furnishing adequate facilities for the review of radiographs in the shop or field, shall be included in the price bid for structural steel.

F. Ultrasonic Inspection. Ultrasonic inspection, when required, will be performed by the State or its representatives unless otherwise provided for in the contract documents. The cost of any required preparation and of furnishing access to the joints shall be included in the price bid for structural steel.

G. Magnetic Particle Inspection. The cost of magnetic particle inspection when specified or required by the inspector to verify limits of defects discovered during visual inspection shall be included in the unit price bid for structural steel.

H. Repair of Defects in Welds and Base Metal. The cost of repairing defects found by visual inspection or nondestructive tests shall be included in the unit price bid for structural steel.

I. Field Inspection of Rejected Material or Material Not Offered for Shop Inspection even though Required to be Shop Inspected by the Contract Documents. When the Department, at its discretion, permits inspection of the subject materials to be performed at the project site, all costs of this inspection shall be borne by the Contractor as a condition of the Department's approval of inspection of this material. All costs associated with the inspection of rejected material, which has been shipped to the field without approval, shall be borne by the Contractor.

J. Straightening Bent Material and Correcting Camber Deficiencies. All corrective work required to straighten bent material and correct camber deficiencies, when permitted, shall be performed at no additional cost to the State.

K. Field Repair, Reaming and Drifting of Holes. All work permitted for the correction of unacceptable holes shall be provided at the Contractor's expense.

L. Metal Scuppers. Metal scuppers shall be paid for as structural steel unless otherwise noted on the plans.

M. Adjustment and Alignment of Bearings. All labor, materials and equipment required for adjustment and alignment of bearings shall be included in the unit price bid for structural steel.

N. Field Splices. When the specific location for a bolted or welded field splice in stringers and girders is not shown on the plans, the Contractor will be permitted to introduce splices at locations of his choice. The splices shall be made in accordance with the provisions of the SCM. No payment will be made for labor, material, and equipment required to make a splice if the splice is not shown on the contract plans. Also, payment will not be made for increases in the thickness of webs or flanges made necessary by the requested splice.

O. Photographs. Photographs requested by the DCES in accordance with the provisions of the SCM, shall be furnished at no additional cost.

P. Testing of Stock Steel. All labor, materials and equipment necessary to perform chemical and physical tests on stock steel when such tests are required shall be furnished by the Contractor and included in the price bid for structural steel.

Q. Heat-Curving and Cambering. All costs of nondestructive testing, repairs or replacement of material damaged due to over stressing or destructive heating during heat-curving or cambering shall be borne by the Contractor.

564-5.03 Progress Payments for Fabricated Steel. Upon application by the contractor, payments for some of the cost of fabricated steel will be made to the contractor prior to shipping and incorporation of such material in the permanent work, subject to the following:

- A. To be eligible for progress payment, the steel must meet all of the following conditions:
1. Include all the structural steel required for one or more spans of the bridge. If stage construction of the bridge is required by the Contract this will be interpreted as all the steel required for one or more stages of one or more spans of the bridge. The weight of steel extending beyond the end of the span to a splice point will be included for payment.
 2. Have a minimum mass of 20,000 pounds.
 3. Be materials which will be incorporated into permanent work.
 - 4.a. For unpainted (weathering) steel, be in a condition which is ready for on-site installation without further fabrication.
 - 4.b. For steel that will be coated or painted, be completely fabricated, inspected and ready for shipment to a coating shop.
- B. With application for progress payments, the contractor shall provide documentation as follows:
1. Bill of sale or vouchers indicating the actual dollar value paid by the contractor for the materials as stored;
 2. Certification of Title showing that title to the materials, without encumbrances, is in the name of the contractor and that title is warranted to the Department of Transportation;
 3. Documented evidence of acceptability of the materials;
 4. A release and waiver covering such materials, and providing access to the storage site, which release and waiver shall be executed by the property owner in favor of the New York State Department of Transportation or its agents.
- C. For rolled beam and plate girder bridges, the amount of progress payments shall not exceed the total invoice amount for stored materials, nor shall the partial payment exceed eighty five percent (85%) of the pro rata value of the lump sum bid. The pro rata values shall be calculated by multiplying the lump sum price bid by the ratio which represents the structural steel members fabricated and stored during the payment period in question. The ratio will be computed by dividing the weight of the steel by the Total Weight for Progress Payments for the appropriate item. See §564-5.04.

§564

D. For truss bridges, arches, or other construction identified in the Contract Documents, the amount of progress payments shall not exceed the total invoice amount for stored materials, nor shall the partial payment exceed seventy five percent (75%) of the pro rata value of the lump sum bid. The pro rata values shall be calculated by multiplying the lump sum price bid by the ratio which represents the structural steel members fabricated and stored during the payment period in question. The ratio will be computed by dividing the weight of the steel by the Total Weight for Progress Payments for the appropriate item. See §564-5.04.

E. When progress payments are made in accordance with this subsection, no application for partial payment will be considered by the Department.

The making of progress payments shall not be deemed to be a final acceptance of materials, nor shall it relieve the contractor of responsibility for such materials. The contractor shall be responsible for assuring that only those materials which comply with the specifications are incorporated into the project.

564-5.04 Progress Payments - Lump Sum. Progress payments shall be calculated by multiplying the lump sum price bid by the ratio which represents the structural steel members erected during the payment period in question and then subtracting any partial and progress payments made. The ratio will be computed by dividing the shipping weight of the erected steel by the Total Weight for Progress Payments for the appropriate item indicated in the contract documents.

564-5.05 Other Work. Work not included in the unit price bid for the structural steel item is as follows:

A. Setting Anchor Bolts for Bridge Bearings. The pipe sleeves, anchor bolts and work required to furnish, set and grout the anchor bolts, shall be included in the price bid for the respective bearing item.

B. Vertical Load Transmitting Devices. The furnishing and installing of vertical load transmitting devices, such as; rubber impregnated random fiber pad, and plain rubber pad, shall be included in the price bid for the respective item.

Payment will be made under:

Item No.	Item	Pay Unit
564.05XX	Structural Steel (Type 1-22)	Lump Sum
564.10nnnn	Structural Steel Replacement	Pound
564.51nnnn	Structural Steel	Pound
564.70nnnn	Structural Steel Replacement	Each

NOTE: nn denotes a serialized pay item.

SECTION 565 - BRIDGE BEARINGS

565-1 DESCRIPTION. The work shall consist of furnishing, placing and setting bridge bearings at the locations indicated on the plans.

The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all bridge bearings in accordance with §106-01 Sources of Supply.

565-1.01 Bearing Types. There are various types of bearings. The specific type required will be indicated on the plans. Bearing types are:

A. Type S.R. - Steel Rocker Bearings. These accommodate rotation by pivoting around a pinned joint. They are fabricated in fixed and expansion versions. The expansion version accommodates longitudinal movement by means of a curved rocker rotating on the bearing surface. Steel rocker bearings do not allow for transverse movement. This type of bearing shall only be used in rehabilitation situations where only one or two bearings are to be replaced on a bridge.

B. Type S.S. - Steel Sliding Bearings. These accommodate rotation by means of a rocker. They are fabricated in fixed and expansion versions. The expansion version accommodates movement with a sliding element. Steel sliding bearings do not allow for transverse movement. This type of bearing shall only be used in rehabilitation situations where only one or two bearings are to be replaced on a bridge.

C. Type M.R. - Multi-Rotational Bearings. These accommodate rotation by the deformation of a confined elastomeric element, or an unconfined urethane disc. Multi-rotational bearings are fabricated in fixed and expansion versions. The expansion version accommodates movement by means of sliding elements. Expansion versions may be guided, allowing movement in only one direction, or non-guided, allowing multi-directional movement.

D. Type E.P. - Plain Elastomeric Bearings. These accommodate rotation by the deformation of a plain elastomeric pad. They may be used for both fixed and expansion applications without changes in details. The bearings will accommodate longitudinal, transverse, and rotational movements.

E. Type E.L. - Steel Laminated Elastomeric Bearings. These accommodate rotation by the deformation of a laminated elastomeric and steel pad. They may be used for both fixed and expansion applications without changes in details. The bearings will accommodate longitudinal, transverse, and rotational movements.

F. Type E.B. - Elastomeric Bearings with External Load Plates. These accommodate rotation by the deformation of a plain or steel laminated elastomeric pad. Elastomeric bearings with external load plates are fabricated in fixed and expansion versions. The fixed version will accommodate rotational movements. The expansion bearings will accommodate longitudinal, transverse, and rotational movements.

565-2 MATERIALS

565-2.01 General. Materials shall meet the following requirements:

Concrete Grouting Material	701-05
Steel Anchor Dowel	709-01 ^a
Disc-Design Structural Bridge Bearings	716-06
Pot-Design Structural Bridge Bearings	716-07
Plain Elastomeric Bridge Bearings	716-10
Steel-Laminated Elastomeric Bridge Bearings	716-11
Elastomeric Bridge Bearings with External Load Plates	716-12
Rubber-Impregnated Woven Cotton Fabric	728-01
Rubber-Impregnated Random Fiber Pad	728-02
Plain Rubber Pad	728-03
Nuts	ASTM A563
Washers	ASTM F436
Anchor Studs	ASTM A325 or A449 Type 1
Cap Screws	ASTM F835M or A574M
Structural Steel Paint Class 1	708-01

NOTE a. Steel anchor dowels shall meet the requirements of §709-01 - Bar Reinforcement.

565-2.02 Fabrication. Steel components of bridge bearings shall be fabricated in accordance with the applicable requirements of the NYS Steel Construction Manual (SCM). In addition, component parts of individual bearings shall meet fabrication details as shown in the contract documents.

A. Type S.R. Bearings. These shall conform to the plans and other contract documents.

B. Type S.S. Bearings. These shall conform to the plans and other contract documents.

C. Type M.R. Bearings. These shall conform to the requirements of either §716-06.01 or §716-07.01 as applicable, and other contract documents. When type M.R. bearings are specified, the Contractor may supply either disc design or pot design bearings. Only one bearing design, disc or pot, shall be supplied for any one bridge.

D. Type E.P. Bearings. These shall conform to the requirements of §716-10 and other contract documents.

E. Type E.L. Bearings. These shall conform to the requirements of §716-11 and other contract documents.

F. Type E.B. Bearings. These shall conform to the requirements of §716-12 and other contract documents.

565-2.03 Drawings. Shop drawings shall meet the requirements specified in the following:

Type S.R. and S.S. Bearings	SCM
Type M.R. Bearings	716-06.01 or 716-07.01
Type M.R. Bearings	716-06.01 or 717-07.01
Type E.L. Bearings	716-11
Type E.B. Bearings	716-12

Comment [c73]:
Errata 1/7/10

565-2.04 Protective Coatings

- A. Machine finished surfaces in contact, including pins, pin holes, surfaces in sockets at the top of rocker bearings, and bronze or copper plates in sliding contact shall receive one coat of automotive grease as soon as machining is complete. None of these surfaces shall be painted.
- B. Stainless steel and polytetrafluoroethylene surfaces shall not be painted or otherwise coated.
- C. Metal to metal surfaces to be field welded shall be given a coat of clear lacquer or other protective coating approved by the Engineer, or Inspector, if exposure is to exceed three months prior to welding. The coating shall be removed at the time of welding. Painting, if required, will be done only after the completion of welding. Surfaces to be painted shall be primed and painted in accordance with §565-2.04D.
- D. All other metal surfaces shall be cleaned to meet SSPC-SP10, “Near-White Metal Blast Cleaning” and painted in accordance with section 572, Structural Paint System: Shop Applied. The paint shall be selected from the Department’s Approved List, Structural Steel Paints – Class 1. For bearings used in conjunction with unpainted steel, the color of the finish coat shall Weathered Brown as defined by §708-05.

565-2.05 Shipping. Each bearing shall be shipped as an assembled unit, except for elastomeric bearings. Elastomeric bearings may be shipped in packages containing more than one bearing, provided the package can be handled with normal construction equipment. Bearings shall be packaged in such a manner to protect all rotating and sliding surfaces from the intrusion of outside material. Bearings shall be packaged securely to prevent separation of the elements during shipping.

565-3 CONSTRUCTION DETAILS

565-3.01 Concrete Bearing Surface Elevations

A. General. The elevation of the concrete bearing surface for all types of bearings, except Type M.R. bearings, shall be as given on the plans.

B. Type M.R. Bearings. The elevation of the concrete bearing surface may vary from that given on the plans depending on the vertical dimension of the actual bearing supplied. The Contractor shall notify the Engineer of all required elevation changes. Changes to the roadway profile will not be

allowed. All elevation adjustments necessary to maintain the profile shall be made to the concrete bearing surfaces. Any adjustments, including changes to the reinforcement, will be made at no additional cost to the State.

565-3.02 Concrete Bearing Surface Preparation. No bearing shall be placed upon a concrete bearing surface which is deformed, irregular, or poorly finished. The entire bearing surface area shall be floated and troweled.

565-3.03 Setting Anchor Studs. Anchor studs shall be set as shown on the plans unless changes are permitted by the DCES. If anchor studs are cast in substructure concrete, templates, or other suitable means, shall be used to keep the studs vertical at the required embedment and in the correct horizontal position during concrete placement. If the Contractor elects to drill the finished, cured concrete in order to set the anchor studs, the reinforcing steel shall be positioned prior to casting the concrete so that it will not be damaged during drilling. If anchor studs are drilled and grouted, material and construction details shall be in conformance with §586-2 and §586-3.

565-3.04 Bearing Pad Installation. Bearing pads placed between concrete, or other masonry, and steel masonry plates shall be located to correct alignment and elevation, and placed at the time of masonry plate installation. Bearing pads shall conform to §728-01, §728-02, or §728-03 at the Contractor's option. Each bearing pad shall be the same size in plan as the masonry plate it supports. Holes to accommodate anchor studs shall be cleanly and accurately cut prior to bearing pad placement.

565-3.05 Bearing Installation and Alignment

A. Type S.R. and Type S.S. Bearings

1. General

- a. The centerline of sole plates or fixed portions of bearing assemblies attached to the structural steel shall not be offset from the centerline of bearing stiffeners or diaphragm connection plates by more than one-half the thickness of the flange at that location, or the thickness of the bearing stiffener or connection plate, whichever is the lesser distance.
- b. The bearing shall be cleaned and greased with automotive grease at the time of installation.

2. Fixed. No additional requirements apply.

3. Expansion. These may vary from perfect alignment. Therefore, expansion bearings shall be set in accordance with the following.

a. Type S. R. Bearings

- (1) The bearing shall be set vertical under full dead load at an ambient temperature of 68°F.
- (2) The maximum variation from perfect alignment is a function of the bearing height. The bearing height is the distance between the upper and lower contact surfaces of the movable portion of the bearing. For bearings with a height of 20 inches or less, the maximum variation from perfect alignment, taking into account the effect of temperature and load at the time of measurement, shall be calculated by the following formula:

$$M = \pm (1/2 \text{ inch} + (L/14,000))$$

where "M" = maximum variation from perfect alignment measured as the horizontal distance between the centerline of the cap plate and the centerline of the masonry plate in inches and "L" = total expansion length in inches between the centerline of the movable bearing being considered and the centerline of the fixed bearing, from which motion must

progress. Such variations shall not exceed 1 inch offset, or a five degree rotation of the movable portion of the bearings from the required alignment, whichever is less.

The maximum variation of all bearings having a height exceeding 20 inches shall be approved on an individual basis by the DCES.

(3) No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted by the Contractor for DCES approval. All adjustments shall be made at no additional cost to the State.

b. Type S. S. Bearings

(1) The sliding plate shall be centered on the masonry plate under full dead load at an ambient temperature of 68°F.

(2) The maximum variation from perfect alignment between the centerlines of the fixed and movable portions of the bearing device, taking into account the effect of temperature and load at the time of measurement, shall not exceed plus or minus 1/2 inch longitudinally. This variation shall be measured as the horizontal distance between the centerline of the sliding plate and the centerline of the masonry plate. The movable portion of the bearing device shall be fully supported by the fixed portion under all temperature and loading conditions.

(3) No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted by the Contractor for DCES approval. All adjustments shall be made at no additional cost to the State.

B. Type M.R. Bearings

1. General. The centerline of sole plates or other fixed portions of bearing assemblies attached to the structural steel shall not be offset from the centerline of bearing stiffeners or diaphragm connection plates by more than one-half the thickness of the flange at that location, or the thickness of the bearing stiffener or connection plate, whichever is the lesser distance.

2. Fixed. No additional requirements apply.

3. Expansion. These may vary from perfect alignment. Therefore expansion bearings shall be set in accordance with the following:

a. The sliding plate shall be centered on the masonry plate under full dead load at an ambient temperature of 68°F.

b. The maximum variation from perfect alignment between the centerline of the fixed and movable portions of the bearing device, taking into account the effects of temperature and load at the time of measurement, shall not exceed plus or minus 1 inch longitudinally unless otherwise indicated on the plans. This variation shall be measured as the horizontal distance between the centerline of the sliding plate and the centerline of the masonry plate.

c. No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted by the Contractor for DCES approval. All adjustments shall be made at no additional cost to the State.

C. Type E.P. and Type E.L. Bearings

1. General

- a. These bearings are designed to function properly provided that minimum distortion occurs along the beam axis under full dead load at an ambient temperature of 68°F. Elastomeric bearings shall be installed when the ambient temperature is between 40° and 80°F inclusive. The Contractor may elect to install the bearings when the ambient temperature is outside of the allowable range, provided the Contractor submits, and receives DCES approval, of an installation procedure that either resets the bearings when the temperature is in the allowable range or deforms the bearings so that they perform as if they were installed at 68°F.
- b. For prestressed concrete superstructures, the bearing shall be anchored to establish the fixed end of the bridge as soon as possible after stringer erection. For adjacent prestressed box beams, or prestressed slab superstructures, the anchorage shall be completed prior to filling the shear keys. The method of anchorage shall be in accordance with the details shown on the plans. Anchor dowel holes shall be core drilled to the nominal size and depth and at the locations required by the plans. In lieu of core drilling, the Contractor may submit an installation procedure that incorporates the use of either preset anchor bolts or pipe sleeves to the DCES for approval. Prior to placing the anchor dowel, the hole shall be inspected and approved for filling by the Engineer. Fill material shall be in accordance with the details on the plans.

2. Fixed. No additional requirements apply.

3. Expansion

- a. These may vary from perfect alignment. The maximum variation from perfect alignment under full dead load shall not exceed the value shown on the plans. This variation shall be measured as the horizontal distance between the centerline of the highest elastomer surface and the centerline of the lowest elastomer surface.
- b. No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted by the Contractor for DCES approval. All adjustments shall be made at no additional cost to the State.

D. Type E.B. Bearings

1. General

- a. The centerline of sole plate or other fixed portions of bearing assemblies, attached to steel stringers, shall not be offset from the centerline of bearing stiffeners of diaphragm connection plates by more than one-half the thickness of the flange at that location, or the thickness of the bearing stiffener or connection plate, whichever is the lesser distance.
- b. These bearings are designed to function properly provided that minimal distortion occurs along the beam axis under full dead load at an ambient temperature of 68°F. Elastomeric bearings shall be installed when the ambient temperature is between 40° and 80°F inclusive. The Contractor may elect to install the bearings when the ambient temperature is outside of the allowable range, provided the Contractor submits, and receives DCES approval, of an installation procedure that either resets the bearings when the temperature is in the allowable range or deforms the bearings so that they perform as if they were installed at 68°F.

2. Fixed. No additional requirements shall apply.

3. Expansion

- a. These may vary from perfect alignment. The maximum variation from perfect alignment under full dead load shall not exceed the value shown on the plans. This variation shall be measured as the horizontal distance between the centerline of the highest elastomer surface and the centerline of the lowest elastomer surface.

§565

b. No bearing adjustments shall be made until the completed structural slab has been in place for at least seven curing days. Any adjustments needed to meet the above requirements may require jacking the superstructure. All adjustments shall be accomplished according to a written procedure submitted by the Contractor for DCES approval. All adjustments shall be made at no additional cost to the State.

565-3.06 WELDING

A. Type S.R. Bearings. Bearings shall be welded permanently to the structural steel only after all necessary adjustments have been made. All welding shall be done in accordance with the requirements of the SCM. The Contractor shall submit a Welding Procedure Specification to the DCES. No welding shall be performed until the manufacturer receives an approved Welding Procedure Specification.

B. Type S.S. Bearings. The requirements of §565-3.06A shall apply.

C. Type M.R. Bearings. The requirements of §565-3.06A shall apply except that during field welding operations the temperature of the steel adjacent to the rotational element shall not exceed 200°F. Temperature shall be controlled by welding procedures and monitored using temperature indicating crayons, or other devices. Procedures, crayons, and other devices shall be acceptable to the Engineer. If the temperature limit is exceeded, the DCES and the Director, Materials Bureau shall be immediately notified. The DCES will provide the proper repair procedure, which may include complete replacement of the bearing. All repair work shall be done at no additional cost to the State.

D. Type E.B. Bearings. The requirements of §565-3.06A and §565-3.06C shall apply.

565-3.07 Grouting Anchor Bolt Holes. All slotted anchor bolt holes in masonry plates shall be filled with concrete grouting material to the top edge of the hole. All excess grout material shall be cleaned from the bearing surfaces in a manner satisfactory to the Engineer. Slotted anchor bolt holes in fixed bearings may be filled any time subsequent to stringer placement. Slotted holes in expansion bearings shall be filled only after all necessary bearing adjustments have been made.

565-3.08 Final Verification. Prior to final acceptance of the bridge, the Engineer will verify that all necessary adjustments have been made; that all steel bearings, or external load plates, are permanently welded or attached with cap screws to the superstructure steel as shown on the contract plans; that all slotted holes are completely filled with grout; that all anchor studs are firmly tightened; and that all other work required to make the bearings completely functional has been completed.

565-4 METHOD OF MEASUREMENT. Measurement will be taken as the number of bearings installed in accordance with the Contract Documents.

565-5 BASIS OF PAYMENT. The unit price bid for each bearing shall include the cost of all labor, materials, equipment and adjustment necessary to complete the work. All material between the bottom of the superstructure, and the top of the substructure, including anchor studs and sole plates, shall be included in the price bid for this item.

565-5.01 Progress Payments. Eighty percent of the quantity will be paid for after the bearing is installed. The remainder of the quantity will be paid for after the bearing is aligned.

Payment will be made under:

Item No.	Item	Pay Unit
565.1121	Type S.R. Expansion Bearing (All Load Ranges)	Each
565.1221	Type S.R. Fixed Bearing (All Load Ranges)	Each
565.1321	Type S.S. Expansion Bearing (All Load Ranges)	Each

565.1421	Type S.S. Fixed Bearing (All Load Ranges)	Each
565.1521	Type M.R. Expansion Bearing (0 to 225 k)	Each
565.1522	Type M.R. Expansion Bearing (226 to 450 k)	Each
565.1523	Type M.R. Expansion Bearing (451 to 675 k)	Each
565.1524	Type M.R. Expansion Bearing (676 to 900 k)	Each
565.1525	Type M.R. Expansion Bearing (Over 900 k)	Each
565.1721	Type M.R. Fixed Bearing (0 to 225 k)	Each
565.1722	Type M.R. Fixed Bearing (226 to 450 k)	Each
565.1723	Type M.R. Fixed Bearing (451 to 675 k)	Each
565.1724	Type M.R. Fixed Bearing (676 to 900 k)	Each
565.1725	Type M.R. Fixed Bearing (Over 900 k)	Each
565.1821	Type E.P. Bearing (All Load Ranges)	Each
565.1921	Type E.L. Bearing (0 to 55 k)	Each
565.1922	Type E.L. Bearing (56 to 111 k)	Each
565.1923	Type E.L. Bearing (112 to 168 k)	Each
565.1924	Type E.L. Bearing (169 to 225 k)	Each
565.1925	Type E.L. Bearing (Over 225 k)	Each
565.2021	Type E.B. Fixed Bearing (0 to 55 k)	Each
565.2022	Type E.B. Fixed Bearing (56 to 111 k)	Each
565.2023	Type E.B. Fixed Bearing (112 to 168 k)	Each
565.2024	Type E.B. Fixed Bearing (169 to 225 k)	Each
565.2025	Type E.B. Fixed Bearing (Over 225 k)	Each
565.2031	Type E.B. Expansion Bearing (0 to 55 k)	Each
565.2032	Type E.B. Expansion Bearing (56 to 111 k)	Each
565.2033	Type E.B. Expansion Bearing (112 to 168 k)	Each
565.2034	Type E.B. Expansion Bearing (169 to 225 k)	Each
565.2035	Type E.B. Expansion Bearing (Over 225 k)	Each
565.30	Rubber Impregnated Woven Cotton-Polyester Fabric	Each

SECTION 566 - MODULAR EXPANSION JOINT SYSTEMS

566-1 DESCRIPTION. The work shall consist of fabricating, furnishing, and installing a modular expansion joint system at the locations indicated on the Contract Plans.

566-1.01 Modular Joint Systems. Modular expansion joint systems are manufactured in various sizes, defined by their total movement capability. The correct movement capability required at any one location is indicated on the Contract Plans.

566-1.02 Sealing Elements. On each individual structure, all the box seals used in the modular joints shall be of the same configuration and shall be from the same manufacturer.

566-1.03 Modular Joint System Suppliers

A. Multicell Modular Joint Systems. Only firms which appear on the Department's Approved List will be acceptable suppliers. No supplier other than those listed will be considered.

B. One Cell Modular Joint Systems. Firms that do not appear on the Department's Approved List may supply one cell Modular Joint Systems. Firms which appear on the Department's Approved List will also be acceptable suppliers.

566-1.04 Terminology. The following terminology will be used throughout this section:

A. Joint System. This term is used to describe the installation with all of its component parts as installed in the structure slab, and if applicable in sidewalks, barriers and other bridge components.

B. Segment. A modular joint system manufactured at less than full roadway width. No segment shall be less than a single lane width long.

C. Joint. The separation between two elements of a bridge to allow for movement.

566-2 MATERIALS. Materials shall conform to the following requirements.

566-2.01 Modular Joint System. The modular joint system and all its component parts, including stiffening plates and anchorages, shall be supplied by the Manufacturer. The Manufacturer shall certify that the following components meet the listed requirements:

Hollow Beams, Steel Extrusions and Milled Steel Shapes	ASTM A588
Box Seals	705-09a
Strip Seal	ASTM D2628b
Adhesive	567-2.02A6
Stud Shear Connectors and Threaded Studs	709-05
Connecting and Sliding Plates - 3/8 inch Thickness	ASTM A588
Parapet Cover Plates - 1/2 inch Thickness	ASTM A36

NOTES:

- a. Shape approval by the Director of Materials is not required. Hardness, Type A Durometer shall be 60 ± 5 ; ASTM Method D2240. A 3 foot sample of the seal shall be submitted for testing to the Materials Bureau. No splices shall be permitted in permanent seals for any reason whatsoever.
- b. Recovery test not required.
- c. Parapet Cover Plates shall be Galvanized in accordance with §719-01, Type I.

566-2.02 Shop Drawings

- A. Shop Drawings shall be required for any joint system supplied as part of this work. Shop Drawings shall be prepared and reviewed in accordance with the applicable provisions of the SCM and this Specification and submitted to the DCES for approval. All Shop Drawings shall note the name and address of the Joint System Fabricator, including the actual location (address) where the fabrication will take place.
- B. The Modular Joint System Manufacturer's instructions for the proper installation of the joint system shall be entered on the Shop Drawings. Manufacturer's instructions shall include the proper width settings for various ambient temperatures. Shop Drawings which lack Manufacturer's installation instructions shall be returned without examination.
- C. Filler metal shall be qualified in accordance with Section 7 of the SCM. Welding Procedure Specifications (WPS) shall be submitted for approval to the DCES with the Shop Drawings for each combination of joint type and welding process shown on the Shop Drawings. Shop Drawing Approval shall be withheld until this requirement has been met.

566-2.03 Fabrication

- A. All steel fabrication (shop and field) shall be done in accordance with the requirements of the SCM. Mill inspection of the steel will not be required.
- B. All metal surfaces to come in contact with the neoprene sealer shall be blast cleaned in accordance with the requirements of Steel Structures Painting Council Surface Preparation No. 6 (SSPC-SP6) - Commercial Blast Cleaning. After cleaning, all cleaned surfaces shall exhibit a clean quality of CSP6, or better, as defined by Steel Structures Painting Council Standard SSPC Vis 1.
- C. The cleaned metal surfaces shall be protected from rusting until such a time as the sealer, and lubricant adhesive are placed against the metal surface. Any cleaned metal surface upon which rusting appears shall be re-cleaned in accordance with the foregoing, at no additional expense to the State.
- D. The curb and parapet sliding plates, if required, shall be shop assembled to fit the modular joint system. The plates may be disassembled from the joint system for shipment to the project site.

E. Unless otherwise noted, each modular expansion joint system shall be fabricated as a single entity. It shall fit the full width of the structure as indicated on the Contract Plans. The system shall be preset by the Manufacturer prior to shipment. Presetting shall be done in accordance with the joint opening at 68°F. The joint opening will be indicated on the Contract Plans. Should the plans indicate that segmental fabrication is permissible, or required, each segment shall be fabricated to exactly fit that portion of the superstructure under construction, including sidewalks. Segments shall be fitted with temporary seals. Temporary seals will not require lubricant adhesive.

F. Shop inspection shall be conducted at the discretion of the Department.

566-2.04 Acceptance. The fabricated joint system will be accepted at the work site by the Engineer after a visual inspection and upon receipt of the Manufacturer's Certification Report (MCR) that the materials and the fabricating procedures were in accordance with the Approved Shop Drawings and this Specification. The Manufacturer shall submit, with the MCR, a Certified Copy of the Mill Test Report (MTR) for all steel used to fabricate the joint system.

566-3 CONSTRUCTION DETAILS

566-3.01 Manufacturer's Representative. During the initial stages of the joint system installation the Contractor shall have present at the installation site a Representative of the Joint System Manufacturer. This person shall be competent in all respects regarding the proper installation procedures to be used. The Representative shall advise the Contractor of, and certify to the Engineer that, the proper procedures are being followed. All certifications to the Engineer shall be in writing. A Manufacturer's Representative is not required for One Cell Modular joint Systems.

566-3.02 Field Inspection. Immediately prior to installation, the joint system shall be inspected by the Engineer, for proper alignment, and complete bond between the neoprene sealer and the steel, and proper stud placement and effectiveness. No bends or kinks in the joint system steel shall be allowed (except as necessary to follow the roadway grades). Nor shall the straightening of such bend or kinks be allowed. Any joint system exhibiting bends or kinks shall be removed from the work site, and replaced by a new joint system, at no additional cost. Neoprene sealer not fully bonded to the steel shall be fully bonded at the expense of the Contractor. Studs shall be inspected visually, and shall be given a light blow with a hammer. Any stud which does not have a complete end weld, or does not emit a ringing sound when struck a light blow with a hammer, shall be replaced. Studs located more than 1 inch, in any direction, from the location shown on the Shop Drawings, shall be carefully removed and a new stud placed in the proper location. All stud replacements shall be at no additional cost.

566-3.03 Installation

A. Manufacturer's Instructions. The modular expansion joint system shall be installed in strict accordance with the Manufacturer's instructions, and the advice of their Official Representative. Two weeks prior to the intended installation, the Engineer shall be supplied with two copies of the written instructions. The permanently installed joint system shall match exactly the finished roadway profile and grades. The words "permanently installed", shall be interpreted to mean that any work necessary to be done to any other part of the structure, in order to achieve a truly complete permanent installation, has been done. This will apply even if the other work is to be paid for under other items of the Contract.

B. Joint System Width, Splices, and Installation Equipment. The modular expansion joint system shall be set to the proper width for the ambient temperature at the time of setting, as indicated on the Shop Drawings. If the joint system has been fabricated in segments, they shall be field spliced to create a single unbroken system.

All mechanical devices, supplied by the Joint System manufacturer, used to set the joint system to the proper width, will remain the property of the Manufacturer. When no longer required, the devices shall be returned to the Manufacturer.

C. Sliding Plate. In order to perform the work of installing the joint systems in a proper manner, some portions of the curb and parapet cannot be constructed until after the sliding plates of the joint system are installed. This surface shall be scrubbed with wire brooms. After the surface preparation has been accepted, every effort should be made to thoroughly wet the concrete surface, and all porous surfaces to be in contact with new concrete, for 12 hours. If, in the opinion of the Engineer, conditions or the situation prohibits this, then the surfaces should be wetted for as long as possible. Construction joints must be wetted by continuous spraying with hoses using potable water. The Contractor shall remove any puddles of free standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated surface dry condition until placement of the new concrete.

D. Permanent Seals. After the joint system has been completely installed over the full width of the structure, including sidewalks, the temporary seals shall be removed and replaced with permanent seals. After the temporary seals are removed, all metal surfaces which will be in contact with the permanent seals shall be commercially blast cleaned (SSPC-SP6) to visual standard CSP6 as defined by SSPC Vis 1-89.

E. Final Placement. After the modular joint system has been set to its final line and grade, the recess opening shall be filled with Class E Concrete. This surface shall be scrubbed with wire brooms. After the surface preparation has been accepted, every effort should be made to thoroughly wet the concrete surface, and all porous surfaces to be in contact with new concrete, for 12 hours. If, in the opinion of the Engineer, conditions or the situation prohibits this, then the surfaces should be wetted for as long as possible. Construction joints must be wetted by continuous spraying with hoses using potable water. The Contractor shall remove any puddles of free standing water with oil-free compressed air, and protect the surfaces from drying, so the existing concrete remains in a clean, saturated surface dry condition until placement of the new concrete. The uppermost surface of the concrete placement shall be finished in accordance with the requirements of Section 557 except that machine finishing will not be required. The cost of this work shall be included in the unit price bid for the slab item(s).

F. Watertight Integrity Test. After the joint system is permanently installed, including plates and all concrete placements, a watertight integrity test shall be performed. The test shall be done in accordance with the requirements of §567-3.01H.

566-4 METHOD OF MEASUREMENT. The work will be measured as the number of feet of joint system completely installed. Measurement will be taken horizontally and vertically along the centerline of the joint system between the outer limits indicated on the Contract Plans. The words “completely installed” shall be interpreted to mean the joint system in-place with the following operations completed, where applicable:

- Nuts tightened, or retightened, as required.
- Concrete placed and finished.
- Watertight integrity tests performed.

566-5 BASIS OF PAYMENT

566-5.01. The unit price bid per foot shall include the cost of all labor, materials and equipment necessary to complete the work.

566-5.02. No payment will be made for any work noted to be done at the expense of the Contractor, or any work noted to be paid for under other items of the Contract.

Payment will be made under:

Item No.	Item	Pay Unit
566.01	Modular Expansion Joint System - One Cell	Foot
566.02	Modular Expansion Joint System - Two Cell	Foot

566.03	Modular Expansion Joint System - Three Cell	Foot
566.04	Modular Expansion Joint System - Four Cell	Foot
566.05	Modular Expansion Joint System - Five Cell	Foot
566.06	Modular Expansion Joint System - Six Cell	Foot

SECTION 567 - BRIDGE JOINT SYSTEMS

567-1 DESCRIPTION. The work shall consist of furnishing and installing bridge joint systems. The particular bridge joint system required will be indicated on the contract plans.

The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all bridge joint systems in accordance with §106-01 Sources of Supply.

567-1.01 Bridge Joint Systems. There are various kinds of bridge joint systems. Those included as part of the work required by this section are:

A. Armored Joint System with Elastomeric Sealer. The system shall consist of armored joint segments, angles, anchor studs, threaded studs, bolts, nuts, lock washers, expansion bolt anchors, and sealant, all combined as noted in the contract documents so that a fully operational and waterproof system shall seal the joint in which it is installed.

B. Armored Joint System with Compression Seal. This system shall consist of angles, preformed compression seal, anchor studs, threaded studs, bolts, nuts, lock washers all combined as noted in the contract documents so that a fully operational and waterproof system shall seal the joint in which it is installed. The system shall provide for the full expansion and contraction movements of the joint.

This system is fabricated as a single entity designed to be installed across the full width of the bridge as measured along the centerline of joint. If the bridge in question has a raised median, one field splice of the joint system will be allowed at the raised median.

Type. Preformed compression seals are manufactured in various type sizes, defined by a literal-numerical type designation (e.g. Type A1, etc.). The type of seal to be installed in any one armored joint system will be indicated on the contract plans.

C. Armored Joint System with Preformed Elastic Strip Seal. This system shall consist of structural steel components, angles, anchor studs, threaded studs, bolts, nuts, washers, lock washers, anchor bolts, preformed elastic strip seal and adhesive, all combined in the manner required by the Contract Documents so that a fully operational, waterproof system will seal the joint over which it is installed. Armored joint systems of this nature are installed by various methods. The required method for a particular installation will be indicated on the Contract Plans.

Type. Preformed elastic strip seals are manufactured in various sizes, defined by a type number. The type of strip seal to be installed in any one joint system will be indicated on the Contract Plans.

D. Armorless Bridge Joint System. The system shall consist of components shown on an Approved Materials Detail Sheet for a Manufacturer and System whose name appears on the Materials Bureau Approved List. The required method of installation will be shown on the Approved Materials Detail Sheet.

567-1.02 Terminology. The following terminology will be used throughout this section:

A. Armored Joint System. This term is used to describe the installation with all of its component parts as installed in the structure slab. Terminology used to differentiate one kind of joint system from another will be found in the title of the various subsections (e.g. 567-2.01 Armored Joint System with Elastomeric Sealer, etc.)

B. Segment. A joint system manufactured at less than full roadway width. No segment shall be less than a single lane width long.

C. Joint. The separation between two elements of a bridge structure to allow for movement.

D. Materials Detail Sheet (MDS). A sheet approved by the DCES and containing all material requirements and installation information for Armorless Bridge Joints which are included on the Materials Bureau Approved List.

567-2 MATERIALS. Material and Fabrication requirements shall be as described for the various bridge joint systems.

567-2.01 Armored Joint System with Elastomeric Sealer

Elastomer (Polychloroprene or Natural Rubber)	Table 567-1
Structural Steel Segment Angles	ASTM A242 and 715-01, or ASTM A36
Headed Concrete Anchor Studs and Threaded Studs (Dimensions as shown on the contract plans)	709-05
Bolts, Nuts and Washers Steel	ASTM A307 Grade A or ASTM A325
Expansion Bolt Anchor Steel	U.S. Government GSA FF-S-325 Group III, Type 1 or Group VIII, Type 1
Bonding Tape (to bond end surfaces of the preformed elastomeric joint sealer to each other)	Fed. Spec MIL C 18969a, Type II, Class B Polyisobutylene-based extrusion, with aggressive tack

A. Physical Composition. Armored segments shall be comprised of elastomer or natural rubber, and structural steel components in the manner indicated on the contract plans.

B. Length. Armored segments shall be furnished in lengths not less than a single lane width, excluding length of tongues. Shorter lengths may be used at locations requiring special treatment or to provide the closing sections.

C. Steel Fabrication. All steel fabrication work shall be done in accordance with the requirements of the SCM. Mill inspection will not be required. Shop inspection will be conducted at the discretion of the Department.

D. Cleaning. The surface of the armored joint segment, to which the preformed elastomer is to be heat bonded, shall be thoroughly cleaned of all dirt, oil, grease, scale and oxides by grinding or sandblasting immediately prior to the heat bonding process. The metal surface after cleaning, shall be defined by SSPC Vis 1-89 Pictorial Standard, and shall meet the requirements of SSPC-SPC-6, Commercial Blast Cleaning, but shall not be of a quality less than CSP6.

TABLE 567-1 ELASTOMER MATERIAL REQUIREMENTS			
Property	ASTM Test	Polychloroprene	Natural Rubber
Tensile Strength	D412	1800 psi	2250 psi
Tensile Elongation at break	D412	400 percent minimum	400 percent minimum
Hardness, Shore A Durometer	D2240	45 (±5)	50 (±5)
Compression Set (22 hrs at 158°F)	D395 Method B	20 percent maximum	20 percent maximum
Low Temperature	D746 Procedure B	Not brittle at -40°F	Not brittle at -65°F
Oil Deterioration (Volume	D471	120 percent maximum	Not Applicable

increase after immersion in ASTM Oil No. 3 for 70 hrs @ 212°F)			
--	--	--	--

E. Basis of Acceptance. All materials used for this item, regardless of whether they are employed for fabrication or installation, shall be accepted at the work site upon certification, by the proper manufacturer, that all of the requirements of the contract documents have been met.

567-2.02 Armored Joint System with Compression Seal

Compression Seal	705-091
Angles, Plates and Bars (Structural Steel)	ASTM A242, A588, 715-01 and SCM
Headed Concrete Anchor Studs and Threaded Studs (Dimensions as shown on the contract plans)	709-05
Bolts, Nuts and Washers	ASTM A307 Grade A or ASTM A325
Support Bar for the compression seal	ASTM A242, AISI 1018 or AISI 10203
Expansion Bolt Anchors	U.S. Government GSA FF-S-325 Group III, Type 1 or Group VIII, Type 1
Adhesive (to bond the preformed compression seal to the steel surfaces)	Table 567-2, Moisture Curing Urethane with hydrocarbon solvent

NOTES:

1. The sealer shall be applied in one piece for the full length of each joint. Splices will not be permitted if the full length of joint is less than 50 feet. If the full length of joint is more than 50 feet, but less than 100 feet long, one shop splice in the sealer will be permitted. If the full length of joint is greater than 100 feet, shop splices in the sealer will be permitted at approximately 50 foot intervals.
2. Support angles may be ASTM A36
3. If AISI 1018 or AISI 1020 steel is used it shall be painted in accordance with the requirements of the contract documents.

Average weight per gallon	8 lbs ± 10%
Solids Content	72% - 74% by Weight
Adhesive to remain fluid, from	5°F to 120°F
Film Strength (ASTM D412)	1200 psi
Elongation	350%

A. Assembly. The joint system shall be shop assembled and delivered to the work site ready for installation.

If the Contractor desires to assemble the joint system at the work site, prior permission to do so must be obtained from the DCES.

Joint systems assembled at the work site shall have all materials certified by the respective manufacturers that the respective materials meet the requirements of §567-2.02A. Field methods of fabrication shall be in accordance with the requirements of this subsection.

B. Procedures. Steel fabrication shall be done in conformance with the requirements of the SCM. Mill inspection will not be required. Shop inspection will be conducted at the discretion of the Department.

C. Cleaning. Metal surfaces which are to be coated with adhesive shall be cleaned in accordance with Steel Structures Painting Council, Surface Preparation No. 6, Commercial Blast Cleaning (SSPC SP6) with the following modifications and additions:

1. The cleaned surfaces shall have adhesive applied before detrimental rusting occurs.
2. A commercial blast cleaned surface shall be as defined by SSPC SP6 and SSPC Vis 1-89 pictorial references BSP6 and CSP6 only.

D. Basis of Acceptance. The armored joint system with preformed compression seal will be accepted at the work site upon certification to the Engineer by the Contractor, that the materials used and the fabricating procedures were in accordance with this specification.

The certification shall include the name of the sealer manufacturer, the lot numbers of all sealers used in the fabrication of the armored joint system and the statement that all sealer used in the fabrication of the armored joint system was appropriately identified as accepted materials by the presence of Department security seals when received by the fabricator.

567-2.03 Armored Joint System with Preformed Elastic Strip Seal. Since there are various methods of installing the joint system, all of the materials listed in this Subsection may not be applicable for a particular installation. It is the Contractor's responsibility to ensure that only those materials necessary are actually installed, where required, or as specified on the Approved Shop Drawings.

Angles, Plates, Extrusions and Milled Shapes	ASTM A588 and 715-01
Headed Concrete Anchor Studs and Threaded Studs (Dimensions indicated on the Contract Plans)	709-05
Bolts and Nuts	ASTM A307 or A325.
Anchor Bolts	ASTM A307 Grade A
Anchor bolt grout	701-07
Preformed Elastic Strip Seal	ASTM D2628 modified ¹
Adhesive(to bond the strip seal to the steel surfaces)	Table 567-2, Moisture Curing Urethane with Hydrocarbon Solvent
Concrete ²	501, Class E
Elastomeric Concrete ²	Contract Documents

NOTES:

1. Recovery Test is not required. The sealer shall be supplied in one piece for the full length of each joint.
2. Concrete and Elastomeric Concrete, if used, shall be placed and paid under a separate item.

A. Steel Fabrication. Steel fabrication shall be done in conformance with the requirements of the SCM. Mill inspection will not be required. Shop inspection will be conducted at the discretion of the Department.

B. Cleaning. Metal surfaces which are to be coated with adhesive shall be thoroughly cleaned of all dirt, oil, grease, scale and oxides by grinding or sandblasting. Metal surfaces after cleaning shall exhibit a clean quality of CSA2, or better, as defined by the Steel Structures Painting Council Standard SSPC Vis1.

C. Adhesive Coating. The recess of the steel extrusions shall be thoroughly coated with adhesive. The strip seal shall be installed within the recess in such a manner that it will be completely and firmly bonded to the recess surface over the total length of the joint system.

D. Basis of Acceptance. The fabricated joint system will be accepted at the work site by the Engineer after a visual inspection and upon receipt of the Manufacturer's Certification Report (MCR) that the materials and the fabricating procedures were in accordance with the Approved Shop Drawings and this Specification. The Manufacturer shall submit, with the MCR, a Certified Copy of the Mill Test Report (MTR) for all steel used to fabricate the joint system.

567-2.04 Armorless Bridge Joint. The material requirements shall be as shown on the Approved Materials Detail Sheet corresponding to a Manufacturer and System listed on the Materials Bureau Approved List.

567-2.05 Shop Drawings. Shop drawings will be required for any joint system supplied as part of this work. Shop drawings shall meet the various applicable requirements of this subsection. All shop drawings shall note the name and address of the joint system (or segment) fabricator as well as the location where the joint system (or segments) are to be fabricated.

A. General. The applicable provisions of Section 2-Drawings, of the New York State Steel Construction Manual shall apply with the following modifications

1. Shop Drawings. Shop drawings shall be submitted for review, approval and distribution in accordance with the requirements of the SCM, Section 2. The shop drawings shall indicate the type, location and details of the mechanical devices required to compress the joint to its required width based on the ambient temperature at the time of installation. All references, within Section 2 to the DCES, shall be interpreted as the Regional Director, with the following exceptions:

- 202.7 - Distribution of Approved Shop Drawings.
- 202.8 - Disposal of Original Reproducibles.

No shop drawing approval will be issued for shop drawings unaccompanied by current WPS(s). No shop work shall begin prior to the Contractor's receipt of approved shop drawings.

2. Welding Procedure Specifications. The Contractor shall submit with the shop drawings a Welding Procedure Specification (WPS), approved by the DCES for each combination of joint system type and welding process shown on the shop drawings.

The WPS approval date shall be within 36 months of the joint system fabrication date. A submitted WPS showing an approval date earlier than 36 months prior to joint system fabrication will be rejected and the Contractor shall be required to submit shop drawings accompanied by a currently approved WPS(s). No extension of time, nor additional payment will be forthcoming for delays caused by the Contractor's failure to submit current WPS(s).

567-3 CONSTRUCTION DETAILS. The construction details shall be as required for the various joint systems and the approved shop drawings.

567-3.01 Armored Joint System with Elastomeric Sealer

A. Manufacturer's Representative. The joint system shall be installed in strict accordance with the manufacturer's instructions and this subsection. In the event of a conflict, the terms of this subsection shall rule. A representative of the manufacturer shall be present at the beginning of the installation. The representative shall be fully conversant in all respects with the correct installation methods. The representative shall be responsible to advise both the Engineer and the Contractor, that the proper installation method is being followed.

B. Preparation. The preformed recess which is to receive the joint system shall be air blown or vacuum-cleaned in order that all loose or foreign matter is removed prior to installation of the system.

C. Storage Inspection and Handling. The joint system shall be stored, inspected and handled in accordance with the following:

1. Handling and Storing. All material shall be handled and stored in a manner approved by the Engineer, and consistent with the requirements of the SCM. No material shall be dropped, thrown, or dragged upon the ground. Material shall be kept clean, properly drained and stored on proper supports above the ground. All material shall be adequately shored, braced, or clamped to resist lateral forces which might occur. Permanent distortion will be cause for rejection of material.

If the shop applied protective coating deteriorates to the point that the Engineer considers it unacceptable, the contractor shall restore the shop applied coating to a condition acceptable to the Engineer. This work shall be done before other coatings are applied. The work shall be done in accordance with the requirements of the contract documents.

2. Field Inspection. All installation work shall be subject to the Engineer's inspection. The Engineer shall be given all facilities required for a thorough inspection. Materials and

workmanship subject to shop inspection shall be identified by the acceptance stamp of the Shop Inspector. Materials and workmanship not required to be shop inspected will be inspected by the Engineer. Certified copies of the results of tests conducted by the manufacturer shall be furnished to the Engineer in accordance with the requirements of 715-01.

D. Installation Inspection. Immediately prior to installation, the armored segments shall be inspected by the Engineer for proper alignment and complete bond between the polychloroprene and the steel, and proper stud placement and effectiveness. No bends or kinks in the armoring steel shall be allowed, nor shall straightening of such bends or kinks be allowed. Armored segments exhibiting bends or kinks shall be removed from the work site, and replaced with new armored segments at the Contractor's expense. Armored segments which exhibit any separation of the polychloroprene and the armoring steel shall be removed from the work site and replaced with new armored segments at the Contractor's expense. Studs shall be inspected visually and shall be given a light blow with a hammer. Any threaded stud which does not have a complete end weld or does not emit a ringing sound when struck a light blow with a hammer shall be replaced. Studs located more than 1 inch from the location shown on the shop drawings shall be carefully removed and a new stud placed in the proper location.

E. Mechanical Devices. In order for the armored segments to be installed properly, they must be set at a width which is directly dependent upon the ambient temperature at the start of installation, as shown on the shop drawings. The width setting shall be accomplished through the use of mechanical devices supplied by the armored segment fabricator. After the armored segment has been set to its proper line and grade and securely attached to its supports, the mechanical devices shall be removed and returned to the armored segment manufacturer.

F. Sealing Segment Surfaces. The mating surfaces of the armored segments shall be scrubbed with wire brushes, or other means satisfactory to the Engineer, to remove any rust from the steel and roughen the polychloroprene. This operation shall immediately precede the application of tape to the mating surfaces.

G. Concrete Placement and Finishing. After the joint system has been fully installed, concrete shall be placed in accordance with the contract plans. The concrete shall be finished in accordance with 557-3.07 - Finishing Integral Wearing Surfaces on Superstructure Slabs.

H. Watertight Integrity Test At least five work days after the joint system has been fully installed the Contractor shall test the entire (full length) joint system for watertight integrity employing a method satisfactory to the Engineer. The entire joint system shall be covered with water, either ponded or flowing, for a minimum duration of 15 minutes. The concrete surfaces under the joint shall be inspected, during this 15 minute period and also for a minimum of 45 minutes after the supply of water has stopped, for any evidence of dripping water or moisture. Water tightness shall be interpreted to be no free dripping water on any surface on the underside of the joint. Patches of moisture shall not be cause for non-acceptance.

Should the joint system exhibit evidence of water leakage at any place whatsoever, the Contractor shall locate the place(s) of leakage and take all measures necessary to stop the leakage. This work shall be done at the Contractor's expense. A subsequent water integrity test shall be performed subject to the same conditions and consequences as the original test.

567-3.02 Armored Joint System with Compression Seal

A. Delivery. The joint system shall be delivered to the work site ready for installation in accordance with the requirements of 567-2.02B1.

B. Preparation. The requirements of 567-3.01B, shall apply.

C. Storage Inspection and Handling. The requirements of 567-3.01C shall apply.

D. Installation Inspection. The armored joint system with compression seal shall be inspected in the same manner as required for armored segments under 567-3.01D. All of the requirements of 567-3.01D shall apply, except that compression seal not fully bonded to the armoring angles will not mandate replacement of the joint system. However, any compression seal which is not fully bonded, shall be fully bonded to both armoring faces, by the Contractor, at no expense to the State.

E. Mechanical Devices. The requirements of 567-3.01E shall apply.

F. Concrete Placement and Finishing. The requirements of 567-3.01G shall apply.

G. Watertight Integrity Test. Not required.

567-3.03 Armored Joint System with Preformed Elastic Strip Seal

A. Site Delivery. The joint system shall be shop assembled and delivered to the work site ready for installation, unless prior permission to field assemble has been granted by the Engineer.

B. Field Assembly.

1. If the Contractor desires to assemble the joint system at the work site, prior permission to do so shall be obtained from the Engineer, in writing.
2. Joint systems assembled at the work site shall have all materials certified by the respective Manufacturers. The certifications shall state that the Materials requirements of this Specification have been met.

C. Storage Inspection and Handling. The requirements of 567-3.02C shall apply.

D. Installation Inspection. The requirements of 567-3.02D shall apply. The term “compression Seal” shall be interpreted as “preformed elastic strip seal.”

E. Mechanical Devices. The requirements of 567-3.01E shall apply.

F. Recess Finishing. If the joint system is installed within a preformed concrete or asphalt recess, the recess will be filled and finished to grade with either structural concrete or elastomeric concrete. The exact materials will be indicated on the Contract Plans. The respective materials will be installed in the following manner:

1. Concrete. Placement shall be in accordance with 555. Finishing shall be done in accordance with 557-3.07. Machine finishing will not be required.

2. Elastomeric Concrete. Placement shall be in accordance with the requirements of the elastomeric concrete specification.

G. Watertight Integrity Test. The requirements of 567-3.01H shall apply.

567-3.04 Armorless Bridge Joint System

A. Manufacturer's Representative. The joint system shall be installed in strict accordance with the manufacturer's instructions and the Approved Materials Detail Sheet. In the event of a conflict, the terms of the Approved Materials Detail Sheet shall rule. A representative of the bridge joint system manufacturer shall be present prior to placement to inspect the prepared surfaces and remain at the job during all phases of the installation. The representative shall be fully conversant in all respects with the correct installation methods. The representative shall be responsible to advise both

§567

the Engineer and the Contractor on properly installing the joint system. The representative may be excused from the project site at the discretion of the EIC.

B. Preparation. All surfaces shall be prepared as per the Approved MDS. At a minimum, the preformed recess which is to receive the joint system shall be air blown using air free of water and oil or vacuum-cleaned so that all loose or foreign matter is removed prior to installation of the system. The substrate shall be dry for a minimum of 24 hours prior to installation for the joint system.

C. Storage Inspection and Handling. The joint system shall be stored, inspected and handled in accordance with the Approved Materials Detail Sheet.

D. Installation Inspection. All installation work shall be subject to the Engineer's inspection.

E. Watertight Integrity Test. At least five work days after the joint system has been fully installed the Contractor shall test the entire (full length) joint system for watertight integrity. The entire joint system shall be covered with water, either ponded or flowing, for a minimum duration of 15 minutes.

The concrete surfaces under the joint shall be inspected during this 15 minute period, and also for a minimum of 45 minutes after the supply of water has stopped, for any evidence of dripping water or moisture. Water tightness shall be interpreted to be no free dripping water on any surface on the underside of the joint. Patches of moisture shall not be cause for non-acceptance.

Should the joint system exhibit evidence of water leakage at any place whatsoever, the Contractor shall locate the place(s) of leakage and take all measures necessary to seal the leak. A subsequent water integrity test shall be performed subject to the same conditions and consequences as the original test.

567-4 METHOD OF MEASUREMENT. Measurement will be made as the number of feet of joint system completely installed, measured horizontally and vertically along the centerline of joint system between the outer limits as indicated on the contract plans.

The words "completely installed" shall be interpreted to mean the joint system in place with the following operations completed where applicable:

- All sealant in its proper position.
- All nuts tightened or retightened as required.
- Concrete placed and finished.
- Elastomeric concrete placed and finished.
- Water-tight integrity tests.

567-5 BASIS OF PAYMENT. The unit price bid per foot shall include all labor, materials and equipment necessary to complete the work. No additional payment will be made for corrective actions.

Payment will be made under:

Item No.	Item	Pay Unit
567.31	Armored Joint System with Compression Seal-Type A1	Foot
567.32	Armored Joint System with Compression Seal-Type A2	Foot
567.33	Armored Joint System with Compression Seal-Type A3	Foot
567.34	Armored Joint System with Compression Seal-Type A4	Foot
567.35	Armored Joint System with Compression Seal-Type A5	Foot
567.36	Armored Joint System with Compression Seal-Type A6	Foot
567.37	Armored Joint System with Compression Seal-Type A7	Foot
567.50	Armored Joint System with Preformed Elastic Strip Seal - Type as Noted	Foot
567.60	Armorless Bridge Joint System	Foot

SECTION 568 - BRIDGE RAILING

568-1 DESCRIPTION. This work shall consist of furnishing and erecting bridge railing as shown on the contract plans and in accordance with the specifications.

~~—The Contractor shall notify the Deputy Chief Engineer, Structures (DCES) of the name and address of the fabricator of all bridge railing in accordance with §106-01 Sources of Supply.~~

~~—As soon as the Contract is awarded, the Contractor shall notify the DCES of the name and address of the Fabricator of all bridge railing. This notification shall list the specific shop or shops in which the railing will be fabricated.~~

As soon as the Contract is awarded, the Contractor shall notify the DCES of the name and address of the Fabricator of all bridge railing in accordance with §106-01 Sources of Supply. This notification shall list the specific shop or shops in which the railing will be fabricated.

Comment [cjt74]:
EI 08-015

568-2 MATERIALS. Materials shall meet the requirements of the following subsections:

Concrete Grouting Material	701-05
Steel Bridge Railing	710-23
Stainless Steel Connecting Products	715-16
Rubber Impregnated Random Fiber Pad	728-02

~~—When Steel Bridge Railing Rustic is specified, the Contractor shall supply all unpainted, weathering steel railing or all galvanized and painted steel railing, unless the Contract Documents require a particular method of obtaining the rustic appearance. A combination of unpainted weathering steel and galvanized, painted steel will not be permitted.~~

Comment [cjt75]:
EI 08-015

568-3 CONSTRUCTION DETAILS

568-3.01 Erection of Railing

A. Inspection of Railing. Immediately prior to erection, the railing shall be inspected for damage. Significant bends or kinks in the railing not specifically called for in the contract documents shall constitute sufficient cause for rejection. Straightening of such bends or kinks shall not be allowed.

Bending or curving rails in the field in order to fit alignment requirements, shall not be permitted. The Engineer may order some bending or curving to allow for necessary minor adjustments.

B. Inspection of Galvanizing. Damage to galvanizing of steel bridge railing shall constitute sufficient cause for rejection except for the following conditions:

1. If the damaged area is not required to be repaired under the provisions of 710-23, Steel Bridge Railing.
2. If the total damaged area of a single piece (i.e. post or rail) is 6 square inches or less. Total damaged area is exclusive of the damaged area as described under §568-3.01B1.

C. Field Galvanizing for Repair. Field galvanizing repair shall be allowed to be performed upon damaged areas meeting the requirements of §568-3.01B2.

Field galvanizing repair shall be made by painting zinc repair material onto the damaged area in accordance with the requirements of §719-01, Galvanized Coatings and Repair Methods.

All finished surfaces of welds and adjacent surfaces of rails and posts upon which galvanizing has been removed, due to any field welding operation, shall be field galvanized.

D. Field Welding. Field welding shall not be permitted unless noted in the contract documents or ordered by the Engineer.

E. Erection. All railing shall be erected in accordance with the contract documents or, when required, the approved shop drawings prepared and submitted as specified in the New York State Steel Construction Manual.

F. Positioning Railing. Railing shall be erected so that the rails are parallel to each other and to the top of parapet, sidewalk or structural slab.

G. Positioning Posts. Posts shall be set vertical.

H. Base Plates. Post base plates shall be perpendicular to the post, unless otherwise noted. When the railing is to be placed on a preformed surface, the base plate may be placed parallel to the grade or may be perpendicular to the post and made level by the use of beveled shims conforming to the applicable requirements of §710-23, Steel Bridge Railing.

I. Non-Metallic Pads. Posts which are to be placed on a preformed surface shall be mounted on a non-metallic pad conforming to the requirements of §728-02. Beveled Shims, if required, shall be inserted between the non-metallic pad and the post base plate.

J. Jacking Nuts. For railings set on jacking nuts, the railing posts shall be erected to proper line and grade before concrete under the post and in back of the granite curb is placed or before the mortar pad is placed.

K. Rail Span. The rails of railings shall span the following minimum number of posts:

Railing Type	Number of Posts
Two-Rail, Steel	3*
Four-Rail, Steel	3
Five-Rail Steel	3

NOTE: * If this is not possible, the absolute minimum shall be 2 posts if approved by the DCES.

L. Anchor Studs. After the anchor stud nuts have been tightened in a manner satisfactory to the Engineer, the studs shall be flame cut 1 inch above the nut. The first thread of the stud above the nut shall be damaged. The cut end of the anchor stud shall be coated in conformance with the requirements of §719-01, Galvanized coating and Repair Methods.

M. Touch-Up Painting. Any damage to the paint on a railing system shall be repaired in accordance with §657 Painting Galvanized Surfaces.

N. Inspection. All erection shall be subject to the inspection of the Engineer who shall be given all facilities required for a visual inspection of workmanship and materials.

Any single piece of the railing system with a total damaged area in excess of the amount specified in §568-3.01B2 shall be rejected and replaced.

568-3.02 Cement Mortar Pads

A. Proportioning. Cement mortar pads shall consist of a concrete grouting material.

The concrete grouting material shall meet the requirements of §701-05, Concrete Grouting Material. The grouting material shall be mixed with water, in the ratio recommended by the manufacturer, to produce a trowelable mix.

B. Mixing. Mixing shall be carried out in strict accordance with the manufacturers recommendations or the following as determined by the Engineer.

- All necessary mixing equipment shall be present and in good working order prior to the start of mixing.
- Mixing time shall not exceed three minutes unless otherwise permitted. No mixing shall be started until all preparations have been made to place the mortar.
- All mortar in any individual batch shall be used within 25 minutes after the start of mixing.
- Retempering will not be allowed.

C. Surface Preparation. All concrete surfaces to receive the mortar shall be free from laitance, oil, grease, paint, dust, loose particles or other foreign material.

The concrete surface shall be cleaned by sandblasting to the satisfaction of the Engineer, followed by a thorough vacuum cleaning.

The bottom surfaces of the base plates shall be free of oil, dirt and other foreign matter.

The concrete surface shall be lightly moistened with water.

D. Form Preparation. The forms shall be positioned about the base plate as shown in the plans or as directed by the Engineer. If the forms are to be coated with a release agent, it shall not be deleterious to the physical properties of the mortar system being used as determined by the Engineer.

E. Application. After the concrete surfaces and the base plates surfaces have been properly prepared the mortar shall be placed within the limits of the forms and tamped into place to assure that there are no voids in the completed pad. Exposed surfaces of the mortar shall be screeded and troweled to the level of the bottom of the base plate. The mortar pads shall be protected from rain for at least 24 hours.

F. General. In all cases, the installation of the mortar pads shall be made when the concrete and ambient air temperatures are above 50°F.

568-4 METHOD OF MEASUREMENT

568-4.01 Bridge Railing. The quantity to be paid for bridge railing shall be the number of feet measured along the centerline of railing anchorage between the extreme outer limits indicated on the contract plans.

568-4.02 Transition Bridge Railing. The quantity to be paid for transition railing shall be the number of feet measured along the axis of the top rail between the limits shown on the plans.

568-5 BASIS OF PAYMENT

568-5.01 Bridge Railing. The unit price bid shall include the cost of furnishing all labor, materials and equipment necessary to complete the work. All pads (including Mortar Pads), shims, splices with their hardware, railing anchor studs with nuts, washers and anchor plates, and hand rails when specified shall also be included in the price bid.

No payment shall be made for those railing pieces which are replacements for those railing pieces that have been rejected.

Progress payments will be made when the railing is erected in accordance with the contract documents as specified in the New York State Steel Construction Manual exclusive of the cutting, peening and galvanizing of studs. Payment will be made at the unit bid price for 90% of the quantity erected. The balance of the quantity will be paid for upon proper completion of the work.

Payment will be made under:

SECTION 569 - PERMANENT CONCRETE TRAFFIC BARRIER FOR STRUCTURES

569-1 DESCRIPTION

569-1.01 Work. The work shall consist of constructing concrete traffic barrier, of the configuration and at the locations indicated on the Contract Plans.

569-1.02 Methods. Construction of the barrier shall be accomplished by cast-in-place or precast methods. Slip forming will be allowed as an acceptable cast-in-place method, unless the plans show

anchor bolts projecting beyond concrete limits; in this instance slipforming procedures will require the approval of the DCES.

569-1.03 Shape Modification. The barrier shape indicated on the plans shall not be altered. Minor modifications, to allow slip-forming, will be submitted to the Regional Construction Engineer for approval.

569-1.04 Approvals. For approval requirements and procedures refer to the Construction Details.

569-2 MATERIALS

569-2.01 Fabrication. Materials used for traffic barrier fabrication shall meet the following requirements:

Precast Concrete Barrier	704-03 and 704-05
Cast-In-Place Concrete (Constructed Forms)	501, Class A Concrete
Cast-In-Place Concrete (Slip Formed)	501, Class J
Epoxy Coated Reinforcing Bars	709-04
Steel Tubes	ASTM A500, Grade B
Steel Plates, or Bars	ASTM A36 or A588 (A709 Grade 36 or 50W)
Anchor Bolts (Fully Threaded)	ASTM A325 or A449 Type 1
Nuts	ASTM A563, Class 10S HH
Washers	ASTM F436, Type 1 or 3
Concrete Grouting Material	701-05
Concrete Repair Material	701-04
Joint Filler	ASTM D1056, Grade 2B1 or 2B2.
Curing Compound	711-05
Locking and anchoring devices for precast units	715-01 and 709-04, as applicable
Galvanizing	719-01

All steel, except reinforcing steel, shall be galvanized.

569-2.02 Fabrication Tolerances. All cast-in-place concrete barrier, regardless of the method of construction, shall conform to the following finished tolerances:

Bar Reinforcement Cover	-0 , + 1/2 inch
Width (Top)	-0 , + 1/4 inch
Width (Bottom)	-0 , + 1/2 inch
Surface Straightness (Deviation from theoretical centerline)	1/2 inch in 20 feet
Vertical Alignment (Deviation from a line parallel to the theoretical grade line)	1/2 inch in 20 feet
Horizontal and Vertical Misalignment (between adjacent precast units)	3/16 inch

All precast concrete barrier shall conform to the tolerances contained in §704-03, §704-05 and to the foregoing misalignment tolerance.

Reinforcement cover shall be verified while the concrete is still plastic, except in the case of cured precast units. In that case, cover will be verified in accordance with established Department procedures.

These procedures may include coring.

569-3 CONSTRUCTION DETAILS

569-3.01 Approvals

A. Cast-In-Place Concrete - Modifications to Contract Plans. The DCES shall be supplied with three copies of pertinent details and necessary design computations. Every effort will be made to render a decision, in a timely manner, after all pertinent information has been received. However, the time required to render a determination will not be taken into account should the Contractor request an extension of time.

B. Precast Concrete. Precast barrier systems shall be approved by the DCES prior to the contract award in order to be used in the contract.

569-3.02 General: Cast In Place Concrete

A. Cleaning. Surfaces against which barrier is to be placed shall be thoroughly cleaned and vacuumed to remove any dirt or other foreign substances, laitance or partially loose chips of concrete.

B. Defects. Defects are divided into two categories: minor defects and major defects. Minor defects in the barrier shall be repaired. Major defects shall be cause for rejection of the section. Such rejected sections shall be removed and replaced or, upon approval of the Engineer, the section shall be repaired to the satisfaction of the Engineer.

1. Minor Defects. Minor defects are defined as holes, honeycombing or spalls which are 6 inches or less, in diameter, and which do not expose the outermost surface of the steel reinforcement. Surface voids 5/8 inch, or less, in diameter, and 1/4 inch, or less in depth are not considered defects. They do not require repair.

2. Major Defects. Major defects are defined as:

- a. Any defect, except as noted in §569-3.02 B.1. above which does not meet the definition of a minor defect.
- b. Minor defects which, in aggregate, comprise more than five percent (5%) of the surface of the barrier section.

C. Repair. Repair shall be made with a material acceptable under §701-04. Methods of repair shall be acceptable to the Engineer. The color of the repaired portion shall match, as nearly as practicable, the color of the surrounding concrete. Repaired portions shall exactly match shape requirements. The repaired portion shall withstand a moderate blow from a 16 ounce hammer. Repair shall be done at no cost to the State.

569-3.03 General: Precast Concrete. The definition of defects and the repair requirements contained in 704-03 shall apply.

569-3.04 Cast-In-Place Concrete - Constructed Forms. The requirements of Section 555 and Section 556 shall apply with the following modification:

Thoroughly wet the structural slab surface and all porous surfaces to be in contact with new concrete for at least 12 hours immediately prior to placement. Remove all standing water with oil-free compressed air, and protect the surfaces from drying, so the concrete remains in a saturated surface dry condition until placement of the new concrete. If the forms are removed before seven curing days have passed, the concrete shall be cured by means of a clear curing compound. No curing blankets will be required.

Curing compound shall be sprayed on the concrete surface immediately following the slipforming and hand finishing operations. The compound shall be applied by means of pressure spraying or distributing equipment at the rate directed by the Engineer, but not less than 1 gallon per 150 square feet of surface. The equipment for applying the compound shall be such that the compound is applied as a fine spray with no surface damage to the concrete. The equipment shall also provide adequate agitation of the compound during application, and shall be approved by the Engineer before work is started. Should the method of applying the compound produce a non-uniform film, or should the spraying equipment fail and duplicate

equipment not be immediately available, the application of curing compound shall be discontinued immediately and the curing shall be accomplished by another method acceptable to the Engineer. The Contractor shall stockpile sufficient approved coverings for protection of the concrete in the event of rain, non-uniform film application, or breakdown of spray equipment.

569-3.05 Cast-In-Place Concrete - Slipformed. The requirements of Section 555, Section 556 and the following, shall apply:

A. The forming of the barrier shall be accomplished by self-propelled equipment approved by the Engineer. The requirements of 555-3.03 shall not apply. Thoroughly wet the structural slab surface and all porous surfaces to be in contact with new concrete for at least 12 hours immediately prior to placement. Remove all standing water with oil-free compressed air, and protect the surfaces from drying, so the concrete remains in a saturated surface dry condition until placement of the new concrete.

B. After all reinforcing bars have been placed, all bridge joints installed, and all other hardware placed in the area of the barrier, the Contractor shall perform a "dry run" over the entire length of the barrier installation location. It is necessary only to "dry run" a single day's placement during any given day; however, the entire barrier length shall be traversed.

The "dry run" may be made with either the actual slip forming equipment, or with an exact "mock-up" of the equipment. The "mock-up"; if utilized, shall be the exact size, shape and dimensions of the slip forming equipment. It shall be a minimum of 4 feet long. Its movement shall be able to be correlated with a string, or survey, line indicating the correct offset location of the barrier.

C. After the "dry run" portion of the work has been completed and all obstructions have been cleared, the slip-forming equipment shall be demonstrated for capability. The demonstration shall be done in the presence of the Engineer. The Contractor shall make all adjustments, or alterations, to ensure that the equipment has the capability to produce an acceptable product. No work shall be done without the Engineer's approval. The capability demonstration will be required only once for each piece of forming equipment used on the project.

D. The Engineer's approval is for equipment capability only. The Contractor shall be entirely responsible for meeting the tolerances given under MATERIALS, 569-2.03. Fabrication Tolerances. Sections which do not meet tolerance requirements are subject to removal and replacement at no cost to the State, at the discretion of the Engineer.

E. Central and Transit Mixed Concrete. The provisions of 501-3.03 C and D shall apply for Central Mixed and Transit Mixed Concrete respectively, except that water may be added to the mixture one additional time at the point of deposition to maintain the desired slump. The water addition may be made anytime after the beginning of discharge until approximately two-thirds of the load, as determined by the Engineer, has been discharged. After the water addition, the concrete shall be mixed at least 30 revolutions in the mixing range. When the water addition is made after discharge the total number of revolutions shall not be more than 190.

Truck Mixed Concrete. The provisions of §501-3.03 E shall apply except that after initial slump has been achieved, water may be added to the mixture one additional time to maintain the desired slump. The water addition may be made anytime after the beginning of discharge until approximately two-thirds of the load, as determined by the Engineer, has been discharged. After the water addition, the concrete shall be mixed at least 30 revolutions in the mixing range.

F. Concrete supply shall be sufficient to produce a continuous, completely shaped barrier. If concrete placement is interrupted, for any reason, the placement shall be protected from drying by several layers of wet burlap. A construction dam, or bulkhead, shall be installed if the interruption exceeds 30 minutes. If the interruption exceeds 90 minutes, further placement shall be discontinued.

Concrete placement at this location may then resume only after 12 hours, measured from the time of delay, has elapsed.

G. Concrete placement may begin at the joint beyond the bulkhead without time constraints. If the length of placement between the bulkhead and the next joint is such that, in the opinion of the Engineer, it may not be slipformed, the Contractor shall form the section by methods other than slipforming.

H. Cold joints in the barrier, that is, joints formed due to the attachment of fresh concrete to set concrete, shall be made in the following manner. The set concrete shall have its surface cut to remove all loose, and otherwise unsatisfactory materials. Tools used for this purpose shall be approved by the Engineer, prior to use. The surface shall be scrubbed with wire brooms and shall be kept wet until new concrete is placed.

I. The Contractor shall make provisions to allow hand finishing, should it be necessary, on all surfaces. Hand finishing, if done, shall be done immediately after the passage of the slipforming equipment. Curing compound shall be applied only after hand finishing has been completed at any particular location.

J. Concrete shall be cured by means of a clear curing compound in accordance with the requirements of 569-3.04.

K. Joints and construction grooves shall be introduced at the locations indicated on the Contract Plans. If sawcutting methods are employed the following requirements shall apply:

1. The equipment shall be demonstrated, for capability, to the Engineer.
2. No sawcuts, for any purpose, shall be made in the structural slab.
3. In order to avoid sawcuts in the structural slab, the portion of the joint 3 inches directly above the structural slab shall be hand tooled immediately after finishing.
4. All sawcuts shall be made normal to the structural slab surface. The joints shall be sawcut as soon as no damage to the concrete will result with a maximum time of 8 hours. The clear curing compound shall be reapplied at the sawcut.

569-3.06 Precast Concrete

A. Immediately prior to installation, the barrier units shall be inspected for defects. Defects which conform to the definition of minor defects as given in §704-03 shall be repaired in accordance with the requirements of that subsection.

After the inspection for defects has been completed, the contact surface of all precast barrier shall be sandblast cleaned in accordance with the requirements of §584-3.02A, and §584-3.02C. After sandblasting operations are completed the surfaces shall be thoroughly vacuum cleaned.

B. After the cleaned surface has been accepted, thoroughly wet the surface over which the precast barrier will be placed for at least 12 hours immediately prior to placing the grout bed. Remove all standing water with oil-free compressed air, and protect the surface from drying, so the surface remains in a saturated surface dry condition when placing the grout bed. All precast barrier shall be installed on grout beds conforming to the requirements of §701-05 as modified herein. The exact bedding placement requirements shall be established by the barrier system manufacturer. However, no grout bed shall be greater than 1/2 inch in thickness after the barrier has been installed in its permanent position. All grout bedding material shall be tooled flush with the barrier edge.

Care shall be taken to prevent grout from setting prior to barrier unit installation. If, in the opinion of the Engineer, the grout has set, or has begun to set, it shall be removed. No retempering will be permitted. The affected installation area shall be thoroughly cleaned of grout, by methods acceptable to the Engineer, and new grout shall be placed, all at no additional cost. All vertical adjustments shall be made by the addition, or removal, of grout. No wedges will be permitted.

Lifting of the barrier which, in the Engineer's opinion, will result in permanent voids occurring between the barrier unit and the grout bed, will not be permitted.

C. Unless otherwise noted joints between units shall utilize materials required by ASTM D1056, Grade 2B1 or 2B2 and shall be installed in the manner indicated on the approved precast barrier system drawings.

D. Units which are damaged during installation, due to the Contractor's operations, shall be repaired, or replaced, as determined by the Engineer. Repair or replacement shall be done at no cost to the State.

E. Precast barrier anchored to the underlying support by means of drilled-in-bolts, may be anchored by one of two methods:

1. Bolts chemically anchored to the underlying support. Holes drilled for this method will not go completely through the underlying support. Bolt installations will be subjected to load testing acceptance requirements.

2. Bolts mechanically anchored to the bottom of the underlying support. Holes drilled for this method will go completely through the underlying support. Bolt installations will not be load tested.

569-3.07 Requirements for Method permitted under §569-3.06E1

A. Drilling shall be done by means of a rotary impact drill. Hole diameter shall be in strict accordance with the grout manufacturer's instructions. If reinforcing steel is encountered, the reinforcing shall be cut and removed by means of a core drill. If approved by the Engineer, hole locations may be moved to avoid encountering reinforcing steel. The remainder of the drilling shall be done by rotary impact drill.

Drilling with a lubricant will not be permitted. Water use is permissible. Concrete spalled, or otherwise damaged by the contractor's operations shall be repaired, in a manner approved by and, to the satisfaction of the Engineer, at no additional cost.

B. Unless otherwise specified in the Contract Documents, the minimum depth of embedment of the anchor bolt shall be in accordance with Table 569-1.

The Contractor may increase the embedment length beyond that shown on the Plans or specified in the above table provided 1) the increase is done at no additional cost to the State and 2) the hole stops at least 2 inches from the bottom of the structural slab.

Nominal Anchor Bolt Diameter (inches)	1/2	9/16	5/8	3/4	7/8	1	1 1/8	1 1/4
Embedment Length (inches)	5 1/2	6	6 1/2	8	8 1/2	10	12	15
Test Load (kips)	11	14	17	25	35	45	50	65

C. Grouting material shall be a non-metallic, non-shrink grout, or polymer resin. It shall contain no products which promote the corrosion of steel. When cured, the material shall exhibit a maximum loss of four percent (4%) when tested for freeze-thaw resistance. Freeze-thaw testing will be done in accordance with Materials Test Method 502-3P, except that the material will be subjected to 50 cycles of testing. Cured material shall not be reactive with salt water, portland cement, or petroleum products.

The contractor shall supply the Engineer with two copies of the grout manufacturer's certification that the material meets the foregoing requirements.

D. All anchor bolts shall be inserted at least the specified depth into the hole. After insertion of the bolt, all excess grout shall be struck-off flush with the concrete face. Should the grout fail to fill the hole, additional grout shall be added to the hole to allow a flush strike-off.

E. A portion of each lot of grouted-in anchor bolts shall be designated by the Engineer for load testing. The first lot shall consist of the first 10 grouted in anchor bolts. The remaining lots shall be defined by the Contractor subject to the following:

§569

- The lot size shall not exceed 600 anchor bolts.
- A lot shall only include anchor bolts installed during a single construction season.
- A lot shall only include anchor bolts grouted with the same grout or resin.

Unless otherwise specified in the Contract Documents, the minimum load applied during the load testing shall be in accordance with Table 569-1.

Table 569-2 shows the lot size (column L), the initial number of anchor bolts selected for testing (column N1) and the number of anchor bolts selected for additional testing (column N2).

Lot Size L	Initial Sample Size N1	Additional Test Sample Size N2
1-30	All the bolts in the lot	---
31-50	30	---
51-75	38	---
76-100	44	21
101-200	49	26
201-300	50	30
301-600	55	30

NOTES:

1. If all of the N1 anchor bolts selected for testing pass the load test, then the lot shall be accepted.
2. If the lot size is 75 or less and one or more of the N1 anchor bolts fail the load test, then all the anchor bolts in the lot shall be tested.
3. If the lot size is 76 or greater and only 1 of the N1 anchor bolts fails the load test, the Engineer shall designate an additional N2 anchor bolts for testing. If none of the N2 anchor bolts fail the load test, the lot shall be accepted. If any of the N2 anchor bolts fails the load tests all of the anchor bolts in the lot shall be tested.
4. If the lot size is 76 or greater, and more than one of the N1 anchor bolts fail the load testing then all the anchor bolts in the lot shall be tested.

Anchor bolts shall be deemed to pass if the specified test load is attained without permanently displacing the anchor bolts. **THIS LOAD TESTING SHOULD BE NON-DESTRUCTIVE. LOADING SHOULD BE STOPPED AS SOON AS THE MINIMUM ACCEPTABLE PULL-OUT RESISTANCE IS ATTAINED.**

F. The testing equipment shall consist of a calibrated jack system, a frame to distribute the jack load, couplers to connect the jack to the anchor bolts, and safety devices. Prior to starting the testing, the Contractor shall supply the Engineer with a certificate of calibration for the jack less than 6 months old.

Supports for the frame used to distribute the jack load shall be located outside a circle centered at the anchor bolt and of a diameter equal to 2 inches plus twice the anchor bolt embedment length but need not exceed 2 feet. The frame and jack shall be positioned so that the load is applied along the centerline of the anchor bolt. Chains or cables shall be used to connect the various pieces of the tensioning system so that free projectiles will not be created by a failure of an anchor bolt anchorage, coupling or other portion of the tensioning system.

G. All anchor bolts which fail load testing shall be replaced and load tested in accordance with the foregoing requirements at no additional cost.

569-3.08 Requirements for Method permitted under §569-3.06E2

- A. The requirements of §569-3.07A shall apply.
- B. Grouting material shall meet the requirements of §701-05. It shall be mixed and placed in strict accordance with the grout manufacturer's instructions unless otherwise modified by the contract documents.

C. Both hole and bolt shall be clean and dry at the time of bolt insertion. The bolt shall be held in place such that it will remain vertical during subsequent grout placement. The method of bolt retention shall be such that the grout will be held within the hole until setting is complete.

Barrier units mechanically anchored to the underlying support by means of bolting shall be grouted into place in accordance with the following:

- Grout shall be prepared in accordance with the grout manufacturer's written instructions. Two copies of the manufacturer's instructions shall be delivered to the Engineer a minimum of two weeks prior to the beginning of barrier installation work.
- Grout shall be placed only if the ambient air temperature is at least 50°F and is predicted to rise. No grout shall be placed if the ambient air temperature falls below 45°F, unless external heat has been provided in the manner required by §555-3.08. The underlying support may be used as the floor of the enclosure if the Engineer approves.
- External heat shall be maintained for a minimum of seven curing days. A curing day is defined by §555-3.08A. After seven curing days have passed, or the grout has reached a minimum compressive strength of 3000 psi, whichever occurs last, the enclosure may be removed. All work of providing external heat shall be done at no additional cost.

569-4 METHOD OF MEASUREMENT. The work will be measured as the number of feet of concrete traffic barrier installed. Measurement will be taken along the centerline of the top of the barrier. No deduction will be made for joints.

569-5 BASIS OF PAYMENT

- A. The unit price bid per foot shall include the cost of all labor, materials and equipment necessary to complete the work. This price shall also include the cost of bar reinforcement, drilling, and testing.
- B. In the case of barrier constructed by cast-in-place methods, 40% of the quantity will be paid for after all of the bar reinforcement has been placed and approved by the Engineer. This payment shall include the cost of chairs, supports, fastenings, connections and any splices not specifically indicated on the plans. If the Engineer permits the substitution of larger bars than those specified, or the DCES permits splices not indicated on the plans, the payment will not be increased nor will any extra compensation be considered.

Payment will be made under:

Item No.	Item	Pay Unit
569.01	Permanent Concrete Traffic Barrier for Structures (Full Section)	Foot
569.02	Permanent Concrete Traffic Barrier for Structures (Half Section)	Foot
569.03	Vertical Faced Concrete Parapet	Foot
569.04	Single Slope (Half-Section) Concrete Bridge Barrier	Foot
569.05	Single Slope (Full-Section) Concrete Bridge Barrier	Foot
569.06	F-Shaped (Half-Section) Concrete Bridge Barrier	Foot
569.07	F-Shaped (Full-Section) Concrete Bridge Barrier	Foot
569.08	Texas Aesthetic Concrete Bridge Barrier	Foot

SECTION 570 - PAINT REMOVAL OPERATIONS

570-1 DESCRIPTION. This work shall consist of providing environmental protection and developing and implementing a worker Lead Health Safety program during paint removal operations.

Whenever a structure spans over a railroad, covers shall be placed and maintained in accordance with §105-09 Work Affecting Railroads. Structures that span a navigable waterway may be subject to regulation by various agencies.

570-1.01 Lead-Exposure Control Plan (LECP). This work shall consist of the development and implementation of a Lead Exposure Control Plan to protect workers from the harmful effects of lead exposure in accordance with 29 CFR Subpart D. Work activities which may expose workers to health

§570

hazards include, but are not limited to abrasive blasting, paint removal, torch-cutting, welding, grinding, and rivet busting.

570-1.02 Medical Testing. This work shall consist of medical testing to monitor the safety of workers with lead exposures.

570-1.03 Personal-Exposure-Monitoring Sample Analysis. This work shall consist of monitoring the exposure levels of workers to define the hazard and/or to verify the effectiveness of control measures.

570-1.04 Decontamination Facilities. This work shall consist of installation, operation, maintenance, and cleaning of decontamination facilities for personnel with lead exposures.

570-1.05 Environmental Ground Protection. This work shall consist of the collection and removal of waste materials, including old paint chips, corrosion residues, spent abrasives, and newly applied paint that result from cleaning and painting operations as specified in the contract documents or as directed by the Engineer.

570-1.06 Environmental Water Protection. This work shall consist of the collection and removal of waste materials, including paint chips, corrosion residues, spent abrasives and newly applied paint that result from cleaning and painting operations as specified in the contract documents or as directed by the Engineer.

570-1.07 Class B Containment. This work shall consist of furnishing, installing, and removing a containment enclosure around the work area used to contain and collect debris generated during paint removal and surface preparation using vacuum shrouded power tools, vacuum blasters, and hand tools. Open abrasive blasting shall not be conducted in a Class B containment.

570-1.08 Class A Containment. This work shall consist of furnishing, installing, and removing a total containment enclosure around the immediate work area to contain and collect debris generated during paint removal and surface preparation operations as specified in the contract documents or as directed by the Engineer.

570-2 MATERIALS. A high-efficiency particulate air (HEPA) filter shall be defined as a filter that is at least 99.97% efficient against particles that are 0.3µm in diameter.

570-3 CONSTRUCTION DETAILS

570-3.01 Lead-Exposure Control Plan (LECP). At least 20 calendar days prior to starting any work which could entail employee exposure to lead, the Contractor shall submit two copies of a written Lead-Exposure Control Plan (LECP) to the Engineer for review and acceptance. This LECP shall address all of the elements required by 29 CFR Subpart D and shall be coordinated with, and need not be repeated in, the site-specific Health and Safety Plan. The Contractor shall not begin any work which could entail lead exposure until the LECP has been accepted by the Engineer.

Submission of the LECP and its acceptance by the Engineer shall not be construed to imply approval of any particular method for addressing lead health and safety concerns, or to relieve the Contractor of the responsibility for adequately protecting the health and safety of all workers.

A competent person shall have current training as SSPC C-3, Competent Person Training for Deleading of Industrial Structures, or the SSPC C-5 refresher training class.

A. Industrial Hygienist. Where required, the Contractor shall engage an Industrial Hygienist (IH) meeting one or more of the following qualifications:

- Current certification by the American Board of Industrial Hygiene.

- A Bachelor's Degree in engineering, chemistry, physics, biological sciences, industrial hygiene, toxicology, the environmental sciences or a related field, and at least three years of documented full-time work as an IH, including field and sampling experience.
- A Master's Degree in one of the above fields, and at least two years of documented full-time work as an IH, including field and sampling experience.

The IH shall have the following responsibilities:

- Development of a written LECP, LECP updates, and preparation of monthly summary reports.
- Provide general oversight of all aspects of the LECP.
- Review all employee medical tests and exposure monitoring results. If required, take corrective actions.
- Intervention by the IH, consisting of an on-site investigation by the IH, implementation of corrective action, and notification of the Engineer in the next monthly report if either of the following conditions are encountered:
 - Blood Lead Level (BLL) > 40 µg/dL (micrograms/deciliter) for one or more workers.
 - BLL increase of 10 µg/dL or more between successive tests for any individual worker.
- Inspect the work site at least monthly during work which produces a potential lead exposure, except where the Contractor documents that employee lead exposure will be below the Permissible Exposure Limit (PEL).

B. Exposure Below the Action Level. If the Contractor can document by air monitoring or the use of appropriate historical data that lead exposure for all employees will be below the Action Level ($\mu\text{g}/\text{m}^3$), then the Contractor shall develop a written LECP including, but not limited to the following:

- A description of the Contractor's lead health and safety organization, including the responsibilities and qualifications of the competent person, and the project Health and Safety Officer.
- A description of OSHA required lead training provided to both supervisors and workers.
- A description of each activity which will entail a risk for lead exposure.
- An initial assessment of anticipated exposure level(s), including any relevant historical exposure monitoring data.
- A description of arrangements for ensuring that Subcontractors will comply with the LECP.
- Plans for updating the LECP.
- Plans for keeping and maintaining records.
- Exposure monitoring.

C. Exposure Above the Action Level and Below the Permissible Exposure Limit. If the Contractor can document by air monitoring or the use of appropriate historical data that the highest employee lead exposure will be above the Action Level ($30 \mu\text{g}/\text{m}^3$), but below the Permissible Exposure Limit ($50 \mu\text{g}/\text{m}^3$), then the Contractor shall develop a written LECP under the direction of an IH, with day-to-day supervision by the competent person, including, but not limited to, the items listed under paragraph B above and the following:

- Medical surveillance and removal program.
- Notifying employees and the Engineer of the results of exposure monitoring and medical tests.
- Worker and supervisor training.
- Monthly summary reports.
- Plans for worker and supervisor lead training.
- Plans for performing exposure monitoring and for notifying employees and the Engineer of results.
- A description of the Contractor's medical surveillance and removal program, including plans for notifying employees and the Engineer of results. This description shall include the names and addresses of the clinic(s) where testing will be performed and of the OSHA-approved laboratory where blood samples will be analyzed.

D. Exposure At or Above the Permissible Exposure Limit. When the highest employee lead exposure will be above the Permissible Exposure Limit ($50 \mu\text{g}/\text{m}^3$), the Contractor shall develop a written LECP under the direction of an IH, with day-to-day supervision by the competent person. The LECP shall include, but not be limited to, the items listed under paragraphs B and C above and the following:

- A description of the engineering, administrative, and work practice controls which will be used to reduce exposure. All feasible engineering, administrative, and work practice controls shall be implemented before considering the use of respirators to reduce exposure.
- Decontamination facilities to be provided including a description and floor plan, a description of any hand-wash stations to be provided, and a description of mandatory hygiene practices which employees will be required to follow.
- A description of a Respirator Program including respirator-fit testing and respirator training.
- A description of Provision of Personal Protective Equipment (PPE), including required cleaning and/or replacement.
- Plans for posting and maintenance of warning signs in high-exposure areas.
- Schedule of periodic work site inspections by the IH and the competent person.

E. Monthly Summary Reports. Except where the Contractor can document that employee lead exposure will be below the Action Level, for each month of work which entails potential lead exposure, the Contractor shall submit a monthly summary report to the Engineer which has been reviewed and signed by the IH not later than the 15th of the following month. This report shall contain the following elements:

1. A summary of the work producing potential lead exposure completed in the past month.
2. A description of any interventions or deficiencies noted, and a summary of corrective actions.
3. A summary of exposure monitoring or medical testing results which were completed in the past month. To protect worker privacy, these results shall not include individual names; instead, workers shall be identified by trade and with an individual control number (not Social Security Number) to allow tracking of their exposure.
4. A certification that, with the exception of any deficiencies noted, the past month's work has been in compliance with the requirements of 29 CFR 1926.62 and this specification.

570-3.02 Medical Testing. The Contractor shall arrange for employees to receive all required medical tests. All medical tests shall be completed by, or under the supervision of, a licensed physician. Blood sampling and analysis shall meet the accuracy requirements of 29 CFR Subpart D and shall be conducted by an OSHA-approved laboratory. The Contractor shall provide the Engineer a summary of medical testing results which were completed in the past month prior to a request for payment. The Contractor shall provide documentation of any medical removals, a description of what triggered them, and the corrective measures taken. The Contractor shall provide an exit medical exam consisting of blood sampling and analysis for lead and zinc protoporphyrin (ZPP) levels for all workers who were potentially exposed within 5 work days of the time a worker completes or is removed from all work which entails a potential for lead exposure. Exit exams shall also be offered within 5 work days of seasonal shutdown or for other periods exceeding 30 calendar days in which no work involving potential lead exposure is scheduled or anticipated. The results of all medical tests shall be provided to affected workers within 5 work days of receipt, and to the Engineer in the next monthly report.

For employees who are offered an exam but choose not to participate or fail to respond, the Contractor shall provide a written declination signed by the worker or, for workers who are no longer on the payroll, a registered letter to the worker's last known address.

570-3.03 Personal-Exposure-Monitoring Sample Analysis. The Contractor shall conduct exposure monitoring. Exposure monitoring samples shall be obtained by the IH, a competent person under the direction of the IH, or other qualified persons as specified in the LECP. Exposure monitoring samples shall be analyzed by a laboratory selected by the Contractor, using a method which meets the accuracy requirements of 29 CFR Subpart D. The Contractor shall provide the Engineer a summary of

exposure monitoring sample test results which were completed in the past month prior to a request for payment.

570-3.04 Decontamination Facilities. Except where the Contractor can document that employee lead exposure will be below the PEL, a minimum of one climate-controlled decontamination facility shall be provided, and shall be utilized by all workers with potential lead exposure. The number of facilities to be provided will be dictated by site conditions and by the Contractor's sequence of operations and shall be approved by the IH and the Engineer.

Each facility shall consist of a "clean" area where workers can remove and store their street clothing when they arrive on site; a shower room with hot and cold running water, soap and clean towels; and a "dirty" area where workers can remove and store their work clothing and PPE at the end of their work shift. The "clean" area and the "dirty" area shall each have a separate entrance. Decontamination facilities shall be cleaned as required, or at least once every week of use. All waste water generated from showers or as a result of cleaning operations shall either be tested and filtered through a 5 µm filter or considered as lead contaminated, and disposed of in accordance with State and Federal regulations.

570-3.05 Environmental Ground Protection.

A. General. Covers shall be provided on or over the ground under all structures that are to be cleaned and painted. Depositing or dropping waste materials into water and onto the ground or roadways outside the specified collection areas is not permitted.

The length of the cover shall be 10 feet longer on each end than the length of the work area, and the width shall be at least 10 feet wider on each side of the work area. The cover shall be positioned in such a manner as to contain and prevent the loss of waste materials.

Environmental Ground Protection shall consist of covers or other material capable of catching and holding waste materials on or over the ground under the structure in the work area. A bridge deck or a highway pavement and paved shoulder under a structure from which wastes may be collected and removed by vacuuming may be used in place of a cover providing that within that area such usage is confined to lanes and shoulders closed to traffic.

Covers on or over roadways or railroads or sidewalks or other similar areas shall not present a hazard of any kind and no cover shall remain in place overnight unless otherwise authorized by the Engineer.

B. Containment Operations. Cleaning or painting operations shall not be performed when the direction or velocity of prevailing winds causes waste materials to fall outside the collection area. If wind or other factors prevent collection, the Contractor may, with the approval of the Engineer, use drapes or other means to prevent drift beyond all specified collection areas.

C. Waste Collection. All waste materials shall be removed from the ground protection by vacuuming. Sweeping, shoveling, or other mechanical means to remove the waste materials from the ground protection is not permitted. Air exhausted from vacuuming equipment shall pass through a HEPA filtering system.

All waste materials that collect on a bridge deck, or on a highway pavement and paved shoulder under a structure or on covers shall be removed at least once a day or more frequently if directed by the Engineer. No waste material shall remain on the bridge deck, pavement, pier, pedestals, abutments, or containment covers overnight.

570-3.06 Environmental Waterway Protection.

A. General. Covers shall be provided under all structures that span bodies of water, waterways, and stream beds, and that are to be cleaned and painted in the field. Depositing or dropping waste

materials into water and onto the ground or roadways outside the specified collection areas is not permitted.

A cover shall be suspended from the structure and shall, as measured over the water, be at least 10 feet greater in length and at least 10 feet wider than each side of the area on which work is underway. The cover shall be positioned in a manner so as to collect and prevent the loss of waste materials. The cover shall not remain in place overnight if it presents a hazard of any kind.

If floating waste materials form on the water surface, they shall be contained from moving upstream or downstream. Floating waste material shall be collected daily, or more frequently. Straw or screening used in the fabrication of water booms shall be replaced with clean material weekly or as otherwise directed by the Engineer.

B. Containment Operations. Cleaning or painting operations shall not be performed when the direction or velocity of prevailing winds causes waste materials to fall outside the collection area. If wind or other factors prevent collection the Contractor may, with the approval of the Engineer, use drapes or other means to prevent drift beyond all specified collection areas.

C. Waste Collection. All waste materials shall be removed from the waterway protection by vacuuming. Sweeping, shoveling, or other mechanical means to remove the waste materials from the waterway protection is not permitted. Air exhausted from vacuuming equipment shall pass through a HEPA filtering system.

All waste materials that collect on a bridge deck, or on a highway pavement and paved shoulder under a structure or on covers shall be removed at least once a day or more frequently if directed by the Engineer. No waste material shall remain on the bridge deck, pavement, pier, pedestals, abutments, or containment covers overnight.

570-3.07 Class B Containment.

A. General. The containment system includes the cover panels, screens, tarps, scaffolds, supports, and shrouds used to enclose an entire work area. The purpose of the containment is to prevent debris generated during surface preparation from entering the environment and to facilitate the controlled collection of the debris for disposal.

The containment shall meet the requirements of SSPC-Guide 6, Class 2P. The containment may have either air penetrable or impenetrable walls, rigid or flexible framing, shall have fully sealed joints, and shall have overlapping entry ways. Flexible covers for flooring shall be impermeable and will be allowed only if the ground or paved surfaces are smooth enough to vacuum debris. If a smooth surface is not available, rigid materials shall be used for the floor of the enclosure.

B. Containment Operations. All cleaning and paint removal work and all work associated with the collection of paint waste debris, including the subsequent air blow-down or vacuuming of debris from the steel surfaces on the structure in preparation for painting, shall be performed inside the containment enclosure.

The Contractor shall make every attempt to limit workers from entering or exiting the containment enclosure when paint removal operations are being performed.

C. Waste Collection. Following paint removal work, all steel surfaces inside containment shall be vacuumed of debris. All waste material that results from paint removal operations shall be cleaned up and collected from the floor, walls, and other surfaces inside of the containment enclosure by vacuuming. Sweeping, shoveling, or other mechanical means to remove the waste materials will not be allowed. Cleanup operations shall be performed daily, prior to inspection, before new paint is applied or before a prolonged work stoppage, such as for weather interruptions.

Prior to disassembly or moving of the containment enclosure, the inside surfaces of the enclosure shall be cleaned of dust and other spent material by vacuuming. The Contractor shall take all measures necessary to prevent the release of waste material during moving or removal of the containment.

All vacuum equipment that is used for collection and clean up work shall be equipped with HEPA filters. All used filters from dust collectors, vacuums, and straw and screening from dam devices, shall be disposed of in accordance with all applicable local, State, and Federal Laws, regulations, and codes. The cost for disposing of these materials shall be included in the lump sum price bid for this item.

D. Ventilation. Ventilation inside the enclosure is not specifically required and may be by natural means. It may be necessary to provide mechanical ventilation to meet OSHA requirements for worker exposure to lead and other provisions. If mechanical ventilation is provided to address these requirements, filtration of exit air is not required.

E. Lighting. Light intensity by natural or artificial means inside the containment enclosure shall be maintained at a minimum of 50 foot-candles on the steel surface. During inspection activities, light shall be maintained at a minimum of 100 foot-candles. Auxiliary lighting shall be provided as necessary. The Contractor shall provide the Engineer with one portable light meter with a scale of 0 to 100 foot-candles. This meter will be returned to the Contractor at the completion of work. All lighting used in the containment shall be explosion-proof.

F. Containment Performance. The effectiveness of the containment enclosure shall be determined by visual inspection for dust plumes or other visible evidence of emissions materials into the environment. Throughout the duration of work there shall be no visible discharges. If there is a visible discharge the Contractor shall immediately stop work and perform necessary repairs to the containment enclosure or modifications to cleaning operations to the Engineer's satisfaction.

The Engineer may direct the Contractor to stop all work activities and immediately clean up all waste materials within the enclosure when threatening weather conditions exist or are predicted. This measure may be exercised when an apparent threat exists that could cause the release of waste material to the surrounding environment, such as high winds or heavy rain.

If the wind velocity causes the containment enclosure to billow, or to emit dust, or to otherwise be a hazard in the opinion of the Engineer, the Contractor shall immediately cease work and clean up all the debris. Under severe conditions the Contractor shall disassemble the containment enclosure.

G. Releases From the Containment. For structures that are located over or adjacent to water, if floating waste materials form on the water surface, they shall be contained from moving upstream or downstream by the use of floating water booms. Floating waste material shall be collected daily, or more frequently.

Any waste material that is released outside the containment enclosure shall be immediately cleaned up using vacuums. Care shall be taken on pavement and other surfaces to collect all waste material so as to prevent it from being redistributed into the air and environment by traffic or other means.

All used filters from dust collectors, vacuums, and straw and screening from dam devices, shall be disposed of in accordance with all applicable Local, State, and Federal Laws, regulations and codes. The cost for disposing of these materials shall be included in the lump sum price bid for this item.

570-3.08 Class A Containment. Fifteen (15) days prior to the start of any abrasive-blast cleaning or paint removal work, the Contractor shall submit for approval detailed working drawing(s) of the Class A containment system that is to be supplied for each structure. The drawings shall be prepared and stamped by a Professional Engineer. Six (6) complete copies of the working drawings shall be submitted for approval.

The working drawings shall detail the proposed containment enclosure and include the following information at a minimum:

- Plan and elevation of the containment enclosure in relation to the structure.
- The type of solid or rigid floor and working platform with appropriate safety and fall protection measures. A description of worker access to the enclosure and the procedures and equipment that will be used to provide fall-protection. If a barge or another type of floating platform is used, include

§570

details regarding its construction, such as materials and dimensions, how the platform will be tied-off, how the debris will be collected and off-loaded, etc.

- A description of how the existing drainage will be routed through the enclosure.
- A description of the type of material(s) for the containment walls, floor, and ceiling.
- The type of support structure that will be used for the floor, walls, and ceiling, including the attachment of the enclosure materials to the support structure.
- The method by which the enclosure will be supported or attached to the bridge, i.e., rollers, clamps. Welding, bolting, or similar connections will not be allowed.
- The method that will be used to seal the joints (seams) formed when fabricating the containment enclosure, and the method that will be used to seal the mating joints between the containment enclosure and the bridge structure.
- The method that will be used to seal the entryway. At a minimum, the use of multiple overlapping door tarps shall be provided to minimize dust escape through the entryway.
- The ventilation system including open-air make-up points, dust collector and exhaust fan(s), location, type of equipment, manufacturer's data sheets, and airflow capacities.
- The type, size, and configuration of auxiliary lighting provided inside the containment enclosure. All lighting must be explosion proof.
- A design analysis of the loads on the structure due to the containment enclosure including: maximum dead and live loads of the enclosure, the workers, blast abrasive, and equipment; maximum allowable load for the floor and working platform; wind loads imposed on the structure by the enclosure; and maximum wind velocity that the containment enclosure is designed to withstand.
- If the containment system is supported by the structure, the working drawing submittal shall include certification by the Professional Engineer that the loads imposed do not cause the overall stress level of any element of the bridge to exceed the Operating Rating Allowable Stresses defined in AASHTO Manual for Maintenance Inspection of Bridges.
- The analysis shall account for all loads on the structure, including the enclosure dead load, worker live load, blast-abrasive load, equipment load, wind load, structure dead load, and highway live load using H20 loading unless other-wise specified plus impact. The highway live load used for analysis purposes shall be either an HS20 truck or equivalent lane loading, whichever is greater, unless a different highway live load is shown in the contract documents. Except as noted, the analysis shall use the loadings and design assumptions in the NYSDOT Standard Specifications for Highway Bridges.
- Details on how the enclosure is assembled, disassembled and moved to a new location on the structure as surface preparation work progresses. Indicate how the dust collector will be included in the containment enclosure. All other pertinent details relating to the containment enclosure shall be included with the working drawings as notes or as written narrative.
- Details on how the use of the enclosure will be coordinated with the maintenance and protection of traffic. Encroachments onto roadways and clearances over waterways and railroads shall be clearly identified.

A. General. The containment system includes the cover panels, screens, tarps, scaffolds, supports, and shrouds used to enclose an entire work area. The purpose of the containment is to prevent all debris generated during surface preparation from entering the environment and to facilitate the controlled collection of the debris for disposal.

The containment shall meet the requirements of SSPC-Guide 6, Class 1A. The containment shall have air impenetrable-walls, rigid or flexible framing, fully sealed joints, and resealable entry ways. Negative air shall be achieved by forced air flow. Exhaust air shall be filtered.

Flexible covers for flooring shall be impermeable and will be allowed only if the ground or paved surfaces are smooth enough to vacuum debris. If a smooth surface is not available, rigid materials shall be used for the floor of the enclosure.

B. Containment Operations. All abrasive-blast cleaning and paint removal work, and all work associated with the collection of paint waste debris, including the subsequent air blow-down or

vacuuming of debris from the steel surfaces on the structure in preparation for painting and inspection, shall be performed inside the containment enclosure.

The Contractor shall attempt to limit workers from entering or exiting the containment enclosure when blast cleaning and paint removal operations are being performed.

C. Waste Collection. All waste material that results from abrasive blasting and paint removal operations shall be cleaned up and collected from the floor, walls, and other surfaces inside of the containment enclosure by vacuuming. Sweeping, shoveling, or other mechanical means to remove the waste materials will not be allowed unless the containment is intact and the vacuuming system is operating. Clean up operations shall be performed daily, prior to inspection, before new paint is applied or before a prolonged work stoppage, such as for weather interruptions.

Prior to disassembly or moving of the paint enclosure, the inside surfaces of the enclosure (walls, floors, ceiling, etc.) shall be cleaned of dust and other spent material by vacuuming. The Contractor shall take all measures necessary to prevent the release of waste material during moving or removal of the containment.

All vacuum equipment that is used for collection and cleanup work shall be equipped with HEPA filters. All used filters from dust collectors, vacuums, and straw and screening from dam devices, shall be disposed of in accordance with all applicable local, State, and Federal Laws, regulations, and codes. The cost for disposing of these materials shall be included in the lump sum price bid for this item.

D. Ventilation. The size of the exhaust-fan system supplied shall be designed to produce an average minimum cross-draft air velocity or an average minimum downdraft air velocity inside the containment enclosure. For enclosures designed with horizontal air flow, the exhaust fan shall have the capacity to produce an average minimum cross-draft velocity of 100 fpm, based on theoretical calculations. For enclosures designed with vertical air flow, the exhaust fan shall have the capacity to produce an average minimum downdraft velocity of 50 fpm, based on theoretical calculations. Forced exhaust air shall flow into dust collectors. The dust collectors shall be used and appropriately sized for the type, size of particulate matter, volume, and velocity of air moved through the containment. All air exhausted from the containment enclosure shall pass through the dust collection system.

Proper operation of the ventilation system shall be maintained after each assembly of the containment and during all phases of work.

E. Lighting. Light intensity by natural or artificial means inside the containment enclosure shall be maintained at a minimum of 50 foot-candles on the steel surface. During inspection activities, light shall be maintained at a minimum of 100 foot-candles. Auxiliary lighting shall be provided as necessary. The Contractor shall provide the Engineer with one portable light meter with a scale of 0 to 100 foot-candles. This meter will be returned to the Contractor at the completion of work. All lighting used in the containment shall be explosion-proof.

F. Containment Performance. NYSDOT will perform air quality monitoring (AQM) for ambient particulate and lead during abrasive blasting/cleanup. Real-time AQM will be used for all Class A containments. High-volume AQM may be used in addition to real-time AQM. The effectiveness of the containment and accessory equipment in preventing unacceptable levels of particulate and lead emissions will be assessed based on established AQM criteria for both the real-time and high-volume monitoring. Throughout the duration of work, there shall be no visible discharges. If the Engineer observes a visible discharge, the Contractor shall immediately stop work and perform necessary repairs to the containment enclosure or modifications to blast cleaning operations to the Engineer's satisfaction.

The Engineer may direct the Contractor to stop all work activities and require the Contractor to immediately clean up all waste materials within the enclosure when severe weather conditions exist or are predicted. This measure may be exercised when an apparent threat exists that could cause the release of waste material to the surrounding environment, such as high winds or heavy rain.

§570

If the wind velocity causes the containment enclosure to billow or to emit dust, or to otherwise be a hazard in the opinion of the Engineer, the Contractor shall immediately cease work and cleanup all the debris. If severe conditions are predicted, the Contractor shall disassemble the containment enclosure.

G. Releases From the Containment. For structures that are located over or adjacent to water, if floating waste materials form on the water surface, they shall be contained from moving upstream or downstream by the use of floating water booms. Floating waste material shall be collected daily, or more frequently.

Any waste material that is released outside the containment enclosure shall be immediately cleaned up using vacuums. Care shall be taken on pavement and other surfaces to collect all waste material so as to prevent it from being redistributed into the air and environment by traffic or other means.

All used filters from dust collectors, vacuums, and straw and screening from dam devices, shall be disposed of in accordance with all applicable Local, State, and Federal Laws, regulations and codes. The cost for disposing of these materials shall be included in the lump sum price bid for this item.

570-4 METHOD OF MEASUREMENT.

570-4.01 Lead-Exposure Control Plan (LECP). The work under the Lead Exposure Control Plan will be measured for payment on a lump sum basis.

570-4.02 Medical Testing. The work under medical testing will be measured for payment on a dollars-cents basis.

The amount shown in the itemized proposal for this work will be considered the price bid even though payment will be made for actual work performed. This amount is not to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded, and the original price will be used to determine the total amount bid.

570-4.03 Personal-Exposure-Monitoring Sample Analysis. The work under the personal exposure monitoring sample analysis will be measured for payment on a dollars-cents basis.

The amount shown in the itemized proposal for this work will be considered the price bid even though payment will be made for actual work performed. This amount is not to be altered in any manner by the bidder. Should the bidder alter the amount shown, the altered figure will be disregarded, and the original price will be used to determine the total amount bid.

570-4.04 Decontamination Facilities. The quantity to be measured for payment will be in calendar weeks.

570-4.05 Environmental Ground Protection. This work will be measured for payment on a lump sum basis.

570-4.06 Environmental Water Protection. This work will be measured for payment on a lump sum basis.

570-4.07 Class B Containment. This work will be measured for payment on a lump sum basis.

570-4.08 Class A Containment. This work will be measured for payment on a lump sum basis.

570-5 BASIS OF PAYMENT.

570-5.01 Lead-Exposure Control Plan (LECP). The lump sum price bid shall include the cost of all labor, materials and equipment necessary to satisfactorily complete the work.

570-5.02 Medical Testing. Payment shall include all reasonable and customary costs incurred (based on receipted bills submitted to the Engineer, plus 5% overhead and profit).

No payments shall be made for additional medical tests or laboratory analyses required due to an increase in the blood lead level of any employee above the OSHA threshold.

570-5.03 Personal-Exposure-Monitoring Sample Analysis. Payment shall include all reasonable and customary costs incurred (based on receipted bills submitted to the Engineer, plus 5% overhead and profit), for laboratory analysis of exposure monitoring samples.

570-5.04 Decontamination Facilities. The unit price bid per week for each facility shall include the cost of all labor, materials, equipment, utility, and disposal charges necessary to satisfactorily complete the work.

570-5.05 Environmental Ground Protection. The lump sum price bid shall include the cost of all labor, materials and equipment necessary to complete the work.

570-5.06 Environmental Water Protection. The lump sum price bid shall include the cost of all labor, materials and equipment necessary to complete the work.

570-5.07 Class B Containment. The lump sum price bid shall include the cost of all labor, materials and equipment necessary to complete the work.

Progress payments will be made based upon the amount of work completed using a daily rate of payment determined from the estimate of work days of cleaning and painting shown in the Contractor’s approved progress schedule and the lump sum price bid.

Should the Engineer request a revised progress schedule and use that schedule to establish a new daily rate, the lump sum price bid shall be reduced by the total of the amounts previously authorized for payment, prior to the establishment of the new daily rate.

570-5.08 Class A Containment. The lump sum price bid shall include the cost of all labor, materials and equipment necessary to complete the work.

Progress payments will be made based upon the amount of work completed using a daily rate of payment determined from the estimate of work days of cleaning and painting shown in the Contractor’s approved progress schedule and the lump sum price bid.

Should the Engineer request a revised progress schedule and use that schedule to establish a new daily rate, the lump sum price bid shall be reduced by the total of the amounts previously authorized for payment, prior to the establishment of the new daily rate.

No payment will be made for each calendar day during which there are substantial deficiencies. Substantial deficiencies are defined as: (1) The second occurrence of a visible emission for a cause which has been previously identified and corrected, or (2) air quality monitoring produces unacceptable results as defined in the Department’s Air Quality Monitoring (AQM) Protocols.

The nonpayment will be calculated as follows:

$$(Lump\ Sum\ Price\ Bid / Actual\ \#\ of\ Work\ Days) \times (\#\ of\ Days\ with\ Substantial\ Deficiencies)$$

In addition to the non payment for substantial deficiencies, the costs of any extension of the Air Quality Monitoring beyond the basic monitoring program or random audits defined in the AQM Protocol, which are necessitated by unacceptable AQM results, will also be charged to the Contractor.

Both of these amounts will be deducted from monies due to the Contractor.

Payment will be made under:

Item No.	Item	Pay Unit
570.01	Lead-Exposure Control Plan	Lump Sum
570.02	Medical Testing	Dollars-Cents
570.03	Personal-Exposure-Monitoring Sample Analysis	Dollars-Cents
570.04	Decontamination Facilities	Calendar Week
570.09nnnn	Environmental Ground Protection	Lump Sum (each structure)
570.10nnnn	Environmental Waterway Protection	Lump Sum (each structure)

SECTION 571 - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE

571-1 DESCRIPTION. The work shall consist of accumulating, packaging, labeling, loading, transporting, treating, and disposing paint removal waste declared to be a hazardous waste containing lead.

571-1.01 Hazardous Waste Disposal Facility. Prior to generating any paint removal waste, the Contractor shall supply the Engineer with a letter from a legally permitted Hazardous Waste Disposal Facility, stating that the Facility has agreed to accept the paint removal waste generated by the work requirements of this project; is authorized to accept paint removal waste under the laws of the State of residence; has the required capacity to treat and dispose of the material; and will provide, or assure the ultimate disposal method indicated on the Uniform Hazardous Waste Manifest. The letter shall be signed by a representative of the Disposal Facility who is legally authorized to sign such an agreement. The Engineer shall be given an original, signed letter. Facsimile copies will not be acceptable.

571-1.02 Waste Transporter. The Contractor shall present evidence that they have a 6NYCRR Part 364 Waste Transporter Permit to haul to the selected facility, or have contracted with a permitted Hazardous Waste Transporter to remove the waste to the selected facility.

571-1.03 Paint Removal Waste. For purposes of this item, paint removal waste is defined as removed paint particles combined with any material used to remove the paint. Paint removal waste will be referred to throughout the item text as 'waste'. Declaration of the waste as 'hazardous' is based on the Department's knowledge that the waste contains lead.

571-1.04 Waste Transport. All waste resulting from paint removal operations shall be in transit to the disposal site no later than 45 calendar days subsequent to 1 ton of waste accumulated at the site, or two weeks following demobilization of the site, whichever occurs first. Waste shall be accumulated, handled, packaged, loaded, transported, treated and disposed in accordance with all applicable Federal, State and local laws, rules, regulations, and codes. The Contractor's failure to comply with the aforementioned deadlines may result in the actions described under §571-5 Basis of Payment.

571-1.05 Minimum Work Requirements. The Contractor is hereby notified that this work requires the following as a minimum:

Waste transporter identification number issued by USEPA.

Disposal facility identification number issued by USEPA. (This will be supplied by the Disposal Facility).

Generator site identification number issued by USEPA. (This will be supplied by the State through the Engineer).

Conformance to 6NYCRR364. Part 364 governs waste transporters. The Contractor shall furnish a copy of the Part 364 permit to the Engineer.

Conformance to 6NYCRR372. Part 372 governs manifest requirements.

Conformance to 6NYCRR373. Part 373 governs treatment, storage and disposal facilities and contains specific generator requirements.

Conformance to 40 CFR 268 promulgated by the Environmental Protection Agency pursuant to the Hazardous and Solid Waste Amendments to the Resource Conservation and Recovery Act. That law prohibits the land disposal of hazardous wastes unless they are treated to diminish the toxicity of the migration of hazardous constituents from the waste.

NOTE: NYCRR regulations are administered by the NYS Department of Environmental Conservation, Albany, N.Y. EPA regulations are administered by the US Environmental Protection Agency, Region II, New York, N.Y.

571-1.06 Bridge Washing Waste. For the purposes of this item, bridge washing waste is defined as paint chips and any organic or inorganic materials dislodged from bridge surfaces by bridge washing operations. The paint chips are known to contain lead, the combined waste stream may therefore be hazardous waste. The Department has presumed that the waste will test as hazardous. Bridge washing waste shall be kept segregated from bridge paint removal waste and shall be placed in containers or roll-offs with additional labeling identifying it as "Bridge Washing Waste".

571-2 MATERIALS. The waste shall be accumulated in clean, dry, weatherproof, watertight containers or roll-offs furnished by the Contractor. The Contractor shall furnish the Engineer with a signed statement from the Disposal Facility that the containers or roll-offs proposed for use by the Contractor are acceptable to the Facility. The dry volume capacity of the container, in cubic yards, shall be clearly marked upon each container, in a location easily readable by the Engineer.

All equipment and containers or roll-offs shall be approved by the Engineer prior to use.

571-3 CONSTRUCTION DETAILS

571-3.01 Containers. All generated waste shall be deposited and sealed, in containers or roll-offs concurrent with generation. No container or roll-off shall be filled to a capacity in excess of that marked on the container or roll-off as the maximum dry volume capacity. No waste shall be left exposed to the elements at the end of the working day.

All containers or roll-offs shall be located in a place secured from traffic and in a manner acceptable to the Engineer.

Each container or roll-off shall be labeled in accordance with US Department of Transportation regulations. Each container or roll-off shall be permanently labeled in the following manner:

HAZARDOUS WASTE. Federal law prohibits improper disposal. If found, contact the nearest police, or public safety authority, or the US Environmental Protection Agency.

Generator's Name: NYSDOT

Manifest Document No. _____.

Date: _____.

BIN: _____.

Note: The date shall be the generation date. It shall be entered by the Engineer using permanent marking material supplied by the Contractor.

571-3.02 Labeling. All labeling, marking (except date mark), and placarding shall be the responsibility of the Contractor and shall be done under the supervision of the Engineer. This work shall be completed to the Engineer's satisfaction prior to the filling or transportation of any particular container or roll-off. All label markings shall be permanent, printed in English, displayed on a background of contrasting color un-obscured by other labels, or attachments. Labeling shall be located away from other markings that could substantially reduce its effectiveness.

571-3.03 Document Preparation. All document preparation and distribution, including the Uniform Hazardous Waste Manifest, shall be the responsibility of the Contractor. The Engineer will sign the Generator's Certification on the Uniform Hazardous Waste Manifest. The LDR (Land Disposal Restricted) certification shall be completed and attached to the manifest, as required by 40 CFR Part 268, "Land Disposal Restrictions."

All waste shall be documented, transported, treated, and disposed as required by the current Federal, State and local laws, rules and codes.

571-3.04 Multiple Collection. It is permissible for the transporting vehicle to pick up paint waste debris, in bulk, from one or more bridge sites for delivery to an authorized treatment, storage and disposal facility (TSDF) if the following conditions are met:

The materials picked up at each site must be essentially identical in physical and chemical characteristics. No materials, other than paint waste debris, may be included if wastes from several individual generating sites are to be combined on the same truck.

All of the component shipments are presumed to be D008 hazardous wastes, and disposed as such.

A manifest is prepared for each generating bridge site. Each manifest must reflect a bulk shipment, and all manifests being carried by the same transporting vehicle must express the quantity in cubic yards. In sum total, the manifests accompanying the shipment must account for the entire volume transported.

All component shipments are intended to be conveyed to the same TSDF, and the TSDF has agreed to accept consolidated bulk loads.

All component shipments must have originated at sites that are under the authority of DOT. No loads may be included that were generated at a site for which another agency is responsible.

Measures must be taken to prevent the blowing or dispersion of the waste during each loading operation and while being transported.

571-3.05 Paint Waste Composition. The Contractor is responsible to ensure that only dry paint removal waste is deposited into the containers or roll-offs.

Provided in the proposal is a note entitled "Typical Paint Removal Waste Composition" which provides typical chemical composition of paint removal waste based on previous chemical testing. The determination has been made that such waste contains less than 2% by weight of organic material. The Contractor is specifically forewarned that disposal facilities perform spot tests and may refuse to accept waste in excess of 2% organic content or that is otherwise different than the Typical Paint Waste Composition. Waste contaminated in this manner will be the Contractor's responsibility. All penalties and costs associated with the refusal of a disposal facility to accept waste not meeting its requirements will be borne by the Contractor. All testing of the waste necessary to satisfy the requirements of the chosen Disposal Facility or Transporter shall be the responsibility of the Contractor.

571-3.06 Paint Waste Stabilization. For the purposes of this item, treatment of the paint removal and washing waste as required by Federal regulations is presumed to require stabilization of the waste such as mixing it with portland cement and water as necessary at a permitted Hazardous Waste Treatment or Disposal Facility. The stabilized waste shall meet the treatment standards of the Federal regulations prior to disposal in a permitted Hazardous Waste Disposal Facility.

571-3.07 Bridge Washing Waste Composition. The Contractor is responsible for ensuring that only dried bridge washing waste is deposited into the containers or roll-offs. The contractor is warned that the bridge washing waste may contain more than 2% organic content. A typical waste composition profile is not available. All testing of the waste necessary to satisfy the requirements of the Disposal Facility or Transporter shall be the responsibility of the Contractor.

571-4 METHOD OF MEASUREMENT. The work will be measured as the number of dry cubic yards of waste accumulated, packaged, transported, treated, and disposed in accordance with the requirements of this item. The actual quantity within a single container or roll-off will be determined by the Engineer. Once the Engineer determines the quantity within a specific container or roll-off, that container or roll-off shall be properly sealed and not thereafter be tampered with. No additional waste shall be placed in it, nor shall any be removed from it. Under no circumstances will a container or roll-off be measured as containing more than the maximum dry volume capacity marked on it.

571-5 BASIS OF PAYMENT. The unit price bid per cubic yard shall include the cost of all labor, materials, equipment, sampling, testing, and fees necessary to complete the work based on the assumption that treatment by stabilization will satisfy the applicable Federal regulations. Should this prove not to be the case on an industry wide basis, as opposed to an individual Treatment or Disposal Facility, the difference in cost between the cost of treatment by stabilization and the method subsequently found to be

necessary shall provide the basis for an order on contract. Only waste for which manifest copies are returned to the Engineer by the Contractor and Disposal Facility will be authorized for payment.

If the Department is fined or penalized as a result of the Contractor's performance or lack thereof on this item, in addition to other remedies the Department may possess, said fine or penalty will be deducted from monies due the Contractor.

The extent of the Contractor's compliance with the provisions under timeliness of disposal will be considered as relevant in any future determination of an award to the Contractor as the lowest responsible bidder for any project under the supervision of the Department.

Payment will be made under:

Item No.	Item	Pay Unit
571.01nnnn	Treatment and Disposal of Paint Removal Waste	Cubic Yard

NOTE: nnnn represents numbers assigned by the designer and keyed to a particular structure. See elsewhere in these contract documents for a list of structures and the numbers assigned to nnnn.

SECTION 572 - STRUCTURAL STEEL PAINTING: SHOP APPLIED

572-1 DESCRIPTION. This work shall consist of preparing and painting new steel surfaces in a permanent facility, enclosure, or building, with four walls to grade and a roof, where surface preparation and painting activities are conducted in an environment not subject to outdoor weather conditions and/or blowing dust. All painting work, except field touchup and bolt painting, shall be conducted inside this facility. See special note entitled “*Structural Painting Details*” for the description and requirements of serialized items.

572-2 MATERIALS

572-2.01 Paints. Paints shall meet the requirements of §708-01 Structural Steel Paints – Class 1, and shall appear on the Department’s Approved List, “Structural Steel Paints - Class 1”. All paint applied to a single structure shall be produced by the same manufacturer. Any exception must be approved by the Engineer and the Materials Bureau Director.

A. Shelf Life. The shelf life of all paint shall be a maximum of 12 months from the date of manufacture. Paint and thinner shall arrive at the work site in new, unopened containers. The label shall include the manufacturer’s name, batch number, color, paint name, and date of manufacture.

B. Paint Storage. Paint in storage shall be protected from damage and maintained in accordance with manufacturer’s recommendations. Paint will be considered in storage if it is onsite for more than 8 hours prior to application.

C. Color. Each single coat of paint shall be a different color and provide substantial contrast with the underlying substrate and previous coats. The colors of the primer, stripe coat, and intermediate coat will be the Contractor's option. The color of the finish coat shall be as specified in contract documents.

D. Data Sheets. The Contractor shall supply the Engineer with the paint manufacturer's technical data and materials safety data sheets for each paint to be applied. The data sheets will be delivered to the Engineer a minimum of five work days prior to beginning of work. Data sheets shall include all information required by §708-01 Structural Steel Paints - Class 1.

572-2.02 Abrasive for Blast Cleaning. Abrasive material for blast cleaning shall be selected by the Contractor. Silica sand and other types of nonmetallic abrasive containing more than one percent free

silica, by weight, will not be allowed. The abrasive blasting shall produce an angular anchor profile suitable for the paint system to be applied.

572-2.03 Paint Inspection Equipment. Prior to the start of work, the Contractor shall supply the Engineer with the following specifications and equipment in good working order:

1. One bound copy of the Steel Structures Painting Council, surface preparation specification, SSPC-SP 10 - *Near-White Metal Blast Cleaning*.
2. One bound copy of the Steel Structures Painting Council, surface preparation specification, SSPC SP-1 - *Solvent Cleaning*.
3. One bound copy of the most current Steel Structures Painting Council Pictorial Standards, SSPC-VIS 1, *Guide and Reference photographs for steel surfaces prepared by dry-abrasive blast cleaning*.
4. One bound copy of the Steel Structures Painting Council method SSPC-PA2, Paint Application Specification No. 2 - *Measurement of Dry Film Thickness With Magnetic Gages*.
5. One copy of ASTM D4417 Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel.
6. One copy of ASTM D4285 Test Method for Indicating Oil or Water in Compressed Air
7. One Air Thermometer, pocket type, 10°F to 110°F.
8. One non-contact Infrared Thermometer, 10°F to 110°F.
9. One Contact Thermometer, 10°F to 110°F.
10. One Magnetic Dry-Film Thickness Gage, Type 2 (as defined per SSPC PA-2), with a display capable of measuring 0 to 60 mils in 0.1 mil increments, with calibration shims.
11. Two Wet-Film Thickness Gages, Prong-Type, capable of measuring 1 to 10 mils in 1 mil increments.
12. Psychrometer and US Weather Bureau Psychrometric Tables.
13. Profile micrometer with extra coarse replica tape.

All equipment will be returned to the Contractor upon completion of the work.

572-3 CONSTRUCTION DETAILS. All structural steel members and other miscellaneous steel items shall be cleaned and painted as per contract documents.

The Contractor shall provide adequate access, suitable lighting, and time for inspections to be made. Any work completed while the Engineer has been restricted from access, shall be recleaned and repainted at no additional cost to the State.

572-3.01 Quality Control Plan. The Contractor shall provide the Engineer with a copy of the Contractor's Quality Control (QC) procedures and/or Quality Control Plan (QCP). The QCP describes the minimum QC activities that will be performed by Contractor's QC personnel to ensure compliance. The QCP shall at a minimum, include operating procedures and maintenance records for equipment on site, proof of formal QC training for the Contractor's QC personnel on site, and daily reports including the following information:

- Compressed Air Cleanliness
- Dry Film Thickness
- Air Temperature
- Humidity and Dew Point
- Surface Temperature
- Abrasive Cleanliness Checks
- Degree of Cleanliness Achieved
- Surface Profile
- Batch Numbers of Paint Used
- Batch Numbers of Thinner Used
- Mixing According to Specification

The Contractor shall provide daily reports to the Engineer upon request. The reports shall be submitted no later than 24 hours following the completion of the day's work.

572-3.02 SURFACE PREPARATION.**A. Abrasive Blast Cleaning.**

1. Atmospheric Conditions. Abrasive blast cleaning operations shall not be conducted under the following conditions:

- a. The relative humidity exceeds 85%.
- b. When the substrate is damp or covered by frost.
- c. The surface temperature is less than 5°F above the dew point.

2. Solvent Cleaning. Before abrasive blast cleaning begins, steel shall be solvent cleaned of all deposits of oil, grease, dirt, salt, or other contaminants by methods specified in SSPC-SP1, Solvent Cleaning.

3. Steel Cleanliness and Profile. All structural steel surfaces to be painted shall be abrasive-blast cleaned in accordance with SSPC-SP10, *Near-White Metal Blast Cleaning*. All abrasive blast cleaning and painting shall be performed at the same facility.

The anchor profile shall be measured in accordance with ASTM D4417, Method C. The Contractor shall ensure that the anchor profile is within the range indicated on the paint manufacturer's data sheets. The profile shall, at a minimum, be measured once per shift and three times in various locations for every 2150 square feet prepared, unless otherwise ordered by the Engineer. The anchor profile shall not exceed 3 mils.

All fins, tears, slivers, burred and sharp edges that are present or occur during the blasting operation shall be removed by grinding, and then the area shall be reblasted to provide the required profile.

4. Equipment. All equipment and compressors used in the cleaning operation shall be equipped with filters and traps to prevent moisture, oil, and other contaminants from being deposited on clean surfaces. The air cleanliness shall be verified by the Contractor with the white blotter test in accordance with ASTM D4285 at least once per shift for each compressed air system.

B. Cleaning Area. The area cleaned shall be limited to that which can be cleaned and prime coated within an 8-hour period. Cleaned areas shall be approved by the Engineer prior to priming. Areas that exhibit flash rusting within the 8-hour period shall be recleaned.

C. Visual Standards. After abrasive blasting is completed, cleaned surfaces shall be compared to SSPC-Vis 1, "Guide and Reference Photographs for Steel Surfaces Prepared By Dry Abrasive Blast Cleaning" Pictorial Standards as applicable. All surfaces shall be free of blasting products and other residues when blasting operations are completed. Surfaces shall be cleared of all foreign matter by means of oil-free, moisture-free, compressed air or vacuum systems.

572-3.03 PAINTING. The Contractor shall apply three full coats and a stripe coat of paint to all surfaces cleaned to SP-10. In addition, all cleaned steel surfaces within 6 feet from a bridge joint shall receive an additional coat of intermediate paint, resulting in four coats of paint in these areas. The paint shall be applied in the following order: primer, intermediate, stripe, and the finish coat. Damage resulting from fabrication, handling and storage in the shop shall be restored before leaving the shop.

Unless otherwise noted, the contractor shall adhere to the procedures and methods for application as described in SSPC-PA 1, Section 7.

A. Atmospheric Conditions. Paint shall not be applied when the receiving surface and ambient temperatures are less than 40°F or greater than 100°F. If the temperature range listed on the manufacturer's data sheets is more restrictive, the manufacturer's range shall be used. No paint shall be applied unless the receiving surface is dry.

Paint shall not be applied when the relative humidity is more than 85% unless the painting manufacturer's data sheets have a more restrictive range. Paint shall not be applied if the receiving surface is less than 5°F above the dew point temperature.

B. Paint Mixing. All paint shall be thoroughly mixed with mechanical mixers in accordance with the manufacturer's recommendations. After mixing, the bottom of the container shall be free of any unmixed pigment prior to use.

C. Solvents and Thinners. Paint may be thinned if recommended by the manufacturer and approved by the Engineer. The primer shall not be thinned such that the resulting VOC level exceeds 500 g/L. Intermediate and finish coats shall not be thinned where the resulting VOC level exceeds 340 g/L. The manufacturer's data sheets shall advise the Contractor and Engineer of the maximum amount of thinner allowed.

Use of unauthorized thinners, or using excess amounts of thinners is prohibited. Any area where unauthorized solvents or thinners are used shall be cleaned and repainted at no additional cost.

D. Paint Application. Painting shall not begin until cleaned surfaces have been inspected and approved by the Engineer. Paint may be applied using spray, brush, or roller, unless otherwise indicated by the contract documents. All paint shall be applied so as to produce a uniform, even coating free of runs, sags, drips, ridges, or other defects. Roller nap shall be limited in accordance with the paint manufacturer's recommendation. Brushes and rollers used to apply the paint must be of a quality to produce a smooth uniform coating without leaving fibers in the coating.

All metal surfaces in contact with concrete shall not be painted. Priming shall begin only after all welding and fabrication work is completed.

E. Stripe Coat. A stripe coat shall extend a minimum of 1 inch away from the following surfaces: all welds, rivets, bolts, nuts, edges of plates and structural members, angles, bearings, lattice pieces or other shapes, corners, and crevices. To provide contrast, paint for stripe coating shall be a different color than the receiving surface. The stripe coat shall use the intermediate paint and be applied after the intermediate coat. The stripe coat shall be brush applied without being thinned. The stripe coat will be applied in accordance with manufacturer's recommendations, with particular attention to the film thickness, recoat window, and cure schedule. Areas near bridge joints that are to receive an additional coat of intermediate paint shall also receive a stripe coat where necessary as described above.

A stripe coat shall not be applied to any slip critical surfaces.

F. Paint Film Thickness. Paint shall be applied to produce the specified dry-film thickness as directed by the range listed on the paint manufacturer's data sheets. The dry-film thickness (DFT) shall be determined in accordance with SSPC-PA 2, Paint Application Specification No. 2 - *Measurement of Dry Film Thickness with Magnetic Gages*, using a Type 2 fixed probe magnetic gages. Dry film thickness gauges shall be calibrated over a blasted, approved surface.

DFTs of the intermediate and finish coats shall be determined by subtracting the average DFT readings of the previous coat(s) from the actual DFT reading. An average DFT value shall be recorded and calculated for every 1000 square feet prepared. The average shall be calculated using a minimum of 5 spot measurements as defined by SSPC-PA2.

Areas failing to meet the specified minimum dry-film thickness shall be top coated with the same paint to produce the total dry-film thickness required. The top coating must be performed within the paint manufacturer's specified recoat window.

The Engineer may require any area exceeding the manufacturer's recommended dry-film thickness to be blast cleaned to the SP-10 condition.

Slip Critical Connections. All metal to metal, slip-critical contact surfaces shall not be painted unless the paint system is identified as being 'Slip-B Approved' on the Department's Approved List, 'Structural Steel Paints - Class 1'. Painted slip-critical connection surfaces shall receive primer only.

Each painted connection shall receive a minimum of 5 spot measurements and analyzed in accordance with SSPC-PA2. DFT ranges for slip-critical surfaces can be found on the Department's Approved List, 'Structural Steel Paints - Class 1'. Slip-critical primed surfaces exceeding the listed DFT range shall be cleaned and restored to SP-10 at no additional cost to the State.

G. Painting Schedule. Primer shall be applied to approved, abrasive-blasted surfaces within 8 hours of the final cleaning operation. If the Contractor fails to apply primer to the surface within 8 hours of cleaning, the surface shall be restored in accordance with the SP-10 requirements, at no additional cost to the State.

To prevent intercoat adhesion failure, recoating must be performed within the manufacturer's recommended recoat window, or 14 days, whichever is shorter. If the contractor fails to recoat within the specified time period, the surface to be painted shall be cleaned and abraded, in accordance with manufacturer's recommendations, to ensure adhesion of the following coat at no additional cost.

If the steel has become dirty between coats, the Contractor shall wash the bridge at no additional cost to the State.

Manufacturer's recommendations shall be observed for cure to handle, and cure to top coat schedules.

H. Stenciling. The following information shall be stenciled on at least one steel element or on the inside web of a fascia member coated under this specification, unless otherwise directed by the Engineer:

1. Month and year of completion
2. Contract number
3. SP10
4. Name of Paint Manufacturer
5. Name of Shop that performed painting
6. Primer, Intermediate, and Finish coat names

The stenciled lettering should be approximately 6 inches in height and be a contrasting paint color to the top coat.

572-3.04 Field Painting. The only field work allowed is touch-up work after steel erection and subsequent concrete placement has been completed. All field painting shall be done at no additional cost to the State. All the requirements of this specification shall apply to field painted material with the following modifications:

A. Hardware. Bolt heads, washers, nuts, bolt thread extensions, and other miscellaneous steel surfaces not painted in the shop shall be cleaned as per SSPC SP-1 and painted after the bolts have been installed and accepted. Abrasive blasting of the bolts is not required. Any dye present on galvanized hardware shall be cleaned in accordance with manufacturer's recommendation prior to painting. The Contractor shall submit the dye-cleaning procedure to the Engineer five days prior to cleaning.

B. Surface Preparation of Damaged Areas. All visible dirt, grease, and other foreign matter shall be removed first by pressure washing and solvent cleaning as per SSPC SP-1 as needed. Areas exhibiting damaged or deteriorated paint not extending to the steel surface shall be hand or power-tool cleaned as necessary to remove damaged or deteriorated, loosely adhered paint. Loosely adhered paint will lift when scraped with a dull putty knife. All edges of paint surrounding the repair area shall be tightly adherent and feathered. These edges and the surrounding painted surfaces to receive a (repair) topcoat(s) shall be abraded to provide a suitable anchor profile for the paint. Areas that exhibit damage of the paint system down to the steel surface shall be cleaned with power tools to SSPC SP-11 and shall exhibit a suitable anchor profile for the primer paint. All power and blasting tools will be vacuum-sealed units. All surrounding steel that has been previously painted in the shop

shall be protected from damage during cleaning operations. Repairs shall be smoothly transitioned into surrounding new paint.

C. Application. Application shall be made by brush and roller only. Areas of steel exhibiting damage not extending down to the steel surface shall receive two coats of paint: intermediate and finish coat. Damage extending to the steel surface shall receive three coats of paint: primer, intermediate and finish coat. These coats of paint shall be applied at a dry film thickness as recommended by the paint manufacturer for such (repair) application.

572-4 METHOD OF MEASUREMENT. The quantity to be measured for payment will be in square feet of structural steel painted, measured to the nearest whole square foot. The total payment quantity will be the number of square feet of structural steel to be painted. Structural elements less than 1 square foot will not be included in the total payment quantity.

572-5 BASIS OF PAYMENT. The unit price bid shall include the cost of all labor, materials, and equipment necessary to complete the work.

Progress payments will be made for 80% of total payment quantity upon delivery. Shop-painted steel will be considered properly painted only when accompanied by the Engineer's or Inspector's written certification that the delivered steel was painted in accordance with the requirements of this Section. The remaining 20% of payment will be made upon completion of cleaning and painting all bolt heads, nuts, washers, bolt thread extensions, and damaged areas.

Payment will be made under:

Item No.	Item	Pay Unit
572.01nnnn	Structural Steel Painting: Shop Applied	Square Foot

NOTE: nnnn denotes a serialized pay item.

SECTION 573 - STRUCTURAL STEEL PAINTING: FIELD APPLIED - TOTAL REMOVAL

573-1 DESCRIPTION. This work shall consist of pressure washing, abrasive blast cleaning to remove all paint, rust, rust scale, mill scale, corrosion producing contaminants, and other foreign matter, and painting structural steel surfaces. See Special Note entitled *Structural Painting Details* for the description and requirements for serialized items.

573-2 MATERIALS

573-2.01 Paints. Paints shall meet the requirements of §708-01 *Structural Steel Paints – Class 1*, and shall appear on the Department's Approved List, 'Structural Steel Paints – Class 1'. All new paint to be applied to a single structure shall be produced by the same manufacturer. Any exception shall be approved by the Engineer and the Materials Bureau Director.

A. Shelf Life. The shelf life of all paint shall be a maximum of 12 months from the date of manufacture. Paint and thinner shall arrive at the work site in new, unopened containers. The label shall include the manufacturer's name, batch number, color, paint name, and date of manufacture.

B. Paint Storage. Paint in storage shall be protected from damage and maintained in accordance with manufacturer's recommendations. Paint will be considered in storage if it is onsite for more than 8 hours prior to application.

C. Color. Each single coat of paint shall be a different color and provide substantial contrast with the underlying substrate and previous coats. The colors of the primer, stripe coat, and intermediate coat will be the Contractor's option. The color of the finish coat shall be as specified in contract documents.

D. Technical Data. The Contractor shall supply the Engineer with the paint manufacturer's technical data and material safety data sheets for each paint to be applied. The data sheets shall be delivered to the Engineer a minimum of five work days prior to beginning of work. Data sheets shall include all information required by §708-01 *Structural Steel Paints – Class 1*.

573-2.02 Water for Washing. Water for pressure washing shall be potable water. Any detergent or soluble salt remover used must receive approval by the paint manufacturer and the Materials Bureau. Water shall not be recycled.

573-2.03 Abrasive for Blast Cleaning. Abrasive blast media for blast cleaning shall be recyclable, ferrous metallic, abrasive grit. All new metallic abrasive shall be in compliance with the specifications of SSPC-AB 3 Ferrous Metallic Abrasive. All ferrous metallic abrasive used shall be recycled and cleaned in accordance with SSPC-AB 2. The Contractor shall select the size, blend, and hardness of the abrasive to produce an angular anchor profile of a recommended depth as indicated on the manufacturer's data sheets.

All ferrous metallic abrasive arriving on the job site shall be new, and invoices shall be submitted for acceptance. All recycling equipment shall arrive empty and clean.

573-2.04 Paint Inspection Equipment. Prior to the start of work the Contractor shall supply the Engineer with the following specifications and equipment in good working order:

1. One bound copy of the Steel Structures Painting Council surface preparation specification, SSPC SP-1 – *Solvent Cleaning*.
2. One (1) bound copy of the Steel Structures Painting Council surface preparation specification, SSPC-SP 10 – *Near-White Metal Blast Cleaning*.
3. One bound copy of the most current Steel Structures Painting Council Pictorial Standards, SSPC-VIS 1, *Guide and Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning*.
4. One bound copy of the Steel Structures Painting Council specification SSPC-PA2, Paint Application Specification No. 2 - Measurement of Dry Film Thickness With Magnetic Gages.
5. One bound copy of Steel Structures Painting Council specification SSPC AB-2 *Specification for Cleanliness of Recycled Ferrous Metallic Abrasives*.
6. One bound copy of Steel Structures Painting Council specification SSPC AB-3 *Specification for Newly Manufactured or Re-Manufactured Steel Abrasive*.
7. One copy of ASTM D4417 Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel.
8. One copy of ASTM D4285 Test Method for Indicating Oil or Water in Compressed Air.
9. One Air Thermometer, pocket type, 10°F to 110°F.
10. One noncontact Infrared Thermometer, 10°F to 110°F.
11. One Contact Thermometer, 10°F to 110°F.
12. One Magnetic Dry-Film Thickness Gage, Type 2 (as defined per SSPC PA-2), with a display capable of measuring 0 to 60 mils in 0.1 mil increments, with calibration shims.
13. Two Wet-Film Thickness Gages, Prong-Type, capable of measuring 1 to 10 mils in 1 mil increments.
14. Psychrometer and US Weather Bureau Psychrometric Tables.
15. Profile micrometer with extra coarse and extra coarse plus replica tape.

All equipment will be returned to the Contractor upon completion of the work.

573-3 CONSTRUCTION DETAILS. The Contractor shall clean and paint all structural steel members, railings, downspouts, and other miscellaneous steel items as indicated in the contract documents.

The Contractor shall provide adequate access, suitable lighting, and time for inspections to be made. Any work done while the Engineer has been restricted from access, shall be recleaned and repainted, at no additional cost to the State to the State.

573-3.01 Quality Control Plan. The Contractor shall provide the Engineer with a copy of the Contractor's Quality Control (QC) procedures and/or Quality Control Plan (QCP). The QCP describes the minimum QC activities that will be performed by Contractor's QC personnel to ensure compliance. The QCP shall minimally include operating procedures and maintenance records for equipment on site, proof of formal QC training for the Contractor's QC personnel on site, and daily reports including the following information:

- Compressed Air Cleanliness
- Dry Film Thickness
- Air Temperature
- Humidity and Dew Point
- Surface Temperature
- Abrasive Cleanliness Checks
- Degree of Cleanliness Achieved
- Surface Profile
- Batch Numbers of Paint Used
- Batch Numbers of Thinner Used
- Mixing According to Specification

The Contractor must provide daily reports to the Engineer at the conclusion of cleaning work and painting work and prior to inspection of such work by the Engineer. Reports at the conclusion of cleaning and painting work shall include all pertinent information listed above that relate to such work and shall be in a format previously agreed to under the QCP.

573-3.02 Surface Preparation. Steel surfaces shall be prepared for painting by a combination of pressure washing, solvent cleaning, and abrasive blast cleaning.

Pressure washing shall be performed first, followed by abrasive blast cleaning to remove all paint, rust, rust scale, and mill scale, as per SSPC SP-10, *Near-White Metal*. If heavy deposits of rust and scale are present, they shall be removed by hand or power tool prior to pressure washing. Deposits of bird droppings taller than 1/2 inch shall be removed prior to pressure washing.

A. Pressure Washing and Solvent Cleaning. All steel surfaces to be painted shall be pressure washed, using an operating pressure range of 1800 to 2000 psi, a minimum flow of 3.5 gal/minute, and a water temperature of 185°F to 200°F. The nozzle shall be held at a distance of 6 to 12 inches from the steel surface. Pressure washing shall only be allowed when ambient air temperatures are greater than 40°F and rising. In no case will pressure washing be conducted when spent wastewater could freeze on roadway or bridge surfaces or in any other way create a hazardous situation. The washing is intended to remove contaminants from the surface, not to remove tightly adhered paint. Oil and grease shall be removed by solvent cleaning as described in SSPC SP1, *Solvent Cleaning*. The areas shall be pressure washed again following this cleaning.

When the washing is completed, the cleaned surfaces shall be free of dust, dirt, oil, grease, animal waste, salts, and other debris

A containment shall be suspended around and beneath the work area during pressure washing. The containment for pressure washing is intended to capture solid paint chips and other solid debris that may become dislodged from washing operations. Unless otherwise noted, spent wash water will not require collection and will be allowed to fall to the underlying ground or waterway, provided that the other requirements of this specification are met.

Special note, Structural Painting Details, will provide scheduling requirements for washing a structure over a body of water. Spent wash water over a public water supply or the New York City watershed shall be collected and diverted to the adjoining land mass.

If steel surfaces become contaminated or 7 calendar days elapse between washing and abrasive blasting cleaning, they shall be rewashed at no additional cost to the State.

The surface shall be allowed to dry before subsequent abrasive blast cleaning begins.

B. Abrasive Blast Cleaning.

1. Atmospheric Conditions. Blast cleaning operations shall not be conducted under the following conditions:

- a. The relative humidity exceeds 85%.
- b. When the substrate is damp or covered by frost.
- c. The surface temperature is less than 5°F above the dew point.

2. Steel Cleanliness and Profile. All structural steel surfaces shall be blast cleaned to SSPC SP-10, *Near-White Metal*.

The anchor profile shall be measured in accordance with ASTM D4417, Method C. The Contractor shall ensure that the anchor profile is within the range indicated on the paint manufacturer's data sheets. The profile, at a minimum, shall be measured five times in various locations every 2000 square feet prepared and once per work shift, unless otherwise ordered by the Engineer. The anchor profile shall not exceed 4 mils unless approved by the Engineer. The Engineer may approve a profile greater than 4 mils if an area is severely corroded or pitted. If the Contractor exceeds the 4 mils profile, the Contractor will be required to measure the profile using extra-coarse-plus replica tape and apply an additional mist coat of primer in accordance with manufacturer's recommendations to obtain a minimum 2 mils film build over the profile peaks, at no additional cost to the State.

All fins, tears, slivers, flame-cut edges, burred and sharp edges that are present or occur during the blasting operation shall be removed by grinding, and then the area shall be reblasted to provide the required profile.

Special attention shall be given to the edges of beam flanges, angles and plates, bearings, rivets, the heads of nuts and bolts, structural steel surrounding bridge joints, and similar surfaces that are marginally accessible and difficult to clean.

Upon completion of blast cleaning and prior to inspection, the containment shall be vacuumed and the cleaned surfaces shall be free of all blasting products and paint debris. Surfaces shall be free of all abrasive prior to inspection. Surfaces shall be cleared of all foreign matter by means of oil-free, moisture-free, compressed air or vacuum systems

All cleaned surfaces will be inspected by the Engineer prior to painting. Any areas that are painted before being inspected shall be cleaned and restored to the SP-10 standard and repainted at no additional cost to the State. If the cleaned surface begins to rust or becomes contaminated in any matter prior to applying primer, the surface shall be restored to SP-10 standard.

3. Steel Grit. The recyclable abrasive shall be cleaned of all paint, chips, rust, mill scale, and other foreign material after each use, prior to reuse. The cleanliness of the recycled abrasive during use shall be confirmed in accordance with SSPC-AB2. The Contractor shall execute, record, and provide the Engineer results of the nonabrasive residue test, water soluble test, and oil content test daily. The Engineer may be present during this testing. The Contractor shall also execute and provide lead content test results weekly. All equipment used for cleaning abrasive shall be specifically designed for this purpose and accepted by the Engineer.

The Contractor shall maintain a balance in the size distribution of the abrasive work mix for the duration of the abrasive blasting operations to maintain a uniform profile across the surfaces to be blasted. The work mix shall not be predominantly coarse or fine, and shall be maintained through proper removal of expended abrasive and its timely replenishment.

4. Protection of Newly Painted Surfaces. Throughout abrasive blast cleaning work, care shall be taken to protect newly painted surfaces from the cleaning operations. Tarps, covers, or other devices shall be used to protect new paint from contamination or damage. Contaminated areas of new paint shall be cleaned as necessary prior to the next coat of paint. Damaged paint shall be blast cleaned to the required condition, and then repainted at no additional cost to the State.

5. Vacuuming. After cleaning operations are completed, all debris generated by the cleaning work shall be removed by vacuuming using HEPA-filtered vacuums. A HEPA filter shall be defined as a filter that is at least 99.97% efficient for particles that are 0.3µm in diameter, or larger.

6. Equipment. All equipment and compressors used in the cleaning operation shall be equipped with filters and traps to prevent moisture, oil, and other contaminants from being deposited on clean surfaces. The air cleanliness shall be verified by the Contractor with the white blotter test in accordance with ASTM D4285 at least once per shift for each compressed air system.

7. Cleaning Area. The area cleaned shall be limited to that which can be cleaned, inspected and prime coated within a 10-hour period. Cleaned areas shall be inspected by the Engineer prior to priming. Areas that exhibit flash rusting or fail to meet the local standard prior to painting shall be re-cleaned to the approved standard at no additional cost to the State.

C. Visual and Project Standards. The Contractor shall prepare at least one project cleaning standard for each representative area on the structure that is being prepared for painting. Multiple standards may be required if the cleaned steel differs significantly from the photographic standards due to surface conditions, or other factors such as distance of the standard from the work area.

The prepared cleaning standard shall conform to SSPC VIS 1, *"Guide and Reference Photographs for Steel Surfaces Prepared By Dry Abrasive Blast Cleaning"* Pictorial Standard as applicable, and shall be approved by the Engineer before the start of general cleaning work. Each cleaning standard shall be at least 12 x 12 inches in size, and shall be located in an area of the structure that is easily accessible, and approved by the Engineer. The Contractor shall protect the work standard from corrosion and contamination throughout the duration of work by applying a clear coat of polyurethane. At the completion of cleaning work, the cleaning standard shall be cleaned and painted. If the project standard becomes deteriorated, or otherwise ineffective, it shall be reestablished at no additional cost to the State. In case of a dispute over the visual standard, the written standard shall take precedence.

573-3.03 PAINTING. The Contractor shall apply three full coats of new paint and one stripe coat to all surfaces cleaned to SP-10. The paint shall be applied in the following order: primer, intermediate coat, stripe coat, and the finish coat. All steel surfaces within 6 feet of a bridge joint shall receive an additional full coat of intermediate paint.

A. Atmospheric Conditions. Paint shall not be applied when the receiving surface and ambient temperatures are less than 40°F or greater than 100°F, unless the manufacturer's recommendations for temperature are more restrictive. No paint shall be applied unless the receiving surface is absolutely dry.

Paint shall not be applied when the relative humidity is more than 85% unless the paint manufacturer's requirements are more restrictive. No paint shall be applied during rain or when rain is forecast to occur by the National Weather Service for the project location during painting operations. All painted surfaces shall be protected from direct exposure to rain for the time interval recommended by the paint manufacturer for proper cure. The Contractor shall observe the dew point and humidity restrictions listed on the manufacturer's data sheets.

If an epoxy coating is exposed to temperatures or humidity conditions outside of the manufacturer's recommended values prior to cure, all affected surfaces shall be visually examined for greased or oily surfaces which may have formed. The Engineer may require the Contractor to use a commercially available amine blush test kit at locations chosen by the Engineer. If testing indicates the presence of an amine blush or if there is any oily film on the surface, the surfaces shall be cleaned and prepared for topcoating in accordance with paint manufacturer's recommendations at no additional cost to the State.

B. Paint Mixing. All paint shall be thoroughly mixed with mechanical mixers in accordance with the manufacturer's recommendations. After mixing, the bottom of the container shall be free of any unmixed pigment prior to use.

C. Solvents and Thinners. Paint may be thinned if recommended by the manufacturer and approved by the Engineer. The primer shall not be thinned such that the resulting VOC exceeds 500 g/L. The intermediate and finish paints shall not be thinned such that the resulting VOC level exceeds 340 g/L. The manufacturer's data sheets shall advise the Contractor and Engineer of the maximum amount of thinner allowed.

Use of unauthorized thinners, or using excess amounts of thinners is prohibited. Any area where unauthorized or improper amounts of solvents or thinners are used shall be recleaned and repainted at no additional cost to the State. All thinning shall be performed in the presence of the Engineer.

D. Paint Application. Painting shall not begin until cleaned surfaces have been inspected and approved by the Engineer. Paint may be applied using spray or brush and roller, unless otherwise indicated by the contract documents. All paint shall be applied so as to produce a uniform, even coating free of runs, sags, drips, ridges, or other defects. Roller nap shall be limited in accordance with the paint manufacturer's recommendation. Brushes and rollers used to apply the paint must be of a quality to produce a smooth uniform coating without leaving fibers in the coating.

Protection against paint spatter, spillage, wind blown paint, or similar releases of paint shall be provided. Covers, tarps, mesh, and similar materials shall be placed around the work area to protect public and private property, pedestrian, vehicular or marine traffic, all portions of the bridge, highway appurtenances, waterways, and similar surrounding areas and property, upon, beneath, or adjacent to the structure. The use of spray equipment for paint application shall be allowed within containments provided that the aforementioned protection against paint release is provided, all equipment used (including tarps, mesh and similar materials) meets all safety requirements for such enclosed use with paint spraying, and all OSHA requirements for safety and ventilation are met.

E. Stripe Coat. A stripe coat shall extend a minimum of 1 inch away from the following surfaces: all welds, rivets, bolts, nuts, edges of plates and structural members, angles, bearings, lattice pieces or other shapes, corners, and crevices. Areas near bridge joints that are to receive an additional coat of intermediate paint shall also receive a stripe coat where necessary as described above. To provide contrast, paint for stripe coating shall be a different color than the receiving surface. The stripe coat shall use the intermediate paint and be applied after the intermediate coat. The stripe coat shall be brush applied without being thinned. The stripe coat will be applied in accordance with the manufacturer's recommendations, with particular attention to the film thickness, recoat window and cure schedule.

F. Paint Film Thickness. Paint shall be applied to produce the specified dry-film thickness as directed by the range listed on the paint manufacturer's data sheets. The dry-film thickness shall be determined in accordance with SSPC-PA 2, Paint Application Specification No. 2 - *Measurement of Dry Film Thickness with Magnetic Gages*, using a Type 2 fixed probe magnetic gages. Dry-film thickness gauges shall be calibrated over a blasted, approved surface.

DFTs of the intermediate and finish coats shall be determined by subtracting the average DFT readings of the previous coat(s) from the actual DFT reading. An average DFT value shall be recorded and calculated for every 1000 square feet prepared. The average shall be calculated using a minimum of 5 spot measurements as defined by SSPC-PA2.

Areas failing to meet the specified minimum dry-film thickness shall be top coated with the same paint to produce the total dry film thickness required. The top coating must be performed within the paint manufacturer's specified recoat window.

The Engineer may require any area exceeding the manufacturers recommended dry-film thickness to be blast cleaned to the SP-10 condition.

G. Painting Schedule. Primer shall be applied to approved, abrasive-blasted surfaces according to section §573-3.02, B. 7 of this specification.

§573

The intermediate coat shall be applied within 72 hours of the final cleaning operation. To prevent intercoat adhesion failure, the topcoat shall be applied within the manufacturer's recommended recoat window, or 14 days, whichever is shorter. If the contractor fails to topcoat within the specified time period, the surface to be painted shall be cleaned and abraded, in accordance with manufacturer's recommendations, to ensure adhesion of the following coat at no additional cost.

If the steel has become dirty between coats, the Contractor shall wash the bridge again at no additional cost to the State.

Manufacturer's recommendations shall be observed for cure to handle, and cure to top coat schedules.

H. Stenciling. After the finish coat of paint has cured, the Contractor shall stencil the following information on the inside web of the fascia member, near the BIN plate, unless otherwise directed by the Engineer:

1. Month and year of completion
2. Contract number
3. SP10
4. Name of Paint Manufacturer
5. Name of Contractor
6. Primer, Intermediate, and Finish coat names

The stenciled lettering should be approximately 6 inches in height and be a contrasting paint color to the top coat.

573-4 METHOD OF MEASUREMENT

The work under this item will be measured on a lump sum basis per structure.

573-5 BASIS OF PAYMENT

The lump sum price bid shall include the cost of all labor, materials, and equipment necessary to satisfactorily complete the work, including the cost of providing protection against damage to public and private property during surface preparation and paint application. Payment for the containment, collection and disposal of dust and paint waste generated by surface preparation work shall be paid for separately.

Progress payments will be based on the percentage of steel cleaned and painted. No more than 60% of the quantity will be paid for surface preparation and priming. The remaining amount will be paid following the satisfactory completion of work.

Payment will be made under:

Item No.	Item	Pay Unit
573.01nnnn	Structural Steel Painting Field Applied - Total Removal	Lump Sum

NOTE: nnnn denotes a serialized pay item.

SECTION 574 - STRUCTURAL STEEL PAINTING: OVERCOATING AND LOCALIZED

574-1 DESCRIPTION. This work shall consist of pressure washing and power-tool or vacuum-blast cleaning of damaged paint areas and corroded structural steel surfaces, and painting surfaces described in contract documents. See Special Note entitled *Structural Painting Details* for the description and requirements of serialized items.

574-2 MATERIALS

574-2.01 Paints. Paints shall meet the requirements of §708-02 *Structural Steel Paints Class 2* and shall appear on the Department's Approved List, "Structural Steel Paints – Class 2". Paints shall be approved for either localized application, overcoating application, or both.

All new paint to be applied shall be produced by the same manufacturer. Any exception must have prior approval of the director of the Materials Bureau and the Engineer.

A. Shelf Life. The shelf life of all paint shall be a maximum of 12 months from the date of manufacture. Paint and thinner shall arrive at the work site in new, unopened containers. The label shall include the manufacturer's name, batch number, color, paint name, and date of manufacture.

B. Paint Storage. Paint in storage shall be protected from damage and maintained in accordance with manufacturer's recommendations. Paint will be considered in storage if it is onsite for more than 8 hours prior to application.

C. Color. Each single coat of paint shall be a different color and provide substantial contrast with the underlying substrate and previous coats. The color of the finish coat shall be as specified in contract documents. The color of the other coats will be at the Contractor's option.

D. Technical Data. The Contractor shall supply the Engineer with the paint manufacturer's technical data and materials safety data sheets for each paint to be applied. The data sheets shall be delivered to the Engineer a minimum of five work days prior to beginning of work. Data sheets shall include all information required by §708-02 *Structural Steel Paints Class 2*.

574-2.02 Water for Washing. Water for pressure washing shall be potable water. Any detergent or soluble salt remover used must receive approval by the paint manufacturer and the Materials Bureau. Water shall not be recycled.

574-2.03 Abrasive for Blast Cleaning. Abrasive material for blast cleaning shall be selected by the Contractor. Silica sand and other types of nonmetallic abrasive containing more than one percent free silica, by weight, will not be allowed. The abrasive blasting shall produce an angular anchor profile suitable for the paint system to be applied.

574-2.04 Paint Inspection Equipment. Prior to the start of work the Contractor shall supply the Engineer with the following specifications and equipment in good working order:

1. One bound copy of the Steel Structures Painting Council surface preparation specification, SSPC SP-1 – *Solvent Cleaning*.
2. One (1) bound copy of the Steel Structures Painting Council surface preparation specification, SSPC-SP 11 – *Power Tool Cleaning to Bare Metal*.
3. One (1) bound copy of the Steel Structures Painting Council surface preparation specification, SSPC-SP 10 – *Near-White Metal Blast Cleaning*.
4. One bound copy of the Steel Structures Painting Council pictorial standards, SSPC-VIS 3, *Guide and Reference Photographs for Steel Surfaces Prepared by Power and Hand Tool Cleaned Steel*.
5. One bound copy of the most current Steel Structures Painting Council pictorial standards, SSPC-VIS 1, *Guide and Reference Photographs for Steel Surfaces Prepared by Dry Abrasive Blast Cleaning*.
6. One bound copy of the Steel Structures Painting Council method SSPC-PA2, *Paint Application Specification No. 2 - Measurement of Dry Film Thickness With Magnetic Gages*.
7. One copy of ASTM D4417 Test Methods for Field Measurement of Surface Profile of Blast Cleaned Steel.
8. One copy of ASTM D4285-83 (1999) Test Method for Indicating Oil or Water in Compressed Air.
9. One Air Thermometer, pocket type, 10°F to 110°F.
10. One noncontact Infrared Thermometer, 10°F to 110°F.
11. One Contact Thermometer, 10°F to 110°F.
12. One Paint Thermometer, 10°F to 110°F.
13. One Magnetic Dry-Film Thickness Gage, Type 2 (as defined per SSPC PA-2), with a display capable of measuring 0 to 60 mils in 0.1 mil increments, with calibration shims.
14. Two Wet-Film Thickness Gages, Prong Type, capable of measuring 1 to 10 mils in 1 mil increments.
15. Psychrometer and US Weather Bureau Psychrometric Tables.

16. Profile micrometer with extra coarse replica tape.
All equipment will be returned to the Contractor upon completion of the work.

574-3 CONSTRUCTION DETAILS. Overcoating is defined as spot cleaning and priming corroded areas followed by applying two coats of paint to all existing painted steel surfaces. Localized cleaning and painting is defined by spot cleaning and applying three coats of paint to spot-cleaned steel only.

The Contractor shall provide adequate access, suitable lighting, and time for inspections to be made. Any work done while the Engineer has been denied, or restricted from access, shall be recleaned and repainted at no additional cost to the State.

574-3.01 Quality Control Plan. The Contractor shall provide the Engineer a copy of the Contractor's Quality Control (QC) procedures and/or Quality Control Plan (QCP). The QCP describes the minimum QC activities that will be performed by Contractor's QC personnel to ensure compliance. The QCP shall minimally include operating procedures and maintenance records for equipment on site, proof of formal QC training for the Contractor's QC personnel on site, and daily reports including the following information:

- Compressed Air Cleanliness
- Dry-Film Thickness
- Air Temperature
- Humidity and Dew Point
- Surface Temperature
- Abrasive Cleanliness Checks
- Degree of Cleanliness Achieved
- Surface Profile
- Batch Numbers of Paint Used
- Batch Numbers of Thinner Used
- Mixing According to Specification

The Contractor must provide daily reports to the Engineer upon request. The reports shall be submitted no later than 24 hours following the completion of the days work.

574-3.02 Surface Preparation for Overcoating. Steel surfaces shall be prepared for painting by a combination of pressure washing and power-tool or vacuum-shrouded blast cleaning. Pressure washing of all areas to be painted shall be performed first, followed by power-tool cleaning of areas demonstrating corrosion of the steel substrate to remove all paint, rust, rust scale, and mill scale, as per SSPC SP-11, *Power Tool Cleaning to Bare Metal* or *SSPC SP-10, Near-White Metal Blast Cleaning* as applicable. If heavy deposits of rust and scale are present, they shall be removed by hand or power tool prior to pressure washing. Areas of tightly adhered coating to remain shall be abraded to provide an anchor profile for overcoat paint. Large deposits of bird droppings shall be removed prior to pressure washing.

A. Pressure Washing and Solvent Cleaning. All steel surfaces to be painted shall be pressure washed, using an operating pressure range of 1800 to 2000 psi, a minimum flow of 3.5 gal/minute, and a water temperature of 185°F to 200°F. The nozzle shall be held at a distance of 6 to 12 inches from the steel surface. Pressure washing shall only be allowed when ambient air temperatures are greater than 40°F and rising. In no case will pressure washing be conducted when spent wastewater could freeze on roadway or bridge surfaces or in any other way create a hazardous situation. The washing is intended to remove contaminants from the surface, not to remove tightly adhered paint. Oil and grease shall be removed by solvent cleaning as described in SSPC SP1, *Solvent Cleaning*. The areas shall be pressure washed again following this cleaning.

When the washing is completed, the cleaned surfaces shall be free of dust, dirt, oil, grease, animal waste, salts, and other debris

A containment shall be suspended around and beneath the work area during pressure washing. The containment for pressure washing is intended to capture solid paint chips and other solid debris that may become dislodged from washing operations. Unless otherwise noted, spent wash water will

not require collection and will be allowed to fall to the underlying ground or waterway, provided that the other requirements of this specification are met.

Special note, Structural Painting Details, will provide scheduling requirements for washing a structure over a body of water. Spent wash water over a public water supply or the New York City watershed shall be collected and diverted to the adjoining land mass.

If steel surfaces become contaminated or 7 calendar days elapse between washing and abrasive blasting cleaning, they shall be rewashed at no additional cost to the State.

B. Power Tool Cleaning. Power tools as described in SSPC-SP 11 shall be used to clean corroded steel. Vacuum-shrouded abrasive blasting may be allowed. Steel cleaned using vacuum-shrouded blasters shall be cleaned to SSPC-SP 10.

1. Atmospheric Conditions. No cleaning operations will be conducted under the following conditions:

The relative humidity exceeds 85%.

When the substrate is damp or covered by frost.

The surface temperature is less than 5°F above the dew point.

2. Steel Cleanliness and Profile. Surfaces which have become visibly corroded shall be cleaned in accordance with SSPC-SP 11 or SSPC-SP 10, as applicable. Areas where the existing paint has peeled, flaked, blistered, or otherwise become deteriorated shall be cleaned until only sound paint, tightly adherent paint remains. These areas need not be cleaned to SP-11 or SP-10 if the damage does not extend to the steel surface and corrosion of the steel substrate or the mill scale is not evident.

Equipment used shall produce an anchor profile meeting the manufacturer's requirements as reported on the manufacturer's data sheets.

Special attention shall be given to the edges of beam flanges, angles and plates, bearings, rivets, the heads of nuts and bolts, structural steel surrounding bridge joints, and similar surfaces that are marginally accessible and difficult to clean.

The edges of intact paint shall be feathered back and the adjoining paint must be tightly adhered. Ragged or lifting edges on adjoining paint will not be allowed. Adherence will only be considered satisfactory if the adjoining paint is smoothly feathered back, and cannot be removed by lifting with a dull putty knife.

3. Vacuuming. The vacuum assembly on all tools shall be capable of containing all visible dust and debris produced by the operation of the cleaning equipment. Air passing through the vacuum assembly shall be exhausted through a HEPA filter. A HEPA filter shall be defined as a filter that is at least 99.97% efficient for particles that are 0.3 µm in diameter, or larger.

4. Preparation of Remaining Coating. Areas exhibiting damaged or deteriorated paint not extending to the steel shall be power-tool cleaned to remove all damaged or loosely adhered paint and provide a suitable surface for top coating. Loosely adhered paint will lift when scraped with a dull putty knife.

After cleaning and feathering edges, all remaining tightly adhered coating shall be abraded. The abrading operation shall not fracture or remove a significant amount of existing coating, only provide surface profile suitable to receive additional coats of paint. The degree of abrasion shall be in accordance with the manufacturer's recommendations.

The Contractor shall choose the method of abrasion. No additional payment will be made for the appropriate containment and waste collection required to abrade the surface. Open abrasive blasting to abrade the surface shall require a Class A containment, in accordance with Section 570 *Paint Removal Operations*. All other methods of abrasion shall minimally require the same level of containment as specified in contract documents for a particular structure.

If the Contractor chooses a wet-abrasive method for abrasion, the containment must meet the requirements of SSPC – Guide 6, Class 2W. All water and abrasive must be collected and disposed of as hazardous waste.

All dust, powder, or residual abrasive remaining on the surface after the abrading operation shall be thoroughly removed and the remaining surface clean prior to painting.

5. Cleaning Area. The area cleaned shall be limited to that which can be cleaned, inspected and prime coated within a 10 hour period. Cleaned areas shall be inspected by the Engineer prior to priming. Areas that exhibit flash rusting within the 10-hour period or fail to meet the project cleaning standard prior to painting shall be recleaned.

C. Visual and Project Standards. The Contractor shall prepare at least one project cleaning standard for each representative area on the structure that is being prepared for painting. Multiple standards may be required if the cleaned steel differs significantly from the photographic standards due to surface conditions, location from work area, or other factors such as distance of the standard from the work area.

The prepared standard shall generally conform to SSPC VIS 3, *Visual Standard for Power- and Hand-Tool Cleaned Steel*, and shall be approved by the Engineer before the start of general cleaning work. Each cleaning standard shall be at least 12 x 12 inches in size, and shall be located in an area of the structure that is accessible to, and approved by the Engineer. The Contractor shall protect the cleaning standard from corrosion and contamination throughout the duration of work by applying a clear coat of polyurethane. At the completion of cleaning work, the project standard shall be recleaned and painted. If the project cleaning standard becomes deteriorated, or otherwise ineffective, it shall be reestablished at no additional cost to the State. Corroded and deteriorated surfaces that have been cleaned using power tools shall be accepted by visual comparison to the project prepared standard(s) for each structure. In case of a dispute over the visual standard, the written standard shall take precedence.

574-3.03 Surface Preparation for Localized Cleaning and Painting. All of the requirements of §574-3.02 shall apply with the exception of abrading the remaining coating. Only tightly adherent existing coating within 6 inches of a power tool cleaned surface shall be abraded.

574-3.04 Overcoat Painting. The paint shall appear on the Department's Approved List, 'Structural Steel Paints - Class 2' and be approved for overcoating application.

The Contractor shall apply each coat of paint in the order listed on the Department's Approved List 'Structural Steel Paints - Class 2.'

A. Atmospheric Conditions. Paint shall not be applied when the receiving surface and ambient temperatures are less than 40°F or greater than 100°F, unless the manufacturer's recommendations for temperature are more restrictive. No paint shall be applied unless the receiving surface is absolutely dry.

Paint shall not be applied when the relative humidity is more than 95% unless the paint manufacturer's requirements are more restrictive. No paint shall be applied during rain.

The Contractor shall observe the dew point restrictions listed on the manufacturer's data sheets.

If an epoxy coating is exposed to cold temperatures or humid conditions outside of the manufacturer's recommended values prior to cure, the surface shall be visually examined for greased or oily surfaces which may have formed. The Engineer may also require the Contractor to use a commercially available amine blush test kit in various locations. If testing indicates the presence of an amine blush or if there is any oily film on the surface, the surfaces shall be cleaned in accordance with paint manufacturer's recommendations at no additional cost to the State.

B. Paint Mixing. All paint shall be thoroughly mixed with mechanical mixers in accordance with the manufacturer's recommendations. After mixing the bottom of the container shall have no unmixed pigment.

C. Solvents and Thinners. Paint may be thinned if recommended by the manufacturer and approved by the Engineer. The primer, if classified as metallic pigmented, shall not be thinned such

that the resulting VOC exceeds 500 g/L. The subsequent coats of paints shall not be thinned such that the resulting VOC level exceeds 340 g/L.

Use of unauthorized thinners, or using excess amounts of thinners is prohibited. Any area where unauthorized solvents or thinners are used shall be re-cleaned and repainted at no additional cost to the State. All thinning shall be performed in the presence of the Engineer.

D. Paint Application. Painting shall not begin until cleaned surfaces have been inspected and approved by the Engineer. Paint may be applied using spray, brush, or roller, unless otherwise indicated by the contract documents or prohibited by the paint manufacturer. All paint shall be applied so as to produce a uniform, even coating, free of runs, sags, drips, ridges or other defects. Roller nap shall be limited in accordance with the paint manufacturer's recommendation. Areas exhibiting trapped fiber or bristles shall be rejected. Prepared areas that exhibited damaged paint not extending to the steel substrate shall receive two coats of paint : intermediate and finish coat.

Complete protection against paint spatter, spillage, wind-blown paint, or similar releases of paint shall be provided. Covers, tarps, mesh, and similar materials shall be placed around the work area to protect public and private property, pedestrian, vehicular, marine, or other traffic, all portions of the bridge, highway appurtenances, waterways, and similar surrounding areas and property, upon, beneath, or adjacent to the structure. The use of spray equipment for paint application shall be allowed within containments provided that the aforementioned protection against paint release is provided, all equipment used (including tarps, mesh and similar materials) meets all safety requirements for such enclosed use with paint spraying, and all OSHA requirements for safety and ventilation are met.

E. Paint Film Thickness. Paint shall be applied to produce the specified dry-film thickness (DFT) as directed by the range listed on the paint manufacturer's data sheets. The dry-film thickness shall be determined in accordance with SSPC-PA 2, Paint Application Specification No. 2 - *Measurement of Dry Film Thickness with Magnetic Gages*, using a Type 2, fixed-probe magnetic gages. Dry-film thickness gauges shall be calibrated over a cleaned, approved surface.

DFTs of the all coats applied subsequent to the primer shall be determined by subtracting the average DFT readings of the previous coat(s) from the actual DFT readings. An average DFT value shall minimally be recorded and calculated for every 1000 square feet prepared. The average shall be calculated using a minimum of 5 spot measurements as defined by SSPC-PA2.

Areas failing to meet the specified minimum dry-film thickness shall be top coated with the same paint to produce the total dry film thickness required. The top coating must be performed within the paint manufacturer's specified recoat window.

The Engineer may require any area exceeding the manufacturers recommended dry film thickness to be cleaned to the SSPC-SP 11 or SSPC-SP 10 condition.

F. Painting Schedule. Primer shall be applied as per §574-3.02, B.5 of this specification.

The second coat shall be applied within 72 hours of the final cleaning operation.

To prevent intercoat adhesion failure, recoating must be performed within the manufacturer's recommended recoat window, or 14 days, whichever is shorter. If the contractor fails to recoat within the specified time period, the surface to be painted shall be cleaned and abraded in accordance with manufacturer's recommendations. This work shall be done at no additional cost to the State.

If the steel has become dirty between coats, the Contractor shall wash the bridge again at no additional cost to the State.

574-3.05 Painting for Localized Cleaning and Painting. The paint shall appear on the Department's Approved List, 'Structural Steel Paints - Class 2' and be approved for localized application.

The Contractor shall apply each coat of paint in the order listed on the Department's Approved List "Structural Steel Paints - Class 2".

All of the requirements of §574-3.04 shall apply with the exception of area painted. Only areas that have been cleaned shall be painted. Paint shall not extend more than 6 inches beyond all power-cleaned areas.

§574

574-4 METHOD OF MEASUREMENT

574-4.01 Overcoating - Lump Sum. The work under this item will be measured on a lump sum basis, per structure.

574-4.02 Overcoating - Square Feet. The measurement of this item will include the area requiring overcoating, measured to the nearest whole square feet.

574-4.03 Localized - Square Feet. The quantity to be measured will be in square feet of area of steel cleaned and painted, measured the nearest whole square feet.

574-5 BASIS OF PAYMENT

The lump sum price bid shall include the cost of all labor, materials, and equipment necessary to complete the work, including the cost of providing protection against damage to public and private property during pressure washing and paint application. Payment for the containment, collection and disposal of dust and paint waste generated by surface preparation work shall be paid for separately.

Progress payments will be based on the percentage of steel cleaned and painted. 60% of the quantity will be paid for surface preparation and priming. The remaining amount will be paid following the satisfactory completion of work.

Payment will be made under:

Item No.	Item	Pay Unit
574.01nnnn		Structural Steel Painting: Overcoating
574.02nnnn		Lump Sum Structural Steel Painting: Overcoating
574.03nnnn		Square Foot Structural Steel Painting: Localized
		Square Foot

NOTE: nnnn denotes a serialized pay item.

SECTION 575 (VACANT)

SECTION 576 - BRIDGE DRAINAGE SYSTEM

576-1 DESCRIPTION. This work shall consist of furnishing and placing scuppers, drainage troughs and downspout systems for bridge drainage as shown on the plans and in accordance with the specifications.

576-2 MATERIALS

Cast Iron Scuppers	ASTM A48M, Class 30 and 715-05
Fabricated Steel Scuppers (Except Gratings)	
Plates or Bars	ASTM A36 and 715-01 ¹
Tubes	ASTM A500, Grade B ¹
Headed Concrete Anchor Studs	ASTM A108, Grade 1015 or 1020
Grating Plates and Bars	ASTM A36, A242, or A572, and 715-01 ¹

Bolts and Cap Screws	ASTM A307 Grade A
Drainage Troughs (PVC)	705-11
Steel For Erection of Trough	
Bars ² (A1, A2) and Plates ² (B1, B2, C1 and C2)	ASTM A575, Grades 1015 and 1020
Rods (fully threaded) and Bolts ³	ASTM A307
Clamps, Malleable Iron	ASTM A47/A47M, Grade 32510 and 715-09
Ductile Iron Downspout Pipe and Pipe Fittings	ASTM A377 (ANSI 21.51) ⁴
Pipe Couplings ⁵ (Ductile Iron or Malleable Iron)	ASTM A536 or A47/A47M Grade 32510
Hoppers ⁶	ASTM A36 and 715-01
Pipe Brackets and Supports	ASTM A575, Grade 1015 and 1020
Anchors	GSA FS-S-325 Group I, Type I, Class I
Nuts and Bolts ⁶	ASTM A307
PVC Downspout Pipe, Fittings and Solvent Cement	706-15
Protective Cover (Cellular Polystyrene)	706-16

NOTES:

1. In addition to the requirements of 715-01, Structural Steel, the Contractor will be required to furnish the Deputy Chief Engineer (Structures), two (2) certified copies of the records of the chemical analysis of the steel.
2. Bars shall be 5/8 inch diameter. Plates shall be 2 x 1/4 inch.
3. Bolts shall be Slotted Button Head Machine Bolts.
4. All pipe shall be groove cut around the full pipe circumference at both ends. The grooves shall be radius cut in accordance with AWWA C606. The grooves shall be such that a keyed housing clamp coupling shall fit into them..The grooves shall be such that a keyed housing clamp coupling shall fit into them. Unless otherwise approved, all pipe bends (elbows) shall be of the long radius type.
5. All couplings shall be gasketed, double keyed, housing clamps designed to lock and seal the joint between two grooved pipes, or fittings, when the housing clamp is bolted and tightened in place. The gasket shall be a molded or extruded compound of Butyl or EDPM, suitable for water service.
6. Galvanized in accordance with the requirements of 719-01. Nuts and bolts shall be galvanized in accordance with 719-01, Type II.

576-3 CONSTRUCTION DETAILS**576-3.01 Fabrication**

A. Shop Drawings. Shop drawings will not be required for scuppers, drainage troughs or downspout systems.

B. Welding

1. Fabricated Steel Scuppers, Gratings. Welding shall conform to the provisions of the SCM. Weld inspection shall be done in accordance with the requirements of the SCM but radiographic testing will not be required. All groove welds shall be complete joint penetration groove welds unless otherwise approved by the DCES.

2. Drainage Troughs. Field Welding (by heat) of the polyvinyl chloride trough material shall not be allowed without written permission of the Deputy Chief Engineer (Structures).

C. Galvanizing

1. Scuppers and Troughs. Galvanizing shall conform to the requirements of §719-01, Galvanized Coatings and Repair Methods. Galvanizing shall be done after all welding and fabrication is completed.

2. Bolts, Fully Threaded Rods and Nuts. All bolts and rods shall have a ANSI B1.13M Class 6H thread. All galvanized nuts shall have a standard oversize tap to allow for the galvanizing on the bolts, rods and nuts.

D. Gratings. Gratings for Types B1 and B2 scuppers shall have a full and even bearing on the underlying surface.

E. Basis of Acceptance. Scuppers, drainage troughs and downspouts shall be accepted at the work site by the Engineer-in-Charge upon certification of the manufacturer that the materials used and fabrication procedure employed conform to the requirements of section 576. The Engineer may reject any scupper, drainage trough or downspout system which, in his opinion, exhibits poor quality or workmanship.

576-3.02 Erection of Downspout Systems

A. General

1. Pipe Installation. The pipe shall be laid true to line and grade as shown on the plans or as directed by the Engineer, with joints close and even, so that a true and even surface of invert will be made over the joints throughout its entire length. Horizontal pipe shall be installed so that the minimum slope shall not be less than 1:50. Pipe shall be placed in accordance with the requirements of this specification unless special methods are called for on the plans or in the itemized proposal.

2. Field Testing. Prior to the acceptance of the structure by the Department, the downspout system should be flushed out and tested to insure that it is flowing at full capacity. Any obstruction in the downspout system preventing the free flow of drainage or its operation at full capacity shall be removed to the complete satisfaction of the Engineer.

B. Ductile Iron Downspouts

1. Pipe Supports. Supports for horizontal piping shall be spaced 5 feet maximum. Supports for vertical piping shall be spaced 6 feet maximum.

2. Pipe Joints. All joints in pipe, except when encased in concrete, shall be made with groove type couplings. Pipes encased in concrete shall have joints formed in accordance with the pipe manufacturer's recommendations.

3. Painting. All metal embedded in concrete shall not be painted. All other metallic portions of the downspout system shall be painted in the field in accordance with the requirements of the contract documents. Color shall be as shown on the plans.

C. PVC Downspouts and Protective Insulator

1. Pipe Joints. PVC pipe joints shall be sealed in the following manner: All necessary cuts shall be square and clean from burrs. Mating surfaces of pipe and fittings shall be cleaned with methyl ethyl ketone or acetone prior to solvent cement application. The solvent cement shall be applied as recommended by the manufacturer. The pipe and fitting should be joined with a twisting motion to distribute cement uniformly. The solvent cement manufacturer's recommendations for cure time shall be followed.

2. Protective Insulator. The protective insulator shall be attached to the pipe in such a manner so as to prevent its dislodgement as the concrete is placed. Suitable methods would include taping the joints with a weather resistant tape or bonding with a non-metallic substance.

3. Form Wire. The PVC pipe and its protective insulator shall be held in place by form wire in such a manner as to provide sufficient lateral support to prevent movement as the concrete is placed.

4. Vibrator. Particular caution shall be taken to prevent the vibrator from striking the pipe and its protective insulator during the placing of concrete.

576-4 METHOD OF MEASUREMENT

576-4.01 Scuppers. Payment will be made at the unit price bid for each type of scupper furnished and placed as shown on the plans and in accordance with the specifications.

576-4.02 Drainage Troughs. The trough shall be measured as the number of feet measured along the center line of each polyvinyl chloride section, furnished and placed as shown on the plans and in accordance with the specifications.

576-4.03 Downspout System. The downspouts will be measured as the number of feet measured along the center line of pipe between the extreme outer limits of downspouts, including hoppers, furnished and placed as shown on the plans and in accordance with the specifications.

576-5 BASIS OF PAYMENT

576-5.01 Scuppers. The unit price bid for each type of scupper shall include the cost of furnishing all labor, equipment and materials necessary to set the scupper to its proper line and grade. No additional payment will be made for furnishing and placing the grating for the Type B1 or B2 scupper.

576-5.02 Drainage Troughs. The unit price bid per foot shall include the cost of furnishing all labor, materials and equipment necessary to erect the trough and its threaded rod supports as indicated on the plans.

576-5.03 Downspout System

A. General. The unit price bid per foot shall include the cost of furnishing all labor, materials and equipment necessary to erect the pipe and pipe fittings, pipe supports, hoppers, nuts, bolts, washers, to provide cleanouts if indicated on the plans, straps to cap and plug the pipe if necessary, and to replace cracked or otherwise defective material necessary to complete the work.

B. Ductile Iron Downspouts. The unit price bid per foot shall also include the cost of furnishing and placing pipe hangers and brackets, grooved type couplings and paint.

C. PVC Downspouts and Protective Insulator. The unit price bid per foot shall also include the cost of furnishing and placing the protective insulator and all adaptor fittings required at the juncture of PVC Pipe and Ductile Iron Pipe.

D. Excavation. All required excavation will be paid for under pay item 206.02 Trench and Culvert Excavation and 206.04 Trench and Culvert Excavation - O.G.

Payment will be made under:

Item No.	Item	Pay Unit
576.01	Scuppers (Type A)	Each
576.02	Scuppers (Type B)	Each
576.10	Drainage Trough	Foot
576.2001	Downspout System (Ductile Iron)	Foot
576.21	Downspout System (PVC)	Foot

SECTION 577 (VACANT)**SECTION 578 - BONDED CONCRETE OVERLAY FOR STRUCTURAL SLABS**

578-1 DESCRIPTION. Prepare the surfaces that will be in contact with slab reconstruction concrete and place slab reconstruction concrete. Prepare the structural slab surface and place a Class E, bonded concrete overlay.

578-1.01 Scope. Concrete removal work will be paid for under the appropriate item(s). Minimum thickness of the overlay concrete is 3 inches. Include the cost of any grade changes necessitated by this requirement in the unit bid price for overlay concrete.

578-1.02 Definitions

A. Overlay Concrete. Class E Concrete placed over existing and slab reconstruction concrete.

B. Slab Reconstruction Concrete. Concrete placed completely around the exposed top mat of bar reinforcement. Slab reconstruction concrete will be Class D for Method 1 and Class E for Method 2, as described in §578-1.03 Placement Methods.

578-1.03 Placement Methods.

A. Method 1 - Separate Placement. Place Class D slab reconstruction concrete and Class E overlay concrete separately.

B. Method 2 - Integral Placement (Optional). When 100% of the top mat of bar reinforcement is exposed or when all of the following conditions are satisfied, Class E overlay concrete and Class E slab reconstruction concrete may be placed in a single lift.

1. The area of the exposed top mat of bar reinforcement is 5% or less of the placement area, per span.
2. No individual area of the exposed top mat of bar reinforcement exceeds 25 sf.
3. No dimension of any area of the exposed top mat of bar reinforcement exceeds 6 feet.

578-2 MATERIALS. All material listed under §557-2.

578-3 CONSTRUCTION DETAILS .

578-3.01 Blast Cleaning. §584-3.02

578-3.02 Preplacement Wetting. §584-3.03

578-3.03 (Vacant)

578-3.04 Handling and Placing Concrete. §584-3.05

578-3.05 Construction Joints. §584-3.07

578-3.06 Finishing and Curing Slab Reconstruction Concrete - Separate Placement. §584-3.09

578-3.07 Finishing Bonded Concrete Overlay. §557-3.07

578-3.08 Curing Bonded Concrete Overlay. §557-3.11 with the following: Cure concrete with wet burlap for 7 days. Provide uniform continuous wetting until concrete curing is complete. The wet burlap and curing cover option is not allowed.

578-3.09 Opening to Traffic. Traffic is allowed only after completion of the required curing period.

578-3.10 Defective or Damaged Concrete. §584-3.08

578-4 METHOD OF MEASUREMENT. For placements with 100% exposure of the top mat of bar reinforcement, the number of square feet of slab reconstruction concrete will be equal to the number of square feet of overlay concrete.

For placements with less than 100% exposure of the top mat of bar reinforcement, measure slab reconstruction concrete prior to overlay concrete placement.

A. Method 1- Separate Placement. Measure slab reconstruction concrete as the number of square feet of Class D slab reconstruction concrete placed. Measure overlay concrete as the number of square feet of plan area of Class E overlay concrete placed.

B. Method 2- Integral Placement (Optional). Measure slab reconstruction concrete as the number of square feet of Class E slab reconstruction concrete placed. Measure overlay concrete as the number of square feet of plan area of Class E overlay concrete placed.

578-5 BASIS OF PAYMENT. Include the cost of all labor, materials and equipment necessary to complete the work in the unit bid price.

Payment will be made under:

Item No.	Item	Pay Unit
578.1201nn	Overlay Concrete, Class E – Type 1 Friction	Square Foot
578.1202nn	Overlay Concrete, Class E – Type 2 Friction	Square Foot
578.1203nn	Overlay Concrete, Class E – Type 3 Friction	Square Foot
578.1209nn	Overlay Concrete, Class E – Type 9 Friction	Square Foot
578.1300nn	Slab Reconstruction Concrete, Class D or E	Square Foot

NOTE: nn denotes a serialized pay item.

SECTION 579 - STRUCTURAL SLAB RECONSTRUCTION PREPARATION

579-1 DESCRIPTION. The work shall consist of initially preparing an existing structural slab for reconstruction. Generally, this work shall entail the removal of concrete to the depths, and at the locations, required by the contract documents.

579-1.01 Structural Slab Scarification

A. This work shall consist of removing the top surface of structural slab concrete. Removal shall be done by scarification to the following limits, unless a greater depth is indicated on the plans:

- Minimum of 1/4 inch
- Maximum of 1/2 inch

B. After scarification, if a structural slab survey is required, the surface to be surveyed shall be cleaned sufficiently to allow the survey to be taken. The Engineer will determine if the surface is cleaned sufficiently to allow performance of the necessary delamination and potential survey tests.

C. All removed materials shall be transported from the work site and disposed of or disposed of in an area on the job site approved by the Engineer.

579-1.02 Exposure of Reinforcing Bars

A. Definitions

1. Bar Mat. That combination of transverse and longitudinal reinforcing steel placed with the structural slab to absorb stresses. Structural slabs generally contain two bar mats; an upper mat and a lower mat.

2. Upper Mat. That bar mat closest to the existing top surface of the structural slab. Only the upper mat is relevant to this work, except in localized areas.

3. Localized Area. An area where full depth removal and subsequent patching will be done as part of this work. For the work of this section a localized area shall not exceed 25 sf. The sum of the localized areas shall comprise no more than five percent (5%) of the structural slab area to be prepared.

B. The work shall consist of structural concrete removal from the periphery of the upper mat reinforcing bars to provide a minimum clearance of 1 inch between the reinforcing bar surface and the remaining concrete surface. In addition, the Engineer may order the removal of other concrete. (Refer to 579-3, Construction Details).

C. All work performed under the requirements of this subsection shall not extend beyond a plane which is 5 inches below the original top of slab, except for localized areas.

D. Removed materials shall be disposed of in accordance with 579-1.01B.

579-2 MATERIALS

Class A Concrete	5012
Quilted Covers (for curing concrete)	711-02
Plastic-Coated Fiber Blankets (for curing)	711-03

NOTES:

1. 501, Class D Concrete, may be substituted at no extra cost.
2. For quantities of 5 cy of total project placement, or less, automatic batching equipment will not be required.

579-2.01 Equipment

A. Power Operated Scarifier. The specific equipment the Contractor proposes to use shall be approved by the Engineer prior to use. Power bush hammers, or other impact type devices which indent or pulverize the surface shall not be allowed under any circumstances.

B. Pneumatic Hammers and other equipment. These shall be subject to the Engineer's approval prior to use. Pneumatic hammers shall meet the requirements of §580-3.02

C. Other Equipment. All other equipment proposed for use shall be approved by the Engineer prior to actual employment in the work.

579-3 CONSTRUCTION DETAILS. The Contractor shall exercise care during the execution of the work to avoid damaging or loosening material that is to remain. All damage caused by the Contractor's operations to material that is to remain shall be repaired, or the material replaced as determined by the Engineer. All repair and replacement work shall be done in a manner satisfactory to the Engineer.

579-3.01 Structural Slab Scarification. Scarification of designated areas shall be accomplished with a power operated scarifier. Inaccessible areas will be scarified with pneumatic hammers.

579-3.02 Reinforcing Bar Exposure

A. Concrete shall be removed from the uppermost reinforcing bars of the structural slab to the limits designated by §579-1.02B. The Contractor may remove concrete, to the designated minimums, from around both sets of bars in the upper mat.

B. If concrete is removed only from the periphery of the uppermost bar, removal shall be done in accordance with those details indicated on the plans.

C. If the Contractor chooses to remove concrete from the periphery of both bars of the upper mat, or if the Engineer determines that:

- The lower bar is corroded; OR
- The concrete around the lower bar is deteriorated; OR
- Delamination extends to the level of, or below, the lower bar; OR
- The lower bar is debonded;

then the concrete shall be removed from the periphery of the lower bar in accordance with the details indicated on the plans.

D. At locations where deteriorated concrete extends beyond the minimum removal limits, the Engineer will order its removal. The Engineer will be the sole determiner of what constitutes deteriorated concrete. This ordered removal shall be part of this work, except that removal of deteriorated concrete below the limit established by §579-1.02C, shall be part of this work only within the limits of localized areas.

Locations where concrete is removed beyond minimum limits, lacking specific orders from the Engineer directing such removal, will be designated as damage locations. All damage locations shall be repaired in a manner satisfactory to the Engineer, at no additional cost to the State.

E. At localized areas, the Engineer may order concrete removal below the plane established by §579-1.02C. When such removal reaches the uppermost bar of the lower reinforcing bar mat, removal shall be continued until full depth removal is achieved.

F. Care shall be exercised when removing concrete to avoid damaging reinforcement, or other materials, which are to remain in place. Reinforcing steel damaged by the Contractor's operations shall be replaced with new reinforcing steel of the same size, appropriately spliced. Reinforcing steel splices shall be made in accordance with the details shown on the plans. Other materials designated to remain in place, which are damaged by the Contractor's operations, shall also be replaced.

579-3.03 Full Depth Patches. Refer to the details indicated on the plans.

A. Immediately prior to placing new concrete, the reinforcing bars and the edges of the existing structural slab, which will be in contact with new concrete, shall be blast cleaned. Forms shall be drawn tightly. Preparation and formwork shall be approved by the Engineer prior to any concrete placement. "After blast cleaning has been accepted, thoroughly wet the structural slab surface and all porous surfaces to be in contact with new concrete for at least 12 hours immediately prior to placement. Remove all standing water with oil-free compressed air, and protect the surface from drying, so the concrete remains in a saturated surface dry condition when placing bonding grout.

B. Concrete shall be placed and consolidated in accordance with the requirements of §555-3.04. The uppermost surface of the concrete patch shall be level with the highest of the surrounding prepared surfaces. The uppermost surface shall be intentionally roughened. The Engineer may require that a coarse textured drag be used on the plastic concrete surface.

C. Concrete shall be cured, in a manner approved by the Engineer, for a minimum of 72 curing hours prior to any other concrete placement work in contact with the curing concrete. A curing hour is defined as any hour, starting from the hour of placement, during which the ambient air temperature at the concrete surface remains at, or above 45°F as measured by a recording thermometer. Curing shall be done by means of quilted covers (§711-02), or plastic coated fiber blankets (§711-03). Quilted covers, if used, shall be kept wet during the entire curing period. The use of curing compounds shall not be allowed.

579-3.04 Hydrodemolition Equipment. Hydrodemolition equipment, if approved by the Engineer, shall be subject to the following:

A. Water Filtration and Disposal. At least two weeks prior to the employment of any hydrodemolition equipment, the Contractor shall submit to the Engineer, for approval, a comprehensive plan for the filtration and disposal of hydrodemolition water.

This plan shall ensure, to the extent practical, that all debris particles will be removed from hydrodemolition water, prior to its being introduced into any lake, river, stream, or any drainage system which empties into a lake, river or stream.

The Contractor is specifically notified that use of the existing bridge drainage system for hydrodemolition water disposal will not be permitted.

B. Water Retention. Hydrodemolition water shall be prevented from running onto, or over all portions of the project site not immediately subject to hydrodemolition work. In addition, the Contractor shall provide shielding, acceptable to the Engineer, that protects traffic and prevents all debris from escaping the immediate work location. A comprehensive plan for accomplishing these requirements shall be submitted to the Engineer, for approval, at least two weeks prior to the beginning of any hydrodemolition work.

The Contractor is specifically notified that use of the existing bridge drainage system, for this purpose, will not be permitted.

The plan for this work may be submitted as part of the requirements of §579-3.04A.

C. Adherence. Once approved, the water filtration and disposal, as well as the water retention plans shall be strictly adhered to by the Contractor. Should the Engineer determine that these plans are not being followed as approved, the Contractor will be required to immediately cease work until the conditions are rectified in a manner satisfactory to the Engineer.

Should the Contractor fail to rectify the situations to the Engineer's satisfaction, the Engineer may, with the concurrence of the D.C.E.C., require the Contractor to use equipment other than hydrodemolition equipment.

No extension of time will be granted, nor will any additional compensation be granted, for either the ceasing of work, or the substitution of equipment, if either one is required as a result of the Contractor's failure to follow the approved plans.

D. Debris Removal. All debris shall be removed quickly enough to prevent rebonding of the debris to the concrete surface. All debris which rebonds shall be removed in a manner satisfactory to the Engineer at no cost to the State.

Material designated to be left in place, which is damaged by rebonded debris removal work, shall be repaired in a manner satisfactory to the Engineer at no cost to the State.

579-4 METHOD OF MEASUREMENT

579-4.01 Structural Slab Scarification. The work will be measured as the number of square feet stated in the Estimate of Quantities shown on the plans. Except to allow for progress payments, no field measurements will be taken. Field measurements for progress payments shall not exceed the Estimate of Quantities figure.

579-4.02 Reinforcing Bar Exposure. The work will be measured as the number of square feet of concrete removed. Quantities will be determined from field measurements.

579-5 BASIS OF PAYMENT. The unit price bid per square foot shall include the cost of all labor, materials and equipment necessary to complete the work. No additional payment will be made for removals, repairs or replacements made necessary due to the Contractor's operations.

579-5.01 Reinforcing Bar Exposure. The unit price bid per square foot shall include the cost of all labor, material and equipment necessary to perform full depth patching in localized areas. Full depth

concrete removal, and full depth patching, in excess of the limits established for localized areas will be paid for as extra work.

Payment will be made under:

Item No.	Item	Pay Unit
579.01	Structural Slab Scarification	Square Foot
579.02	Reinforcing Bar Exposure	Square Foot

SECTION 580 - STRUCTURAL CONCRETE REMOVAL

580-1 DESCRIPTION. The work shall consist of removal of structural concrete from structural concrete elements, steel supported structural slabs (with and without shear connectors), concrete approach slabs, concrete bridge pylons, concrete from structural steel members, and other concrete removal indicated on the plans or ordered by the Engineer. All removed material shall become the property of the Contractor and shall be removed from the work site. All work shall be done where indicated on the contract plans or where ordered by the Engineer.

580-1.01 Removal of Structural Concrete. All concrete shall be removed to a pay line shown on the plans, or to sound surface as determined by the Engineer.

Reinforcing bars and miscellaneous material shall be removed as part of this work unless the contract plans or the Engineer specifically direct otherwise. Surfaces from which structural concrete has been removed shall be cleaned, except that surfaces not designated to come in contact with new concrete placements, need not be cleaned.

580-1.02 Removal of Concrete Bridge Pylons. Reinforcement left exposed due to the removal of the pylon shall also be removed. Surfaces exposed by the removal of the pylon shall be brought even with the neat lines of the structure, and repaired.

580-1.03 Removal of Steel Supported Structural Slab (with and without Shear Connectors). All materials, carried by the supporting steel members of the superstructure, shall be removed unless the plans specifically indicate removal under another item or that the material is to remain in place.

In the case of structural slab removal where shear connectors are present the Contractor has the following options:

- Retain and reuse the existing shear connectors. OR
- Remove existing shear connectors; replace with new stud shear connectors.

580-1.04 Removal of Concrete from Structural Steel Members. Concrete removed as part of this work shall be understood to be portland cement concrete of any nature (e.g. shotcrete), as well as portland cement mortar. In addition, any material used directly or indirectly to anchor the concrete in place shall also be understood to be concrete as it pertains to this work.

580-2 MATERIALS. Materials used in this work shall conform to the following requirements:

Stud Shear Connectors	709-05
Mortar Sand	703-03
Epoxy Resin System	721-01
Epoxy Polysulfide Grout	721-03
Sandblasting Sand	No. 40 Boiler Slag Grit or No. 2 Sandblast Sand

580-3 CONSTRUCTION DETAILS

580-3.01 General. Care shall be exercised in removing concrete so as not to damage material designated to remain in place. Reinforcement designated to remain in place shall be cleaned in a manner satisfactory to the Engineer.

Saw cutting of concrete shall be performed only where indicated on the contract plans or where ordered by the Engineer.

All concrete surfaces which require cleaning, after the concrete removal has been performed, shall be thoroughly blast cleaned, or abraded by other mechanical means satisfactory to the Engineer. After blast cleaning, the surface shall be air-blown or vacuum cleaned. Air-blowing may be used on vertical or overhead surfaces. Vacuum cleaning will be required for all other surfaces.

For any structural concrete removal item, where a hammer size limitation is specified on the plans or in the specification, the Engineer-in-Charge may order the Contractor to use a lighter hammer than that specified, if, in his opinion, the hammer being used is destroying concrete that should remain. A hammer heavier than that specified may be used if written permission is secured from the Deputy Chief Engineer (Structures).

580-3.02 Removal of Structural Concrete. Chipping hammers shall weigh no more than 45 lbs with the bit and muffler removed. The hammer shall deliver no more than 1600 blows per minute. The Contractor shall provide the Engineer information from the hammer manufacturer that these requirements are not exceeded. The air pressure used to power the hammer shall not exceed 110 psi measured at the air compressor. An air pressure gauge in proper working condition shall be provided. Only sharp chisel point bits, a minimum of 2 inches wide, shall be used. All bits determined by the Engineer to be dull shall be sharpened or replaced. If the Engineer determines that the Contractor's operations are resulting in damage to concrete that is to remain, the Contractor shall make immediate corrections. These corrections shall include the use of a lighter chipping hammer if so ordered by the Engineer.

580-3.03 Removal of Concrete Bridge Pylons. Pylons shall be removed to a plane approximately 1/4 inch above the supporting concrete surface. All reinforcement, exposed by the pylon removal, shall be removed to the depth shown on the contract plans. However, the depth shall be a minimum of 1 inch below the final finished concrete surface. The remainder of the pylon shall be brought flush with the supporting concrete surface either by bush hammer or other finishing methods approved by the Engineer.

All holes in the final finished concrete surface, left as a result of reinforcement removal, as well as any other depressions shall be filled with epoxy mortar. The epoxy mortar shall be comprised of three parts mortar sand to one part of any of either §721-01, or §721-03. Measurement shall be by volume. Mortar sand shall be absolutely dry immediately prior to being mixed with any epoxy system. All holes and depressions shall be fully cleaned and thoroughly dried immediately prior to the addition of the epoxy mortar.

580-3.04 Removal of Steel Supported Structural Slab. If existing shear connectors are present and the Contractor elects to remove them, the new stud shear connectors shall be furnished and installed as indicated on the contract plans. Existing shear connectors shall be removed by oxygen cutting. The remaining cut surface shall be 1/4 to 3/8 inch from the surface of the main material. Oxygen cutting shall be performed in such a manner that the main material is not damaged. The remaining cut surface need not be ground or finished in any manner unless required by the contract documents. New stud shear connectors shall be installed in accordance with the provisions of the SCM, Section 7, Part C.

All unpainted structural steel surfaces exposed by concrete removal, against which new concrete will be subsequently placed, shall be cleaned sufficiently to ensure proper bond between the steel and concrete. Cleaning methods shall be chosen by the Contractor. Cleaning results shall be satisfactory to the Engineer.

580-3.05 Removal of Concrete from Structural Steel Members. Structural steel members shall have all concrete removed from their surfaces. It will not be necessary to remove the concrete to such an extent that bare steel is exposed. However, the concrete must be removed to such an extent that subsequent cleaning operations will remove any concrete residue. The Engineer shall be the sole judge as to whether or not the concrete has been sufficiently removed under the terms of this subsection.

Portions of concrete may be anchored by material welded to the structural steel member. Under the foregoing circumstances the welds shall be ground flush with the steel surface.

Care shall be taken to insure that the structural steel members are not damaged due to the Contractor's operations. Should a structural steel member be damaged due to the Contractor's operations, the Engineer shall be the sole judge as to whether or not the structural steel member may be in need of repair. Should the Engineer decide that repair may be in order, notification shall be made to the DCES who shall make the final determination. The DCES determination will be one of the following:

No repair is necessary.

Repair is necessary. In this case, the DCES shall determine the method(s) of repair. The Contractor shall perform all repair work in strict accordance with the DCES instructions.

Replacement of the structural steel member is necessary. In this case, the DCES shall determine the material(s) and method(s) of replacement. The Contractor shall perform the replacement work in strict accordance with the DCES instructions.

The DCES will make every effort to render the necessary determinations without appreciable delay. However, all expenses caused by any delay attributable to the time required for the DCES to render those determinations, shall be borne by the Contractor.

Any required repair, or replacement of structural steel members performed under the terms of this subsection, shall be done at the expense of the Contractor.

Chipping hammers shall meet the requirements of §580-3.02.

580-4 METHOD OF MEASUREMENT

580-4.01 Removal of Structural Concrete. The work shall be measured as the actual number of cubic yards of concrete removed and disposed of.

580-4.02 Removal of Concrete Bridge Pylons. The work shall be measured as the number of concrete bridge pylons removed and disposed of.

580-4.03 Removal of Steel Supported Structural Slab (with and without shear connectors); Removal of Concrete Approach Slabs. The work will be measured as the number of square feet of structural slab removed and disposed of. Measurement will be taken in the field without any deductions for openings unless otherwise indicated on the contract plans.

580-4.04 Removal of Concrete from Structural Steel Members. The work will be measured as the number of linear feet of structural steel member from which all the concrete indicated to be removed by the plans, has been removed. The distance shall be measured along the longitudinal axis of the member.

580-5 BASIS OF PAYMENT

580-5.01 Removal of Structural Concrete. The unit price bid per cubic yard shall include the cost of all labor, materials and equipment necessary to complete the work.

580-5.02 Removal of Concrete Bridge Pylons. The unit price bid for removal of each concrete bridge pylon shall include the cost of all labor, materials and equipment necessary to complete the work.

580-5.03 Removal of Steel Supported Structural Slab (with and without shear connectors); Removal of Concrete Approach Slabs. The unit price bid per square foot shall include the cost of all labor, materials and equipment necessary to complete the work.

580-5.04 Removal of Concrete from Structural Steel Members. The unit price bid per linear foot shall include the cost of all labor, material and equipment necessary to complete the work.

Conditions and work for which compensation will not be made, are noted under §580-3.04.

Payment will be made under:

§580

Item No.	Item	Pay Unit
580.01	Removal of Structural Concrete	Cubic Yard
580.02	Removal of Steel Supported Structural Slab (with shear connectors)	Square Foot
580.03	Removal of Steel Supported Structural Slab (without shear connectors)	Square Foot
580.04	Removal of Concrete Approach Slab	Square Foot
